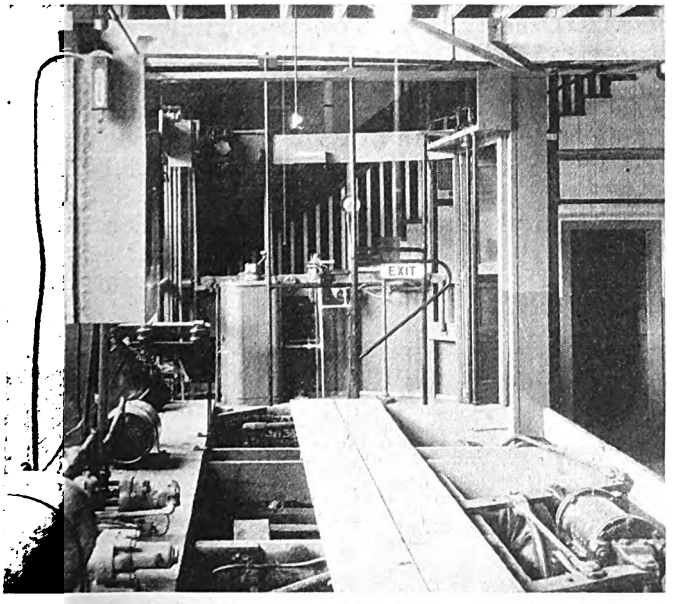
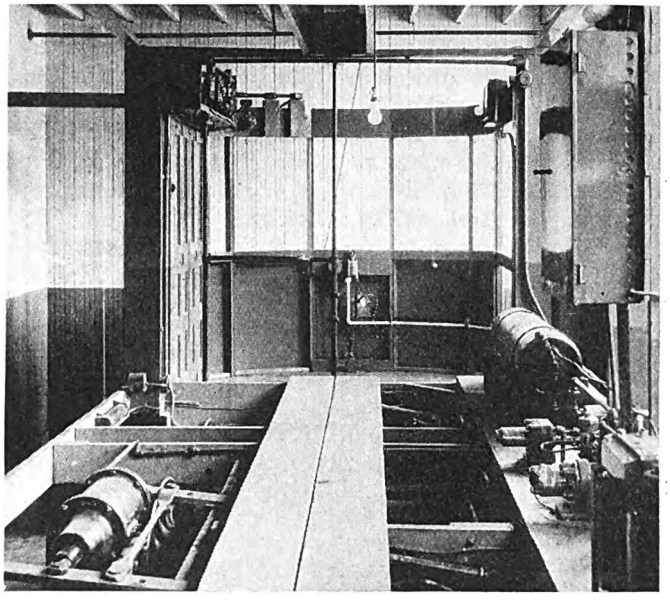
The reconstructed training car represents a modern transportation unit so arranged as to facilitate the examination and study of its auxiliary equipment. The forward vestibule is equipped with rear door control levers, hand brake, air valves for braking and forward door operations, air gage, K-35 controller, rear door signal, rear vision mirror and switches for both power and light circuits. A storage battery, relays, and an automatic line breaker are located on the left side of the car. The line breaker is incased in glass for observation of its action at close range. The thermostatic car heat control placed in the rear vestibule is designed for manual operation, with a series of small lamps substituted for the car heaters to illustrate its performance. The rear vestibule is also equipped with a door lever for use when the car is run as a two-man unit, a reverse valve and door engines, the latter installed above the door. The trucks of the instruction cars are mounted above rails with clearance to permit the free running of wheels and observation of the braking equipment. The brake rod is brought up over one of the cross members of the car frame to illustrate its action.

The supply, application, and exhaust air lines are painted in contrasting colors to facilitate tracing their relative positions in the braking system. Motor leads and all other car wiring are exposed. The car was designed and built in the company's shop and installed by its own mechanics at an estimated total cost of $2,500.



In this skeleton instruction car of the Kansas City Public Service Company a complete set of control, brake and door equipment is installed in full view



At the rear of the car is the air brake reservoir, air pump and governor. Rear platform equipment is included to show its action on a two-man car

1927 Census Report

Statistics on 655 electric railways show increase in car mileage over 1922. Number of passengers carried increases

THE Department of Commerce announces that according to data collected at the quinquennial census of electrical industries taken in 1928, 655 companies engaged in the operation of electric railways in 1927 reported totals of 27,866 miles of line (first track), 89,642 cars operated, 2,120,774,257 car-miles, and 14,521,977,983 car passengers carried. As compared with 1922, the last preceding census year, these figures show the following decreases: Number of operating companies, 21 per cent from 826; mileage of line, 7 per cent from 30,070; number of cars, 7 per cent from 95,931; number of car passengers, 2 per cent from 14,881,857,530. The only item that was greater in 1927 than in 1922 was the number of car-miles operated, which shows an increase of 2 per cent over 2,081,085,455.

Electric railways reported totals of 3,878 buses in operation in 1927 (no data are included for bus lines other than those operated directly by electric railway companise), 130,015,315 bus-miles, and 398,323,932 bus passengers carried. These figures show increases over 1922 as follows: Number of buses, 954 per cent over 368; bus mileage, 1,731 per cent over 7,100,624; passengers, 2,373 per cent over 16,109,836. Foregoing figures for 1927 are exclusive of data for 32 electric railways which are believed to have been in operation in 1927 but which had failed to make reports prior to Sept. 14, 1928. These companies reported 3 per cent of the total pasengers carried in 1922. In order to make a true comparison with 1922, the figures for that year, as given above, have been adjusted by deducting the data for the 32 companies in question.

The 655 operating electric railways reporting for 1927 were distributed by states as follows: Pennsylvania, 81; New York, 80; Ohio, 55; Illinois, 42; Massachusetts, 26; California, 24; Indiana, 21; Iowa, 20; Michigan, 20; Texas, 20; Washington, 18; Virginia, 17; Kansas, 15; Missouri, 15; New Jersey, 14; Wisconsin, 14; Maine, 13; Tennessee, 13; Colorado, 10; West Virginia, 10; Minnesota, 9; North Carolina, 8; Oklahoma, 8; Arkansas, 7; Georgia, 7; Kentucky, 7; New Hampshire, 7; Florida, 6; Louisiana, 6; Utah, 6; Connecticut, 5; Maryland, 5; Montana, 5; South Carolina, 5; Vermont, 5; Nebraska, 4; North Dakota, 4; Oregon, 4; Alabama, 3; Arizona, 3; District of Columbia, 3; Mississippi, 3; New Mexico, 2; Delaware, Idaho, Nevada, Rhode Island and South Dakota, 1 each. The decrease in the number of operating companies from 826 in 1922 to 655 in 1927 is due to the fact, so the department points out, that 141 companies did not operate during any part of 1927 and 30 were merged with other companies between Dec. 31, 1922, and Jan. 1, 1927.

In the accompanying table a summary is presented for the electric railway industry for 1927, 1922 and 1917. Figures for 1927 are preliminary and subject to such correction as may be found necessary after further examination of the returns that were made by the companies which reported to the department.

Numerous Benefits Bestowed in Montreal

CONSIDERABLE relief work was accomplished during the year ended April 30, 1927, by the Montreal Tramways Mutual Benefit Association, Montreal, Canada. To members on old age pension $26,163 was paid during the year against $19,381 in 1927. On the permanent disability pension an amount of $15,469 was paid compared with $6,426 during the preceding year. Under the heading of death benefits $39,000 was paid, compared with $25,000 during 1927. To disabled members benefits amounted to $39,795, against $42,445 in the previous year.

The gross revenue for 1927-1928 was $232,010, and for the year 1926-1927, $258,903. Total expenses were $169,007, compared with $153,761. The balance transferred to the reserve fund was $63,002, and $105,142 for the 1926-1927 year.

The Montreal Tramways Mutual Benefit Association was incorporated in 1904. The number of members on April 30, 1928, was 3,843 against 3,754 on the same date of 1927.

SUMMARY FOR ELECTRIC-RAILWAY INDUSTRY: 1927, 1922 AND 1917

	1927 Totals of Reports Received Prior to Sept. 14, 1928	1922 Adjusted for Comparison with 1927*	1922 As Originally Published Comparable with 1917	1917
Total number of companies	998	1,166	1,200	1,370
Operating	655	826	858	943
Lessor	343	340	342	364
Total number of employees	†262,725	292,624	300,523	294,826
Number of bus employees (included in total above)	7,168	400	404	.....
Total miles of track operated	41,417.65	42,373.99	43,931.86	44,835.37
Miles of first track	27,865.70	30,070.34	31,264.26	32,547.58
Total number of cars (all types)	89,642	95,931	99,255	102,603
Total number of car-miles operated	2,120,774,257	2,081,085,455	2,138,281,674	2,139,801,530
Total number of car passengers	14,521,977,983	14,881,857,530	15,331,399,851	14,506,914,573
Number of revenue car passengers	11,802,916,612	12,335,286,642	12,666,557,734	11,304,660,462
Miles of bus route (round trip)	‡13,031.34	683.86	685.36	.....
Number of buses	3,878	368	370	.....
Total number of bus-miles	130,015,315	7,100,624	7,116,404	.....
Total number of bus passengers	398,323,932	16,109,836	16,120,115	.....
Number of revenue bus passengers	325,919,601	12,783,202	12,791,308	.....

*The figures given in this column are totals for those companies which made reports for 1927 prior to Sept. 14, 1928, and those which operated in 1922 but went out of existence as separate companies prior to Jan. 1, 1927.

The 1922 figures for the companies which are believed to have operated in 1927 but which had not submitted reports prior to Sept. 14, 1928, are as follows: Number of operating companies, 32; total number of employees, 7,899; number of bus employees, 4; total miles of track operated, 1,557.87; miles of first track, 1,193.92; total number of cars (all types), 3,324; total number of car-miles operated, 57,196,219; total number of car passengers, 449,542,321; number of revenue car passengers, 331,271,092; miles of bus route, 1.5; number of buses, 2; total number of bus-miles, 15,780; total number of bus passengers, 10,279; number of revenue bus passengers, 8,106.

†Not strictly comparable with 1922 because of the fact that some establishments which at the census for 1922 included data for power plants in their railway reports made separate power-plant reports for the year 1927.

‡Not strictly comparable with 1922 because of the fact that the schedule for 1922 called for miles of bus lines, *one way*, whereas the 1927 schedule called for miles of route, *round trip*.

Opportunities for

Improving Public Relations

Through Employee-Customer Contact

This article, based on the report of the committee on employee-customer contact of the American Electric Railway Association, contains a wealth of ideas on a subject which is commanding the attention of every electric railway operator today. The members of this committee, responsible for the report, are Thomas Fitzgerald, vice-president Pittsburgh Railways, chairman; David W. Gordon, director service improvement Chicago Rapid Transit Company; Clinton D. Smith, superintendent department of personnel Cleveland Railway; D. W. Snyder, Jr., vice-president Illinois Traction System; C. E. Thorney, assistant to vice-president Chicago, North Shore & Milwaukee Railroad, and W. E. Wood, president Virginia Electric & Power Company.

NECESSITY for improvement in the technical and mechanical features of street railway operations has overshadowed the need for development in certain phases of public relations work, where antiquated methods have not appeared so strikingly obsolete as out-of-date equipment. Remarkable progress has been made in the design of cars, although it is generally admitted that the evolution is only in its first stages, but much of the present operating practice, to which custom has given the stamp of approval, has not been subjected to such critical analysis.

One of the most important effects of the increased use of the automobile upon the duties of the trainman has been to make of him not merely an operator or fare collector, but also a traveling agent of the company, who personally introduces its product to the prospective customer. The progress of the street railway industry is largely dependent upon the efforts of the trainmen, whose contact with the public can be made a major operating asset not available to the manufacturer of commodities. It must be admitted that a platform man, mindful of the possibilities in his job, alert to the necessities of the industry, and disposed to co-operate with the management, is in a strategic position to render service of great value. The success of a policy aimed to take advantage of employee-customer contact is contingent, therefore, upon the willingness and ability of the employee to co-operate.

Improvement in the state of public relations is not the only objective of the plan. The industry must now solicit business, and any measures which will tend to encourage car riding should be utilized. It is difficult enough to retain present patronage, much more so to gain new customers; but unless the trainmen are enlisted in support of the office policies, and equipped to assist in carrying them out, the best laid plans may fall far short of success.

It was thought at one time that courtesy on the part of trainmen was the single requisite in the matter of public relations, but the exigencies of the present situation have revealed the inadequacy of the former view. Today it is essential that the platform man co-operate with management in its effort to provide efficient and reliable service, greatest speed, and safer transportation in comfort—and that he also act as advocate when the opportunity is presented.

Street railway problems are difficult to solve, but employee-customer contact is a factor in the answer to most of the difficulties confronting the industry today, and its influence on results cannot be ignored. The mental attitude of the worker is of fundamental importance and justifies first consideration.

The cause of unsatisfactory public relations may generally be traced to lack of information on the part of the customer concerning the operations of the company. Success without the support and co-operation of the public is difficult, if not impossible to attain. The real purpose, therefore, in utilizing the employee-customer contact in the interest of the company is to convey to the public a knowledge of a business that is conducted under the same fundamental principles as any other enterprise. A general understanding of this fact alone will contribute to an improved state of public relations.

The industry is fortunate in having available exceptional opportunities for informing the car rider of its operations, winning the confidence of the public, and selling its services. The ownership of space for car ads, for instance, is an asset which should be used to the fullest extent in a plan designed with a definite objective. Haphazard announcements fall short of the mark. No company today follows a hit-or-miss policy in the actual operation of cars, and the publicity program justifies constructive thought to the same degree.

Publicity items are generally prepared for the single purpose of improving public relations, and much originality has been displayed in this field. The average person, however, still has the impression that the railway companies are making large profits, concealed from public view by the "mysteries" of the business. Under such conditions, the state of public relations might be satisfactory, as far as the lack of militant opposition is concerned, but active co-operation and support are more to be desired. This can be obtained by taking the public into confidence and informing patrons of the difficulties confronting all operators, and of the economies effected in an effort to overcome them. When the financial rec-

Digitized by Google

ord is an open book, the street railway industry will not always be on the defensive, which has been its characteristic attitude in the past.

Advertising is not properly a part of this study but its function is similar to that of the general subject, and its place in a comprehensive policy of "selling the company" is to act in support of the primary effort to utilize the natural advantages offered by the contacts between employee and customer. Few industries, if any, enjoy a position of comparable strategic value. So far, this element of position has been overlooked, for the most part, in programs aimed at winning the confidence of the public, and the value of the trainman as an agent for securing co-operation has not been fully realized, except in a few instances where marked success followed well-directed campaigns.

Newspaper advertising can be utilized to advantage in a systematic display program, portraying the duties of the individual employee and designed to promote friendly co-operation between the trainmen and the public. A series of advertisements, directed to the personnel of a company, not only creates a greater confidence in the road, but also shows definite results in additional business. Other forms of educational advertising can be used to good effect and can tie in securely with the fundamental newspaper display program.

But after publicity has called the attention of the public to the trainman, the chief problem still remains—that of making the contact position of the trainman an asset rather than a liability. The attention of the street railway industry has been directed recently to the advantages, both to the company and to the public, inherent in the contacts between employee and customer. These contacts, when properly analyzed, will be found to be at least as effective in producing favorable results as the customary advertising program, for the scope of possibilities is much broader. The plan lends itself readily to the new conception of the term "publicity," which has outgrown its narrow field, as commonly understood, and now includes provision for informing the public about matters which heretofore have been considered the business of a company alone. Good public relations can only be founded upon confidence, and confidence can be won only by telling the whole story. This can be done in conversation as well as by print, and in a manner fully as convincing.

Enlisting the Employee in Public Relations Work

The co-operation of employees, so essential in promoting good public relations, is readily secured by the broad-minded, alert executive when he has only a small number of men to supervise, and when, by frequent contact with them, he gains knowledge of their circumstances, characteristics and mental attitudes. To secure co-operation from a large working force has become the problem for which solution is sought.

The fundamental is not obscure. The problem resolves itself into decision as to the best methods of maintaining contact, of communicating an explanation of the company's business, and of acquiring an understanding of the attitude of the employees.

In the first place, the employer, manager, or supervisor must be in a position to say that the workers will share in the prosperity of the company. If the hands of the officer are tied, if he cannot give assurance that initiative will be rewarded as revenues permit, then co-operation is difficult to obtain. The worth-while employee measures his services in terms of payroll, and, therefore, the employer must be free to state that the progress of the company will benefit all.

Secondly, co-operation should be sought only when the supervisory force has such a complete understanding of the company's policies that they can answer readily the many questions which arise, without being embarrassed when an inquiry is made.

Transportation is a community project. The appearance of a newspaper article dealing with any company activity makes it necessary that the supervisory organization be so informed on the subject that the men may discuss it freely with associates, and thereby eliminate confusion in the minds of others.

When only partial information is given to the leaders, or contact men, their initiative is limited. The first concern in dealing with this subject is to make a business family out of an official organization. Co-ordinated effort will naturally result from an attitude which gives consideration to the prestige that should be attached to the various positions held by the key men. When the official family is left to make its own conclusions on the policies of the company, a feeling of suspicion and, frequently, misstatement of facts generally follow.

An Uninformed Employee is a Liability

Opinion is probably unanimous that an uninformed and disgruntled employee is a liability, but there is no similar agreement as to either the causes of dissatisfaction or the items concerning which the employee should be informed. Among the causes of dissatisfaction are: (1) Lack of consideration shown to the employee by management; (2) influence of bad leadership which has prevailed in absence of company leadership; (3) bad working conditions, which exist frequently because of ignorance of conditions on the part of leading executives, and (4) misinformation, which generally exists when contact and correct information are lacking.

Lack of Consideration—Dissatisfaction and lack of interest are created by the failure of a supervisory officer to recognize the individual as an associate. The greeting, the handshake, and the smile, when natural, are acts of consideration. Every employee expects them, and for that reason alone should receive them. In some cases, when arrangements are made closely touching the interest or habits of the employee, his opinion should be sought. Consideration is the first and basic fundamental for securing the co-operation of employees.

Influence of Bad Leadership—The main cause of disloyalty is the neglect on the part of supervisory officers to exercise a leadership that has been allowed to drift to outside individuals. A group of employees expects leadership and will follow a leader who always advocates sound policies.

Bad Working Conditions—Dissatisfaction resulting from a faulty condition of physical environment, during working hours, is most readily corrected when the executive who controls the situation maintains a proper contact with actual operations. He should not shoulder the responsibility of others, but as a true supervisor, must know what is going on. Much has been said about the use of the automobile by transportation officials. The chief objection to this practice is that it tends to take the official out of the environment of the salesmen, and a sales-manager cannot properly guide his force when he does not know the conditions under which it works.

Misinformation—Rumors, gossip, and misstatements result from failure of authorized officials to give out

Digitized by Google

correct data, and to maintain constant communication with their men. Under a policy of informing the men as to the development of the day, frequent contact and other means of notification will spread the right information almost automatically.

The average human being, out of contact with progress and left to himself or to association with similar uninformed employees, will construct beliefs from mere impressions or false knowledge. It is the trainman, thus neglected, who is most liable to develop into a chronic knocker, and in conversation communicate to patrons a biased, but deep-rooted distrust of the company.

But the employee has an interest in his job when he feels it is a responsible one—when he hears it talked about at company meetings, reads about it in newspapers, company publications and bulletins. He becomes ambitious to be worthy of the commendation given him, and realizing the importance of his work strives to maintain the good reputation established and to repair the effects of misinformation.

General and Specific Information Needed by the Trainman-Salesman

It is an axiomatic fact that in any business well-informed employees render the most efficient service. In the public transportation business this is especially true. The employees of a street railway company differ from most salesmen in that trainmen both manufacture and sell the company product. Obviously if they are not well-informed they can not produce the best service, much less sell it to a temperamental public.

For the best results, it is necessary that every employee of the company measure up to the following three requirements: (1) He should possess a clear understanding of the theory upon which the business is founded, of the conditions which justify its existence, and of the reasons back of the policies and practice adopted by the owners and management; (2) he should be a finished specialist in that phase of the business with which he is connected, be he track greaser, trainman, director of publicity, or manager, and (3) he should have a sincere desire to serve the public most efficiently, to gain the public's friendship for his company, and to carry out the policies of his superiors in the interest of all concerned. An uninformed employee cannot measure up to these qualifications. Educational work, interestingly and intelligently conducted, is the only means of developing employees so qualified.

As soon as the employee really begins to understand the problems of the business, if he is a normal human being, he will begin to be interested in those problems. This interest in turn develops into enthusiasm, and the inmate human instinct to overcome difficulties then becomes operative. The employee becomes a constructive factor in the industry. Not only is he working for his day's pay but he is getting out of his work a sense of satisfaction—a "kick." He is no longer a lifeless automatum but is a part of the prime moving force of the organization.

His increasing knowledge of the business brings him to realize its necessity and justification, to see that it is up to him to help make it succeed. Like every red-blooded man, he is ready to "tackle the job." The apparent difficulties in his way only serve to sharpen his wits, for by this time he is in the game to win.

But apart from interesting him in "playing the game," this understanding will prove to him that his own proper self-interest requires that he help make the business a success. For how else can he reap the reward due him unless his business be successful?

There are many means of interesting and informing the employee, none of which will probably be successful without the enthusiastic and aggressive backing of the very head of the organization, who in turn has the job of arousing the enthusiasm of the whole official family in the accomplishment of this work.

The employee should receive information relative to the following fundamentals: (1) General and simple economics of street railway operations; (2) the forces of competition; (3) methods of meeting the competition, and (4) regular information of all company activities.

General and Simple Economics of Operation—When the employee receives periodically a statement of gross revenues, operation expenses, taxes, etc., the mystery of what becomes of the millions collected every year will be explained. The potency of the millions vanishes when expenses and revenue per trip are considered the unit.

The employee should understand the mechanics of operation, particularly of the transportation department. He should know the relationship between the peak and the off-peak business, so as to appreciate the extraordinary expense of extra equipment needed for the short period of maximum traffic. Other economic facts are pertinent information, and will suggest themselves once a plan of spreading the information is adopted.

The Forces of Competition—The employee should know that regulated transportation today is affected adversely, in varying degrees, by the privately-owned automobile, the taxicab, the telephone, de-centralization of merchandising stores, the radio, and the desire of the public for luxury and personal service. An appreciation of the situation will cause the employee to be interested in receiving suggestions designed to counteract the competition.

Methods of Meeting the Competition—Plans of the company to secure new business should be passed on to the employee. It may be sales training of the individual employee, one-man operation, new cars, economies of operation, etc.

Regular Information of All Activities Should Be Issued—Much can be done, also, in keeping the employee informed concerning not only his own road's service but also that of associated companies and connecting lines. For if he furnishes detailed and reliable information to his customer, he performs an inestimable service in the interest of better public relations and increases business.

Methods of Transmitting Instruction

It is impossible to assemble large groups of trainmen, but it is feasible to convene recognized leaders or representatives, who, when conditions are understood and the good faith of the company is recognized, will transmit to others the general principles of the company plan, and the inspiration to co-operate.

A method of instructing by classes has been followed by some companies with good results. It has a psychological value, in addition to its educational value, for the very fact that management is endeavoring to enlist the support of the employee, and to equip him for further service, removes one of the principal causes of industrial unrest, as pointed out by economists, namely, the failure of management and ownership to regard labor as an associate directly interested in the success of a business.

The distribution of publications, such as general literature on the industry, house organs and bulletins, will accomplish results in a sufficiently large number of cases to justify the effort.

Digitized by Google

Contact between officers of the company and the men all along the line goes far toward removing causes for antagonism, which has characterized relationships in industry in the past.

The education of the employee for the purposes outlined is a difficult undertaking, but when properly accomplished amply repays the effort put into it.

Complaints Afford Opportunity for Salesmanship

The handling of complaints, which concerns employee-customer contact directly, is a much larger problem than that presented by the written complaints received by the management and dealt with directly by it. For every patron who takes the trouble to write to the company there are many more whose displeasure reaches the ears of the trainman only. Consequently, there are many opportunities for true salesmanship in the somewhat neglected field of the verbal complaint.

The extent to which expediency should govern in arriving at a correct attitude toward complainants cannot be determined by snap judgment, for the ethics of the subject may be debatable, and a company should always be adverse to doing an injustice to an employee. Since two conflicting interests are at stake in this field—the necessity for improving public relations, on the one hand, and employee relations, on the other—neither the slogan, nor a policy designated by its reverse, will prove to be a solution to the problems presented. The complexities of the present social and industrial order have relegated such simple methods of solving problems to the rôle of antiquities. Modern practice demands a more rational treatment of situations, to which cut-and-dried methods in good standing in the past are no longer applicable.

It is true that some patrons deliberately impose upon a street railway company, but the percentage is exceedingly small. It is possible, moreover, for a patron to be sincere in making a mistaken complaint. Harsh treatment, in either instance, accomplishes no good end and is more damaging to the interests of the company than the imposition—or the mistake—of the patron.

There is a tendency today toward a recognition of the natural desire of humanity to do the right thing, and to avoid making mistakes; and when steps are taken to remove misunderstanding, human relationships are in great measure readily adjustable. For this reason, controversy between trainmen and the public can be, and is, frequently settled without recourse to a makeshift slogan.

Handling of written complaints within the office is important, for the same complaints may also be made verbally to the conductor and, moreover, the attitude of the customer toward the trainmen is influenced by the manner in which the complaint has been settled by the office. The difficulties of the platform men may be lightened or increased by office action toward a complaint.

The strategic position of the trainman in the matter of complaints and criticism has not received the consideration which the subject deserves. The constant stream of complaint and comment directed at the trainman, or uttered in his presence, is of undisputed value to a company. Expressions of that kind are actually sought by some manufacturers to enable them to improve a product or to understand the market. A street railway company sells its wares only through its own employees, and is in an enviable position to know what the market wants and dislikes about its service.

A complaint is not always a "knock" but may frequently be viewed as a suggestion, from which, in many cases, the company could undoubtedly profit. The benefits to be derived from verbal criticism and comment would possibly justify a definite plan whereby the company could receive, through the various carhouses, a summary or digest of the remarks made about the service, which the platform man hears daily. Instruction of trainmen as to circumstances out of which complaints arise, and the attitude they should take toward those making complaints, should be provided. The necessity for a consistent policy in the matter is set forth in the following section of this report. The self-interest of employees is involved, and this alone should remove any difficulties arising in the introduction of a system of instruction.

Management Responsible for Policies

The determination of the company policies which govern the relations of the front-line employees with the public is unquestionably the responsibility of the management. The supervisory force is responsible for the publication of these policies and for the proper instruction of subordinates concerning them; but the responsibility for actually carrying out the policies rests with the public-contacting employee and, in the last analysis, this is the phase of company policies in which the public is most deeply interested—the manner in which they are carried out.

Hence, any plan for obtaining or developing a favorable public attitude toward a company should be constructed on the realization that the public-contacting employee is an essential factor. Such a plan, to be effective, should include a comprehensive scheme for thorough and systematic training of employees in the art of meeting the public.

A course for employees having contact with the public should include the following, in addition to the data concerning the business, to which reference has already been made:

1. Instruction in the elements of good personal service, such as—(a) Attentiveness, or the interest and consideration shown by an employee in giving service that satisfies the customers' needs; (b) information, or the adequacy of the answers given by an employee in response to the customer's questions; (c) speech, or the facility with which an employee expresses himself when addressing a customer; (c) politeness, or an employee's use of the commonly accepted and routine polite acts and expressions, and (e) appearance, or the cleanliness and attractiveness of person, the appropriateness and neatness of clothing, and the tidiness of working equipment.
2. Instruction in the fundamentals of salesmanship.
3. Development of company loyalty or *esprit de corps.*

To be effective, company rules and regulations for the guidance of employees, and courses of training in meeting the public should be made with the knowledge that situations arise for which the employee is not in any way responsible. In a training course we need to give consideration to these situations.

The time has arrived when the industry must take cognizance of its shortcomings in the fields of employee and public relations, and place these subjects—of such vital importance to successful operation—on a par with technical and mechanical problems in respect to the need for immediate and systematic investigation. No phase of the industry invites research with greater promise of paying results than the subjects which concern these relationships, but it is perhaps the most neglected field in the transportation business.

Lubrication*

By Dr. W. B. D. Penniman
Consulting Chemist, Penniman & Brown, Baltimore, Md.

ELECTRIC RAILWAY energy may be loosely divided into (1) transforming and distribution costs; (2) heating costs and their regulation; (3) dragging brake shoes, and other mechanical defects, and (4) lubrication losses. Aside from the increased use of electric current in cold weather due to the necessity of heating the cars, there is a marked increase in current consumption due to friction.

If over the period 1925-1926 we consider the dragging brake shoes as constant throughout the whole temperature range, or the heaters as constant when the average temperature is below 20 deg., we still have an increased use of current due to a variation in frictional resistance from 3.5 kw.-hr. per car-mile to 5.0 kw.-hr. per car-mile, or a change of 40 per cent in frictional resistance between zero and 100 deg. F., the extremes of our climate.

It is the custom of the United Railways & Electric Company of Baltimore to measure current at the point of delivery before conversion, so that the cars are charged with conversion and line losses, as well as motor losses. These are less in cold weather than in hot, so that the heater load is carried in part by decreased electrical losses in cold weather, but the frictional losses increase so rapidly this fact is not apparent. If we can succeed in reducing the variation in friction losses so that they are the same in winter as in summer, we can expect the power consumption of the cars to curve downward due to the greater electrical efficiency of distribution and motors in cold weather.

The custom of most railways is to consider the cost of oil as the main factor, and largely disregard power losses. Power costs in Baltimore when this investigation was started were about $1,500,000 while the cost of lubricant was only in the neighborhood of $8,000 a year, or about one-half of 1 per cent.

There are two ways of avoiding the power loss and other losses of the sliding of one solid over another. The first is by substituting a rolling motion for a sliding one, as in the ball bearing or roller bearing. The second method is to modify or change the rubbing surfaces in such a way that physical contact between the solids is avoided, or practically avoided, by substituting liquid or almost liquid surfaces for solid surfaces. Layers of another substance, generally oil, are introduced between the two rubbing solid surfaces. This oil adheres to each of the rubbing surfaces, smoothes out their mechanical and molecular irregularities, and hence the solid surfaces are no longer in contact.

Of the three kinds of friction, dry, greasy and viscous, the last kind is the most desirable. Bearings lubricated in this manner often are spoken of as being perfectly lubricated, or as having full fluid lubrication. If this is not obtained, or is not obtainable, "greasy friction" is our second line of defense against the undesirable and destructive dry friction.

Let us consider the mechanism and operation of a perfect bearing with this desirable full-fluid lubrication. Fig. 1 shows a chart taken from an article by Karelitz, entitled "An Investigation of the Performance of Waste-Packed Armature Bearings." This is a vertical section through the middle of a rotating journal which is supplied with an abundant amount of oil. The rotating journal acts as a pump and there is a place where liquid is under a maximum pressure and another point where

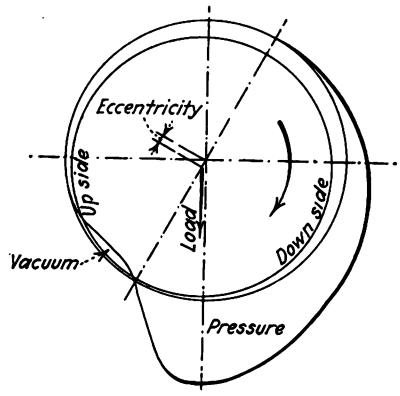

Fig. 1—Hydrostatic pressure in a bearing with perfect lubrication

there is a vacuum space. This vacuum space exists a little in front of the line of high pressure, and evidently if new oil is supplied at the vacuum point, the pumping action will supply the journal with a sufficient amount of lubricant, and there will not be any undue amount of oil running out at the ends of the journal itself, unless the vacuum is broken by admitting air. It must not be forgotten that the actual distance separating the two metallic surfaces at the point of greatest pressure is small, and in extreme cases adherent coatings of lubricant may be bearing the most severe part of the load, but if sufficient oil is supplied, this can largely be avoided. This final layer, if the lubricant is badly designed, may be too thin, but if the oil has high adhesive properties, it can and should be of such a thickness that the metallic surfaces are protected. When this perfect bearing is in motion, if there be a sufficient supply of lubricant, the frictional resistance may be summed up as follows:

1. It is almost independent of pressure.
2. It increases with the speed of the surfaces.
3. It increases with the area of surfaces.
4. It is almost independent of the condition or the material of the surfaces.
5. It depends almost entirely on the viscosity of the lubricant.

While in motion, if the bearing is designed properly, the main thing we have to consider, is to obtain an oil of

Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.

Digitized by Google

minimum viscosity. The pumping action at high speeds is sufficient to carry the oil to the point of high pressure. In addition to the viscosity, we also require an oil of high "greasiness" to take care of starting and very low speeds.

We shall now consider the way in which lubricating oil for electric and steam cars is generally bought, and the reasons why these oils are chosen. Winter oils and summer oils are used on the theory that a thinner oil is required in cold weather. As the atmospheric temperature at which the oils are in use varies in this climate from zero to 100 deg. F. most of these oils, if suitable at the higher temperatures, would not be suitable at a lower one.

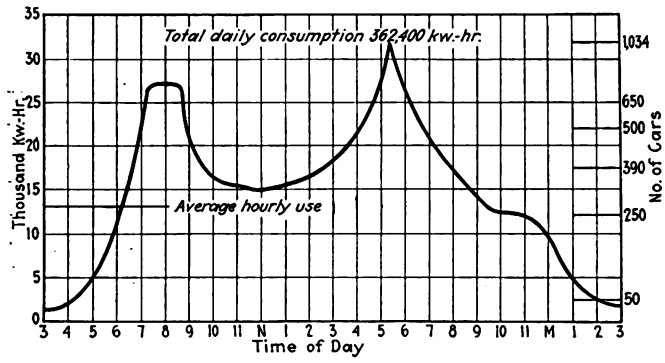

Fig. 2—Typical hourly power distribution curve for United Railways & Electric Company of Baltimore

Oil specifications, in general, make no mention of the oiliness or adhesive properties of a lubricant. An oil may be both coherent to itself and adherent to the metal, and in ordinary practice of buying oils of high viscosities (cohesion) we secure an oil of relatively high oiliness (adhesion).

Necessary oiliness or greasiness of the lubricant has tc do with the fact that the surfaces of liquids and solids have energy of a great power, and this power is often selective. Physicists and chemists have given the name "adsorption" to this special property of matter. The use of the surface attraction or adsorptive powers are numberless, ranging from activated charcoal to the ore flotation process.

The metallic surfaces of our bearings have this adsorptive power, and so we add to the oil of extremely low viscosity other material which will be selectively adsorbed by the metals from which these greasy layers are built. It has long been known that petroleum oil is improved by the addition of small quantities of other substances, lead oleate, aluminum soaps in non-chatter oils, blown rape seed in marine engine oils, etc. Wells and Southcombe have patented the addition of small quantities of fatty acids, and it is common shop practice to use lard oil or tallow oil when bearings become hot.

The commonly used term "oiliness" or "greasiness," though applicable to the very thin layers that are very firmly attached to the metal, by no means tells the whole story of what these should be, if we are to get efficient lubrication with the very imperfect bearings that are necessarily used in practice.

Having laid down the outline of our theories on which our work has been done, we think it well at this point to epitomize from a practical standpoint. First, get your bearings in as good condition as possible and supply them with oil in the proper place. Second, use an oil of minimum viscosity. Third, use an oil of maximum oiliness. Fourth, use plenty of oil.

In considering the bearings and lubricants of the United Railways & Electric Company of Baltimore we will not concern ourselves with any data except that of the bearings when the car is traveling at the rate of 12 m.p.h. The bearings and their characteristics are as given in Table I.

In the journal bearings the peripheral speed is the lowest of any, and the pressure per square inch the highest. It is a well-known rule in lubrication that a bearing running at a low speed and heavy load requires a heavier lubricant than another bearing running at a higher rate of speed and a lighter load. The practical effect of this is that an oil that has sufficient viscosity "oiliness" and "mushiness" to take care of our journal lubrication is at least heavy enough to lubricate the other bearings of the car, unless temperature conditions of the compound bearings are markedly different.

TABLE I—BEARING CHARACTERISTICS

	R.P.M.	Rubbing Speed Ft./Min.	Pressure in Lb. Per Sq.In. of Projected Area
Eight journal bearings	122	127	252
Four gear end axle bearings	122	160	54
Four motor end bearings	122	160	13.5
Four pinion end motor bearings	602	435	130 to 22
Four commutator end motor bearings	602	470	approaches zero

Speed of car 12 m.p.h.
Total weight of car 50,000 lb.

There are many dust guards on the market, but they soon become inefficient as dust guards and oil seals, because they do not remain tight. The failure of these guards is due to lack of provision to take care of the varying position of journal and bearing. We have devised an oil seal for which patent applications have been made, to remedy this defect, and not only exclude dirt and water, but preserve the maximum saturation of the waste, so that plenty of oil is available. There is no perceptible wear on the leather after two years and the whole system is now being equipped.

Axle and armature bearings offer a more difficult problem than the journal bearings. The feed of the lubricant has to be regulated, for an excessive supply will leak out at the ends of the bearings, and if this oil finds its way to the insulation compound of the motors it softens and eventually destroys it. For this reason, after a short period of use of a light oil in these bearings, we felt ourselves compelled to use temporarily a heavier oil than we otherwise would, heavier than the oil which we use in the journal bearings. The problem was to keep an abundant supply of proper lubricant in the bearing. Evidently, this can be done in two ways: (1) by regulation of the inflow, and (2) by regulation of the outflow.

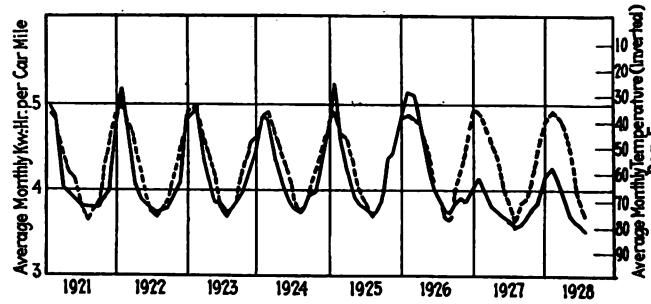

Fig. 3—Power consumption and temperature curves using average monthly kilowatt-hours per car-mile and average monthly temperature

great loss. We have reduced it somewhat by seasonable changes in the lubricant, but limitations of construction and operation hamper us. Our work on automobile gearings may lead us to favorable results in street car gears.

About 30 per cent of the total cost of power is for power that is never actually used. This may seem at first unreasonable, but Fig. 2 will indicate why this should be. It shows that the demand is irregular, as we not only have daily peaks, but also a large increase during the cold weather. This increased use of power in cold weather has been due largely to the heater load, though a glance at the viscosity curves makes it plain that the estimate, making the division between the heater load and the power load, is incorrect and the heater load overestimated.

To determine facts a section of track in the suburbs was selected that connects by equal grades two hills of about the same height; a car under test was brought to the top of one of these hills, the current turned off and the car released and allowed to coast down one hill and up the other until the potential energy of the car had been expended in its oscillation, and it came to rest in the valley. The coasting ability of the car with various lubricants was determined in several tests.

To make a more detailed study of the different kinds of bearings and lubricants that might be used, a car was selected and thermo-couples were placed in each bearing in the same relative position and as close as possible to the bearing surface. This car has 24 testing units in five different groups, the condition of running of each unit of the group being practically the same. As an example of the value of this test car we start with full knowledge of the power consumed and the temperature of the bearings of oil A. We then replace the oil in half of the bearings with oil B and run the car in service to neutralize the effect of oil A. Then a test run is made in which half the bearings are lubricated with oil A and half with oil B. Temperatures of all bearings are recorded and total power consumed. This gives us data sufficient to evaluate oil B in comparison with oil A on all or any of the bearings.

The bearings of the car have all been accurately measured and weighed and they are removed from time to time for examination and to determine their loss in weight. One of the first observations made on this car of interest and of importance had to do with the length of time that the ordinary journal bearing must be run before it has reached a condition of minimum friction losses.

Fig. 3 illustrates what has been accomplished. The cold weather peak is still present, but is very much reduced in height and we believe that so far as bearing friction is concerned it will disappear during the winter of 1929-30.

When the system is fully equipped, the general trend of the curve both winter and summer will drop down to the neighborhood of 3½ kw.-hr., which will mean a further saving of considerable moment. The power savings in 1927 were $176,000, to which we should add a marked decrease in bearing renewals and general machinery wear. The cost of the lubricant has gone up from about $7,000 a year to approximately $15,000, but this cost of lubricants will go down again when the lubricating appliances are on the entire system. That we have been successful and are on the safe side is shown by our hot box record, given in brief in Table II.

Economies to Be Effected by Labor Saving Machinery*

By W. T. Rossell
General Manager Pittsburgh Railways

THE use of labor-saving machinery is a purely economic problem. Assuming a certain amount and quality of necessary work being performed by a given number of men, the cost of this labor, together with all necessary overhead including supervision, housing, etc., gives a unit cost for the work. If a machine of known capacity be used in place of hand labor, the unit cost of the same work is calculated by allowing proper interest on cost of machinery, depreciation and maintenance, and the cost of such labor as may be required, together with all overhead. A comparison of these costs will then determine whether the purchase of the machine is advisable.

Of course, there are other factors, varying with the special conditions of the problem, such as the quality of the workmanship, which may not be the same in both instances, and such as the more complete control which is possible where the machine is used. Thus the individual problem may be solved. As in every economic problem, there are always certain hidden factors about which the data are insufficient that may affect the decision.

It is useless to expect the best judgment at all times from the men charged with the daily routine work, since this often tries them to the utmost, and they have little thought or enthusiasm remaining for the careful and detached survey of the problem that is necessary for the best judgment. With this in mind, organization should provide a department whose principal function would be the solution of this problem. In the case of small organizations, specified times should be set apart for the operating man to study this subject.

Those who have this duty should, and must for the best results, go out to other properties, both within and without the industry, and study what is being done. In this way only can the proper perspective be obtained. It would be strange indeed if a man seeking such information could not find something of value on each property that he visited. It is believed that in no other way can the best results be obtained.

The advertising in trade journals and other sources shows much of value, and any tool or machine which

**Abstract of a paper presented at the annual convention of the American Electric Railway Engineering Association, Cleveland, Ohio, Sept. 22-28, 1928.*

Digitized by Google

seems to hold any possibilities should be investigated and its application to the industry studied. In this way there would be a constant flow of small tools and machinery onto the property for trial, and with their trial there would tend to grow an improvement in the method of doing all work.

In the track department, in recent years, there have been brought out many new and valuable tools. There are cranes, concrete breakers, steam and electric shovels, grading devices, spreaders, small tractors, tamping machines (both electric and pneumatic) for ballast and concrete, spike-driving machines, cutting torches, welding methods of various sorts, rail grinding machines, track drills, power wrenches, and small tools too numerous to mention.

Anyone who has followed the course of track construction methods during the last two decades cannot fail to see the beneficial influence of such tools upon the methods of track construction. The modern construction gangs in the large cities are models of efficiency, and have almost reached the high standards of shop manufacturing processes. The smooth flow of materials and the progress of the work should be of interest to anyone, whatever his department, owing to the fact that many of the methods used have application in other lines of work.

The maintenance of track has not reached the same degree of perfection. It cannot be urged too strongly that, in this department of trackwork, surveys and studies be made and plans worked out for the development of track maintenance on an overhaul basis and with an efficiency comparable to that in use in track construction work. The use of small cranes and moving devices, and of trackmen in larger groups, organized more in the direction of specialization, together with the greater and greater use of all forms of track tools and machinery, offer very great possibilities for improved maintenance and lowered costs

Overhead Lines

In the overhead lines department the construction groups employ a number of very interesting tools and machines. Many of the tower trucks, reels and methods of stringing wires and feeders are worthy of remark. The use of cranes, post-hole diggers, paint-spraying equipment for poles, cutting torches and welding apparatus may be seen on many properties.

In this department, as in the trackwork, the routine maintenance ordinarily shows a woeful lack of the coordinated use of tools and overhaul methods. It might be stated at this point that such development as in trackwork would probably show a considerably improved maintenance with lowered costs.

In the shops, of course, the variety of tools used and which might be brought into profitable use is almost endless. We have all of the standard tools such as lathes, drill presses, planers, special drilling and honing devices, as well as steam hammers, cutting tools and wood-working machinery of various sorts.

In addition to this, the bench work as ordinarily practiced lends itself to the use of all sorts of small hand and power tools and machines. Here again, advertising in the trade journals and other sources could well be scanned for additional labor-saving machinery.

A few interesting small machines might be cited: A pneumatic tool for grinding valves, and the so-called "blacksmith's helper" or small power-driven hammer. The use of the large riveting machine, together with jigs and dies that may be devised for special purposes, would show a tremendous saving in labor and improvement in the quality of output. Also, there have been developed, and are now being developed on some properties, power-driven wrenches and jigs for the assembly of trucks and other equipments, which show great ingenuity and inventive talent.

More and more, as the work is laid out along lines of mass production and specialized labor, will the need of a tool for a special process come to the front. We have in the shop department cutting torches, automatic welding equipment for wheels and other parts, portable rivet heaters, paint-spraying equipment, and many other tools and machines of wide variety.

Transportation

Even in the transportation department there are in process of development certain machines which, it is believed, will move the industry a long step forward in performance. There are now small machines which measure and show on a printed record, on individual cars, the time during which the car is in motion, the rate of speed at all times, and the length of stops.

In addition, headway recording devices are now in process of perfection which can be used to bring into a central dispatching bureau a picture showing the passage of cars at various selected points throughout the system at all hours of the day. This information, recorded on timed cross-section paper, together with the development of a group of emergency inspectors mounted on motorcycles, offers possibilities of improved regularity and speed of service without limit.

Office Work

Showing the wide application of machines to all forms of office work are the various types of computing, bookkeeping and statistical machines now coming into use more and more in office work. Their possibilities in the way of more accurate and far-reaching statistics and methods of keeping records have not been explored.

It is prophesied that the need of keeping pace with the modern trend in all industries will rapidly bring into the street railway industry more machinery and better methods. Looking back a few years, the question has often been asked: "How will those now receiving a better education than their parents be able to make a better living and be satisfied with their lot?" This view even brought about criticism of the education of all the children of the country. The question of "white-collar" jobs came up, and it appeared that men who had received some education would refuse to take up the ordinary work of trades, and insist on filling office positions, which caused a surplus of such workers, reacting in very low pay for these positions.

The very pressure of this condition has been a part of the need for and the development of machines. The machine seems to offer the only way out. It permits greater and greater production for the individual. He, in turn, secures a percentage of this production, which has the effect of constantly raising the real wages of the workman.

This is the way of modern progress and is the answer to the old question of what to do with those receiving a better education and desiring a higher scale of living.

It becomes a duty of men in managerial positions to seek constantly to bring into the organization more efficient machinery, and those who do not take up this challenge and keep pace with the modern trend will inevitably be left behind and cast off by the industry.

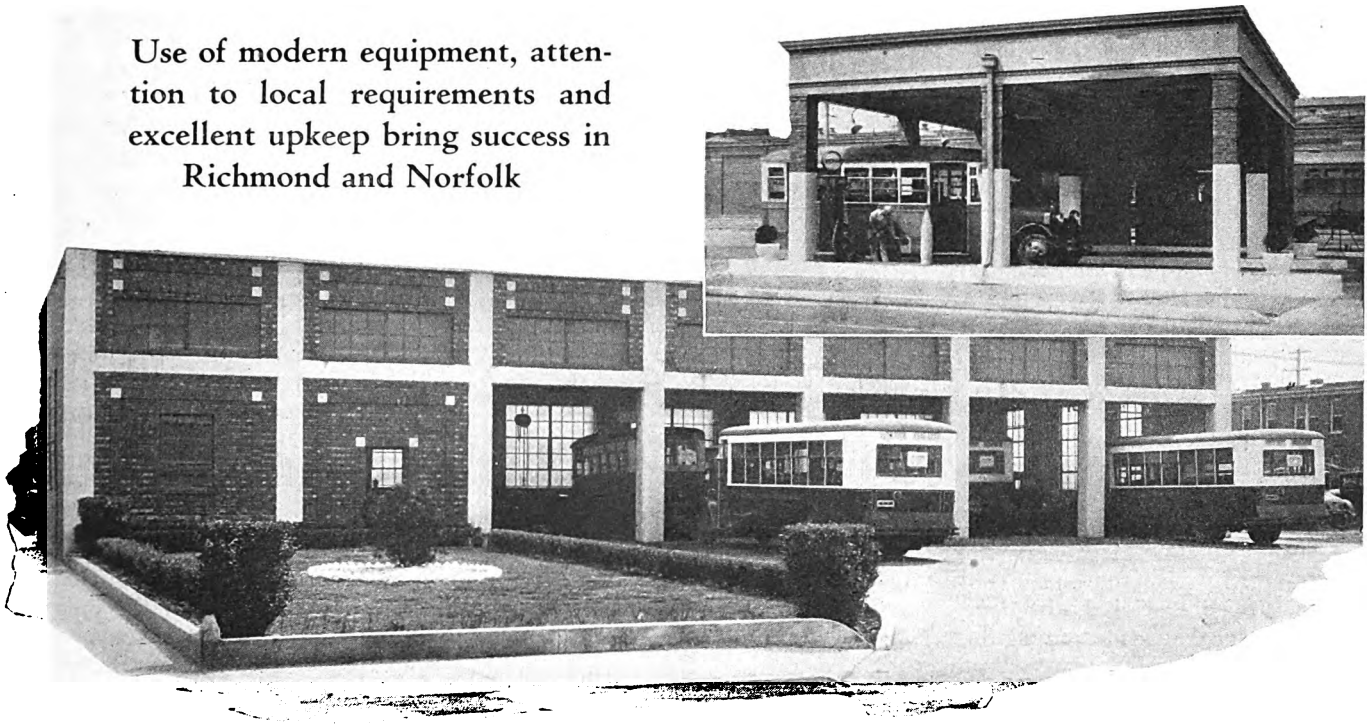
Buses Win on Merits in Virginia

Use of modern equipment, attention to local requirements and excellent upkeep bring success in Richmond and Norfolk



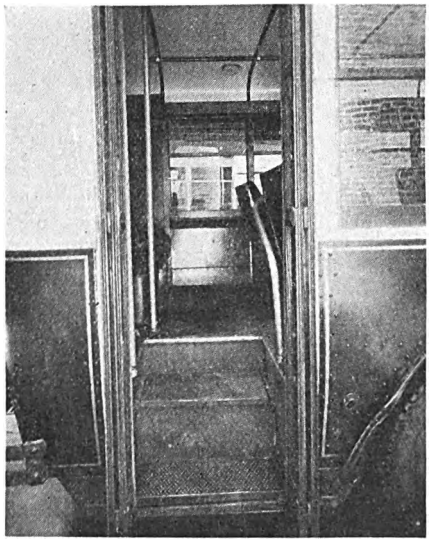
These views of a filling station and bus garage of the Virginia Electric & Power Company in Richmond tell without words the character of bus service given

BUS operation constitutes an important part of service given by the Virginia Electric & Power Company, the winner of the Coffin prize this year. In last week's issue particulars were given of the operating features and financial results of bus and car operation of the company in the four cities served—Richmond, Norfolk, Portsmouth and Petersburg. This week an account will be given of some of the notable features of the company's bus operation, as outlined in its brief for the Coffin prize. Later issues will contain similar notes on its track and shop practice.

From the accompanying illustrations of a filling station and bus garage in Richmond, belonging to the company, some idea will be obtained of the high standard now prevailing in the maintenance of motor buses. Buses are now regularly inspected every 1,000 miles. It has been found that the use of rubber blocks, originally placed under the springs as a preventive of rattle and wear, saves maintenance. Only four broken springs have occurred in the bus service of the company in more than 1,000,000 miles operation of rubber-block buses. As a result, the latest buses have still more rubber blocks.

Popularizing the One-Man Bus

To popularize the one-man bus, all of the larger buses have been equipped with treadle-operated side doors at the rear. This was an especially important matter in Virginia, where the practice followed, as in other Southern states, is for colored passengers to take the rear seats. The rear exit makes it easy for these passengers, who are already seated in the rear, to make use of the rear door for exit instead of brushing against the white passengers in the front end of the bus. At the same time, the interchange of passengers has been materially speeded up. The treadle step exit of this type of bus was made safer by adding stanchions and balustrade, as shown in one of the views.



Richmond improves bus exits by providing each rear treadle door with stanchions and balustrade

On the first fifteen treadle buses the door engines were mounted under the body with the levers placed so low that they were likely to be struck by high paving. These engines are now mounted in a housing directly under the cross-seat nearest the rear door.

Troubles from door failures have been practically eliminated, partly because of the indoor location of the engine and partly through the use of shorter levers. The new way is also more quiet.

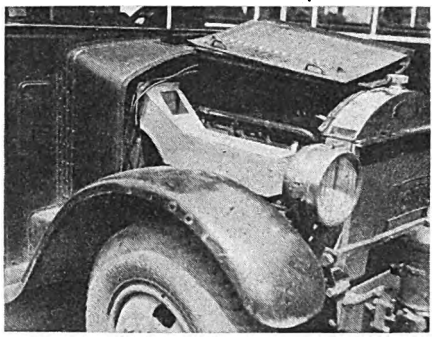
Another improvement made by the company was in the method of heating buses. The type of heater usually supplied by the bus makers conducts the exhaust gases through heater pipes installed inside the bus. This practice involves the use of flexible pipe from the exhaust pipe connection to the heater pipes. When these flexible pipes corrode and break under vibration, noxious gases col-

Digitized by Google

lect beneath the floor boards. The company has also found it difficult at times to keep the pipes gastight inside the bus. In some cases celluloid umbrella tips have ignited from contact with the heaters.

In attempting to solve the problem of heating buses, the management started on the basis that the ideal heat agent is fresh hot air. To get this without the use of exhaust gases and pipes a heater of the exhaust manifold stove type was installed on many buses. A sheet-steel hood is carried from the front of the manifold to the back, where it enters directly into the dash. The front of the hood is open and adjacent to the fan, so that air is blown directly through into the bus from a point where it is picked up fresh and clean. Since the manifold is the hottest part of the exhaust system, the forcing of air over it provides the bus with all the heat required.

All that is necessary to make the heater operative is to open the trap-door in the dash. The door swings upward from a top pivoted joint and closes an opening in the top of the heater hood. Hot air then passes directly into the bus. With the dash opening closed, the opening in the hood provides circulation through it, and prevents overheating of the manifold. These heaters



Sheet-steel hood in position on manifold through which the radiator fan blows hot air into the dash of the bus

cost, installed, about $7 each, and their construction is shown in an accompanying illustration.

Change of Carburetor Location on Engine Improves Starting and Saves Gas

A style of bus with block type of engine, used by the company, gave trouble in warming up and in the maintenance of the proper adjustment on the carburetors. Both drivers and mechanics said the engines were "cold natured." The drivers complained that they could not get the bus away after taking on and discharging passengers. This made it difficult for them to maintain regular schedules.

The engine had been put together as shown in the picture at the left illustrating this point. The carburetor *A* was located 10 in. below the intake manifold *B* on a piece of aluminum pipe *C*. The absence of insulation or cover of any kind caused the intake gases to become chilled before they reached the main manifold. The principal reason for this arrangement was that the carburetor would not fit into the space between air compressor *D* and the starting motor *E*. To correct this, a carburetor was secured with an offset body *A*, as shown in the picture at the right. This fitted perfectly into the small space between the air compressor *D* and the starting motor *E*. This change permitted the elimination of the 10-in. length of aluminum pipe *C* (shown in the left-hand view), the carburetor float level thus being raised 13¼ in. above the old position.

Following these changes the buses maintained their schedules more satisfactorily, and the average miles per gallon of gasoline have increased from 4.5 to 5.67, a net gain of 1.17 miles for every gallon of gasoline consumed.

Change to Eradicate Transmission Failures

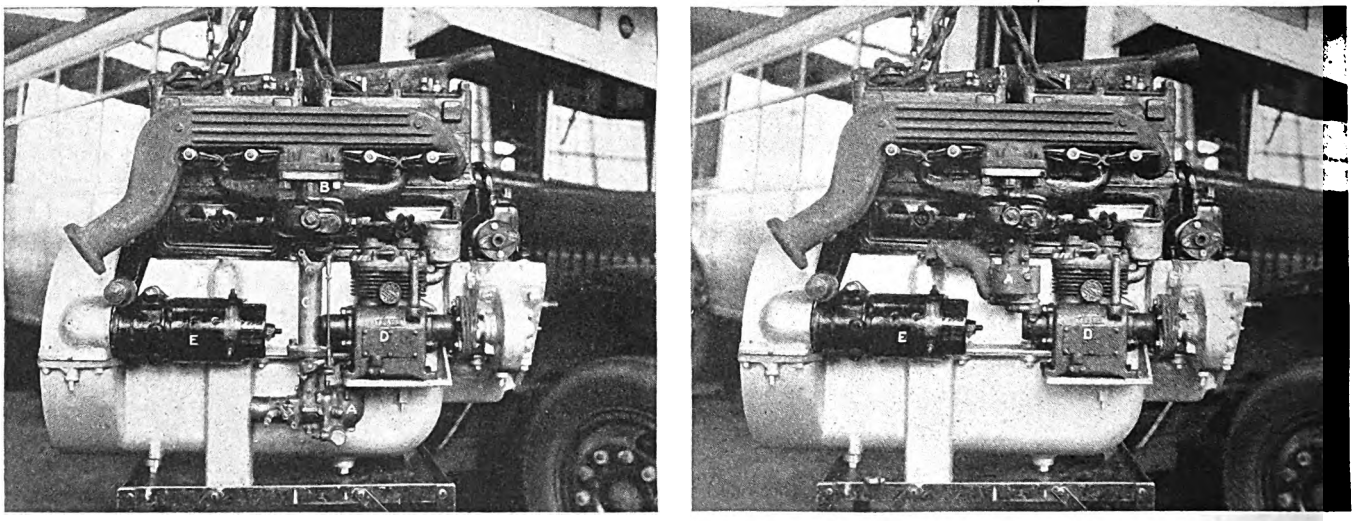
One type of bus suffered chronic failure of transmissions. Nearly always the breakage of the unit in question ruined an expensive aluminum transmission case and crippled the bus. Analysis disclosed that in all cases the countershaft had broken and that the breakage occurred at the same part of the shaft.

It was pointed out to the manufacturer that the fault lay, first, in the fact that when the shaft was cut down to gear hub dimensions the point of breakage was fitted with a square shoulder instead of a fillet; and, second, too deep a keyway was carried through this point.

The trouble was corrected by providing a long radius fillet to eliminate local vibration stresses, and using two round-ended keyways with a different ratio of depth to width, where previously there was one keyway. The improved shaft is now standard with the manufacturer.

Servicing of Buses Also Improved

Improvements were not confined to the buses themselves. Many important changes were made at the



The slow starting of a block type engine was remedied and the gasoline consumption reduced by raising the carburetor

At left, steam radiator with fan connection in Richmond garage. The shield shown on the radiator at the left deflects the warm air to the floor. At right, swivel pipe for filling radiators with water. It can serve an area of 20 ft. radius

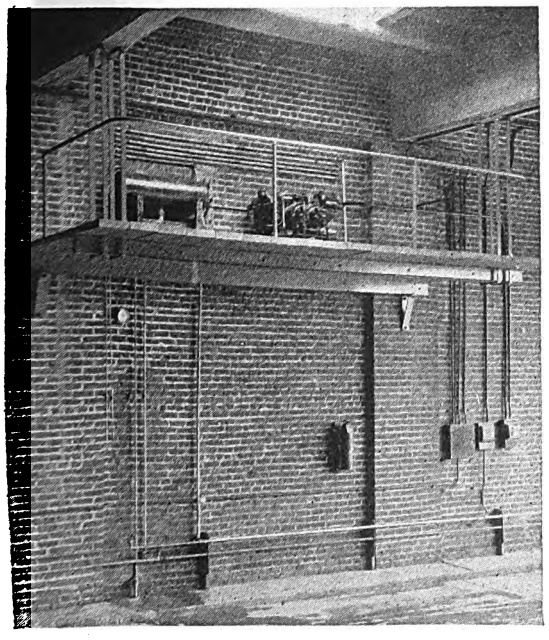
garages to make them more comfortable places in which to work and to simplify the servicing of the buses. Thus, an accompanying illustration shows the heating system used in the company's Richmond garage and comprising steam radiators with electric fans to drive out the warm air. The radiator at the left has a home-designed metal shield to deflect the warm air toward the floor.

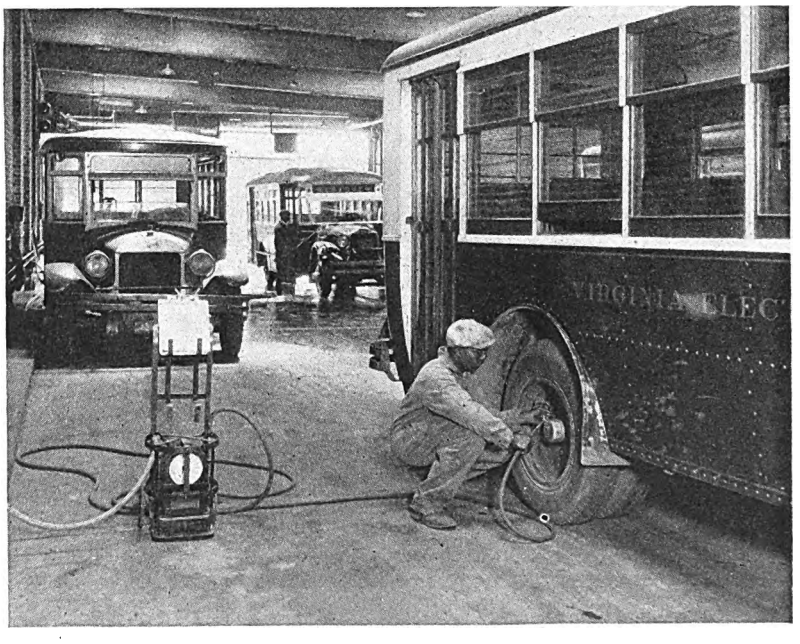
Another view shows the apparatus used in the same garage for filling bus radiators with water. The horizontal pipe, to which the rubber hose is attached, works in a swivel joint at the end nearest the rolling steel door. With this joint as a center, the pipe can be rotated horizontally to serve any bus within a radius of 20 ft.

The pipe and hose are brought back to the position shown by means of two coil springs. On the end of each spring is attached the movable pipe; the other end is fastened to a stationary pipe frame. To relieve any possible strain the horizontal pipe is supported by a guy rod which can move with the pipe.

Tire inflation time was cut more than half, or from 19 to 8½ minutes by means of an air compressor and tire inflater. The compressor is mounted on a platform 12 ft. above the floor to conserve floor space and to be free from tampering and excessive dust. It is of the high-pressure type with a water governor which cuts out at 160 lb. The air is piped from the two storage tanks, the entire length of both garages on each side of the building for 626 ft. to give a full supply at any location en route.

Tire inflation is effected with an "Eco" tire inflater, installed on a home-made carriage. It is connected between the main air supply and the bus tire to tell the tireman when the tire is properly inflated. All that the tireman has to do is to set the dial for the desired pressure.



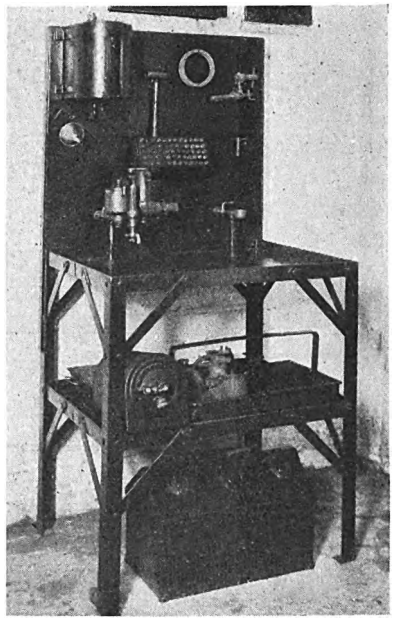


Tire inflation is almost automatic in Richmond. The view at the left shows the motor-compressor and one tank

Digitized by Google

A bell in this instrument rings intermittently until the required pressure is reached.

Many time-saving repair methods are used. A full complement of equipment is provided for this purpose. An interesting illustration of the design of special equipment for repair work is a carburetor testing stand with which proper level, flow of gas, leaky gaskets, etc., can be given practically the the same test as on the engine. The stand has a vacuum tank, as shown in the upper left-hand corner of the picture, supplying the gasoline for testing. All gas lines are on the rear of the instrument board. Extra carburetor jets are carried on a wooden container block with 60 receptacles for the different sizes and types of jets. Formerly, the jets were carried loose in a box, but this meant a great deal of searching before the right jet was found. The jets would thus become scratched and scarred, with dirt gathering in the ports to keep them from functioning properly.



Carburetor testing set for checking flow of gas, leaky gaskets, etc.

The final practice of the company in its bus maintenance, selected for illustration and comment here, is one of the methods followed to encourage pride in workmanship in the repair garage. This is to provide that every mechanic has his own tool kit. There is no borrowing or lending of tools in the garages of the company. Each man takes pride in the fact that his personal kit contains the proper tools for any job that he may be called upon to handle.

A special room equipped with racks is provided in the Richmond garage of the company to store eighteen tool kits valued at $7,000. The least valuable of these kits, one which belongs to the junior member of the force, is valued at $100. The most elaborate kit actually cost $700.

Every bus mechanic takes pride in perfect work because every tool is his own

Railway at St. Joseph 40 Years Old

THE electric railway of the St. Joseph Railway, Light, Heat & Power Company, began operations in 1888, soon after the famous road in Richmond, Va., was opened, and so is 40 years old this year. Like the Richmond road it has been in continuous operation, though the original electrical division has been extended many times. An interesting article about the line, with dates, and about earlier electric railways, appears in the September issue of the company's publication *Rylite Employees News.*

The Readers' Forum

Preservative-Treated Timbers and Ties Give Long Service

CLEVELAND RAILWAY
CLEVELAND, OHIO, Oct. 1, 1928.

To the Editor:

For a number of years the writer has from time to time contributed short articles dealing with the advantages of preservative treatment of timber in an effort to bring home to the electric railway executives and engineers the economies of the problem.

During the past month there appeared in the *Engineering News-Record* two articles bearing on this subject, which I feel sure are of sufficient interest to justify calling specific attention to them.

In the issue of Sept. 6 there appeared a very interesting description of a railroad trestle constructed with creosoted yellow pine timber by the Southern Railway over a part of Lake Ponchartrain in 1883 and still in service after 45 years. Particular attention is called to the result of strength tests on timber taken from this trestle in comparison with similar tests on newly treated timber of the same general characteristics, the comparison being very favorable.

In the issue of Sept. 27 there appeared an abstract from the report of the Forest Service, U. S. Department of Agriculture, relative to the increase in the use of preservative treatment for railway ties. This showed a total of 74,231,840 railway ties treated during the year 1927, an increase of nearly 18.5 per cent over 1926. Of course, the bulk of these treated ties were for steam railroads, but this does not detract in the least from the value of the story which these statistics tell.

Data recently have been presented from New Orleans showing rail replacement on creosoted ties which had been in service 21 years and still in an excellent state of preservation. From Atlanta, we have records of creosoted ties still sound after 31 years of service and corresponding long-life records from still other points.

When the writer has made the statement that 31 years life could reasonably be expected from pressure-treated wood ties in street railway track in paved streets, he has noted occasional tendency on the part of individuals concerned to scoff at the idea. The above records substantiate fully his claims, and there are undoubtedly many instances not on public record where these experiences have been duplicated or even bettered. They tell a story which no management can afford to ignore.

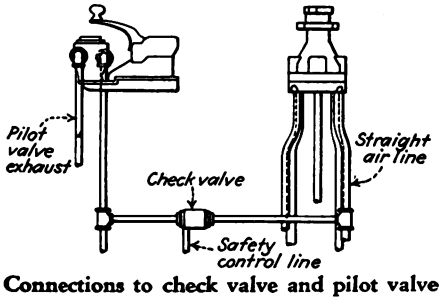
Maintenance Methods and Devices

Improved Safety Device Mechanism

By H. C. Pressler
Master Mechanic
Eastern Texas Electric Company,
Beaumont, Tex.

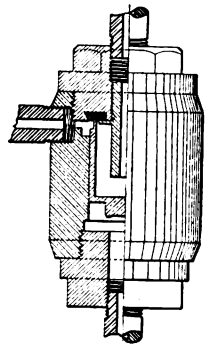
SOME troubles were experienced with the safety control equipment used by this company, due to leaks and difficulty of operator in holding down the foot valve. As a result a new pilot-valve operating mechanism and check-valve arrangement were designed in the shops of the Eastern Texas Electric Company, Beaumont, Tex. Accompanying illustrations show the design. The foot-valve



Connections to check valve and pilot valve

mechanism has an arm extending up wards with a spring attachment to operate the pilot valve. The valve pedal does not tire the operator's foot. The cost of installing this equipment was $10 per car and previous troubles have been eliminated.

The check-valve arrangement is



Construction of check valves

placed in the line in order to prevent knocking out the overhead breakers when brakes are applied with the operator's hand off the control handle. The spring in the check valve holds the safety control line open until 30 lb. of air is in the brake cylinder. Then it closes and cuts off the safety control line.

High-Strength Soldering

COMMERCIAL high-strength solder used in railway work comes in three forms: (1) lead, tin and antimony, (2) cadmium-zinc, and (3) copper-zinc. The first melts at 300 deg. F., the second at 700 to 800 deg. F., and the third at 1,500 to 1,600 deg. F. In each the proportion of the metals used in making up the solder alloys may vary, with the result that these solders melt at a lower or higher temperature, with a corresponding decrease or increase of strength. Lead, tin and antimony solder has an approximate tensile strength of 4,000 lb. per square inch, cadmium-zinc solder of 15,000 lb. and copper-zinc solder of 30,000 to 40,000 lb. per square inch.

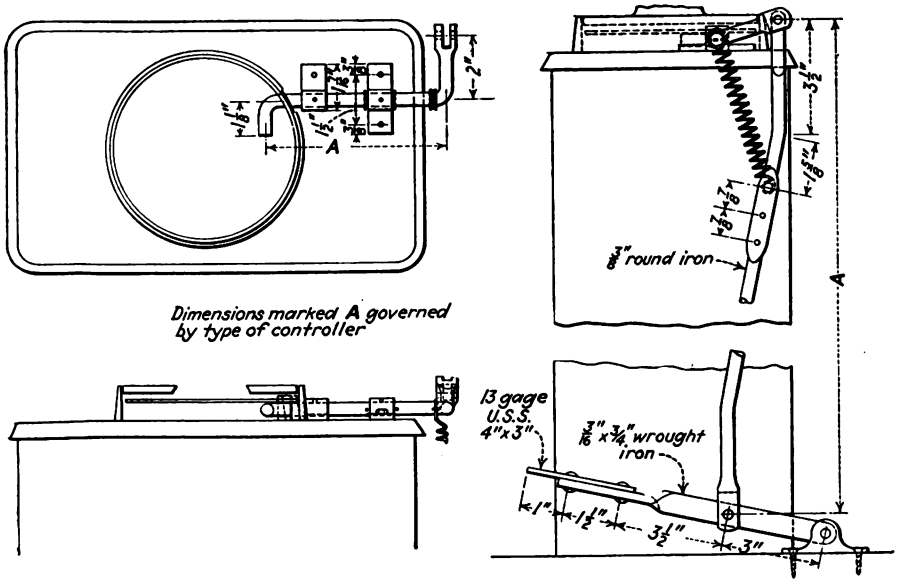
The use of these solders is based upon the principle that almost any metal will surface-alloy with another metal which melts at a higher temperature, provided the surface of the latter metal is chemically clean and is heated to a temperature corresponding to the melting point of the solder used. Where the base metal is maintained in contact with the molten solder at this correct heat for a period of several minutes, the extent of the penetration of the solder into the base metal is quite remarkable.

When bronze-welding cast, malleable and wrought iron, high and low carbon steels, copper, monel metal, aluminum-bronze and other metals and alloys that melt at a comparatively high temperature, it is necessary merely to have the weld areas clean and heated to a good red heat only. Then the Tobin bronze, manganese bronze or other filler rods, if melted upon these weld areas, will instantly effect a joint of very high strength.

The oxy-acetylene flame has been adopted largely as a source of heat for the application of these various solders because it possesses great advantages over the old-type soldering iron or copper. For some of this work the required heat can be furnished almost instantaneously, thus effecting a great saving in time and increasing speed in production.

The first chemical reaction in the burning of acetylene with oxygen is the production of carbon monoxide and hydrogen. The hydrogen, burning in the outer strata of the flame, envelops the molten solder and the heated weld area of the base metal, protecting them from the oxygen in the surrounding air. This enables a skilled operator to obtain practically the maximum strength of the solder used.

In the production of work where the high temperature required for welding might cause discoloration or coatings of oxides which would have to be removed before finishes could



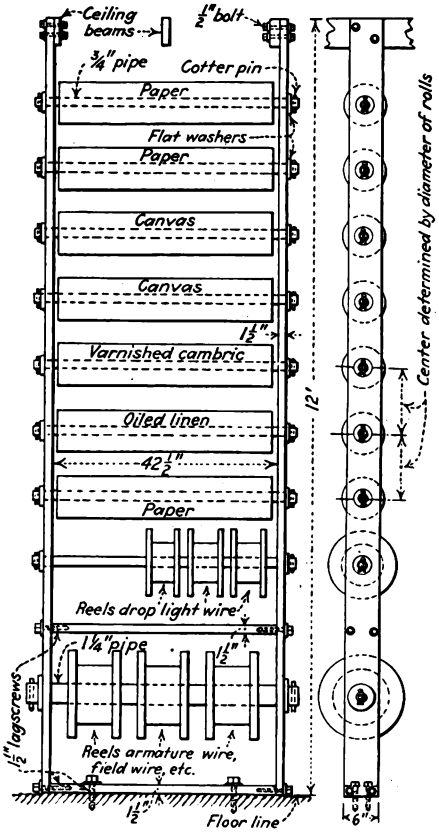
Pilot valve operating mechanism

Digitized by Google

be attempted, joints can be made with the assistance of a fluxed solder. Then under the heat of an oxy-acetylene flame, the solder is observed to melt and spread, effecting a quick, clean weld, free from discoloration and desirable in every respect.

Small Storeroom Material Rack

CONSIDERABLE time is lost where material is not accessible in storerooms. The Richmond Railways, Inc., Staten Island, N. Y., has designed and installed the special rack shown in the accompanying sketch to obviate the waste of time. It is made of wood and occupies the small floor space of 45½x6 in. It is used for the storage of rolls of material such as paper, canvas, oiled linen,



Storage rack for wire and insulating material

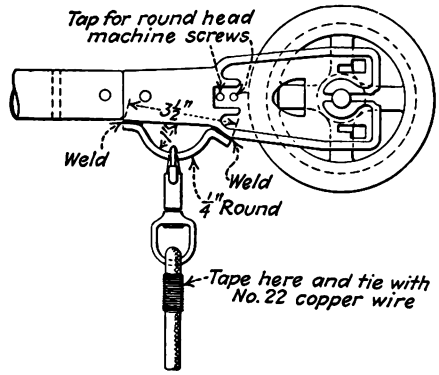
cambric and reels of wire. Two 1½x6-in. oak timbers spaced 42½ in. are bolted to the ceiling beams by ½-in. bolts and lagged to a 1½x6-in. oak beam fastened to the floor. The rack is 12 ft. high. It is designed to accommodate seven rolls of material and several reels of various kinds of wire. The reels and smaller rolls are supported on ¾-in. pipe installed in the uprights, whereas the heavier reels are carried on 1¼-in. pipe.

Snap Connection for Trolley Ropes*

By Charles Herms

General Foreman San Diego Electric Railway, San Diego, Cal.

CHANGING of trolley ropes or poles quickly without losing time in opening knots or cutting the rope has been made possible on the lines of the San Diego Electric Railway, San Diego, Cal., by using a harness snap at the end of the trolley rope In order to make it possible to fasten the snap to the trolley harps a piece



Method of attaching trolley rope and shunts to harps on the San Diego Electric Railway

of ¼-in. round iron is welded into position to form an eye, as shown in the accompanying illustration. The trolley rope is passed through the eye end of the snap and doubled back for a distance of about 3 in. This is wrapped with several turns of friction tape, and over this about fifteen or twenty turns of No. 22 gage bare or enameled wire. This protection overcomes danger of rope being burned and appears neat.

Another improvement on trolley harps which is used on the San Diego cars is in the use of collector brushes which fit the sides of the harps. These originally were riveted in place, but as it frequently is necessary to remove them for replacement they are now fastened by machine screws through holes drilled and tapped in the harp. Replacement then can be made quickly and as a result these shunts are kept in much better condition.

Checking a Water-Soaked Armature

WHEN armatures have been flooded and it becomes necessary to dry them out in an oven, a voltmeter indication may be very misleading unless checked with a lamp test circuit at operating voltage. A week or more may be required to boil all of the water out of an armature, and during this entire period a voltmeter will appear to indicate a dead short-circuit. The meter deflection observed may not actually be full line voltage, but it is so near that on a fluctuating voltage circuit, the man conducting the test will be unable to note the difference. When a meter indicates a dead short, the indication should be checked with the lamp test. If there is no metallic short, the lamps will burn perceptibly brighter when the test points are touched together than when the insulation is included in the test circuit.

The conclusiveness of any test made on the insulation of an armature depends somewhat on the testing means available, and on the testing methods adopted. A voltmeter test at 110 volts may pass insulation that a meter test at 600 volts would condemn. A bell circuit test of a few volts may pass insulation that a 110-volt test would find defective. Low voltage tests appear to indicate only the existing actual conditions of the insulation, and are unable to indicate weaknesses that might be considered on the verge of breaking down. For this reason, armatures should be subjected to at least the voltages at which they are to be operated, and it is customary to use voltages of about three times the rated operating voltage.

New Equipment Available

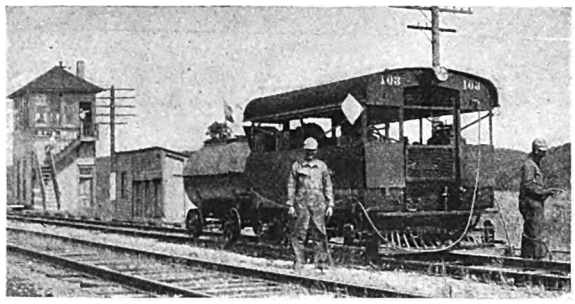
Track Oiler and Spraying Machine

FOR oiling rail joints or the entire track structure or spraying the roadbed, a new track oiler and spraying machine is announced by O. F. Jordan Company, East Chicago, Ind. The machine is self-propelled, and is built strongly and ruggedly to withstand the severe railway operating conditions.

The wheels, of 24 in. diameter, are mounted on heat-treated axles which turn on roller bearings. The drive from the engine to each axle is by means of roller chain and sprockets through a heavy-duty three-speed selective transmission and special reverse gear. This allows three speeds in either direction. All speeds are

Digitized by Google

regulated automatically. Brakes are supplied by the Westinghouse Air Brake Company. All controls, meters, gages and levers are placed conveniently to permit of one-man operation. An aluminum oil heater warms the oil with exhaust gas from the engine. Accessories include electric starter, storage battery, electric head and tail lamps, and electric warning signal.



Automatic track oiler and spraying machine, in use on the lines of the Chicago & Northwestern Railroad

In the valve control of the oil flow, solenoid coils are required to work in an oil bath subjected to temperatures as high as 150 deg. F. Bakelite tubes and washers are used as insulation surrounding the coils.

The oiler resembles a miniature engine. One operator, one pilot and two laborers can handle all oiling required on 30 to 50 miles of single track per eight-hour day under ordinary traffic conditions. When oiling joints only, the machine can be handled by one man. In addition to the oiling of joints the Jordan track oiler and spraying machine will oil the entire track including all tie plates, spikes, joints, anchors, etc. at a speed of 25 m.p.h.

Two specially constructed oil spray guns with 40 ft. of hose provide means for oiling all switches, switch stands, frogs, derails, crossings, interlockers, drawbridge mechanism, etc. The special oil spray guns are constructed so that any adjustment from a fine needle stream to a large cone spray can be used. With the large spray station ground platforms, highway crossings or other places can be oiled. The machine is particularly convenient for weed killing.

Light-Weight Floor Material

A NEW floor material consisting of a combination of truss plate and Masticoke is announced by the Johns-Manville Corporation, New York, N. Y. Truss plate is made of two sheets of No. 22 USS gage steel in which staggered rows of oval cones have been pressed. The two sheets are placed so that they can be riveted or welded together through the tops of the cones. Truss plate is made of copper bearing steel to retard corrosion. The finished material is coated inside and out with Elaterite which is a rust-proofing paint for steel and protects the underside and provides a bond for the surfacing material.

Masticoke is an asphalt composition wearing surface and is very light in weight. While truss plate itself weighs more than other types of steel car sub-flooring, the finished car flooring weighs much less. This is made possible due to the construction of truss plate. The mechanical strength makes a $\frac{3}{8}$ or $\frac{1}{2}$ in. wearing surface practical, whereas other floor structures rely on a thicker wearing surface for strength.

Truss plate weighs 2.5 lb. per square foot. Masticoke weighs 1 lb. per square foot per $\frac{1}{8}$ in. thickness. In practice a $\frac{3}{8}$ in. wearing surface is recommended so that the total weight of the complete structure is 5.5 lb. per square foot. Compared with other types of car flooring, this effects a saving of from 2 to $3\frac{1}{2}$ lb. per square foot.

Truss plate is made 30 in. wide by any convenient length up to a maximum of 144 in. The over-all thickness of the plate is $\frac{7}{8}$ in. The cones or depressions measure $3\frac{1}{2}$x$1\frac{3}{8}$ in. at the base and are arranged in alternate rows of six and seven each. This allows the depressions to overlap slightly. The rows are spaced on $2\frac{1}{2}$ in. centers, both longitudinally and transversely. The distance from the center of the outside row to the edge of the plate is 2 in., leaving a flat margin of $1\frac{5}{16}$ in. for splicing the plates together. At the ends the distance is $3\frac{1}{4}$ in., leaving a flat margin of $1\frac{1}{2}$ in.

This type of flooring may be applied to the underframe car construction either where the heavy steel plate floor is used or where this plate is eliminated. Where the steel plate floor is used, the plate itself is applied in the usual manner, and nailing strips are then fastened to the steel floor plates transversely on the car at intervals equal to the width of the truss plate. Truss plates are then laid across the car, the side edges coming above the transverse nailing strips. Longitudinal nailing strips should be used over the side sills and may be used at intermediate points if desired.

Where the heavy plate is not used, truss plates are secured directly to the center, side and transverse sills. The transverse sills should, if possible, be placed so that the joints of the truss plates rest on them.

Truss plates are joined together by inserting a filler strip of insulating material between the top and bottom side margins. This strip may be of hard wood when bolts or screws are used, but should be of asbestos when hot rivets are used. Wood strips should be $\frac{7}{16}$ in. thick and asbestos strips $\frac{1}{2}$ in. thick. The truss plate that holds the filler strip is then inserted into the margin of the adjoining truss plate. The distance that the plates overlap should never be less than $1\frac{1}{4}$ in.

After the margins have been overlapped with the filler strip between them, the margins of the two top sheets should be concaved until they touch the filler strip. This is done to stiffen the margin of the top sheet and to prevent bolts or rivets from protruding above the surface of the plates. The end margins are treated in the same way.

Association Activities

Accident Prevention Through Interdepartmental Co-operation*

By John J. Reynolds
Claims Attorney Boston Elevated Railway, Boston, Mass.

THIS subject is a particularly timely one because of the industrial accident problem and the workmen's compensation cost that the railways are seriously facing today. The tragedy of preventable accidents has been like a huge shadow obstructing the sun. The heavy toll demanded by this common enemy is the price of carelessness. In spite of all the work that has been done, in spite of all the money its prosecution has cost, in spite of all that has been done to focus public attention upon this awful toll in human life and suffering, it continues to sweep through the country and the industries like a sand storm, leaving in its wake a deplorable human wreckage. In spite of all the efforts that have been made to create a conception of its staggering economic waste, a survey of current accident history makes one pause and ask, What curious impulse is it that causes men to be careless?

It must be admitted that for the length of time in which workmen's compensation has been in operation in the United States, and for the length of time in which intensive accident prevention work has been going on, we have achieved really remarkable results. Since the tendency is toward liberalization of benefits, however, it is manifestly important that there shall be no let up in either activity or intensity to reduce accidents to an irreducible minimum.

Departmental Dependence

Now to discuss briefly the question of departmental dependence. The first fact to be considered is, shall we interpret it as a term of limitation or of extension? We have elected to treat it in a broad or comprehensive sense, since departmental action has an influence on human life beyond department limits, even when such department is not consciously aware of this influence. It excludes the idea of any logical halting place between a thoroughgoing spirit of earnestness and a thoroughgoing feeling of interest. Where obstacles in the road of progress cannot be surmounted, they must be removed. Departmental efficiency is clearly influenced by the number and seriousness of its failures and accidents.

While the performances of each department is measured largely by the results it achieves, they are not in any practical sense isolated departments, and failures or accidents in one frequently are but the beginning of a train of events which affect other parts of the organization. Departments function only through individuals who represent them. Too often some employees seem not to have had a proper appreciation of the fact that the good will and success of the railway is built up or destroyed through their actions, their failure to act, their failure to co-operate, just as much as through failure of the management itself.

The policies of all departments may properly be said to have the same general objectives, hence they should be formulated with a view to protecting not only the interests of each department, but of the whole organization. To get the best results in our efforts toward this 100 per cent interest, it is fundamentally important that there should be as few individual differences as possible in the interest of employees, not only in their own special job but in the general business welfare and success of the employer, too. Should there be a tendency toward the development of a departmental, as distinguished from an interdepartmental outlook, then obviously it is not conducive to the best interests of the organization as a whole, in that there is then the danger that it will result in taking a restricted view of the railway's interests.

Department Heads Must Lead

Heads of departments, superintendents, foremen, and other supervisory officers have in all probability been selected because of special skill which has been acquired, no doubt, through long experience in their particular field. Their training has tended to give them a broad outlook, thus giving them special knowledge upon which to base an appeal for constructive interest. This is particularly true of foremen, inspectors and other supervisory officers, because they ordinarily spend a good part of each day among the workmen, and in that way are able to keep in close touch with, and informed of conditions and tendencies of employees. These close contacts place them in a position where they can be of great service in developing this spirit of interest, and if they are awake to their opportunities, may often make suggestions which will result in spreading this interest to other departments.

Employee Attitude Important

The question of the attitude of the individual department employee is too important to be left entirely to chance and his own discretion. It is of grave concern to the railway, and if proper control is to be exercised and systematic interest secured toward the elimination of accidents, the policy defining these relations should be thoughtfully conceived and consistently applied. Only by such means can a uniformly high standard of performance be hoped for.

Interdepartmental interest and coordination is the road to profitable operation of the railway as a whole. It is of no avail to save a minute here or a dollar there in machine work or assembly, if that saving is lost in slow interdepartmental appreciation of the cost of preventable accidents, which not only waste time and lower production, but gnaws at the very vitals of the railway revenue. Every executive, each department head, superintendent, foreman and employee owes it to himself and to his company, to get the facts on what is being done in his department to prevent

accidents, and contribute what he can from his experience toward their complete elimination.

Probably no one thing in railway department operation is more important than the safety of employees. That more will be accomplished for the prevention of accidents by educational methods than through any other means is an accepted fact. But we must not overlook the further fact, that this presupposes that the railway itself has done everything reasonably practicable to make the place of work safe, both physically and mechanically.

Another thing to be considered in any movement looking toward accident prevention, is the necessity of having a prompt and full report of an accident, since a systematic compilation of accident records is the foundation of a well organized accident prevention. Therefore, it is imperative to have an adequate system of reporting accidents, a proper method of analyzing and classifying them, and a workable plan of co-ordinating the accident activities of the different departments for purposes of effective prevention. Maximum success in accident prevention work necessitates tabulations of accidents that will show who, and what, was responsible for each accident, all leading to the formulation and administration of definite plans for prevention.

Still another important thing in our work for accident prevention is to have a "fact-finding body." This has been found to be of great help in reducing accidents, in that it has developed both individual interest and organization efficiency. It is therefore obvious that to do the best work for prevention there should be such an agency, which may consist of a committee of employers, and a committee of employees, or outside experts in personnel work, but preferably the three agencies sympathetically co-operating. The scope of the activities of this agency should at least cover the working conditions, the health, the accident problems of the different departments, for they are the base of regularity and decreased labor turnover, and also because they may mean contentment, as well as the elimination of fatigue and worry, the latter being now a well recognized cause of accidents.

Educational Aids Are Necessary

No matter what may be said to the contrary, the history of the accident prevention movement testifies without exception in any state, that the attempt to secure even an approximate reduction of accidents without invoking educational aids and methods is foredoomed almost to complete failure. Nowhere has it succeeded, nowhere can it succeed without the help of these important factors. So, as a final conclusion drawn from this fact, it may be stated that any scheme directed to secure interdepartmental co-operation in preventing accidents should have its base in educational effort.

The educational program must be designed to meet the needs of all concerned, and when so designed it results in harmonizing the interests of all departments and their employees, and hence promotes better interdepartment interest and safety. Department heads should be held responsible for the workers' safety; therefore it follows that a high accident rate should count against the promotion of any executive or sub-executive as it indicates his failure properly to educate the men under him.

Management and employees—efficient, willing, intelligent, interested, both on their toes in reciprocal relationships—working with each other and together with dignity and integrity, and in a spirit of mutual helpfulness, and for the promotion of the best interests of the railway: those are the factors which tend to promote and sustain constructive and safe interdepartmental activity, and in outline is what we understand co-operation to mean.

Learn to count men among your assets. It is their brains, their alert minds, their eyes, their hands, their efficient operation remaining throughout the working-day, which permits you to lower the cost of running your departments, and hence increase the net revenue. Therefore, have an open mind—don't disregard, without giving it fair and full consideration, a suggestion made by an employee for the safe conduct or economic operation of your department. When necessary, be big enough to put aside the defense mechanism, by which the mind seeks to expel or repress unwelcome ideas.

A responsive stimulus to interdepartmental co-operation in accident prevention is the appeal to departmental pride to have: (1) The longest no accident record, and (2) the best record for the number of hours worked without a lost time accident. The personal impressions of railway employees, their likes and dislikes, their naturally favorable reaction to a sense of fair treatment, and their feelings of resentment and their desire to retaliate in the face of sharp practice, all are bound to color their actions. Their personal equation is ever to be reckoned with in business, for no matter how utilitarian or impersonal the organization may seem, it derives its character and tone from the personalities of individuals.

The accident problem, in spite of all the changes that have come about, is still the same old problem. One need but study its history to be satisfied of this. Take but a cursory view of the marvels of modern mechanics, of modern maintenance methods, of the ingenious and useful devices and contrivances designed for and intended to solve this problem and then remember that with safety incorporated in the design, construction and installation of industrial equipment, it is possible to prevent only about 25 per cent of industrial accidents through mechanical means, and that for the prevention of the rest, we must turn to educational methods, better supervision and improved morale of employees. One may then realize why the solution of our problem depends so much upon education and the creation of a constant spirit of co-operative safety—why it is necessary to have the fullest possible co-operation between the several departments of the railway, all co-ordinating to stamp out thoughtlessness and carelessness.

Overcoming Transportation Hazards*

By D. L. Fennell

General Superintendent Transportation Kansas City Public Service Company Kansas City, Mo.

ORGANIZED accident prevention work on the part of electric railways was almost unknown fifteen years ago. Today, however, all wide-awake electric railway managements are carrying on accident prevention campaigns. That the safety work of the city electric railways has been successful is, I believe, conclusively shown by the fact that in 1912 there were approximately 3,000 fatalities in street railway operation, and only 1,661, according to National Safety Council figures, during 1927. Of the 1,661 fatalities in street railway operation during the past year, 500 occurred in collisions with automobiles or trucks, thus reducing to 1,161 those attributable to other causes. This decrease resulted despite the fact that railway speeds have been materially increased to meet popular demand and competition of motor-driven vehicles.

There are some properties much more advanced than we in Kansas City in accident work; but the results that we have obtained have, in my opinion, been so successful as to be worthy of your consideration. Fifteen to eighteen years ago neither the operating officials nor the trainmen in Kansas City were greatly concerned with accident prevention, although men were disciplined if, in the opinion of officials, accidents occurred due to gross carelessness. Today an entirely different situation exists, and it might be of interest to know how this change has been brought about.

It was necessary before any comprehensive plan for accident reduction was put into effect, to make a study as to where and how accidents occurred. An addition was made to the general transportation force in the way of a statistical clerk, who compiled data of all accidents occurring over a long period of years, and made careful analyses and comparisons. The next step was to secure active co-operation of division operating officials, which was done through meetings of an educational nature, explaining the need for intensive work throughout the entire transportation organization. Having information as to facts, the division and general

*Abstract of a paper presented at Seventeenth Annual Safety Congress, New York, N. Y., Oct. 1-5, 1928.

Digitized by Google

transportation officials next carried the problem to those who actually operate the cars, the trainmen. In a series of meetings held at the various divisions, the men were given an outline of accident conditions, data as to number occurring, cost, etc., and their co-operation solicited towards obtaining the desired reduction and improvement.

Analyses developed an excessive number of so-called boarding and alighting accident; apparently caused by persons attempting to get on or off cars while in motion. As an aid in improving conditions the management equipped all cars with folding doors and steps, thus doing away with open platforms. The mechanical department co-operated by putting into effect a much more thorough system of inspection and maintenance of equipment. This has been a most important factor in reducing accidents. With this assistance from the mechanical department, it was found that car operators were much more interested in reporting defects in equipment, which heretofore they had been prone to neglect.

Railway Co-operates With Local Safety Council

Through the activities of the traffic committee of the Safety Council, much has been accomplished in the way of improving operating conditions, through reduction of traffic congestion. The personnel of this committee consists of representatives of several industries and has the respect of the general public and newspapers.

The traffic committee of the Safety Council is called on by the City Council to make recommendations on all ordinances affecting traffic, and while there is still much unaccomplished, conditions have been materially improved. Traffic problems in general are handled also through this division of the Safety Council. Accident prevention work among the thousands of school children is another part of the council's activity and has been an invaluable aid in our efforts to overcome transportation hazards.

Last December, on recommendation of the traffic committee, the police commissioners put into effect pedestrian control at all downtown intersections where traffic officers are stationed, which has materially speeded up our operation at these intersections and reduced the possibility of collisions with pedestrians. Some few streets used by our cars have been made arterial or stop streets, and this has resulted in fewer collisions with vehicles crossing the tracks. Safety zones have been installed at all car stops in the business district and at many outlying points. With vehicles prohibited from driving on track through safety zones, a marked reduction in collisions with automobiles and trucks has been obtained. Yellow lines on pavement marking overhang of cars, have been placed at many locations where our studies found that accidents to vehicles and pedestrians being struck by rear end of car had previously occurred. This class of accidents has been almost eliminated at such locations.

Within the past few years a much more careful selection has been made in the employment of men as car operators. After filling out a preliminary application, the applicant is given an inspection to determine fitness for work and then must pass a rigid physical examination before being turned over to the instruction department. Three days are spent in the instruction school, prior to actual road instruction, and where some fifteen years ago a man was considered competent to operate a car with one week's instruction, our present training period is from 21 days at the smaller divisions, to 30 days at the larger ones. During his first seven days of operation alone, a man is checked daily by a representative from the instruction department, and for a period of 90 days is followed up on an average of once a week by a traveling instructor. A careful record is kept in a card index system in the instruction department.

All accidents are carefully investigated by the division superintendent or his assistant, and the man concerned interviewed the day that accident occurs. Division superintendents send in a written statement, made out in duplicate, one copy of which is sent to the adjustment department and the other being filed in the operator's record. Twice yearly the division officials compile accident records of car operators, and a man is called in personally by the division superintendent and commended if he has a good record, or advised as to improvement necessary.

To keep the trainmen fully advised as to results a daily system of bulletins was inaugurated, showing in chart form the number of accidents, a general classification of those chargeable to each division, and explanation as to the number apparently avoidable and how some could have been prevented. These bulletins are posted at divisions not later than noon of the day following, and although this system has been in effect for many years we find the men still greatly interested.

We have never tried the bonus system in effect on some properties, but as an incentive towards improvement and to create rivalry among divisions, an accident table was worked out by operating officials and the general transportation committee. Under this plan accidents are divided into five major classes and a certain number of points are allowed for the best record in each class, according to the importance of that particular type of accident. Points also are awarded for the greatest percentage of improvement over the month previous and over the same month for the year previous. All accident comparisons are made on a basis of car-miles operated, or 1,000,000 passengers carried. A prize of $50 per month is awarded to the division making the best record and a $25 prize to the division next in line. A $25 prize is also given to the motor coach division making the best record. The division making the best record for the year in accordance with this schedule, is given a banquet or outing, and a trophy to display at its headquarters.

In competitions of this kind there is usually a tendency on the part of a few to avoid if possible reporting all accidents in order to better their own or division record. These unreported or "blind" accidents constitute a serious problem for the claim or adjustment department, and also cause the company to pay out large sums of money. To minimize this class of accidents our plan provides for the awarding of prizes to those divisions making the best record in this respect. Each "blind" accident charged to a division carries such a high penalty that an otherwise splendid record would be practically wiped out and minimizes the chances for a division winning the monthly prize.

Prior to our intensive safety work we were involved in many car collisions, serious in nature, and costing thousands of dollars, and resulting in serious and some fatal injuries to passengers. In 1912 there were 333 of this class of accidents, as compared with 106 in 1927, a reduction of 68.2 per cent. A comparison of 1922 with the year 1927 shows 164 in 1922, as against 106 in 1927, a reduction of 35.4 per cent. In 1912 we had 1.43 car collisions per 100,000 car-miles, and last year, 0.44. Our record for 1928, based on eight months' experience, will be even better. Of the 106 car collisions occurring last year, few resulted in other than bent fenders or touching of bumpers, and little or no injuries to passengers.

One-Man Car Service Is Inaugurated

In the early part of 1927 with revenues constantly falling off, it was necessary to make drastic reductions in operating expenses, and decision was reached to put into effect one-man operation on all cars in greater Kansas City. Prior to July 1, 1927, 37 per cent of our car-miles were one-man operated, and between July 1 of last year and July 16, 1928, changeover to 100 per cent one-man operation was made. To accomplish this in the short space of a year it was necessary to instruct approximately 600 conductors and 250 motormen in the details of one-man car operation. This greatly increased the work of the instruction department, but we are able to say that changeover has been made without a single serious accident that is in any way chargeable to the change to one-man operated cars. Our peak schedule calls for approximately 700 cars in service. In making this change all possible safety devices were installed on cars, including rear-exit treadle interlocked with brakes, as well as features to make door operation impossible when car is in motion.

All of our cars are single end, and unfortunately the majority of outlying termini are so located as to make looping impossible, so a wye movement must be made. Accidents have occurred to vehicles and pedestrians being struck by the rear end of a car backing at a wye, and in making a changeover to one-man operation, there was installed on these cars a rear end control feature which enables operators to back a car from the

Digitized by Google

rear end. Although this safety feature added $30,450 to the cost of remodeling cars, it was thought necessary to install, to eliminate this accident hazard. With one-man cars backed from the rear in making a wye, there have been no accidents of this nature since the change-over to one-man operation.

To reduce the number of so-called "falling in car" accidents, sometimes caused by sudden starting, a line breaker switch also was installed on cars at the time of rehabilitation. This switch between controller and motors opens if the operator attempts to feed too rapidly, which would cause surge on motors. Opening of this switch automatically prevents car jerk from improper feeding of controller. Installation of this feature cost $81,720.

Safety Meetings Are Effective

Safety meetings conducted by division superintendents and assistants are held each week with all men at divisions on the extra board, and once each month, a general meeting for all men at divisions on the extra board. Once each month a general meeting for all men at the divisions is held. Each division, by popular vote, elects ten captains from its own men. These captains, in turn, select their own team from the operating personnel, and the winners on these teams each month receive various prizes.

While we have made a reduction in the number of accidents, we have not been so successful in so far as vehicle accidents are concerned. This is largely accounted for by the great increase in the number of automobiles in Kansas City. In 1912 there were 4,519 automobiles in Kansas City; in 1927 there were 79,763, more than sixteen times as many as were on the streets in 1912. Vehicle accidents during this same period increased 104 per cent, with 2,571 recorded in 1912 and 5,254 in 1927. A large part of this increase, however, can be attributed to conditions existing the latter part of 1918 when almost the entire transportation force left service, making necessary the hiring and training of approximately 6,000 men to obtain a force of 2,000 competent trainmen.

A comparison of 1922 with 1927 shows 4,980 vehicle accidents during 1922 and 5,254 in 1927, an increase of only 5.5 per cent. In this five-year period the number of automobiles in Kansas City increased 54.3 per cent from 51,688 to 79,763. Vehicle accidents in 1912 were 1.11 per 10,000 car-miles; in 1922 they were 1.99 per 10,000 car-miles, and in 1927 they were 2.16 for each 10,000 car-miles operated. Most gratifying of all is the reduction in fatal accidents, there being only sixteen chargeable to car operation in greater Kansas City in 1927, as against 33 in 1912; a decrease of 51.5 per cent during this period. Also, the majority of such fatal accidents occurring in 1927 were ones which our operators could in no way have averted, they being due to gross carelessness on the part of automobile drivers. This total of sixteen deaths in street railway operation is considerably less than the number killed by automobiles in Kansas City last year, and we can say without fear of contradiction that the street car is today the safest means of transportation.

Before concluding, I should like to make a statement with which many may disagree, and that is—It is possible to go to extremes which may react unfavorably. I sometimes wonder if we have not already gone a little too far in being overly cautious as to attempting to prevent accidents with automobiles and trucks. As it is, most of us are constantly telling our men to slow up, and have the car under full control at all street intersections, and I am inclined to believe that this hesitancy or giving of right of way to autos makes the auto drivers more careless, and puts the burden of preventing collisions almost entirely on the railway. No doubt, were we to dispute this right of way with truck or auto drivers, there would for a little while be a considerable increase in accidents with vehicles, but I am of the opinion that within a short time conditions would be much improved over what they are today, in that drivers would become more cautious.

British Municipals Hold Annual Meeting

BUS competition and the outlook for electric railway extension were the principal subjects discussed at the annual meeting of the British Municipal Tramways & Transport Association held at Manchester, Sept. 12-14. In spite of the present fashion for buses, in which the British steam railroads are now participating, the president of the association, James Bowes, J.P., of Manchester, pointed out that the municipal tramways were holding their own and generally were prosperous undertakings.

In a paper, J. K. Cheetham of Oldham pointed out that much of the bus development had been brought about by more favorable legislative conditions, as private undertakings of this character require no statutory authority. He did not know of any case, however, where bus fares were equal to or below the tram fare or where the conditions imposed by Parliament on street railways as to workingmen's fares and a number of other handicaps were imposed upon private bus operators. H. P. Stokes of Plymouth presented the accompanying statistics, based on 86 municipal tramway undertakings which had replied to a questionnaire.

A committee appointed by the Council offered a proposed standard classification of bus accounts in view of the increasing number of buses operated by members of the association.

STATISTICS FROM 86 BRITISH MUNICIPAL TRAMWAY UNDERTAKINGS

	1907–08	1919–20	1927–8
Cars, single truck	6,090	7,265	8,094
Cars, double truck	1,672	3,329	*4,123
Cars, single deck	460	468	556
Cars, double deck open top	3,136	1,622	1,108
Cars, double deck covered top	2,886	6,713	9,245
Cars, total number	7,762	10,594	12,046
Cars, average seating capacity	52	55	59
Track-miles of route	1,480	1,669	1,834
Track-miles measured as single track	2,096	2,688	2,981
Fare, average distance in miles for 1½d. fare	1.95	1.35	1.5
Cost of energy per kilowatt-hour in pence	1.2	1.71	1.19
Total cost, in millions of pounds	37.163	52.544	77.912
Total debt, in millions of pounds	29.456	26.699	35.927
Passengers carried, in billions	2.0126	3.8739	4.0750

*Divided 121 equal-wheel bogies, 4,002 unequal-wheel bogies (such as maximum traction)

Maryland Utilities Association Meets

UNTIL the electric railways of the country have discarded the antiquated rolling stock now being used and have replaced it with modern equipment approaching the automobile and bus in comfort and riding qualities they cannot hope to regain the traffic which has drifted away from them during the past few years, was the opinion voiced by operators at the midyear meeting of the Maryland Utilities Association at Braddock Heights, Md. C. Melvin Sharpe, executive assistant to the president of the Washington Railway & Electric Company, Washington, D. C., took the stand that the time had come for the electric railways to stop "ballyhooing their troubles." "I am not stating the policy of my company," said Mr. Sharpe, "but I firmly believe that the railways must give service as good and as comfortable as the buses. I have never ridden on a trolley car that afforded comfort to compare with the private automobile." Mr. Sharpe further expressed the opinion that the time would come when the industry would endeavor to give each passenger a seat, even during the rush hours.

Miles B. Lambert, of the Westinghouse Electric Company's electric railway division, asserted that trolley cars were already being produced that closely approached the bus in comfort and convenience. He also pointed out that the leaders of the industry well realized the need for new equipment, and predicted that by 1930 the railways would enter upon a period of rehabilitation that would restore them to their old standing among public utilities.

S. E. Emmons, assistant general manager United Railways & Electric Company of Baltimore, made the statement that the cause of his company waging such a fight upon the depreciation issue in its fare case was its determination to set up adequate reserves wherewith to replace its obsolete rolling stock with more modern equipment. Labert St. Clair, director of advertising of the American Electric Railway Association, made a plea for relief from traffic congestion in the larger cities, citing the successful results for all concerned that had followed the abolition of parking within the Loop district in Chicago. He also advocated the employment of salesmen to make a house to house canvass in the interest of the sale of rides.

News of the Industry

Power at 1 Cent a Kilowatt for Seattle Municipal

A. W. Leonard, president of the Puget Sound Power & Light Company, has submitted an offer to the City Council of Seattle, Wash., to furnish all the electric energy required to operate the Seattle Municipal Railway system at the rate of 1 cent a kilowatt-hour, or a saving of $85,000 a year to the city light department.

Mr. Leonard's statement followed an announcement that members of the City Council has abandoned plans to reduce the cost of current sold to the Municipal Railway, since C. E. Lundgren, chief accountant for the light department, informed them that it now costs 1¼ cents a kilowatt-hour to produce current sold by the city's own plant to the railway for 1 cent.

Mr. Leonard said:

I am surprised to note that according to the figures furnished by Mr. Lundgren the current now being furnished to the railway at 1 cent per kilowatt-hour is actually costing the light department 1¼ cents per kilowatt-hour. At the time of the purchase of the railway by the city, this company contracted to furnish all the current necessary to operate the lines at 1 cent per kilowatt-hour.

The city then reserved the right, however, to take over this load and is now actually furnishing to the railway about 65 per cent of the power necessary for its operation. The balance is still being furnished by this company at 1 cent per kilowatt-hour. This rate provides a reasonable profit to the company and we would be very glad to furnish all of the electric energy to operate the Seattle Municipal Railway at 1 cent per kilowatt-hour and would contract to do this for a definite period of years.

Since, according to the city light department, it is actually losing ¼ cent on each kilowatt-hour furnished, our offer would save the light department approximately $85,000 annually and would release the power which the city is now selling at a loss to meet the shortage which the city claims exists in its present generating capacity.

Frankly, I cannot understand why the city's costs are so much higher than ours. We would consider a load of this character and magnitude profitable and desirable business at the 1-cent rate.

Mr. Leonard's offer to the city was answered by W. J. McKeen, assistant to the superintendent of city light, who replied in the absence of J. D. Ross, superintendent.

Mr. McKeen said:

Mr. Leonard can't sell power to the railway at 1 cent and make a profit if he assumes the burden city light now carries for new buildings, equipment and machinery, to take the place of the old stuff sold us when the city took over the railway from his company, together with the cost of the operators in charge of generators transforming alternating to direct current for the use of the cars.

Talk of furnishing current at 1 cent is buncombe. Mr. Leonard knows he can't do it and we know he can't There is an obligation, in bonds and other securities, of $474 against every horsepower of the Puget Sound Power & Light Company. This contrasts with obligations of $173 against every horsepower of city light. We can sell current cheaper than Mr. Leonard and make a profit.

New San Francisco Line to Open Oct. 20

Opening of the Judah Street extension of the San Francisco Municipal Railway via the newly constructed Duboce Tunnel, is scheduled for Sunday, Oct. 21. Chief Assistant City Engineer Nelson A. Eckart has announced that the new street car line could be opened on Oct. 20, but that in view of the plans of the Sunset organizations for a civic celebration of the event, he would officially open the line the following day.

Trolleys Must Run—Code of Linemen in Jacksonville

LASHING wind and driving rain, broken wires and flooded streets harassed the Jacksonville Traction Company, Jacksonville, during the early part of September, when Florida was hit by a disastrous West Indian hurricane, but in spite of the difficulties caused by weather, the cars established a record by the avoidance of all accidents and the service maintained was so good as to merit the praise of city officials, police and many other persons.

Every resource of the company was used to provide good service to all parts of the city. Seventeen trolley breaks were reported and repaired within a short while. Flooded streets interrupted service on several lines but this obstacle was overcome by routing cars over other lines and transferring passengers. Operators, linemen, repairmen, inspectors and employees of every other department served willingly for long hours to insure a maximum of service during the storm.

The day after the storm, J. P. Ingle, general manager of the railway, made the following statement to the Jacksonville newspapers:

While, of course such interruptions to street car service cannot be prevented, the employees made every effort to reduce them to a minimum—and the consideration and absence of criticism from our patrons in such an emergency are most gratifying to each street railway employee.

Chicago Companies Will Study New Drafts

Officials of the Chicago Surface Lines and Chicago Rapid Transit Company have received copies of the new traction ordinances as tentatively adopted by the local transportation sub-committee of the City Council. The companies have been asked to study the drafts thoroughly and to meet the sub-committee on Oct. 15 to negotiate for a permanent settlement.

The fundamental points in the new ordinances and financial plan, which the companies are asked to accept and which have been previously reported in ELECTRIC RAILWAY JOURNAL, are consolidation of elevated, surface and bus lines; local regulation, service-at-cost, construction of a downtown subway system, and amortization with a view to city purchase within 40 years. The committee is said to favor the plans submitted by Major R. F. Kelker, Jr., city engineer, for a comprehensive rapid transit subway to be financed by special assessment and ready for operation in the next fifteen years. Estimates on the cost of the tubes range from $79,000,000 to $99,000,000 for the fifteen-year period.

No decision has yet been reached by the committee on the capital value of the proposed unified transportation company or on the future use of the city's $55,000,000 traction fund and $16,000,000 renewals fund, although it is estimated that the capital account will be somewhere between $250,000,000 and $265,000,000. Under Major Kelker's plan both the traction and renewals fund would be used in purchasing bonds of the new company.

The return to the company, according to the Kelker plan, would total approximately $15,430,000. The actual compensation which will be allowed to the company, however, will be only about $1,130,000, or one-tenth of 1 cent from each of the estimated 1,130,000,000 revenue-passengers. The balance of the $15,430,000 is obtained by figuring the capital value at $260,000,000 and granting a 5½ per cent return on that amount, most of which will be paid out in interest on bonds and stocks owned by the city and other security holders.

Discussion of the sections of the ordinance dealing with subway construction disclosed at the last meeting of the aldermen, that a group of Chicago contractors had submitted a proposition to the city for franchises to organize a new company to take over the present surface, bus and elevated lines and to build and operate a subway system approximately 192 miles in length. It has also given assurances that it could raise between $700,000,000 and $800,000,000 to finance the projects, and amortize and return the properties to the city in 60 or 65 years.

Interborough Man Arrested

The arrest of Harry C. King, Interborough Rapid Transit Company tram clerk and occasional towerman, was ordered by Magistrate Corrigan in the homicide court in New York on Oct. 4. He was charged with second-degree manslaughter in connection with the fatal subway wreck in the Times Square Station of the Seventh Avenue Subway on Aug. 24. At the same time, the magistrate dismissed the homicide charge against William S. Baldwin, Interborough maintenance man, who had been on trial before him.

Dinner for Richmond Executives

Although the date of the event has not yet been determined, a congratulatory dinner is to be tendered President William E. Wood and officials of the Virginia Electric & Power Company, Richmond, Va., and officials of Stone & Webster, Inc., of which the company is a subsidiary. The occasion is in recognition of the winning of the Coffin award. The dinner will be given by the Richmond Chamber of Commerce. In the resolution adopted by the Richmond Chamber of Commerce, it is stated that body "is deeply appreciative of this fine honor the Virginia Electric & Power Company has brought to Richmond, to Virginia and to the South."

Massachusetts Electrification Awaited

Electrification of the Boston, Revere Beach & Lynn Railroad is to be completed this month and will then become a part of the extensive trolley system of Metropolitan Boston. The steam engines which formerly drew the narrow gage trains are to be discarded but the cars have been fitted with motors of their own.

Under the new scheme of operations schedules will be shortened with a noticeable improvement in service and in more economical operation. The line is being supplied with current from the Edison Electric Illuminating Company and the Lynn Gas & Electric Company. A substation has been established at Orient Heights and another at Lynn to provide for the increased load.

Progress of Fare Fight in Los Angeles

Carrying the fight to preserve a basic 5-cent fare on the street railways of Los Angeles to the Supreme Court at Washington, Attorney Carl I. Wheat and Assistant Attorney Reginald L. Vaughan of the Railroad Commission have left San Francisco to present to the justices of the Supreme Court a plea for a stay of execution of the 7-cent fare granted by the Federal District Court at Los Angeles. That court has allowed a stay to and including Oct. 15, thus giving time for the attorneys for the Railroad Commission and the city of Los Angeles to present the matter in Washington. Herman Mohr, deputy city attorney of Los Angeles, and attorneys Wheat and Vaughan will prepare together the necessary petition for a further stay pending appeal while traveling east.

The decree of injunction issued by the Federal Court on Oct. 1 would have gone into effect on Oct. 11 had it not been for the granting of a motion for five days stay by the judges at Los Angeles. All of the necessary steps for the taking of an appeal from the decision of the lower court have now been completed and whether or not the Supreme Court grants a further stay of execution of the injunction it is expected that the case will be advanced on the calendar so that final determination may be expected within a few months.

The change in fare would affect every rider on the street cars of the Los Angeles Railway Corporation, since rates will be increased from 5 to 7 cents if the injunction should go into effect. It is expected that the argument for a stay will be made on Oct. 15.

Wage Hearings in St. Louis

Hearings on the demands of the union employees of the St. Louis Public Service Company, St. Louis, Mo., for increased wages and improved working conditions are being held at the St. Louis City Hall. The Missouri Public Service Commission, acting as arbitrator between the company and the men, is taking the testimony. The City of St. Louis intervened in the case so that any increased rates of fare involved in the final decision could be handled at the same time.

All the contentions made by the men to date have been disputed by the company. Although the main battle is centered around the 3,600 platform men and bus drivers hundreds of shop workers and maintenance men are affected. Indirectly the decision of the commission will also affect all other employees.

The present wage of platform men is 50 cents an hour the first year, 55 cents the second, 63 cents the third year and 67 cents the fourth year and thereafter. This class has demanded 55 cents the first three months, 62 cents the second three months, 68 cents the third three months and 72 cents after a year. Other demands provide that 65 per cent of the runs be made "straight" runs and that time and a half instead of time and one-fourth shall be paid for all overtime; that the $100 a month minimum wage be abolished and that there be substituted a rule that all men reporting for duty be allowed pay for two hours each time he reports whether he takes out a car or not.

The company will present testimony to show that if all the demands are met an additional $4,000,000 a year in revenue will be needed and an increase in fare of at least one cent from the present 8-cent rate. The company contends that it would be forced to raise all its wages in proportion to any increase granted the union men.

Benefits for South Shore Region

In accord with its policy of advancing step for step with growth in business, the South Shore Line has put into effect a new, faster train service between Chicago and all stations on its line. Steadily increasing passenger returns, due to the public's appreciation of the greater convenience of South Shore Line service through the congested-highway region south and east of Chicago, have made it feasible to advance to a still faster running time, according to officials of the line.

Ten minutes will be cut off between South Bend and Chicago, in both directions. Limited trains will now make this 90-mile run in two hours and twenty minutes. As a special convenience to South Bend and Michigan City patrons, an extra fast dining car train will leave South Bend at 7:00 a.m., making the trip to downtown Chicago in two hours and five minutes, the fastest time ever offered South Shore Line patrons. A 5:15 p.m. dining car limited out of the suburban station of the Illinois Central Railroad at Randolph Street, Chicago, will cover the distance to South Bend in the same fast time.

Limited train times will be shortened at every station along the line. So complete are the changes in every instance that the patron is urged to obtain a time folder from the ticket agent, in order to fix in mind the new leaving times. South Bend departures will be unchanged, the famous "every hour on the hour" rule still holding good. At Michigan City, the general leaving time for westbound trains, with exceptions, will be 12 minutes before the hour, instead of nine minutes as heretofore. At Gary the leaving times for westbound trains will be advanced as much as eight minutes. Advances at East Chicago and Hammond will correspond.

Half hourly service to Hammond, East Chicago and Gary will be extended from 7:30 to 10:30 p.m. for eastbound trains, and from 8 p.m. to 11:22 p.m. for those leaving Gary for Chicago. The schedules of the Chicago-Gary express runs will also be speeded up. The after-theater flyer, which will make all limited train stops, will permit theater patrons to "see the last act" before leaving for their train. This will be a two-hour-ten-minute train to South Bend.

Connecting motor coach service to Benton Harbor and St. Joseph, Mich., and points on the way will be speeded up to meet the faster South Shore Line schedules. Shore Line motor coaches will connect at Michigan City with trains leaving Chicago. New time folders recently issued cover these changes, and are obtainable at all Shore Line motor coach stations.

These improvements are a further step in the big program undertaken by the present management when it took over the South Shore Line three years ago. They are being made in order to give the cities of the South Shore region the very best transportation service consistent with the traffic potentialities of the territory served.

Dispute Over Contract Clause in Montreal

A dispute between the city of Montreal, Canada, and the Montreal Tramways on the interpretation of a clause in the contract over the percentage of earnings to be paid to the city will be submitted to the superior court in an action which the city has taken for $250,000 damages.

Under the original contract of 1892, according to the city, the company agreed to pay 4 per cent of the gross earnings and a sliding scale was established whereby the percentage increased by 2 per cent for every additional $500,000 earnings up to 15 per cent, when the receipts reached or exceeded $3,000,000 a year. In 1918 the contract in which this stipulation was embodied was replaced by another contract, and a clause set forth that the rights of the parties to claims made under the old contract would not be prejudiced by the new. It is said the litigation has been submitted to the courts more as arbitration on a subject upon which the parties have been unable to agree.

Hammond Improvement Ordered

The Hammond, Whiting & East Chicago Railway and its receiver, the Chicago Title & Trust Company, have been ordered by the Public Service Commission of Indiana to begin elevating the railway's tracks on Hohman Street in Hammond to the new grade. This order was issued following the filing of a petition by the city of Hammond in which the city demanded that the railway raise its track to grade level or surrender its franchise.

During the hearings, city officials of Hammond testified that the improved section of Hohman Street, one of the principal thoroughfares of the city, could not be opened to traffic until the company's tracks were raised to the level of the new pavement and the right-of-way improved.

Charles Lawrence, superintendent of the railway, testified the company was willing to undertake the improvement, which was estimated to cost $10,000, but was financially unable to do so, owing to the heavy operating losses suffered during the last twelve months.

Flower Gardens a Hobby in Chicago

As a part of its campaign for better public relations, the Chicago Surface Lines has been conducting a contest among the car stations for the most attractive flower gardens. The awards have just been made, Noble division being first, Devon second, and North Avenue third. The gardens were laid out and maintained by the men at the car stations under the direction of the foremen and some very beautiful displays of flowers resulted. At most of the car stations, window boxes were used in profusion, and ground which heretofore had been allowed to lie idle was cultivated and turned into beautiful flower beds. The track department also made special efforts to beautify loops and terminals.

Many letters of commendation were received by the management. The contest will be continued next year.

Another Plan Evolved for Seattle Pension System

As the financial frailty of the Seattle Municipal Railway department, Seattle, Wash., now stands as an obstacle to the proposed new pension and annuity system voted by the people last year for city employees, it is now proposed that the rates to be charged employees for the maintenance of an annuity fund to accompany the pensions, be reduced if possible; that employees be not limited to credit for only 25 years of service; and that aged employees who would be forced into retirement Jan. 1, under the ordinance as it now stands, be given more time.

This idea was advanced after members of the Council declared that no way had yet been found by which the utility would be able to pay its share of $143,283 into the fund of $369,680 needed in 1929 for the first year of the pension system. To leave employees of the railway department out of the pension system as a means of solving this phase of the problem would be illegal, city officials claimed, and it was said that it would be equally impracticable to lay the burden of this or any other utility department upon the general fund to be shouldered by the taxpayers. Opposition by some of the older city employees to certain provisions of this measure previously had threatened to cause the Council to abandon the entire pension matter for another year.

Overcoming Study Difficulties in Los Angeles

A new appeal is being tried in Los Angels, Cal., by an adult education council composed of the leading universities and school systems working in conjunction with the Pacific Electric Railway. The plan is to benefit the commuter who meets the suggestion of the railway company "You can study while you ride" with "Yes, but I don't." Since the difficulty is largely one of the bulk of the textbook, the objection of size is to be overcome by the substitution of small, portable units in loose-leaf, pocket-size form. The commuter takes a few pages with him each morning, slips them into his pocket and uses them for study on the train. The loose-leaf forms are made by cutting up standard textbooks into neat units and punching them for insertion in a manilla binder.

The Los Angeles County Council for Adult Education is in charge of the commuters' school. By agreement with the Pacific Electric Railway every ticket agent of that company becomes an information agent and salesman for the courses in the commuters' school.

Explanation of Boston Agreement Made to Governor Fuller

Provisions in the new agreement between the Boston Elevated Railway, Boston, Mass., and the Carmen's Union are summarized in a report which Chairman Samuel L. Powers of the board of public trustees has submitted to Governor Fuller of Massachusetts. By reason of that agreement, and subsequent votes of the board of trustees four specific results have been accomplished. They are enumerated by Chairman Powers as follows:

1. That the general manager is directed to submit to the board of trustees his recommendations of persons for appointment as motormen in rapid transit service, together with an abstract of the records and qualifications of such persons.
2. That all rapid transit motormen will be given a physical examination at least once each year.
3. That the records of all rapid transit motormen have already been examined, four besides McDonald (operator of the fatal train) have been dismissed, and others are under consideration.
4. That hereafter, by agreement with the union, in case of the discharge or suspension of an employee, the final appeal by the union will be to the board of trustees. Heretofore an employee had the right to appeal to a board of arbitration.

Under the new arrangement an examination of the motormen has already been held and General Manager Edward Dana has classified them as "good," "fair" and "not so fair." Since then six motormen who were classified as "not so fair" have been discharged by the management in the interest of safe operation, exclusive of Motorman McDonald, who was found guilty of the fatal Beach Street accident.

Chairman Powers also reports:

The agreement we have secured with the union is of far-reaching importance. It is the very thing that we have attempted to secure for many years past, without success. We now have the power to enforce discipline with far greater freedom than ever before, and the authority thus secured cannot fail to have a salutary influence upon the men engaged in the operation of rapid transit lines.

My feeling is that your co-operation in this matter of discipline has been of the greatest service to us in bringing about a modification of the agreement with the Carmen's Union. In saying this I do not mean to have you understand that we have failed in the enforcement of discipline in the past. Our records show that since Jan. 1, 1920, 476 employees in car and train service have been discharged for disciplinary reasons, such as accidents, use of liquor, fare irregularities, continually being late, insubordination, incivility and various other causes; but the very fact that a discharged man had the right of appeal to a board of arbitration, with the privilege of selecting one of the arbitrators, made the men feel more or less secure against discharge for misconduct.

New Merchandising Plan

Utica to be scene of program designed to appeal to 83 per cent of buying public

A SYSTEM for stimulating street railway and bus travel and at the same time improving the commercial activity of downtown business districts, announced by the Co-operative Exchange System, Inc., New York City, is to go into effect on Nov. 1 on the lines of the New York State Railways in Utica, with the prospect of its application to the other cities of the system at regular intervals.

Among other factors, the program embraces a patented co-operative cash discount coupon which is issued as fare is paid and accepted as cash by merchants of the community, on the basis of minimum purchases. The net result is that while the fare remains the same, the cost of a ride is reduced as much as 86 per cent, but the economic inducement is such that it should result in an increase in street car and bus travel.

In congested business districts, progressive merchants have for some time been offering to refund to patrons who come by automobile the cost of their parking, provided their purchases bulked larger than $1, the object being to encourage automobile patrons to visit the business district more frequently.

Based on the analysis of traffic conditions in Milwaukee, Pittsburgh and Detroit, which show that approximately 19½ per cent of the traveling and buying public walk, 17½ per cent ride in private automobiles and 63 per cent use group transportation, any inducement made to the automobile using public affects only 17½ per cent of the potential buying public while most of the 83 per cent of the buying public is left without any special inducement to visit the business district more frequently. The program of the Co-operative Exchange System, Inc., is directed toward inducing the 83 per cent to travel more frequently and to travel by street car or bus.

Under the plan about to go into effect in Utica the fare receipts which are given to each rider have cash discount coupons attached. These coupons are accepted by merchants on the basis of 2 cents on each 25-cent purchase. In other words, if a person makes a 25-cent purchase he pays 23 cents in money and 2 cents in coupons. A dollar purchase is made for 92 cents in money and 8 cents in coupons, etc. Coupons must be used in the week in which issued and each week begins a new series of a different color to facilitate redemption by merchants. The cost to the merchant upon first consideration appears to be 8 per cent, or as 2 cents is to 25 cents, but the cost against volume really is found to be about one-half of 1 per cent. The merchant simply agrees to accept the coupons on the basis of minimum purchases.

The program costs the railway nothing until revenue has been created, at which time it pays to the company operating the plan a percentage of the actual increase. Under this arrangement the cost of installing and supervising the program is borne by the Co-operative Exchange System, Inc. It is this type of contract which has just been signed by the New York State Railways. It is understood that in two days more than twenty leading merchants in Utica, representing twenty different retail lines agreed to the plan. The program is not limited to any particular merchant or group of merchants and it is expected that by the time the first coupon is issued about Nov. 1 more than 200 merchants will be participating in the plan.

The program of the Co-operative Exchange System, as offered to the transportation industry, comprises a complete sales service and is so planned as to cost the railway nothing unless and until results are obtained.

Higher Subway Fares Urged in New York

Higher subway fares in New York City to make the city's investment of about $250,000,000 in present subways and nearly $500,000,000 on new subways self-sustaining and to release at once ample funds from the city debt limit for the construction of the proposed tri-borough bridge, schools, tunnels and playgrounds, are advocated in a report of the committee on public service in the metropolitan district of the Chamber of Commerce of the state of New York.

The report is based on a study of the city's financial difficulties for ten years. It states that the basic and fundamental problem in the city's straitened financial condition, and the one certain and immediate remedy, is an increased subway fare. The report further suggests that necessary improvements, including some advocated by Mayor Walker, cannot be financed now without exceeding the city's debt limit, and that this condition exists only because of the attitude of the city authorities on the 5-cent fare.

When the new lines under construction are completed the city will have about $1,000,000,000 invested in subways. As the fares collected in the subways are not sufficient to pay interest on the investment, the city's debt for subways is not exempt from the debt limit, as the members of this chamber fully appreciate. The report says:

The chamber has repeatedly advocated subway fares sufficient to make our transit facilities self-supporting. This action would automatically release the bonds issued by the city for the subways now in operation, amounting to about $250,000,000, from the city debt limit. The city then could go ahead at once, not only with building the tri-borough bridge, but with the construction of schools, playgrounds and many other much-needed improvements.

Car Award Still Pending

The award by the Detroit Street Railway Commission of contract covering 100 street cars for the municipal railway to Perley Thomas Car Company, after having been informally approved by City Council, has been referred back to committee for further consideration as result of protest of other bidders.

Sensing the Public Pulse

Omaha wonders what innovation Mr. Shannahan will spring next. Election coming

IN NOVEMBER a year ago Omaha was anxiously awaiting the arrival of John N. Shannahan, who was to prescribe for the Omaha & Council Bluff Street Railway. This November the "doctor of sick street railways" will be watching the election returns, wondering if the public wants him entrusted with the 30-year franchise ordinance to supply transportation in Omaha and Council Bluffs. His earnestness on the new franchise grant is evidenced in the negotiations with the City Commission, and his own statement "When I accept the franchise I marry it; I accept it for better or for worse."

A cursory glance at the record of activities in Omaha under Mr. Shannahan's guidance would make it appear a foregone conclusion that residents of that city would give without any reservations a free hand to so accomplished a leader. Even if nothing were known of his former record in the railway field, notably in Newport News, his accomplishments at Omaha have already surpassed even generous expectations.

Concentrating more on the making of potential friends than on the number of revenue-miles, he has rarely missed an opportunity for performing some service no matter at what inconvenience, if it appealed to the rider. He solicited suggestions and complaints, too, and whenever worth while, he acted upon them immediately.

When he sensed general dissatisfaction over the ruling that no smaller number than six tokens at 40 cents could be purchased at a time, he arranged to have the fare put on a three-for-20-cent basis. The return to the skip-stop system is the result of an overwhelming vote in its favor, a vote in which ballots were placed in the cars and every rider asked for his opinion. More recently he asked Omaha what color it favored for its cars—and presto—the former yellow pigment is to dissappear in favor of golden brown.

But one might expatiate at even greater length on Mr. Shannahan's many acts of courtesy and kindness toward his patrons. One humane and wise edict of his issued last winter during an unusual cold spell elicited favorable comment from the press of that city. Trainmen were told to "wait for passengers." In explanation he said:

"A few seconds lost in schedule time in this way are compensated by the appreciation the passenger shows for the friendly act."

In his philosophy, mice can bring forth mountains, his little acts having great consequences. Even the New York *Times* in its issue of Sept. 2, commented on the political troubles of Omaha, and discussed the transit situation, and in eulogistic terms told about Mr. Shannahan's accomplishments in establishing good feeling on the part of the patrons of that city.

Large Sale of Pullman Tickets at North Shore Stations

Travelers purchasing inter-line railroad tickets have found a great convenience in the Pullman car tickets placed on sale at the principal North Shore Line stations. The Chicago, North Shore & Milwaukee is the only electric interurban in the country which has been given the privilege of selling through Pullman car tickets. The privilege was granted on Aug. 1. For August the sale was greatly in excess of expectations of traffic officials of both companies. The business was especially heavy in Milwaukee, travelers appreciating the convenience of being able to buy their Pullman tickets along with their railroad tickets and to have their baggage transferred at Chicago without any trouble to themselves.

Wage Agreement in Springfield-Worcester Continued

The Springfield Street Railway and the Worcester Consolidated Street Railway, operating in Springfield and Worcester, Mass., respectively, have drawn up a two-year contract with the uniformed employees of the companies that extends the present wage rate which has been in force since 1924. The scale to be continued calls for a wage rate of 68 cents an hour for operators on cars with two men and 76 cents an hour for operators of one-man cars. This renewal follows a month of conferences at which Attorney Louis C. Parker, Westfield, acted as intermediary. Clark V. Wood of Springfield, Mass., is president of both companies.

Arguments on Piedmont and Northern Issue Continue

Extensions of the Piedmont & Northern Railway in the Carolinas would not make a new trunk line railroad by consolidation with existing steam lines, H. J. Haynesworth, Greenville, S. C., attorney for the railway, told the Federal District Court at the second day's hearing of the injunction proceedings brought by the rail line against the Interstate Commerce Commission. Rebuttal arguments of the Piedmont & Northern attorneys answering contentions by Blackburn Esterline, assistant to the solicitor-general of the United States, opposing the proposed extensions, featured the session of the court. Mr. Haynesworth took up the question of the jurisdiction of the Interstate Commerce Commission in supervising electric interurban railways under the act of Congress establishing its power.

After Mr. Haynesworth's argument, S. S. Alderman, representing the Southern Railway, one of the defendants among the steam roads, sought to controvert the arguments advanced in behalf of the electric carrier.

The Piedmont & Northern is seeking an injunction against the Interstate Commerce Commission to prevent its enforcing an order denying the railway the right to make two extensions of its lines to connect up two sections. One of these sections is in North Carolina and the other is in South Carolina.

Marking Street Car Stops in San Francisco

As a rule, all Market Street cars in San Francisco stop on the near side of crossings, but where the cable cars stop on the far side of a crossing white stop marks are placed on the street paving. In a few places where electric cars stop

So the rider may be sure

on the far side of crossings overhead "cars-stop-here" signs are hung. At the Market Street safety stops the stop marks on the inside tracks are located several feet back of the marks on the outside tracks, since the street is used by both the Municipal and the Market Street Railways. This enables passengers to pass conveniently behind cars on the outside track to board cars on the inside track. When cars are approaching on both tracks a hand signal to the inside track motorman given by the passenger waiting to board a car indicates that the passenger wishes to board his car; however, such a signal is ordinarily unnecessary.

Under these conditions a great deal of time and much annoyance are saved street car patrons in San Francisco by the practice of painting the words "Enter Cars Here" at the point on the pavement where the rear of the car stops. This also saves considerable time of the company. Ordinarily, people waiting to board cars stand on the crossing, but the effort has been made to induce them to stand at the end of the safety station where the car stops. It is at this point that the words "Enter Cars Here" have been painted.

Freight Business on South Shore Booming

Rapid growth of carload freight business south and east of Chicago on the Chicago, South Shore & South Bend Railroad (South Shore Line) has necessitated the establishment of a new carload freight station at Hokewisch, Ill. The new agency opened on Oct. 1, at 13550 Brainard Avenue, and will handle all carload freight formerly handled through the Kensington Station.

Safety Awards in Alliance

Prizes amounting to $300 have been awarded car operators by officials of the Stark Electric Railroad Alliance, Ohio, for safety records during the last twelve months. Original plans called for awarding three prizes, totaling $175, but because of the close race, officials allowed three second and two third prizes.

Charles Smith, an interurban operator, won first prize of $100 for completing 3,100 hours without an accident. J. L. Fryfogle with no accident in 1,600 hours, F. L. Snyder with two minor accidents in 3,100 hours and Bert Patterson with one accident in 2,500 hours were awarded second prizes of $50 each. P. D. Tullis with two minor accidents in 2,500 hours and E. J. Brooks with two minor accidents in 2,700 hours were awarded third prizes of $25 each.

To eliminate accidents, an operator's school is conducted each Tuesday by Walter Croft, superintendt of transportation. Night men report for classes at 9:30 in the morning and day men at 6:30 in the evening.

In the cause of safety, E. W. Sweezy, general manager of the Stark Electric, has ordered five new block signals at a cost of $3,000 to be installed between Alliance and Salem. When this work is finished the entire system from Canton to Salem, a distance of about 33 miles, will be similarly protected. The system between Alliance and Canton was installed early this year.

No Repeal of One-Man Car Restriction in Oakland

Final action on repeal of the one-man street car ordinance was taken by the Oakland City Council on Sept. 21. The proposal to rescind the measure was lost. The repeal ordinance was introduced six weeks ago by Eugene K. Sturgis, commissioner of revenue and finance. It would have permitted operation of one-man street cars in Oakland, now prohibited by city ordinance.

The measure was passed to print on Aug. 9, when Mr. Sturgis, Frank Colbourn, commissioner of public works, and William H. Parker, commissioner of streets, voted in favor of it. Mayor John L. Davie and Charles C. Young, commissioner of public health and safety, opposed the ordinance.

Sponsored by the Key System Transit Company, the ordinance has been the subject of heated controversy since its introduction. Heading the opposition was William J. Moorehead, former city commissioner and representative of the trainmen. Numerous civic and improvement clubs voiced the opinion that adoption of one-man cars would prove hazardous, add to the unemployment problem, and impede service.

The Key System took the stand that extra traffic hazard would not be introduced, that no men would be thrown out of work, but that extra cars could be run with use of trainmen on the ground as collectors.

Digitized by Google

Indorsements of the company's stand were filed by numerous civic and labor organizations.

Omaha Employees Active in Chest Drive

A campaign will be conducted among employees of the Omaha & Council Bluffs Street Railway, Omaha, Neb., from Oct. 15-24 for contributions to the Omaha Community Chest drive. Lieutenants have been appointed in every division of the company, who in turn will appoint assistants to call on individual employees to ask them to contribute to the chest. John N. Shannahan, president, in a message to the employees, urges all to help those who are less fortunate; to give cheerfully and generously. The amount to be raised is $446,649, divided on a percentage basis among 31 organizations, embracing all creeds. The slogan adopted for use during the campaign is "Omaha Must Take Care of Its Own."

Briefs Filed in Interborough Case

Four briefs, totaling more than 700 pages, were filed on Oct. 8 in the United States Supreme Court by the Interborough Rapid Transit Company in defense of its plea for a 7-cent subway fare. The case, appealed by the city of New York and the State Transit Commission, is scheduled to be argued on Oct. 15. One of the briefs said:

No statute authorizes the imposition upon the elevated railroads operated by the Interborough Company of a fare limitation of 5 cents, and without such statutory limitation the fare limitation is void.

The city claims the fare limitations applying to those subways and elevated lines, embodied in contracts, must be held legal. The company's brief argued at great length on the points of reasonable return on the value of the property and stated that the right to a "reasonable fare" has not been contracted away by the company.

The Transit Commission's action in denying the road an increase was argued to be a denial of due process of law and confiscation. More than 40 separate legal points were discussed in the briefs.

Firemen and Police of Seattle Scored Again on Free Ride Issue

Abolition of free rides on the Seattle Municipal Railway System, Seattle, Wash., for policemen and firemen has again come up as a city budget issue. E. L. Blaine, chairman of the finance committee, declared that in his opinion policemen in uniform should ride free, but should not have the privilege when not on duty, nor the right to take their families with them as some do without paying fare. Efforts to strike from the budget $40,000 to pay for policemen's rides and $38,000 for firemen's rides failed at the budget hearing.

What the Street Car Tie-Up Showed

IT TOOK a five-hour paralysis of the trolley lines during Monday's storm to convince the city that the street car is still the dog-faithful handyman of transportation. . . . Of the street car service, this much only need be said: It is of that vital class of things which are most highly valued when they are least in evidence. Creatures of habit, we accept the efficient, continuous, reliable operation of the trolley as we accept the schedule round of the sun or the clock-like ebb and flow of tides. The failure of cables was unfortunate, but it at least jarred us out of the routine; it helped us evaluate a service which lies 24 hours a day unnoticed and unsung, at the very tip of our collective noses. The service, now that it is normal, will be shortly forgotten. We shall speak again, shortly, of the automobile age. But the trolley will function 365 days in the year, in the same old rôle. Monday merely emphasized the rôle; Tuesday obscured it, suddenly and completely, behind the curtain of routine.—Minneapolis *Tribune*.

Committee to Study Pittsburgh's Needs

A committee has been appointed by the Allied Boards of Trade to study Pittsburgh's railway and bus service, including the 25-cent bus line, and many other transportation angles. Possible provisions for a subway and other rapid transit facilities probably will be included in the scope of the transportation survey, but for the present the committee will focus its attention on traffic problems that give promise of being adjusted to afford early relief. The allied boards, through the special committee, have employed expert assistance to go into virtually every phase of Pittsburgh's transportation system.

C. V. Shoup has been appointed chairman of the special committee. George P. Kountz and Harry Bastow, president and secretary, respectively, of the Allied Boards of Trade, are ex-officio members.

P. J. McGrath, secretary of the Amalgamated, recently headed a delegation of union leaders who appeared to protest against increasing the number of one-man cars on the lines of the Pittsburgh Railways. The objections of the men were heard by members of the traction conference board, of which Charles A. Finley is head, the members of Council, representatives of the law department and of the railway. The matter was referred to the traction conference board.

Mr. McGrath said in part:

I am not for one moment saying this as a threat, but it is the feeling among many of the employees that they cannot go much farther under the present system of operation. I hope it will not be necessary for them to take the stand that they cannot continue to operate one-man cars under present schedules.

The men told the Council that they had been informed that the number of one-man cars was to be greatly increased in the near future and asked that this order be held up until the matter could be looked into.

W. T. Rossell, general manager of the railway, cited a list of cities where one-man cars are used, and said that the experience in Pittsburgh and elsewhere showed them to be even safer than the two-man type, in which responsibility for operation is divided.

More Motor Truck Lines for Michigan Electric

An order authorizing extension of freight service of the Michigan Electric Railway, Lansing, Mich., by permitting the Southern Michigan Transportation Company, a subsidiary, to operate trucks and trailers over routes paralleling the present railway lines and over additional routes has been issued by the Michigan Public Utilities Commission

The Michigan Electric Railway is now operating trucks on highways paralleling its lines. The new order grants authority to operate trucks between Grand Rapids and Jackson and from Owosso to Flint over routes not served by the electric lines.

Additional service is added on the highways extending from Kalamazoo to Grand Rapids; from Kalamazoo to Battle Creek to Jackson, from Jackson to Lansing and St. Johns; from Kalamazoo to Allegan and Lansing, and from Grand Rapids to Grand Haven and Muskegon.

The subsidiary company is authorized to serve intermediary points on the main lines with the exception of several routes now served by other companies operating under the authority of commission orders granted previously.

Oppose Higher Fares on Chicago-Elgin Line

Commuters from fourteen western suburbs of Chicago have organized and incorporated the Commuters' Protective League for the purpose of opposing the proposed increase in commutation rates by the Chicago, Aurora & Elgin Railroad.

Permission to raise commutation fares to new levels ranging from 2 to 30 per cent over existing rates was asked by the company early last spring. The new rates were to have gone into effect on Sept. 15 had the commission not ordered the railroad to maintain its present fares until an examination of its finances could be completed. In its order of Sept. 14, the commission suspended the higher fares until Jan. 12, 1929. In the meantime hearings on cost of operation and earnings will be conducted.

How Much Pay for Beebe of Seattle?

Just how much the city of Seattle, Wash., must pay to B. H. Beebe, world-war veteran, employed as a motorman on the Seattle Municipal Railway, to make up the difference between his earnings on a part-time job since January, 1927, and what he should have earned on a full-time job, in accordance with a recent State Supreme Court decision, is the problem to come before the finance committee of the City Council. The court ruled that because the Seattle city charter grants a preference to the World War veterans in the matter of employment, Mr. Beebe should not have been put on the part-time list until non-veterans, irrespective of seniority, had been previously reduced. He was awarded judgment for the difference in salary during 1927 and costs, amounting to about $500, and he now asks for the payment of this judgment and for recovery of the difference between his pay on the part-time job and that for a full-time job since last December, and up until such time as he may be reinstated in a full-time position. It is roughly estimated that he will be paid about $1,000 by the city.

Taxes Total $122,758 in Virginia

Taxes totaling $122,758 will be paid to the state of Virginia by the electric railways under the assessments by the State Corporation Commission for 1928. The total value of the tangible property of the electric railways was assessed at $9,875,555. Of the $122,750 in state taxes the Virginia Electric & Power Company, operating in Richmond, Petersburg, Norfolk, Portsmouth and other places, will pay $80,689. Its annual franchise tax, based on gross transportation receipts in 1927, will amount to $71,893. The company's real estate, roadway and other tangible property, taxed by the counties and cities, was assessed at $5,770,673.

Foreign News

Extension Planned by Seibu Railway

Construction of a short extension to one of its lines is planned by the Seibu Railway, Japan, which operates about 52 miles of electric railway in the Tokyo district. Plans are also under way for future construction of 16 miles of line from the Shinjuku Station in Tokyo to Tachikawa, and change from single track to double track for one of its other lines running out of Shinjuku Station in Tokyo. The company is capitalized at 13,000,000 Yen, 6,900,000 Yen being paid up. The company has annual profits of more than 300,000 Yen and usually declares 8 or 10 per cent dividends.

Bavaria Installs Electric Service

Electrification of the section of the Bavarian railways between Rosenheim and Traunstein was recently completed, and electric trains are now running between the two towns. It is expected that the section between Traunstein and Salzburg will also be completed within a short time.

Old Wales Railway Electrified

Electrification of what is claimed to be the oldest railway in Wales, the Swansea & Mumbles Railway, is close to completion. The cost of this work will be more than $5.750,000. Power is supplied to the line from the Swansea public utility which has completed the erection of a special substation at Blackpill to furnish 1,500-kw., three-phase alternating current at 6.000 volts. Current is converted by 500-kw. rotary converters to 650 volts direct current for the overhead transmission line, which is arranged for the sliding bow type of equipment. Eleven new cars for the line are being constructed by the Brush Electrical Engineering Company, Ltd., and will be operated in pairs, furnishing a 7½-minute service. Each car, double-decked, weighs 30 tons and will accommodate 106 passengers.

Indian Electrification Progresses Rapidly

Electrification of the main line of the Great Indian Peninsula Railway, India, is progressing rapidly. It was originally hoped to open the electric service from Bombay to Poona on March 31, 1929. It now appears probable that the new power house will be ready to give a limited supply of current by the end of January and the transmission lines are expected to be completed during that month. It is hoped that limited service will be possible by the middle of April. The electrified line to Igatpuri will be opened a year later, when the whole undertaking should be completed.

Train Services Improved in London

Many important service improvements were introduced this year on the Hounslow, Harrow, Ealing and Uxbridge lines of the Metropolitan District Railway, London, England. These included new trains, earlier trains, longer trains and more through trains.

Hitherto manually operated signals have been used on this outlying section. These were superseded on March 5 by a system of automatic signaling similar to that in use on the London Underground Railways. As a result it is possible to operate eighteen additional trains to and from the stations above named during heavy traffic hours.

Reconditioning of London Cars

At a recent meeting of London County Council, London, England, the Highways Committee reported that if the Council continued its program for the reconditioning of tram cars with transverse cushioned seats and other improvements, 1,450 cars would be reconditioned by June 30, 1930. The total number of cars fit for service is 1,777. Two experimental cars for use in hilly districts have been authorized and when the result of the experiment is known, the committee will consider the provision of 50 cars of similar type.

Italy the Second Country in Railway Electrification

Extensive development in the electrification of railways in Italy is shown by statistics recently compiled of electrification in various countries, which place Italy as now the second country of the world in the length of electrified railway lines. It is surpassed only by the United States. Italy has approximately 1,600 kilometers of railway lines operated by electricity, compared with approximately 3,000 kilometers in the United States. Italy is only slightly in advance of Switzerland in electrification, the latter country holding third place with a total length of 1,500 kilometers of electrified railway. Switzerland is followed by Germany, with 1,445 kilometers, and at a much greater distance by France, which has only about 1,000 kilometers of electrified line.

New Japanese Subway Declares Dividend

Net profits of the Tokyo Subway Company, Tokyo, Japan, amounted to 340,757 yen ($159,712) for the first term of operation, out of which a dividend totaling 216,000 yen ($101,239) or 8.1 per cent has been declared. The company has been in operation only a few months.

Liverpool Tramways Still Helping the Ratepayers

The Liverpool City Council has agreed that a further sum of £115,000 shall be allocated from the profits of the tramway undertaking to the relief of the local rates. It was stated that the tramway undertaking has been written down to £931.000 and that it could be sold for £5,000,000.

Electrification Progress in Mexico

Electrification of an additional stretch of the mountainous section of the Mexican Railway between Cordova and Paso del Macho has been completed. Together with previously completed sections, a total of 65 miles between Esperanza and Paso del Macho is now electrified.

In the 65 miles of electrified line between Pasa del Macho and Esperanza, the road rises from about 1,500 to 8,000 ft. above sea level.

Recent Bus Developments

Appeal Expected in Chicago

An appeal from the decision of the Illinois Commerce Commission granting a certificate of convenience and necessity to the Chicago Motor Coach Company for extensions of bus routes and refusing feeder bus routes to the Chicago Surface Lines will be prosecuted at once by the Surface Lines. The fact that the decision was handed down in the midst of the hearing of objections by the Surface Lines will be used as an argument. The commission took the stand that the Surface Lines could not use its special renewal and replacement fund for the purchase of buses and that it had no right to operate buses under its existing charter.

This order of the Illinois Commerce Commission, referred to in a previous issue of ELECTRIC RAILWAY JOURNAL, over-rode the demands of thousands of residents on the northwest side of Chicago and the desire of the majority of the City Council. In short, the plan for feeder buses for the Chicago Surface Lines system favored by citizens of the northwest side and the City Council was practically ignored by the commission is granting these certificates.

Those who favored feeder buses for the Chicago Surface Lines contended that the company would give service for a 7-cent fare with free transfer to the Surface Lines system, whereas the service by the Motor Coach Company would be at a 10-cent fare with transfers only to its other motor coach lines.

The Chicago Motor Coach Company started service immediately after the issuing of the order of the commission and John A. Ritchie stated that regular schedules would be obtained as quickly as possible. New bus routes ordered add 70 miles to the service of the Chicago Motor Coach Company, making the total 215 miles.

Hudson Valley Sells Bus Lines

Following a decision of the Delaware & Hudson Company to abandon the Hudson Valley Railway in its entirety and to give up bus transportation, the Hudson Transportation Company has been sold to D. H. Cowles, James McPhillips, and other business men.

The abandonment of the entire Hudson Valley line would have left Hudson Falls and Fort Edward without transportation facilities, and when railroad officials announced that no substitute would be provided, Mr. McPhillips and Mr. Cowles negotiated for the purchase. Mr. McPhillips has been chief counsel for the Hudson Valley Railway for some time.

The company will at once apply for franchises over Glen and Warren Streets at Glens Falls, Main Street at Hudson Falls and Broadway and East Street at Fort Edward. If the franchises are granted the company will acquire sixteen buses, each seating 29 passengers. It is also proposed to extend the bus system through South Glens Falls to Saratoga Springs.

The total investment will represent about $265,000 and stock will be offered to residents of the cities and villages to be benefited by the new line.

The Hudson Transportation Company was created as a subsidiary of the Hudson Valley Railway to provide bus service in place of trolley cars in the cities where railway service was abandoned last July.

Zone Cab Service in Minneapolis

The Zone Cab Company of Minneapolis, Minn., has been organized as a subsidiary of the Twin City Rapid Transit Company, which had previously acquired three companies, to furnish taxicab service at reduced rates under the zone plan. Definite bounds are set for the zone from the downtown district to outlying streets.

The Zone company will carry one or more passengers within this zone for 50 cents. Outside these limits the rate is 50 cents for 2½ miles, with an extra charge of 25 cents for each extra stop to take on or discharge passengers. The color of the cabs is brown.

No License Required for New Salt Lake City Vehicles

A decision has just been rendered by Harvey H. Cluff, Attorney General of Utah, to the effect that the electric coaches recently placed in operation by the Utah Light & Traction Company on its Fourth East line in Salt Lake City are not self-propelled vehicles for the operation of which licenses must be obtained from the secretary of state. Mr. Cluff held that the coaches now being used are not motor vehicles under the Utah statutes, and therefore are not subject to the law regulating and licensing motor vehicles. The attorney general calls attention to the fact that the Utah statutes define a motor vehicle as "any self-propelled vehicle except such as run exclusively on rails." The dictionary, he points out, defines the term "self-propelled" as "containing within itself the means of its own propulsion." As the trackless trolleys in question are not run by any power within themselves, but electrical current not of their own manufacture, the attorney general holds they are not motor vehicles within the meaning of the statutes.

Traffic Jams in Toledo Discussed

A movement to take interurban buses off the streets for loading and unloading passengers and to construct a short loop for interurban electric railways was started in the City Council of Toledo, Ohio, recently by Charles Hoover, Vice-Mayor, who protested against the serious traffic situation caused by parking of large buses in the downtown district. Out of the discussion a new interurban terminal may be developed. Nearly a score of interurban bus lines now operate into stations near the interurban terminal, but they use the streets for loading, unloading and parking.

Developments Expected on Geneva Line

The Geneva, Seneca Falls & Auburn Railroad is destined to go into the discard in favor of buses. This became evident recently from information given out by Lansing S. Hoskins of Geneva, N. Y. and from applications already received by the village boards of Waterloo and Seneca Falls for a franchise for the Geneva Railway Bus Lines, Inc. Proposed abandonment has aroused the anger of both town and village boards because of the enormous amount of work and expense incidental to removing of trolley tracks and special provisions made in paving West Main Street and construction of the Waterloo-Geneva Boulevard and other similar thoroughfares.

The Waterloo village board will have a public hearing on Oct. 22 to act upon the application of Attorney Hoskins for a franchise through the village for the Geneva Railway Bus Lines, Inc., and Seneca Falls village board will hold a similar meeting Oct. 19. It was explained before both boards that the line intended operating buses from Geneva east through Waterloo to the end of Fall Street. Seneca Falls. Application for a franchise through Waterloo township will be made soon.

The Geneva Railway Bus Lines, Inc., for some months past, have operated buses in Geneva city. If franchises are obtained, it is proposed to route buses over both the main highway, by way of Lake Street, Geneva, and the Border City town road, by way of North Street, Geneva.

Efforts to sell the Geneva road failed some months ago because none would assume the burden of $72,345 that the line owed the municipality of Geneva. Waterloo and Seneca Falls.

Would Use Buses on Lincoln Line

Application has been made by the Lincoln Traction Company, Lincoln, Neb., to the State Railway Commission for authority to abandon cars on its line to the suburb of Normal, and to substitute bus service. The immediate reason is the insistence of the city authorities that the company build a subway at the intersection of Sumner with Jefferson

Digitized by Google

Avenue in order to give the latter an outlet to the northeast. As the company's lack of earning ability prevents it from getting new capital on reasonable terms it asks authority to quit the service. When the line was built it ambled through a part of the city where few houses were located, in order to reach the suburb. This district, between Thirty-third and Sumner and Thirty-eighth and South, still is thinly populated, but the buses would be so run as to traverse a section almost entirely without car service.

Marion Goes to Bus

After 34 years of continuous operation city electric railway service in Marion, Ohio, has ceased. Most of the men who have been employed as motormen, conductors and assistants will be retained in other departments of the Columbus, Delaware & Marion Electric Company, which ran the railway.

A system of buses operated by the Marion Rapid Transit Company, Inc., will provide transportation in the city. Eight buses are ready to start. Two will go on the east and west Center Street run and the others will traverse other scheduled routes with daily service until midnight. The franchise calls for twelve buses, which have been ordered but cannot be delivered until late in October. Sale of tickets for the new service has been large, more than 3,000 having been purchased in advance. These are mostly of 50 in a book for $3, but few of the 15 for $1 books are being taken.

Routes Authorized Along Jersey Shore

The New Jersey Board of Public Utility Commission has authorized the Atlantic City & Shore Railroad to operate three buses between Atlantic City and Ocean City through Ventnor and Longport. At the same time the board granted authority to the Reading Transportation Company to operate buses by way of the New Longport and Ocean City Boulevard between the two cities.

Knoxville Awaits Decision

No developments looking toward immediate action are recorded in Knoxville, Tenn., on the bus-railway franchise controversy. The Knoxville Rapid Transit Company, an independent transportation agency, opened up negotiations some months ago and made application for a franchise to operate an independent city-wide bus system. After no definite action had been taken on Aug. 22 the City Council accepted the withdrawal of that petition. Since that time, and for practically some time before that, the Knoxville Power & Light Company had been negotiating with the City Council with a view to establishing a bus service in co-ordination with its railway lines. As yet no decision has been made on this proposition.

Further Replacements in Green Bay

As soon as the plan of the Wisconsin Public Service Corporation to replace car service on the South Broadway line in Green Bay, Wis., with bus transportation is approved by the Railroad Commission, work will begin on tearing up the tracks, according to an announcement of C. R. Phenicie, vice-president of the company. The company was recently authorized to discontinue the 23-mile interurban line connecting Green Bay and Kaukauna. The Mather Street and the Duck Creek lines in Green Bay were abandoned some time ago and the bus service which was instituted has proved so satisfactory that there was no opposition to the plan to abandon the South Broadway line.

New Springfield Line to Open in November

The Springfield Street Railway, Springfield, Mass., expects to put in operation in November its Worthington Street bus line, for which the Department of Public Utilities has granted a franchise. Coaches of 29-passenger size will be run on this route, which is to replace the present car line with an eastern extension.

Parking Scored in Kansas City

A plan to remove the congestion in the downtown section of Kansas City, Mo., caused by intercity bus parking is being considered there by a sub-committee of the traffic committee of the Kansas City Safety Council and by operators of interurban and suburban buses. The question was raised following the introduction of an ordinance in the City Council which would restrict parking throughout the downtown district by buses operating in Kansas City.

It has been found through a survey that there are at least 50 independent bus lines operating between Kansas City and surrounding towns. Much of the blame for violation of parking and other traffic regulations is laid to unlicensed and unregulated buses. These lines are also cited as injurious to the business of regular licensed buses because they are cutting prices.

Several plans have been suggested for regulating the parking. No recommendation has been made by the committee.

Washington Company Wins Commission Order

An order enabling the Washington Railway & Electric Company to operate buses from Washington to Hyattsville Hills in competition with the R. L. May line has been issued by the Public Utilities Commission. This order supersedes the refusal of the Public Utilities Commission in May to grant the Washington Railway & Electric Company the right to extend the Rhode Island Avenue bus line to Hyattsville. The reversal of the order came about when the Washington & Potomac planned an interstate bus route, sending buses direct to Hyattsville Hills.

A local fare of 10 cents will be charged on the new routes with free transfers.

Only One Railway Line Left in Durham

According to the *Herald* of Durham, N. C., the versatile bus is crowding out the trolley cars—those faithful servers of the Durham public through many a fair, circus or baseball season. The Durham Public Service Company at present maintains a last gallant band of six trolley cars on its single line of operation, with a reserve of two for rush hours and special occasions. These are now receiving a new outfit of upholstered leather seats. The only car route now in use—from East to West Durham through Main Street—forces a double trolley line to remain through the business district, but according to the *Herald* the tracks will be removed when the buses have completely replaced the cars.

Services Extended in California Cities

A certificate of public convenience and necessity has been granted by the California Railroad Commission to the Los Angeles Railway to operate auto stage service in the cities of Los Angeles and Culver City. This will be an extension of the present service.

Certificate for Indiana Route Sold

Formal approval has been given by the Indiana Public Service Commission for the sale to the Indianapolis & Southeastern Railroad of the certificate of convenience and necessity formerly held by the Indianapolis & Cincinnati Traction Company for a bus route between Indianapolis and Shelbyville. The deal was made recently at a receivership sale by Will M. Frazee, receiver for the Indianapolis & Cincinnati Traction Company, the predecessor of the Indianapolis & Southeastern.

Alameda Bridge to Be Used Pending Tube Completion

The Key System Transit Company has been directed by the California Railroad Commission in a supplemental order to begin operation of its proposed bus service between Oakland and Alameda with whatever variation is necessary in the route prescribed by the commission in its previous order. At the time of the commission's hearings on this matter it was estimated that the Oakland estuary tube would be ready for service on Oct. 1, but it has since developed that the tube will not be completed as soon as was expected, and the city of Alameda and the Key System Transit Company have requested permission to institute the proposed bus service over Webster Street bridge until such time as the tube is completed.

Financial and Corporate

Traffic Increase on Local Lines in Los Angeles

Traffic over bus and street-car lines of the Los Angeles Railway, Los Angeles, Cal., for the first eight months of the current year showed a moderate increase over the corresponding period of last year, while August traffic fell below the similar month of 1927.

The total revenue passengers carried by railway and bus lines, including half that of the Los Angeles Motor Coach Company, which is owned jointly with Pacific Electric Railway, was 169,567,659, compared with 168,487,567 for the similar period last year, a gain of 1,080,092. August traffic amounted to 20,323,589, as compared with 20,802,518 in August, 1927, a decrease of 478,929 passengers.

As evidence of the increasing popularity of the bus as a means of travel, traffic on the bus division, together with one-half that of the Los Angeles Motor Coach Company, increased 1,574,467 passengers or more than 15 per cent for the eight months over the similar period last year. On the other hand, railway traffic dropped from 158,146,954 to 157,642,579 passengers.

The passenger car-miles for the total system showed slight differences for the two periods. The various divisions traversed 24,889,224 miles for the 1928 period and 24,665,633 miles in the 1927 period.

Route-miles operated or the total distance one way of all routes increased from 203.11 miles as of July 31, 1927, to 204.71 miles for the railway system, and from 78.31 to 83.15 miles for the bus division together with one-half the motor coach company. Twenty-seven railways lines are now operating compared with 25 a year ago.

Gary Railways Absorbs Interurban

The Gary & Southern Traction Company has been purchased by the Midland Utilities Company. It was announced at the same time that an extensive rehabilitation program would be launched at once.

While two new modern, steel, interurban cars are being built, however, the Gary & Southern Traction Company has made arrangements to lease interurban cars from the Gary Railways in order that service may be improved in the immediate future. Running time of 45 minutes between the two cities is proposed.

The Midland Utilities Company also controls the Northern Indiana Public Service Company, Gary Railways, Chicago, South Shore & South Bend Railroad and other public utilities located chiefly in northern Indiana and western Ohio.

Charles W. Chase, president of the Gary Railways, under whose direction the Gary & Southern Traction Company will be operated, said that the interurban railroad would be run as a separate property, but that it would have the benefit of the services of the management of the Gary Railways as well as representatives of the Midland Utilities Company.

Key System Holding Its Own

Gross operating revenue of the Key System Transit Company, Oakland, Cal., for August was $631,650, compared with $643,783 in August, 1927, a decline of $12,132. Expenses were reduced to $482,948 from $493,329 in August, 1927. Gross operating revenue for the eight months ended Aug. 30 shows a decline of $175,499 when compared with the corresponding eight months last year. Gross profit for August was $122,083, a decline of $2,926. Net profit for August of $8,786 compares with $17,806.

Straightening Out the Detroit United

Review of recent moves out of which new company will succeed old. Some points still to be settled

AFTER twice being postponed, the sale of the assets of the Detroit United Railway, Detroit, Mich., was held Sept. 12, when the property was bid in by the bondholders for $2,575,300. As indicated previously in the JOURNAL, the successful bidders were Edward W. Durner, Princeton, N. J., and James T. Harrigan, New York City, representing holders of the Detroit United Railway and the Detroit, Monroe & Toledo Shore Line securities.

Interurban rail lines to Jackson and Port Huron were not involved in the sale. Rail lines extending from Detroit to Flint, Pontiac, Farmington, Wyandotte, Monroe and Toledo were involved as were also a great number of bus companies, including the Peoples' Coach, the Star, Wolverine, White Star, Blue Goose, Highway and the Detroit & Toledo Trackless Coach companies and city bus services in Flint, Port Huron and Ann Arbor.

An order for the foreclosure of mortgages amounting to approximately $11,000,000 and the sale at public auction was signed on July 25 by Judge Charles C. Simons in the federal court on the petition of the Union Trust Company, Detroit, and the Central Union Trust Company, New York. The sale was conducted by William S. Sayres, Jr., standing master in chancery of the Federal District Court.

In a statement attributed to A. D. B. Van Zandt, public relations director of the properties, it was pointed out that the buyers by the purchase surrendered $7,500,000 of D. U. R. bonds and assumed $11,000,000 in liabilities in exchange for which they obtain a utility valued, in all, at perhaps $20,000,000.

The Detroit United Railway and the Detroit, Monroe & Toledo Shore Line Railway will be succeeded by the Eastern Michigan Railway Company after the sale has been confirmed.

Corporation Counsel Wilcox of Detroit announced after the sale that he would ask Judge Simons to amend the order to allow the city to purchase now the interest held by the D. U. R. in the city's D. S. R. purchase debt, and filed a check for $30,000 with Mr. Sayres. Municipal railway and D. U. R. auditors have been checking the records of the two organizations to establish the reason for the difference between the equities.

According to the records the city still owes $11,080,000 on its purchase contract by which the city took over the local Detroit lines and the city records show that of this amount only $30,000 is held free and clear by the D. U. R., the other $11,050,000 being held by owners of D. U. R. securities. The D. U. R. receivers, however, contend that the railway holds an equity of $161,000.

In 1924 the Circuit Court ruled that the outstanding purchase debt was $15,880,000, and that payments should be applied on $15,850,000 in outstanding Detroit United Railway bonds. The remainder, it is the city's contention, is the Detroit United Railway equity. The exact amount owed on the contract under which the Department of Street Railways at Detroit took over the city properties of the D. U. R. is now $11,225,766, against which there are bonds of $11,051,420.

William S. Sayres, Jr., standing master in chancery, stated that he did not reject the city's bid for the D. U. R.'s interest in the purchase contract with the city, but that he was merely carrying out the federal court's order in accomplishing the sale and took the bid under advisement to be submitted to the court for confirmation. The terms of the court mandate ordering the sale made it necessary for him to submit all bids to the court for confirmation.

Since the sale the Detroit City Council has informally approved two alternative plans suggested by Mr. Wilcox, by which the city might assume its outstanding debt of $11,000,000 to the D. U. R. The formal adoption of either plan will depend, Mr. Wilcox said, on the outcome of the sale of the D. U. R.'s assets.

The first plan proposed by the corporation counsel was the refinancing of the city's debt to the D. U. R., whereby the interest rate could be reduced from the present 6 per cent to 4½ per cent by special arrangement with the banks.

The other plan calls for submission to the voters in November of an $11,000,000 bond issue to cover the indebtedness.

Digitized by Google

Through agreement of the D. U. R. reorganization committee, the properties of the Department of Street Railways at Detroit, operating the local municipal railway lines there formerly included in the system of the Detroit United, were segregated from others of the D. U. R. to permit the city to bid on the equity held in the railway by the D. U. R. In addition to the equity, the remainder of the $11,000,000 purchase price is in bonds on which the D. U. R. pays 4½ per cent interest, Mr. Wilcox said.

The Department of Street Railways at Detroit owns approximately $3,700,000 of the D. U. R. bonds in the latter's sinking fund, he said, and this amount would be returned to the city if the bond issue is passed, being credited against the purchase price of the property.

Commission Sanctions Reorganization Plan

Governor Fred W. Green of Michigan and a majority of the State Public Utilities Commission have approved the proposed reorganization of the Detroit United Railway over the protests of Sidney E. Doyle, the commission chairman. The Governor said:

This reorganization is among the stockholders themselves and is not a merger that might injure the general public. I find that overhead expenses are to be reduced from $600,000 to $200,000 and many other economies are planned.

Mr. Doyle suggested refinancing by preferred stock instead of bonds. He pointed out that should the company by chance default again in payment of interest on bonds, it is headed for a costly receivership, while purchasers of stock are entitled to receive returns only when they have been earned. Commissioner Doyle said:

Under this reorganization, capital stock of the D. U. R. totaling $15,375,000 is washed away. General creditors to the extent of $2,000,000 will not receive a cent. Bondholders, under a first mortgage, must give up their interest and part of their principal and be content with the balance in bonds secured by a second mortgage. The capital stock of the Detroit, Monroe & Toledo short line, totaling $2,581,000, is lost. Holders of first mortgage bonds valued at $3,000,000 must surrender $1,200,000 and take the balance in second mortgage bonds.

To me this is appalling. We cannot help what has been done in the past in good faith, but we can be careful of the future. When we approve an issue of stocks and bonds we must have in mind the protection of the public and the protection of investors.

The reorganization plan was first submitted two weeks ago at a meeting of three utilities commissioners. Mr. Doyle was not present. After listening to an outline of the plan, the three commissioners approved it. Their order, however, was recalled by the Governor when Mr. Doyle protested. Commissioners Samuel Odell, James Bice and Robert H. Dunn remained steadfast, declaring that the refinancing is the only way out of the D. U. R. receivership tangle.

Statistics of Abandoned Utah Interurban

The Boise Valley Traction Company, which owned and operated a street railway system in Boise, Idaho, and an interurban railway connecting Boise with Nampa, Caldwell, Middleton and other communities in the Snake River Valley, suspended last May. Electric power for the operation of the lines of the company was purchased from the Idaho Power Company. A statement of earnings of the company for the year ended Dec. 31, 1927, compared with the three previous years, follows:

	1927	1926	1925	1924
Gross earnings from operation	$192,238	$234,450	$246,619	$250,627
Operating expenses, including taxes	219,434	241,380	252,296	258,989
Net earnings from operation	$27,196*	$6,930*	$5,677*	$8,362*
Other income	325	14	17	.....
Total income	$26,871*	$6,916*	$5,660*	$8,362*
Interest on bonds and notes	85,700†	85,700†	85,700†	85,700†
Other interest and deductions	13,958	14,803	17,001	15,385
Balance	$126,529*	$107,419*	$108,361*	$109,447*
Renewal and replacement reserve	3,134	6,140	61,40	6,140
Balance	$129,663*	$113,559*	$114,501*	$115,587*

*Deficit.
†This represents twelve months interest on $750,000 ten-year 5 per cent mortgage notes and $964,000 Boise & Interurban Railway, Ltd., first mortgage 5 per cent gold bonds. No interest on the former issue has been paid since Jan. 1, 1923, and interest on the latter issue was defaulted April 1, 1923

The estimated population and number of communities served by Boise Valley Traction Company as of Dec. 31, 1927, the miles of track then in use, and the total number of passengers carried and certain other traffic data for the twelve months ended Dec. 31, 1927, compared with the two previous years, are given in the following table.

	1927	1926	1925
Population served	40,000	40,000	37,000
Communities served	7	7	7
Passengers carried during twelve months	888,371	1,261,614	1,670,878
Car-miles	770,032	934,554	953,843
Car-hours	49,117	70,278	72,094
Average number of cars operated	8	12	13
Miles of electric railway (single track equivalent)	64*	69*	83

*Decrease reflects certain track abandonments.

Sale of Puget Sound Electric Railway Recommended

Following the filing of a petition in federal court by Attorney Scott Z. Henderson, receiver for the Puget Sound Electric Railway, Tacoma, Wash., recommending that the property be sold, Federal Judge E. E. Cushman set Oct. 8 as the date for a hearing on the petition. Mr. Henderson stated that continued operation of the Seattle-Tacoma interurban by the railway will benefit neither the owners nor the creditors. Attached to his petition was a statement showing that the line was operated at a loss of $455 between Feb. 21, when Mr. Henderson was appointed receiver, and Aug. 31. This did not allow for depreciation, amortization, interest requirement or dividends.

Revenue for the period was $270,060 and operating expenses were $241,603, leaving a balance of $28,456. However, taxes to the amount of $28,855 accrued and interest amounted to $26.66, resulting in an actual loss.

Henry L. Gray, court appraiser, places a value of $489,541 on the properties of the company, assuming that operation will be discontinued. This is $5,287,824 below the book valuation of the company, given as $5,777,365 in the receiver's report filed with Judge Cushman on June 9.

Mr. Henderson was appointed receiver of the line following the attempt of the holding company to collect on a mortgage, payment on which was long overdue. Following his appointment, he recommended that the line be dismantled and the equipment sold, pointing out that at least $461,000 would have to be spent to improve the line and put it in first-class operating condition.

Abandonment of Two Mile Line in Oregon

Permission has been granted the Oregon Electric Railway by the Interstate Commerce Commission to abandon its Woodburn branch line in Marion County covering a distance of 2.3 miles. The main line of the company extends from Portland to Eugene, Ore. The branch to be abandoned was constructed prior to 1910 to furnish a connection between the main line and Woodburn. From 1923-1927 this branch has shown a steady decline in both passenger and freight traffic. It was the opinion of the commission that the present and future public convenience and necessity permitted the abandonment.

Houston Reports Deficit

The Houston Electric Company, Houston, Tex., after deducting operating expenses, 8 per cent for income on investment and 4½ per cent for depreciation, reports for August a deficit of $22,889. From Jan. 1 to Aug. 31 the deficit totaled $129,550, and for the twelve months' period to Aug. 31 the total deficit was $149,271. The gross earnings for the Houston Electric Company for the year ending Aug. 31 were $269,015. Of this amount, $52,688 came from bus operation and $216,327 from street cars. The company has spent $6,681 for replacements so far this year, the report states.

Book Reviews

Principles of Transportation

By Drs. Emory R. Johnson, G. G. Huebner and G. Lloyd Wilson. Published by D. Appleton & Company, New York. 815 pages. Price $5.

The authors have brought together for the first time, and within one book, an account of the services of all four kinds of carriers; those by railways, highways, waterways, and airways, treating all four agencies both as separate services and as parts of a co-ordinated system, but the different branches of transportation are discussed separately.

The greatest part of the book is devoted to railroad transportation. The authors have stressed the services rendered, and have considered government regulation. The war has completely changed the outlook of railroads. With the passage of the Transportation Act of 1920, the attitude has become one of consolidation and co-operation.

The war also brought to the fore the development of the automobile and truck as a useful arm of transportation. The automobile is still revolutionizing transportation in a manner that is not immediately apparent. It is bringing transportation to one's very door instead of at recognized terminals. It has already offered formidable competition to electric railway transportation and at present regulatory methods are being made by every state.

Aviation is still in its early stage of development and it is impossible to conceive to what extent it will supplant the other means. It has already attained a definite place as a useful transportation agency.

Of particular interest to men engaged in the local transportation field is the fact that the book brings out that the different agencies of transportation bear a complementary as well as a competitive relation to each other. It not only lays down the broad principles but provides abundant facts on every element of transportation problems. It shows the vast possibilities for a gradual development of a universal transportation system which will unite every farm, home, and factory with every other farm, home, and factory in the country.

New Publications

Spoor- en Tramwegen, Vol. 1, No. 1. Published every two weeks in The Hague, Holland. Editor, S. A. Reitsma.

This is the latest railway paper, and its first issue is dated July 10, 1928. The editor admits that there are many at present, but thinks there is a field for still another, to be published in Dutch and to take up both trunk line and street railways. In Holland and the Dutch East Indies, much is certainly being done. The leading article in this first issue, and to be continued in later issues, is a discussion of the economic gains of railway electrification. Particulars and maps are given of some of the European installations.

Principles of Inland Transport

By Stuart R. Daggett, Harper & Bros., New York. 705 pages. Price $4.

While the greater part of this book is devoted to traffic matters, such as routes, rates and legislation thereon, common carrier liability and similar problems, the author has been able to include chapters on the relations between the public and the railways in England, France and Germany, as well as on street and interurban railways, highway transportation, commercial aviation, waterways and some of the sociological aspects of transportation. The treatment is harmonious throughout, and the citations appear to be up to date. While the book appeals particularly to those interested in carrier liability and freight rates and legislation relating to them, it can be read with profit by anyone engaged in the transportation business.

Die Organisation des Fernnaldewesens der Deutschen Reichsbahn

Published by the Verkehrswissenschaftlichen Lehrmittelgesellschaft der Deutschen Reichsbahn, Berlin. 76 pages and 6 large plates. Price, 5 marks.

This is a treatise on the use of the telephone and telegraph for dispatching and other company uses by the German Street Railway System. It explains in simple language to the user of this apparatus the principles of its employment from a non-technical standpoint. The author is one of the responsible officers of the company, located at Halle.

One Hundred Years of American Railroading

By John W. Starr. Published by Dodd, Mead & Company, New York. 336 pages. Price, $3.50.

This is the story of the rise and growth of American railroads, just now celebrating their centenaries. Few realize, when they think of the enormous systems of railroads which now span our country, that a century ago the country itself was largely untrodden wilderness and would still be largely that were it not for the railroads.

In presenting this study the author describes in the first chapters the early engines, roadbeds, equipment, and the beginnings of the first two railroads, one in Massachusetts and the other in Pennsylvania. He then follows with an account of the beginnings of the Baltimore & Ohio, the Erie, and the New York Central Railroads, the earliest railroads in point of continuous service.

In separate chapters, he takes up the early roads of the different sections of the country, devoting whole chapters to some of the most important ones—the Pennsylvania, the Illinois Central, and the Atchison. In his final chapters, he devotes space to recent improvements such as modernization of equipment, installation of safety brakes, development of luxurious parlor cars, dining cars, and special "crack" train service. In his final chapter he summarizes the ideas as expressed by leading railroad executives of the place the railroads will hold in the country's future growth.

Why Men Fail

Edited by Morris Fishbein and William A. White. The Century Company, New York, N. Y. 344 pages. Price, $2.

Startling as its title may sound and extraneous as the subject may seem in the columns of ELECTRIC RAILWAY JOURNAL "Why Men Fail," might be read profitably by a very large proportion of the men engaged in this industry, or, for that matter, in practically any industry. For here is an exhaustive investigation and diagnosis of the human being doing his work in the face of natural and unnatural handicaps. Here is a readable record of notable successes and pitiable failures, resulting in the first instance from the conquering of mental disturbances and imaginings, and in the second instance, from the inability to focus the mind and so develop a more healthy viewpoint.

In the hectic rush of modern living, in the stress and turmoil attendant upon wage earners' crowded hours, these opinions of eminent medical men, offered as practical helps, are stimulating and even inspiring—stimulating because much can be done by the individual in his own mind to improve conditions which on the surface seem hopeless, and inspiring because, as pointed out, the reward for the successful accomplishment of a hard task is "in a feeling of self-reliance that makes not only for happiness, but is a character builder."

The book deals with the home-made failures, "queer" failures, bluffers, and day-dreamers, and especially the so-called job misfits, those who are being repeatedly transferred from job to job, being fired or resigning. In a chapter on job misfits V. V. Anderson, refers to the definite social obligations on the part of business and industry to cut down this large army of maladjustments.

For years the forward thinking utility companies have been giving careful study to the employee—his endowments and possibilities both for the cause of business and for humanity. With competition in business growing and the complexities of living increasing, a more intensive study of this subject will be required in the future, for the right man in the right job is the secret of business success and life's success. As is pointed out in 'Why Men Fail," the job one fills may be made an inspiration and stepping stone for further advancement or a millstone around the neck which ultimately leads to failure.

Personal Items

Prince Made Honorary Chairman of Engineering Congress

Prince Chichibu, brother of the Emperor of Japan, has been named honorary president of the World Engineering Congress to be held in Tokio in 1929.

As patron of this gathering of international scientists, the Prince will take an active part in preparing for the Congress, which it is expected, will be attended by a large body of the most eminent American engineers, to receive whom the Japanese engineers are making lavish plans.

The Prime Minister of Japan will be the host at a dinner to the delegates, and other officials of the government will preside at functions being planned for the visiting engineers. Imperial Government Railway will furnish free transportation for the visitors.

Herbert Hoover is honorary chairman of the American Committee.

W. H. Woodin, Jr., Director of Research

William H. Woodin, Jr., son of the head of American Car & Foundry Company and of the American Locomotive Company, has been appointed director of research of the first-named company. Long study and practical experience in the plants of the American Car & Foundry Company have prepared Mr. Woodin for this position. His research and practical experiments in metallurgy have already resulted in decided improvements in several of the company's products. Besides his work in metallurgy his activities as a microscopist and as electrical engineer have already attracted attention. As research director it is expected Mr. Woodin will render invaluable service in the fields of buses and trucks.

J. F. Gilchrist, Commissioner, Heads New Company

Another defection from commission ranks into larger financial and business fields is seen in the announcement of John F. Gilchrist, chairman of the New York Transit Commission, assuming the presidency of the newly organized Consolidated Indemnity & Insurance Company with offices at 475 Fifth Avenue, New York City. Mr. Gilchrist has denied reports to the effect that he would resign from the transit commission.

Back in 1897 Mr. Gilchrist was in the insurance business but relinquished it in 1908 to become under-sheriff of New York County. Later when the present Governor of the state of New York was elected sheriff he retained Mr. Gilchrist as under sheriff and the latter served another term in that office under Governor Smith's successor. When the Hylan administration was ushered in Mr. Gilchrist was appointed commissioner of licenses and still later became a member of the board of purchase. In 1923 he was named a member of the State Tax Commission.

Mr. Gilchrist has been more prominent in the transportation regulatory field in which he made his formal entrance in April, 1926, when Governor Smith appointed him chairman of the New York Transit Commission for the long term of nine years to succeed George McAneny. Other appointees at the time were Leon G. Godley and former State Senator Charles C. Lockwood, both of Brooklyn. The appointments of Mr. Gilchrist and of Mr. Lockwood were immediately confirmed by the Senate on motion of Senator Knight.

Mr. Gilchrist came in after the expiration of the old transit law and under the reorganization of the state government as provided for in the Hughes plan the transit commission became a bureau within the new public service department. It has regulatory functions similar to the public service department proper, but is confined in its jurisdiction to transit in New York City.

Mr. Gilchrist was born in New York City in 1873. He was educated in the public schools and in a business college. Early in his career he worked for the Thomas J. Pope Sons' Company.

Homer Loring in Textile Business

"Here's a Good Man Open for Big Offer" is the way the New York *Times* of March 11, 1928, announced the resignation of Homer Loring from the chairmanship of the executive committee of the Boston & Maine Railroad. The press of Oct. 10 tells the story on the "doctor of railroads" entering the textile field. Mr. Loring, who found an outlet for his constructive genius in rehabilitating the Boston & Maine Railroad, is to be president of the newly formed Merchants & Manufacturers', Inc., a corporation which plans to buy and operate converting houses in the North and the South.

In the long list of achievements to his credit can be included his fostering the campaign in behalf of the holders of the securities of Massachusetts electric railways in 1918. As chairman of the Association of Massachusetts Street Railway Security Owners Mr. Loring directed an educational campaign on behalf of the electric railways of that state. In this connection it is generally conceded that the association's activities were chiefly responsible for securing the passage of remedial legislation. He had done a big job as public trustee of the Eastern Massachusetts Street Railway and back of that is his service record as receiver of the Des Moines, Fort Dodge & Southern Railroad and his notable accomplishment with the Saginaw Traction Company in Michigan, which company had been losing money. Both companies were restored to conditions of prosperity.

During the four years that Mr. Loring directed the work of re-establishing the Boston & Maine Railroad he accepted no compensation. When the board accepted his resignation in the early part of the present year it voted him $100,000. This Mr. Loring accepted only to establish a fund for the good of all employees of the Boston & Maine.

Staff Changes in Vancouver

F. H. Fullerton has resigned from the publicity department of the British Columbia Electric Railway, Vancouver, B. C., Canada, to accept the western agency of a group of Toronto trade publications. L. G. Swann has joined the department. Mr. Fullerton took over the work of James Lightbody, well-known newspaper man, who for several years acted as public relations man for the British Columbia company.

W. J. H. PENMAN formerly traffic superintendent of Edinburgh Tramways (Scotland), has been appointed manager of Perth Tramways. He succeeds W. G. Snell, resigned.

OBITUARY

ROBERT V. PRATHER, secretary of the Illinois State Gas Association, Illinois State Electric Association and the Illinois Electric Railway Association since 1918, died suddenly in St. Louis on Oct. 7 while there to attend the world series baseball games. Mr. Parther had been secretary of the Public Utilities Commission, having been appointed to that office in 1914. He was nationally known in the utility field and in addition to the executive offices in the associations, he purchased with Ben Lyon the Kewanee Public Service Company and operated it for some time before selling it to the Illinois Power & Light Corporation. It was through his executive ability that the three associations, gas, electric and railways, were combined and it has been under his direction that one joint convention has been held each year since the consolidation. He had recently issued a call for a meeting of the presidents of the three associations to be held on Oct. 18 to decide the time and place for the convention of 1929.

WALTER W. SMITH, former superintendent of the New Jersey & Pennsylvania Traction Corporation, Trenton, N. J., died on Oct. 6. Mr. Smith left Brooklyn, N. Y., twenty years ago and was made superintendent of the Trenton company when that road was first built.

JOSEPH F. MAHER, former Trenton park commissioner and general timekeeper of the Trenton & Mercer County Traction Corporation, Trenton, N. J., died recently. He held the position with the railway for nine years.

Manufactures and the Markets

Electrical Work in Philadelphia

An ordinance was introduced in the Philadelphia, Pa., City Council recently authorizing the director of city transit to make a contract, without competitive bidding, for electrical work in the Fern Rock subway with the Philadelphia Rapid Transit Company.

The proposed contract would amount to between $2,000 and $3,000, the lessee of the subway to furnish all labor and materials at cost, plus "a proper percentage for overhead."

The work includes connecting the machinery in the terminal shops and other buildings to modify the lighting where necessary. This ordinance was referred to the transportation committee.

$17,146,500 for New York Subways

The Board of Estimate of New York, N. Y., has approved appropriations totaling $17,146,500 for the construction of new subway lines and improvements to the city's independent subway system, and along with the appropriations approved contracts for the work that had been prepared by the board of transportation.

The largest item was $6,490,000 for the construction of a section of the Bronx subway. The Larocca Construction Corporation was the lowest bidder and the contract was approved.

The next largest item was $5,943,000 for the Schermerhorn Street, Brooklyn, route, the section running under Schermerhorn Street to Bond Street. The Necaro Company, Inc., was low bidder and the board voted approval of the contract.

The contract for the Smith Street-Ninth Street route in Brooklyn, for which $3,145,000 was voted, was obtained by the Cornell Contracting Company. The work calls for the construction of express tracks under Prospect Park and private property near Prospect Park southeast to Terrace Place; and local tracks under private property on Howard Place and Prospect Avenue from Windsor Place to Terrace Place will be built.

For station finish work on three Manhattan stations $393,000 was voted and the contract with the Woodcrest Construction Company was approved.

The Board of Estimate appropriated $608,500 for the installation of tracks and contact rails on Manhattan routes, the contract going to B. T. & J. J. Mack, Inc.

An item of $317,000 for the installation of sewers and appurtenances at the Concourse yard in the Bronx was voted and the contract for the work, obtained by James O'Connell, was also approved by the board.

The Lumber Manufacturing Company nas obtained the contract for $35,000 for untreated ties and contact rail protection board for which an appropriation was voted.

The Eppinger & Russell Company obtained a contract for $92,000 for similar lumber and Charles Mead Company received a $225,000 contract for station finish work on Manhattan routes.

The Board of Estimate at the same time approved the proposed Queens Boulevard subway in Queens and it now remains for the board of transportation to prepare plans and advertise for bids.

Buying Methods Being Studied

With a view to checking up the reported wide-spread change in purchasing methods during the past ten years, the Institute of Economics is making a study of "hand-to-mouth buying." Purchasing agents are being asked how far ahead their company has been in the habit of placing orders for two of the more important commodities purchased in 1914, 1918, 1922, 1924, 1926 and 1928; what proportion the approximate average inventory for those years has been of the year's needs; whether there has been any important change in inventories carried in proportion to annual requirements; whether there has been any definite improvement in the company's purchasing technique during the past five years; whether the company is buying more frequently and in smaller quantities, and, if so, why these things are being done.

$120,000 Improvements for Gary & Southern Traction

In announcing the purchase of the Gary & Southern Traction Company, Crown Point, Ind., the Midland Utilities Company, Chicago, Ill., made public an extensive rehabilitation program to start at once. The sum to be invested in new cars, improvements in roadbed and improved electric facilities, including a new electric substation and additional power connections, will total $120,000. Two steel interurban cars have been ordered.

Plans for the new cars, which will replace the heavy, two-man equipment now operated over the line provide for a seating capacity of 45 passengers with individual plush-upholstered chair seats. The floors of the cars will be covered with colored rubber tile to harmonize with the interior finish of mahogany and ivory. The cars will be equipped with dome lights and a 13-seat smoking compartment arranged in the Pullman style so that passengers will not have to pass through it to enter the body of the car. Both cars will be the light weight single-end, one-man type.

Improvements to the right-of-way will include complete rehabilitation of the track and pole line between 45th Avenue, Gary and Crown Point. The present rail, owned by the Gary & Southern between the Little Calumet River and 45th Avenue on Broadway, Gary, will be thermit welded, re-tied, re-surfaced and re-lined. In addition to this work, which is to start immediately, a new substation will be built and feeder lines installed to interconnect the company's power system with that of the Gary Railways.

New Cars for St. John

Four new cars of the one-man motor, passenger, city type, have recently been placed in service by the New Brunswick Power Company, St. John, New Brunswick, Canada. These double-end, single-truck cars are 31 ft. long, 8 ft. wide, and seat 30 passengers. The bodies are of semi-steel construction with steel sides and dashers, arch roofs, and folding end doors. The seats are leather upholstered rotating pedestal chairs. The lighting is done by indirect dome type fixtures. Additional features are given in the following specifications:

Length over all	31 ft. over bumpers
Length of body posts	20 ft.
Truck wheel base	7 ft. 6 in.
Width over all	8 ft.
Rail to trolley base	11 ft. 6 in.
Window post spacing	30 in.
Body	Semi-steel, with steel sides, dashers and letterboards
Doors	End, folding
Brakes	Hand brakes only
Armature bearings	Plain
Axles	M.C.B.
Car signal system	Faraday high voltage
Conduit	All motor leads in rubber tubing inside of car
Control	Westinghouse K-6
Couplers	Brill
Curtain fixtures	Roller curtain behind motorman and conductor
Curtain material	Pantasote
Energy-saving devices	Economy Electric Devices Company
Fare box	Cleveland No. 2
Finish	Enamel, Sherwin Williams, Old Dutch Exterior
Floor coverings	Tuco Flexolith composition, red
Gears and pinions	Tool steel, noiseless gear
Glass	Double strength, set in rubber core tubing
Hand brakes	Peacock
Hand rails	Nickel plated
Heaters	General Electric, Calrod element
Headlights	Golden Glow
Headlining	Beaver board
Interior trim	Oak and whitewood
Journal bearings	Plain, babbitted
Journal boxes	Brill
Lamp fixtures	Safety car lighting fixtures, 12-in. domes in roof
Motors	Westinghouse 101-B-2, inside hung
Painting scheme	Persian Scarlet below belt rail and letterboard. Cream, on window stool, drip mould, both continuous around car, and window posts between same also door posts. Doors and sash, dark red. Roof, slate.
Roof type	Arch, covered with tongue and grooved narrow spruce board $\frac{1}{8}$ in. thick, 10-ounce duck in one piece.
Safety car devices	Keystone stop-light system
Sash fixtures	O. M. Edwards, sash locks, rack and compression rollers
Seats	Hale-Kilburn, Type 900-rotating chairs, 8 per car. Longitudinal seats in opposite corners of car (door side) with small 24 in. seats in other opposite corners.
Seat spacing	30 in. centers
Seat material	Solid leather
Steps	Folding, operating with door
Step treads	Mason safety, lead filled
Trolley catchers	Ohio-Brass
Trolley base	Ohio-Brass, Form-4
Trolley wheels	Holland Trolley Supply, type H
Truck	21-E-Brill single truck
Ventilator	Utility honey-comb; Railway Utility Co.
Wheels	Rolled steel, No. E-T33. Contour-F-3-B-I. 33 in. dia. Standard Steel Works

No Steel Equipment for Brooklyn "L" Cars

A request by the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., for approval of the expenditure of $1,200,000 for steel undercarriages to be installed on wooden cars now used on its elevated lines was turned down by the Transit Commission. The decision was taken to mean that the commission is committed to the speediest possible elimination of this type of car on elevated lines.

Granting of the request, engineers of the commission said, would have meant the adding of twenty years to the life of the average wooden car now in use on the lines. The company estimated the cost of equipping 150 cars with steel undercarriages at $8,000 a car.

Members of the commission's engineering staff are known to feel that merely equipping wooden cars with steel undercarriages will not prevent the telescoping in cases of collision. Experiments which have been conducted by combined engineering groups have been directed toward development of steel cars heavy enough to prevent telescoping, yet light enough to impose no undue strain on elevated structures and to remain upon the rails in case of collision.

South Shore Freight Station Opened

The rapid growth of carload freight business between Chicago and nearby Indiana cities has necessitated the establishment of a new carload freight station at Hegewisch, Ill., by the Chicago, South Shore & South Bend Railroad. The new agency, opened Oct. 1, will handle all carload freight formerly shipped and received at the Kensington (115th Street) Station. H. C. Larsen has been appointed freight agent in charge.

The Growing Need of Terminal Electrification

The Westinghouse Electric & Manufacturing Company has just released a new publication on the subject "The Growing Need of Terminal Electrification." This publication points out the need for rapid and clean suburban transportation and shows why the steam railroads are in a position to furnish this type of service and why the public is willing to pay higher rates for it. The advantages to the railroad of suburban and terminal electrification are described. Among others the following examples are cited:

The Long Island Railroad operates 1,100 electric trains daily—many of eleven cars each—bearing 130,000 passengers.

The Pennsylvania Railroad, at Broad Street Station, Philadelphia, reduced train movement 16 to 20 per cent by electrification and increased the terminal capacity 12½ per cent.

The Illinois Central Railroad, by electrification at Chicago, reduced running time between terminals 10 to 24 per cent.

The Chicago, South Shore & South Bend Railroad doubled its gross revenue in less than two years of electric service.

Completing Rehabilitation in Kansas City

One of the most comprehensive general rebuilding programs ever carried out by a city transportation property is being completed by the Kansas City Public Service Company, Kansas City, Mo. This plan called for an expenditure of $6,600,000 over a period of three years for rebuilding track and special work, and remodeling and rebuilding the rolling stock. The expenditure of this money will have been completed in a two-year period instead of three years, or one year ahead of schedule.

The construction department has completed the construction of 46 miles of tangent track as originally planned and has only a few special work replacement jobs remaining to be done.

The equipment department is at present winding up its schedule of two rebuilt cars per day, in putting final touches on 29 single-truck 400 and 500 type cars. All passenger cars are now in one-man service, this part of the work having been consummated when the 200, 400 and 1,000 car jobs were completed the latter part of June.

The total increase in the number of men employed during this rehabilitation period was approximately 740 over normal requirements.

$1,000,000 Program at Detroit Being Concluded

The Detroit Department of Street Railways at Detroit, Mich., is rapidly drawing to completion the $1,000,000 repair program which has been conducted during the current season and which covered tracks in widely scattered sections of the city. Several main traffic arteries have been repaired and rebuilt and the resulting new roadbeds make riding on the cars smoother and traveling easier for the motorists. The proposition to relieve the railway department of the responsibility and expense of paving between tracks was voted down when it was submitted to the electors.

The present program includes the rehabilitation of the Grand River line from Meyers Road to the new city limits in Redford. This work is to be completed before the end of the present construction season. New ties, rails and paving are to replace the long stretch of interurban construction.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

	Oct. 9, 1928
Metals—New York	
Copper electrolytic, cents per lb	15.025
Copper wire, cents per lb	17.125
Lead, cents per lb	6.5
Zinc, cents per lb	6 60
Tin, Straits, cents per lb	49.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.40
Somerset mine run, f.o.b. mines, net tons	1.90
Pittsburgh mine run, Pittsburgh, net tons	1.825
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	0.925
Kansas screenings, Kansas City, net tons	1.875

Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.3
Weatherproof wire base, N.Y., cents per lb	17.625
Cement, Chicago net prices, without bags	2 50
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10.8
White lead in oil (100-lb. keg), N. Y., cents per lb	13.25
Turpentine (bbl. lots), N. Y., per gal	$0.5725

TRADE NOTES

POTOSIE TIE & LUMBER COMPANY, St. Louis, Mo., has purchased the Hobart-Lee Tie Company, Springfield, Mo. The purchaser is said to have involved $1,500,000.

N. L. MORTENSEN has been appointed chief engineer for the Cutler-Hammer Manufacturing Company, Milwaukee, Wis. T. E. BARNUM, former chief engineer, has been appointed consulting engineer for the company, in which position he will be able to give uninterrupted attention to engineering problems and outside engineering relations.

VANADIUM CORPORATION OF AMERICA, 120 Broadway, New York, N. Y., has opened an office at 2245-2246 Oliver Building, Pittsburgh, Pa., under the direction of J. Alfred Miller, Jr., general manager of sales.

VAN DORN ELECTRIC TOOL COMPANY, Cleveland, Ohio, announces that E. J. Phillips, who has been selling Van Dorn products in Detroit, has gone to San Francisco to take over that territory for the Van Dorn company. His place in Michigan will be filled by his brother, George Phillips. J. F. Spaulding has been transferred to the Baltimore territory to fill the vacancy resulting from the transfer of Jack Beggs from Baltimore to the headquarters office in Cleveland.

ADVERTISING LITERATURE

AMERICAN MANGANESE STEEL COMPANY, Chicago, Ill., has issued a booklet entitled, "Manganese Steel." This booklet contains a history, a description of the contents and a description of the use of manganese steel.

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., has recently published leaflet 20371, describing the type CH carbon breakers for automatic substations.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued bulletin 874B, descriptive of WD-200A arc welder, and bulletin 19E descriptive of CR 7006-D4 and D5 a.c. enclosed magnetic switches.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

McGraw-Hill Publishing Co., Inc.
JAMES H. McGRAW, *President*

CHARLES GORDON, *Editor*

LOUIS F. STOLL, *General Manager*

Volume 72 New York, Saturday, October 20, 1928 *Number 16*

Complete Agreement Exists Only in Defeat

"IF ELECTRIC railway men continue to wait for the 'last word' in new street car designs before making purchases they'll all be broke," emphatically declared one railway executive at the Cleveland Convention of the American Electric Railway Association held recently. His pronouncement was echoed by a score of other railway operators who appeared willing to admit that perhaps the final step in the development of new cars and auxiliary equipment was one destined never to be reached.

There was at least partial agreement also that many railway companies have put off too long making their own service tests with what has been available in modern transportation vehicles; experiments which could easily be justified in view of the continued loss of revenue using existing antiquated railway equipment. As bluntly stated by another railway man, "If we delay much longer making up our minds to try out new cars we'll have no passengers left to try them out on."

Railway properties that have courageously gone ahead with car replacement programs are finding that the sums so expended are returning them value received many fold. So satisfactory have been the results obtained on some of these properties that in several instances the investment has proved to be exceedingly profitable.

There is no denying the fact that while many properties are waiting for the accumulation of evidence concerning the returns to be obtained by the use of specific types of vehicles and auxiliary equipment, their revenues are decreasing—in some instances at a rate which eventually won't leave enough to act on the conclusions of other managements, much as they might then desire to do so. The time to act is before the remaining patronage of the smaller street railways has disappeared in the wake of the business already lost; to act while revenues are still sufficient to finance new equipment.

Constructive Criticism a Means Toward Better Maintenance

THERE are many ways of improving the working methods in the average electric railway shop. Frequently, however, the men responsible have become so accustomed to performing operations in a certain manner with a fixed equipment of tools that they find it hard to recommend changes that will alter the system. In one shop the general superintendent had each foreman visit another department of the shop and then make a report of methods that could be improved, new equipment that could be used to advantage and practices that could be used in his own department with benefit. The scheme resulted in some very helpful suggestions.

A week was given each foreman to make the inspection and report. A general list of points to look out for was furnished each foreman in advance. This included such items as material handling equipment, labor saving methods, safety precautions, arrangement of machines, routing of work, record system used, suggestions for decreasing idle time, handling of scrap, cleanliness of the department, etc. Many problems are common to the various departments and even though the material and work handled are quite different, the average foreman is able to grasp the fundamentals of the other fellow's department.

One result of great benefit was a tendency toward closer co-operation. Each man learned much about the work being done in other departments and so could appreciate more readily the reasons for delays and inconveniences with which he had previously been inclined to be impatient. The general knowledge gained was helpful to him in arranging his work to fit closer into the schedules of other departments and so to speed up the complete operation.

Inactive Stock Represents Potential Loss

EXISTENCE of slow-moving materials creates a problem difficult to control. All electric railways have many items of material in stock which though not entirely obsolete, may be made so on short notice by the replacement of old equipment on which it is used. The practice of ordering future requirements on the basis of previous requirements is one of the main causes for a surplus of slow-moving material. Orders for large quantities of material during temporary rush periods, as during the overhaul of a group of cars, is another cause for quantities of inactive stock. Equipment which is retired from active service and retained for possible emergencies, contributes another cause of frozen assets in the form of replacement parts on the storeroom shelves.

It behooves all who are in any way responsible for ordering, carrying and distributing stocks of parts to be continually on the alert to avoid the accumulation of inactive materials. However, to have material in stock to supply the demand only when needed and to have no surplus, is an impossibility. Despite the best of regulations, unusable materials will accumulate. In an address at the Cleveland convention, A. S. Duncan, assistant director of finished stocks of the Westinghouse Electric & Manufacturing Company, presented a comprehensive outline of the individual depreciation system of meeting this situation from an accounting standpoint. By means of this predetermined penalty system, it is possible to set up some method whereby inactive stock will be reduced to its actual book value so that in the eventual disposition of this stock, the losses will have been taken by easy stages instead of dropping suddenly from a 100 per cent book value to scrap. However, this system, though it enables the loss to be spread over a period of time, does not eliminate the loss itself. Once material is scrapped, the salvage value is rarely more than 1 per cent of the original value, except on non-ferrous mate-

This is the issue in October that is devoted essentially to maintenance and construction subjects

Digitized by Google

rial, and even this small saving may be considerably reduced if the labor cost of salvaging is properly considered.

Slow-moving material can be disposed of in many ways to save a large part of the loss through scrapping. Much can be saved by the remodeling and reshaping of parts, and by the removal of usable equipment from obsolete assemblies. However, labor costs must be carefully considered in this method of salvaging. An important and often overlooked method of reducing apparently immovable stocks is by the interchange of standard parts with companies using the same or similar equipment. Opportunities exist for the sale or exchange of parts directly between operating companies. In too many instances these are not fully exhausted before taking the large loss involved in scrapping parts which though still entirely serviceable and in many instances practically new, have been made obsolete by the replacement of the equipment for which they were intended.

The Best You Can With What You Have

NO MORE forceful argument in favor of modernization could be found than the one contained in the brief of the Virginia Electric & Power Company, which won the Coffin Award. There the matter has been reduced to the basis of dollars and cents. That record, succinctly stated, is that as a result of the $3,800,000 spent between July 1, 1925, and Dec. 1, 1927, net earnings for the calendar year 1927 increased $441,651 over the twelve months' period ended June 30, 1925, or a return of 11.60 per cent before depreciation on the $3,800,000. That is tangible. It is conclusive. But best of all is the fact that the program of the company for bettering its condition was not presaged on this expenditure.

No sooner did the new management in Virginia begin to function than it set about doing what it could with what it already had at its disposal. It is true that betterment of public relations is dependent upon the improvement of physical property, but such betterment is not entirely dependent upon the spending of large sums of money. There is little reason to quarrel with the individual or the corporation that does its level best with what it has, but the public is quick to sense any disposition not to do the level best.

The program in Virginia did not contemplate wholesale replacements. Nor does any similar program need to contemplate wholesale replacements for its success. Cars and buses antiquated beyond recall were relegated to the scrap heap in Virginia just as they ought to be, but where salvage was possible rebuilding was resorted to with the desired public effect.

Of course, the expenditure of new money is desirable where it is available at reasonable rates, but much can be done pending the accession of such funds. There is concrete evidence in the Virginia case of the returns that may be expected where managements have the hardihood to look facts in the face. It is, of course, distasteful to moralize. But it is difficult not to do so when the preponderance of the evidence is so greatly in favor of the policy of doing the level best with the facilities that are at hand. Each of the Coffin briefs is replete with suggestions to this end, suggestions that do not contemplate the expenditure of large capital funds. Each company in the industry needs to examine its practices in the light of the accomplishments of the Coffin Award contestants of the past, but particularly in the light of the accomplishments of the contestants for the honors during 1928.

More and Better Tools Needed in Our Shops

CONSIDERATION by electric railway officials of the replacement of inefficient shop tools should take into account that it is quite generally conceded that the present favorable industrial situation and high wages are due to more general use of improved machinery. The worker is able to increase his production through use of more and better equipment and so he is more valuable to his employer. While America, no doubt, leads in the effective use of improved machinery it is indisputable that electric railway shops are woefully lacking in modern machine tools. The survey made by the editors of this publication in 1924 showed that 40 per cent of the machine tools used by electric railways were then more than twenty years old. With a few outstanding exceptions, there has been little improvement in this respect since that time.

While age alone cannot be considered as the determining factor for obsolescence, many improvements have been brought out in the past twenty years that increase the usefulness of machine tools and decrease time and labor needed. To decide if the equipment used at present is obsolete it should be compared with equipment that is available for the same purpose. If the new tool is sufficiently superior from a cost-reducing standpoint to make its installation a good investment then the equipment in use has become obsolete. Managers of progressive industrial concerns know that this is a sure means of increasing profits and will gladly borrow money at a normal rate of interest to earn a much greater return through ownership and use of the improved equipment.

Among electric railways, however, there is a decided reluctance to replace anything that may retain a few years of service. Master mechanics and superintendents of shops put up with inferior machinery rather than attempt to urge the economy of new tools with the general manager. Frequently they have no records of performance on which to base a real buying argument. This should be the first step. The performance of present tools should be checked and compared with that being obtained from modern tools doing the same work.

What Expenses Should Be Included in the Cost of Materials?

THE cost or price of materials should logically include all the expenses up to the time and point of use, including cost of purchasing and other expenses incurred in receiving, inspecting, storing and delivering materials to the point of use. This was the conclusion of R. A. Weston, special accountant of the Connecticut Company in an address before the Purchases and Stores Division at the Cleveland Convention.

A difference of opinion was evidenced by the lengthy discussion following this address. The fact was brought out that the value of materials and supplies is in no way increased by labor of officers and clerks, either in the purchasing agent's office, the storekeeper's office or auditing office, nor by labor of stock men handling material after it has reached its destination. There are, no doubt, many large companies that, due to their type of organization, must know the cost of maintaining these separate departments. On the smaller properties, where one official and his office force may cover one or more departments, it may not seem as essential to recommend a standard practice for arriving at an issue price of material and supplies. But on properties in which a central purchasing and stores organization functions for several subsidiary or associated interests, especially where mate-

Digitized by Google

rial and supplies are bought and sold between associated companies, the cost of purchasing and handling obviously involves a legitimate overhead charge.

Further difference of opinion on this subject is shown by the joint report of the purchases and stores special committee No. 3, and the committee on stores accounting of the Accountants' Association. In sending questionnaires to 39 member companies, this committee asked these companies to explain in detail all items which are included in and charged to stores expense. In very few instances did the answers agree.

The time seems opportune to give this subject close consideration, as there appears to be a very general feeling that Account 95, Stores Expense, I.C.C., should be thoroughly revised to define the charges clearly. The committee handling this subject has a difficult task to perform. It should keep clearly in mind the advisability of making its recommendations fit the requirements of the average property.

Millions for Absurdities But Not One Cent for Practical Plans

THICK and fast come proposals to relieve street traffic congestion by various elaborate and fantastic means. A prominent architect wants to transform our cities into modern imitations of Venice with automobiles on the roadways taking the place of the gondolas in the canals, and graceful bridges for pedestrians spanning the rapidly moving streams of traffic. On the other hand the Mayor of New York proposes to dig a vehicular tunnel for 2 or 3 miles through the rock which lies below the several existing lines of underground railways. Still others would emulate the example set by Napoleon at Paris many years ago, and cut wide swaths through valuable buildings to create new streets. Many other equally bizarre proposals have been made. All of these have one point in common: their execution would cost untold millions. The measure of relief which they would afford is extremely problematical.

Meanwhile, little general interest is being shown in practical plans to relieve traffic congestion. To make better use of existing facilities offers little romance compared with stupendous new undertakings which cost vast sums of money. Yet the simple and practical plans are likely to be far more effective. For example, the construction of the double-deck Wacker Drive in Chicago cost $22,000,000 and afforded only limited local relief of congestion, whereas the elimination of parking in the Loop district, at no cost at all, immediately increased both the volume and the speed of traffic in that entire area.

It is true that engineers usually are consulted before these ambitious plans get very far, and the engineer is ordinarily a rather practical person. But there seems to be some subtle fascination about a gigantic undertaking that often causes even the practical-minded engineer to turn from the realities of the present to vague dreams about some indefinite future. Without doubt imaginative planning for the future is very necessary. We should not, however, allow spectacular possibilities of this sort to distract our attention from the simple remedies that can be adopted economically and immediately. Parking restrictions, elimination of left-hand turns, installation of proper signal lights, etc., will go a long way toward solving the present pressing problem. New York, where traffic congestion daily grows more serious, lags rather than leads in the intelligent use of its existing street facilities.

Many Factors to Lubrication Besides Choice of Oil

LUBRICATION of electric cars has been influenced to a great extent by mechanical considerations. Large clearances in bearings are permitted that make it easy for the oil to get out and for dirt and water to get in. Danger of failures from these causes has led to the use of heavy oils as a matter of precaution. The underlying influence must be remedied as a first step toward improved lubrication.

Tests have been made with oils of low viscosity in Chicago and Baltimore. In Chicago use of oil with a viscosity of 56 seconds at 100 deg. F. decreased journal bearing temperature 57.8 per cent and reduced energy consumption 7.15 per cent. This oil was used without changing the construction of journal boxes. In Baltimore, oils of exceedingly light viscosity were tried. Here it was found necessary to equip journals with a special oil seal at the back of the journal box to keep dirt and water out and the oil in. Where oil can flow out the lighter the oil the greater will be the loss. It is evident that to secure the advantages from use of light oils greater attention must be given to bearing fits and to methods of providing a tight oil box.

In an analysis made on one electric railway property as to causes for hot bearings it was found that the most frequent causes were due to mechanical defects. Excessive wear was a chief offender and in trying to take up this wear bearings were forced inward so as to clamp the axle too tightly. Loose, lost and badly fitted covers were other causes of entrance of dirt and water to bearings. Any study of lubricating problems leads to many considerations other than the proper choice of the oil.

Educating Employees a Good Investment

DURING recent years considerable attention has been given by some electric railways to furthering the educational development of their young employees by offering the more promising of them the opportunity to complete courses of instruction leading to college degrees. During the meetings of the Accountant's Association in Cleveland the statement was made that the money spent by one property, in helping some of its more promising young men to complete college or university courses which for pressing economic reasons had been abandoned in mid-career, had proved a very profitable investment.

This policy of offering certain well-defined educational opportunities to especially promising employees may well be investigated by more electric railway companies. Where good judgment is exercised in the choice of the men to whom such an opportunity may be offered most satisfactory results may be expected. Above and beyond the immediate returns in enhanced ability of the individual affected, there is being built up an enduring loyalty born of gratitude which will tend to bind these men more closely to the interests of the company and the industry. The electric railway field needs more young men in its ranks; young men imbued with the idea of devoting their talents and enthusiasm to the solution of the problems at present vexing the older heads in the business. As a means of securing and retaining enterprising young men in the electric railway field this idea of co-operation in educational work should command more general interest.

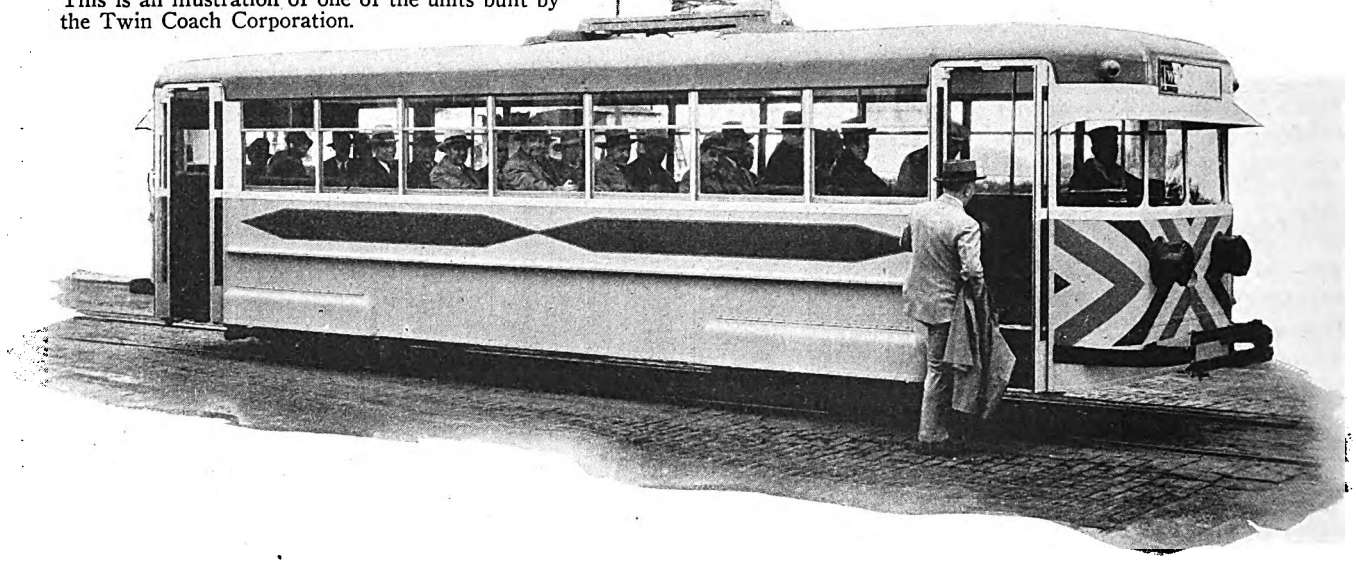
Many Unusual Features in

New Type Four-Wheel Cars

Riding Comfort, Quietness and Fast Acceleration and Braking—

These are the objectives in the design of the new automotive type street cars shown for the first time at the Cleveland convention and embodying many novel features, including types of drive that permit wheels to pivot on curves. This is an illustration of one of the units built by the Twin Coach Corporation.



Adaptation of automotive ideas to car construction opens new possibilities for light-weight, four-wheel, rail vehicles. Fageol and Birney sample units utilize pivoted wheels to achieve economy of single-truck car without corresponding limitations in riding qualities

RENEWED interest in the possibilities of the four-wheel type of street car was aroused among delegates at the recent Cleveland convention of the American Electric Railway Association by the exhibition of two distinctive new designs. These seem to eliminate many of the limitations of the former single-truck type car and to open up new possibilities in the way of a light-weight, economical, comfortable and attractive electric rail unit to meet present-day traffic conditions and automobile competition. The new types of cars are the products of the Twin Coach Corporation and the St. Louis Car Company, respectively. The former produced three sample units for the A.E.R.A. exhibit, incorporating both two-motor and four-motor drive.

The distinctive feature of these new designs lies in the adaptation of automotive ideas to street railway car construction to provide a comparatively long wheelbase in a light-weight, four-wheel unit which will negotiate short radius street railway curves. This general feature is common to both the Twin Coach and the St. Louis cars. There are, however, many differences between the two units in the arrangement of driving mechanism and running gear and in general construction. The cars produced by the Twin Coach Corporation represent in general the ideas of F. R. Fageol, to whom are generally credited two previous distinct departures from precedent in transportation vehicles; first, the development of the low-hung "safety coach" type of bus with long wheelbase, and more recently, the "Twin Coach" type of bus design. In fact, the Twin Coach automotive street car is a direct adaptation of the Twin Coach idea to rail car requirements. The St. Louis unit is hailed as the "New Birney" and is sponsored by C. O. Birney of the Stone & Webster organization, who pioneered the original single-truck, one-man safety car which helped to save many properties from bankruptcy in the trying years during and immediately following the World War.

In general the construction of the Fageol street car resembles the Twin Coach in appearance. Minor structural changes were made to adapt the design for operation on rails, but many of the structural features are interchangeable with the gas-propelled coaches manufactured by this company. On two of the three sample cars that have been built, each of the four wheels are independently driven by a 35-hp. high-speed electric motor, suspended under the chassis frame cross-members amidship of the body, where it is clear of wheel wash. The motors are mounted relatively high up on the chassis frame, to give maximum road clearance. Each wheel unit has a separate worm drive which is pivoted with the wheel about a vertical axis, similar to the mounting for the front wheels of an automobile. These pivot points are directly in line with the point of contact between the wheel and rail, so that in going around a curve the wheel is free to turn with the rail. By locating the pivot point directly above the point of wheel contact with the rail, the space required for the wheel to turn is reduced to a minimum, thereby making it possible to use large wheels with only comparatively small wheel housing projecting above the floor of the car.

Large capacity Timken roller thrust bearings are used on the upper end of the pivot knuckles to carry the ver-

Digitized by Google

tical load. For side thrust on the knuckle mounting, large diameter hardened steel against bronze sleeve bearings are used at both top and bottom. Preliminary tests have shown this to provide a free moving mounting which requires very little flange guidance in running around a curve. Between the driving motors and each driving worm at the wheel there is a longitudinal driveshaft connected to the worm through an automotive type universal joint. This joint permits the wheel and its driving worm assembly to follow curves or rail special work.

On the Birney car the two motors are mounted longitudinally in specially constructed cradles, which, by being attached at two corners to the Wisconsin type automotive driving axles and at a third point to the body frame, forms a torque arm for the axle, as shown in accompanying illustrations. From each motor a propeller shaft leads to a differential in the axle housing at each end of the car through a universal joint. The wheels are attached to the axles through knuckle joints to permit the wheels to pivot in taking sharp curves. The attachment of the motor cradle to the body framing is arranged to permit the entire driving mechanism to move relative to the body in taking track irregularities to avoid the transmission of these movements to the car itself.

Combine Advantages of Single and Double Truck Cars

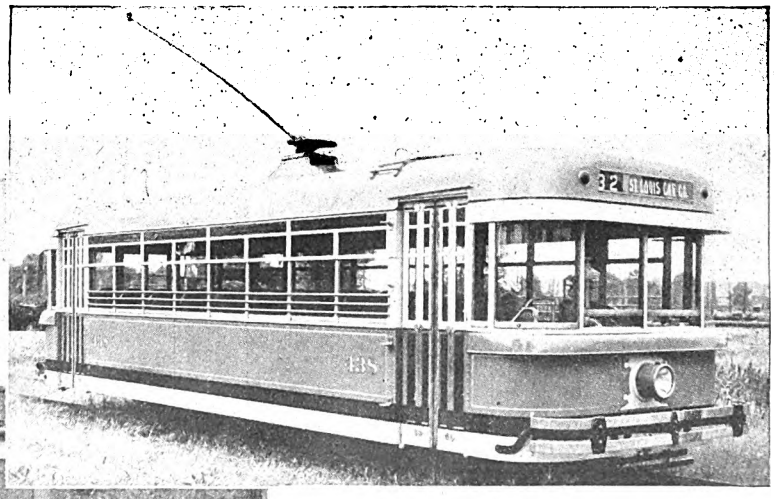
Thus the fundamental objective of both these new car designs is to provide means for permitting the wheels to follow the track on curves and special work, while taking advantage of the weight reduction which can be obtained on a four-wheel vehicle in comparison with the conventional double-truck design. In comparison with the conventional type of single-truck car, they permit the use of a wheelbase longer than that which was heretofore possible with available types of fixed-axle single-trucks. This increased wheelbase, together with other features incorporated to improve riding qualities, opens up the possibility of light-weight economical rail vehicles suitable for operation on frequent schedules and possessing riding qualities comparable to modern automotive vehicles. Quiet operation, smooth, rapid acceleration and retardation, attractive appearance and rider appeal, were some of the other factors sought in both designs. On the Fageol cars the wheelbase was made 16 ft. On the Birney car this figure is 12 ft. 3¼ in.

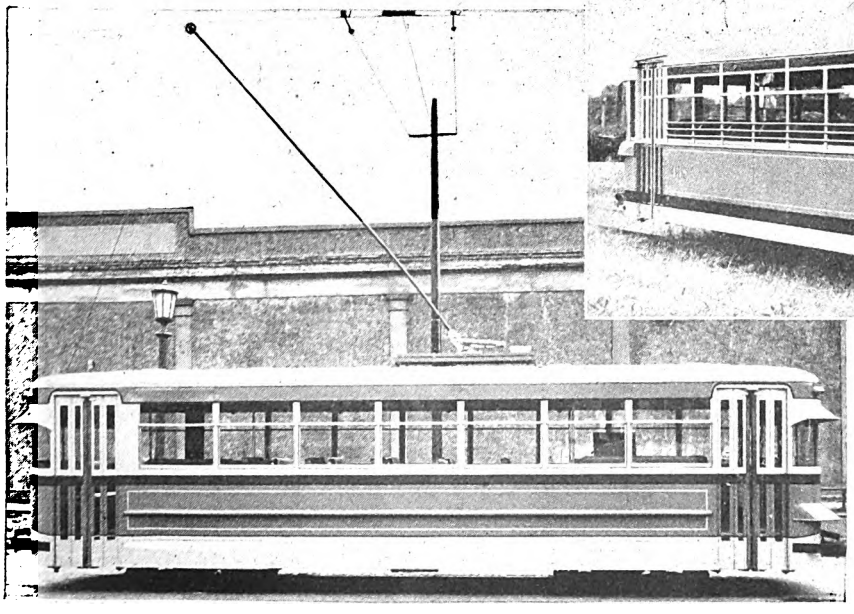
To achieve quietness in operation, both cars are equipped with specially designed rubber insert wheels, taking advantage of previous experience gained in experiments with wheels of this kind which have been successfully used under automotive trucks for several years. It is interesting to note that on both units the use of 26-in. diameter wheels has been abandoned in favor of larger diameters to provide suitable loading conditions and a practical design of the rubber insert type of wheel.

Rubber Cushion Elements Withstand Bearing Pressures

The details of the wheel design on the two cars are different. On the Fageol units these wheels consist of a rolled steel flanged tire, case hardened to prevent picking up particles from the rail surface, and pressed onto wide steel bands under which are inclosed high-grade rubber cushion elements of generous proportions for the bearing pressures obtained in service. The rubber is installed under compression between the wide inner and outer bands of the wheels to avoid shrinkage or set when the load is applied. The sides of the rubber cushion elements are bounded by vertical strips of laminated rubber, against which steel bands are held by long through bolts. These vertical strips of laminated rubber are intended to take the initial driving and braking torque, while the flat main cushion elements carry the vertical loads.

The inner part of the wheel on the Fageol car is cast integral with the brake drum to reduce weight and simplify construction. These wheels are designed so that they can be removed from the axle units without disturbing any of the adjacent parts. Special anti-side motion features have been built into the interior of the cushion elements to prevent excessive side motion, which





Above—The "New Birney" makes a strong appeal to riders with its stream lines and carefully finished coachwork. Equipped with two 50-hp. high-speed motors it is capable of accelerating from a standing start to 20 m.p.h. in five seconds.

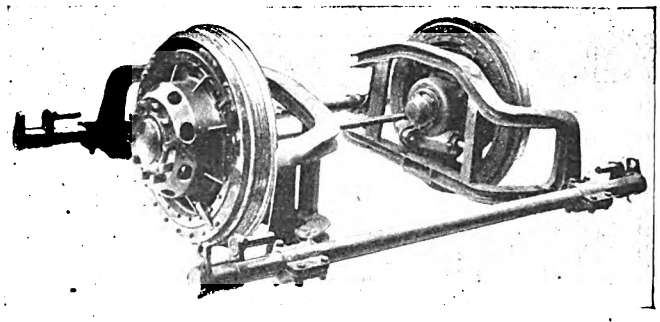
has been found by experience to be extremely destructive to cushion wheels. Details of the wheel design on the Birney car are not available at this time.

Other Special Features in Both Designs

Both cars are mounted on long, half-elliptic springs. In the Birney design these are carried below the axle, between the motor cradle and the wheels, inside the gage line, and support the body through suitable shackles mounted on the main longitudinal members of the body chassis. On the Fageol car, each wheel carries a light cast-steel yoke at its pivotal bearings. The two yokes are tied together by two parallel cross-members, which in effect forms a truck frame for each pair of wheels. Extensions of these cross-members, shown in the accompanying illustration, carry the spring shackles, so that the springs themselves are outside the wheels. By thus widening the spring base as much as possible, it was the intention to provide maximum riding stability.

Since the wheels on both cars are mounted so as to move freely about a vertical pivot, they are kept parallel with each other by a tie bar, as in the case of an automobile front axle. In the Fageol design this bar is carried straight across between the two wheels. In the Birney design the tie bar is carried below the half-elliptic springs and is connected to the wheels through two vertical castings clamped to the tie bar. At the center this tie bar passes through a lug which extends down below the axle, with a long helical spring on each side. As the bar is moved horizontally in either direction by the pivoting of the wheels on a curve, one or the other of these springs is compressed, and exerts a force tending to bring the wheels back to normal position, at right angles to the axle.

Automotive type, internal expanding brakes are used in both car designs. On the Birney unit, individual Westinghouse brake diaphragms mounted at each wheel are connected through suitable mechanism to internal expanding metal shoes which make contact with a brake drum inside the wheel. The brake control is electro-pneumatic. A cane-type emergency hand brake, working through cables, provides a double and an independent brake control. On the Fageol unit the brake drums are on the outside of the wheels. Here, also, automotive type internal expanding shoes are used. Two types of brake control are available on the Fageol car, one of which is identical with that used on Twin Coaches. This consists of a foot-operated graduated pressure brake valve. For this brake system the air supply is obtained from a 6-ft. automotive-type compressor driven by a special light-weight 600-volt motor. This unit is the result of lengthy experimentation in an endeavor to reduce the weight of compressor equipment available for light car use. The graduated pressure foot brake valve and motor-driven automotive compressor was furnished by the automotive division of the Westinghouse Air Brake Company. This combination of brake equipment is preferred by the car manufacturer because of its greatly reduced weight and cost in comparison with conventional electric railway brake equipment and because of the smoothness of brake control, the application pressure always being in direct proportion to the movement of the operator's control pedal. When this automotive type of brake control is used it includes an interlock with the automatic treadle-operated rear exit door. Optional brake equipment for this car consists of hand control with standard safety car devices, variable load brake adjustment apparatus and conventional type street railway compressors.



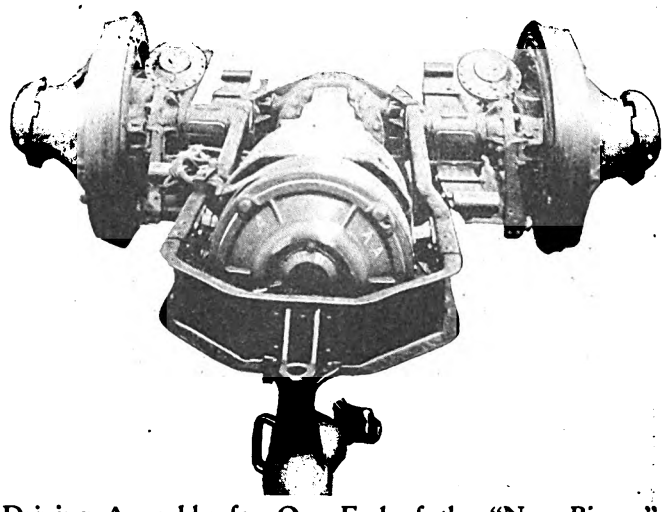
Wheel and Drive Assembly of the Fageol Units

In the Twin Coach design each wheel is independently driven through an underslung worm from an automotive type driveshaft and universal leading from the motors which are mounted on the body framing. The wheels are free to pivot about a vertical axis in passing around sharp curves, on the same principle as that used in mounting the front wheels of an automobile. Long half-elliptic springs not shown in the illustration are mounted in the shackles shown at the ends of the crossbars.

Approximately double the motor capacity per pound of weight found in conventional street cars provides high acceleration rates for these four-wheel units. The Birney car weighs approximately 18,000 lb. complete. It is 31 ft., 10¾ in. long over the bumpers and seats 39 passengers. Control is single end, but a special back-up device is included for operation from the rear end when switching. The weight is divided approximately as follows: car body and drive, 15,220 lb.; motors and control, 2,130 lb.; air brakes, 650 lb.

Two 50-hp. Westinghouse type 1426 motors furnish the motive power for this car. These are geared 8.64 to 1, providing a free running speed of 35 m.p.h. The control is Westinghouse, HL cabinet, type, mounted in cabinets in the front vestibule, as shown in an accompanying illustration. With a motor capacity of approximately 2½ hp. per seated passenger, the car has an accelerating rate of 4 m.p.h.p.s., so that it can attain a speed of 20 m.p.h. in five seconds from a standing start. For city service, making seven stops per mile, with seven seconds average duration of stops it is claimed to be capable of maintaining a schedule speed of 13 m.p.h.

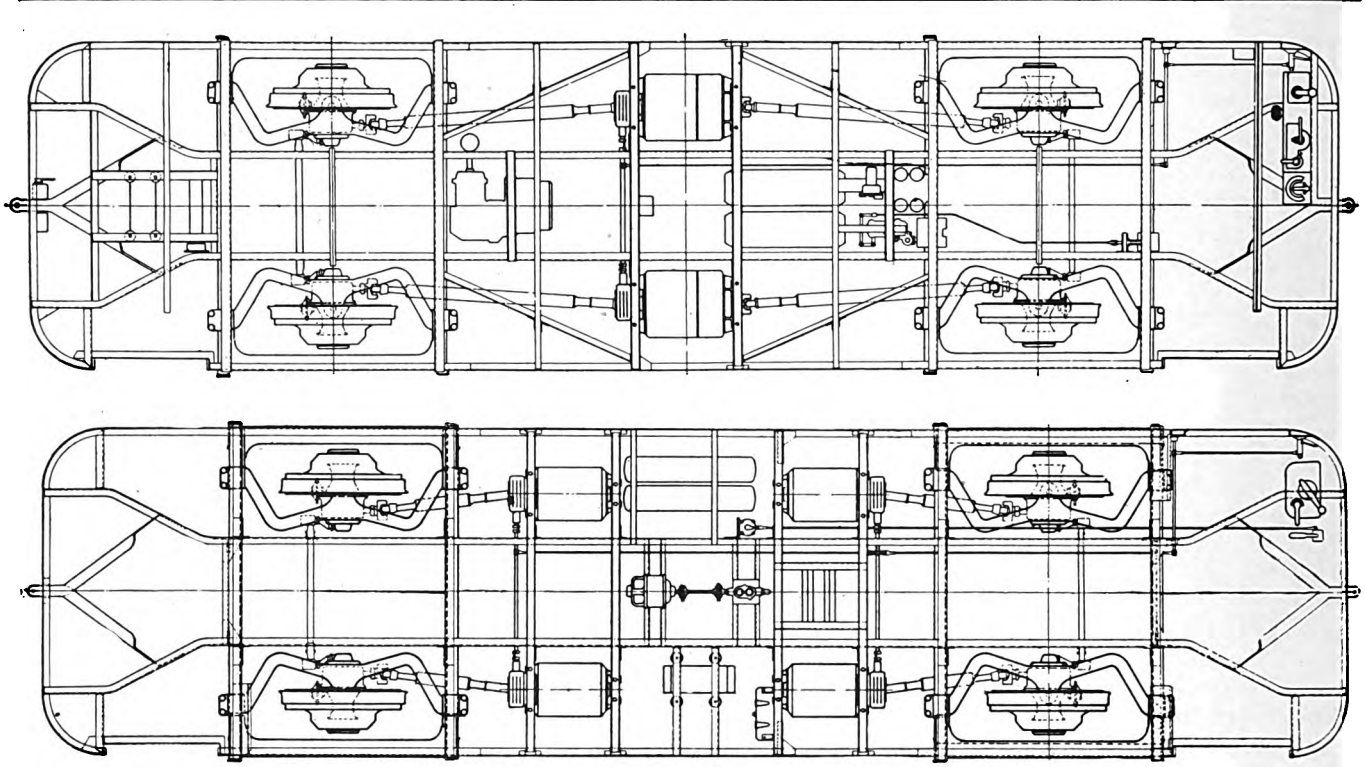
Both two-motor and four-motor drive is represented in the three sample units built by the Twin Coach Corporation. This is available in either Westinghouse or



Driving Assembly for One End of the "New Birney"

The motor, rated 50 hp., is mounted in a special cradle carried at one end on housing of the automotive type driving axle, and suspended at the other from the body framing. The drive is comparable to that of an automotive vehicle except that the wheels at each end of the axle are mounted on spindles so that they can pivot relative to the axle on sharp curves.

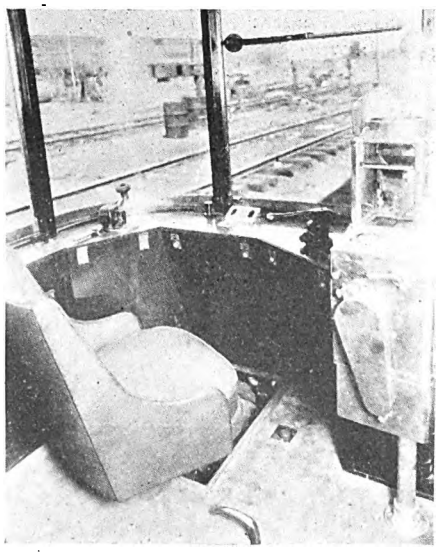
Digitized by Google



Both two-motor and four-motor designs of the Twin Coach automotive type street cars were shown at the exhibit. In the two-motor design above, each motor drives the wheels on one side of the car through driveshafts and universal joints, as shown in the diagram. In the four-motor design below, each wheel is independently driven by an individual motor

General Electric equipment. In the two-motor design, two 50-hp. high-speed motors are hung amidship and longitudinally on each side of the car under the chassis frame cross-members. Each motor is connected to the forward and rear wheel on the corresponding side of the car by automotive-type driveshafts and universals. Each motor in this type of installation drives one front and one rear wheel, as shown in an accompanying diagram. This power equipment is capable of driving the car with 44 seated passengers at a free running speed of 35 m.p.h., and of accelerating at the approximate rate of 4 m.p.h.p.s. On the sample two-motor unit, the control consists of Westinghouse HL magnetic type, using a type 15B master controller. The control group on this car is mounted in the rear end of the body between the ends of the chassis frame, and is so installed that adjustable parts are accessible through a large hinged panel opening in the rear.

The General Electric equipment in the four-motor installation consists of four type 1126, 600-volt, 35-hp. high-speed motors with a light-weight K-75 controller. The motor capacity on this unit is claimed to be sufficient to give 40 m.p.h. free running speed at 555 volts with a seated load of 44 passengers. In this type of drive each motor is independently connected with its corresponding wheel through a longitudinal driveshaft and universal joint, as shown in the accompanying diagram. The controller provides five steps in series and three in parallel. The resistors are mounted ahead of the motors in one group. A single DH-98-A cutout switch is used for changing connections when a pair of motors are cut out. This permits series-parallel control to be maintained, even when operating with one pair of motors cut out of the circuit. The controller is also arranged to take an LB control device for use with a line breaker.



The operator's seat on the "New Birney" is mounted in a well which brings him below the line of passengers' vision and gives him a clear view of the track and street

Many Novel Features in Bodies

In addition to the rubber-insulated wheels used on both the Fageol and the Birney cars, rubber insert pads are used liberally on both units at spring mountings and in other locations where noise of vibration might be transmitted from rails or motors to the car body. On one of the Fageol units the eight points where springs are connected to the body are provided with side sway bolster units and thermoid rubber cushions.

The body of this car is of standard Twin Coach construction with $\frac{1}{4}$x$1\frac{1}{4}$x$1\frac{1}{4}$ in. tees used for all vertical posts. On the outside of the body between the window ledge and the bottom, $\frac{1}{4}$-in. Plymetl is used. This same material, formed to shape in one piece measuring 42 in. wide by 24 ft. long, is used for the main roof section. The curved hoods at each end of the roof are formed of No. 18 gage steel. Front and rear of the car are provided with 14-in. safety glass on the ends and corners. The side sash are of special design metal construction and may be raised.

Arrangement of seats on the interior of the Twin Coach automotive type street car is optional.

Digitized by Google

Although longitudinal seats are installed on the sample units to provide additional aisle room for entrance and exit, full cross-seat arrangement may be used without serious interference from wheel housings. The general equipment of the interior of the sample cars follows Twin Coach practice. An automatic, treadle-controlled rear exit door is provided to permit passengers to circulate from front to rear without congestion in the aisle.

The body of the Birney car is built up of two longitudinal steel chassis members and the sides of the body are brought down in the form of a skirt to conceal all driving mechanism. The unit is completely streamlined, front and rear, as shown in accompanying illustrations. All glass in the body is shatter proof. The operator's seat at the front end is mounted in a well, so that the motorman is below the passenger's line of vision. All electrical control equipment is concealed in inclosed cabinets, which gives the interior a completely finished appearance and makes this apparatus readily available for inspection and repair. The arrangement of cabinets at the front end, with covers removed, is shown in an accompanying illustration. An air-operated fare box is mounted in a location convenient to both passengers and operator. The rear door is of the automatic treadle-controlled type operated by National Pneumatic equipment.

Careful attention was given to both exterior and interior finish of the car, which gives an impression of the luxury of high-grade coach work. Interior woodwork is mahogany and fittings are aluminum, with the exception of a few parts which are nickle-plated brass. Windows are weather stripped. Automotive type bumpers on the exterior are chromium plated. The floor of this sample unit is covered with sheet rubber in a mosaic pattern, and the seats, of deep spring cushion type, are covered with hand-buffed hyaline leather. The first of the "New Birneys" is destined for service in Houston, Tex. It is painted in a combination of red, gray and blue. A red stripe around the top is carried through the tops of the windows by a red glass strip which helps to balance the proportions of color and to accentuate the streamline appearance of the vehicle.

LUBRICATION

of Electric Railway Equipment

The wide variation in temperatures in which railway motors operate makes the lubrication problem a severe one. Careful application of oil and selection of waste are important

By H. L. Kauffman
Denver, Col.

LUBRICATING electric railway equipments costs a relatively small amount, the expense being only about $\frac{1}{10}$ per cent of the total operating cost, or approximately 2 per cent of the car maintenance cost. Through carelessness or inefficiency in lubrication, a motor bearing may fail, a hot journal develop, or some similar trouble occur and the resultant cost through repairs and loss of revenue-miles will be many times the cost of the lubricant, the use of which would have eliminated the difficulties.

The importance of using lubricants of correct grade, properly applied to the rubbing surfaces, is readily appreciated by those railway executives and operating men who have been able to trace various operating troubles or excessive maintenance costs to improper or inefficient lubrication. Railway equipment is lubricated under conditions that are far from ideal. This is due partly to the fact that the equipment is operated at high speeds over streets that are usually dusty and dirty, yet often wet. In addition, lubricants must function over a great range of temperature changes and withstand both frictional and electrically generated heat.

Railway lubricants are of five main types: (1) Car oil, (2) black oil, (3) gear lubricant, (4) compressor oil and (5) semi-fluid grease. Other lubricants, are used also; but their requirements naturally are dependent upon the particular equipment being lubricated, and upon operating conditions.

Car oil is listed first, because it is used on the most important bearings and in the largest quantities. Axle and armature bearings, and journals, are lubricated with car oil which, for best results, should be a pure mineral oil. The use of car oils compounded with animal or vegetable oils is objectionable, since thereby is made possible the emulsification of the oil if brought into contact with water. Such emulsification or "soaping" may cause the waste to glaze while in contact with the shaft. When this happens, the ability of the waste to feed as a wick is destroyed. Car oils containing from 2 to 4 per cent of lead soap are widely sold by some oil refiners, but no emulsification difficulties occur, due to the insolubility of lead soap in water.

Car oils are made in two grades, winter and summer, the latter being used during the time when the tempera-

Digitized by Google

ture does not fall below about 40 deg. F. A typical winter grade has a Saybolt viscosity of about 55 seconds at 210 deg. F., and a pour test of approximately 0 deg. F. A typical summer grade has a viscosity of about 100 seconds at 210 deg. F. and a pour test that may be as high as 35 deg. to 45 deg. F., without offering any difficulties, though the use of an oil of even lower pour test is not objectionable. In making the two grades of oil, manufacturers endeavor to produce a summer car oil having the same viscosity at average summer temperature as the winter car oil has at average winter temperatures. In applying car oils a frequent practice is to add one grade of oil to the other already in use, thus bringing about a gradual change to suit a variation in temperature conditions.

Black oil is used for the lubrication of brake rigging and center plates. Frequent swabbing of the chains, brake rods, etc., insure positive operation of the brake rigging. No particular qualities are required of black oil.

Use of a gear lubricant of proper grade is very important for keeping gear noise and gear wear to a minimum. A suitable oil for this purpose for winter use is one made from an asphalt-base crude having a viscosity of 2,000 seconds at 210 deg. F.; and for summer use, a similar oil with a viscosity of 5,000 seconds at 210 deg. F. Such products are almost non-fluid in their characteristics and will retain a certain amount of the dirt that finds its way into the gear case, thereby protecting the gears from the abrasive action of the dirt. The use of soft greases has the disadvantage that in cold weather such lubricants are not sufficiently fluid, in consequence of which the grease "channels" and the gears run dry. Soft grease is very difficult to keep in place, tending to leak through gear-case openings, with a possibility of its working into motor bearings where it is apt to glaze the waste or drip to the street.

Oil Prevents Leakage in Compressors

Compressor oils, like car oils, are available in two seasonal grades to suit atmospheric conditions. Compressor lubricating systems are of two main types: splash and ring-oiled. The purpose of a compressor oil is not only to lubricate the piston as it moves up and down the cylinder, but also to form a seal about the piston rings and thus prevent the leakage of cylinder gases past the rings. Thus, it is evident that the requirements of a compressor oil are similar to those of an oil used in lubricating an internal-combustion engine.

For best results a winter grade of compressor oil should have a viscosity of about 300 seconds at 100 deg. F.; the summer grade, a viscosity of about 500 seconds at 100 deg. F. The oil, also, should be non-gumming in its characteristics. Gumming results either in sticking of the valves or a poor seal, with consequent difficulties. So too, in order to minimize the motor load and to insure flow to all moving parts, the oil should flow readily at the lowest operating temperatures encountered.

Semi-fluid grease finds a variety of applications in the lubrication of street railway equipment. It is used for door engines, motorman's valves, air-brake cylinders, foot valves, circuit breaker cylinders, controller fingers and other electric contacts. Major requirements for this grease are (1) that it should be capable of remaining in place for an extended period; (2) that it should be affected but little, if at all, by temperature changes, and (3) that it must not carbonize or gum.

Motor armature bearings are all of the sleeve type, with the exception of a few small motors having armature bearings of the ball or roller type. Lubrication is provided by means of waste and oil. The importance of proper lubrication and care of bearings is something that can not be emphasized too strongly, for axle bearings must support a considerable part of the weight of the motor. In lubricating such bearings the oil-saturated waste must always be in contact with the rotating part; otherwise, lubrication will fail. The importance of using waste of high quality is therefore self-evident.

Careful Selection of Waste Important

The main requirements of the waste employed in bearing lubrication are resiliency and capillarity. If these properties of the waste are decreased in any way, the lubrication of the bearing is affected adversely. Waste contains from 60 to 100 per cent of pure wool, any admixture being cotton waste. All-wool waste, or waste high in wool content, are to be preferred, since experience has shown that cotton waste is not suitable for packing material. This is on account of the difficulty of holding it against the shaft and the fact that it glazes quickly. Cotton waste has a lower oil-storage capacity, and also a lower capillarity; and since the lubrication of the bearings depends on capillary attraction for feeding the oil from the reservoir to the journal surface of the shaft, it is readily appreciated why the use of a product with a high degree of capillarity is to be preferred. Consequently long-fiber, all-wool yarn, due to its springy nature even after it is saturated with hot oil, is the most desirable bearing packing now obtainable. Felt has been used as a pad in lubricating bearings, but owing to its tendency to glaze it is inferior to wool waste.

Specifications for purchasing wool waste should call for rejection if much cotton yarn is mixed therewith or if the waste contains jute, sweepings, flying wire, leather or other extraneous matter or an excess of 10 per cent by weight of moisture, or 15 per cent by weight of oil or grease. Long-strand wool waste, free from knots and kinks, gives better capillarity and hence represents the most desirable product. Especial precaution should be taken against the purchase of waste that has been "sized" in the process of preparation.

To insure initial lubrication of the bearings after packing, the packing previously should be saturated thoroughly with oil. This is accomplished by submerging the waste in oil at 60 to 70 deg. F. for 48 hours and then draining for about 24 hours at the same temperature, or until about a quart of oil remains per pound of waste. The oil content is generally judged to be correct if, on pressing a ball of the waste in the hand, a slight amount of oil works through the fingers.

The application of heat greatly accelerates the process of saturating the waste. This can be provided quite conveniently by the use of an electrically heated tank, having thermostatic control that has been perfected. In this tank a temperature range of from 118 to 122 deg. F. is maintained. By the use of such equipment the waste can be soaked and drained in four hours, two for soaking and two for draining. In addition to the saving in time, there is an even greater advantage in the use of such an electrically heated tank in the uniformity of the product thus obtained.

A railway motor, of necessity, is a rugged piece of apparatus and, because of its comparative inaccessibility, does not receive the care usually given a stationary machine. However, to keep maintenance costs at a minimum and to increase the life of the motor, it should

Digitized by Google

receive the same care given apparatus of less rugged construction and located in a more accessible position. Proper lubrication is one of the most important factors involved in caring for such motors to prevent failures in service.

While the "down-feed" motor was designed originally with the idea of using grease as a lubricant, present practice consists in so modifying the arrangements for lubrication that oil instead of grease can be used—this being advisable since experience has shown that longer life of bearings results when oil is employed. The part of the housing that clamps the bearings originally was made with a box for holding the lubricant. This box was placed either above only or both above and below the bearing while slots or "windows" looking into these boxes were made in the bearing itself.

Grease lubrication exclusively was intended when the motor was fitted with only a top grease box. In this case the plan was that the frictional heat of the bearing should melt the grease and bring it down through the "window" in the bearing to the shaft. When both top and bottom boxes were present it was intended that the lower box should be filled with oil before assembling the bearing. Thereafter, in use, the oil was to be fed to the shaft through a felt wiper one end of which dipped in the oil and the other end against the shaft. The felt was held in place by a spring.

Down Feed Lubrication Unsuccessful

This method of bearing lubrication was not generally successful for several reasons: first, because of the tendency of the felt to glaze; second, because the condition of the felt could not be inspected without dismantling the motor; and third, because when the felt became worn the steel springs cut the shaft, whereas if copper springs were used they lost their resiliency quickly and so did not function properly.

Due to the above-mentioned disadvantages, present practice in lubricating this type of motor consists in closing the bottom slot or "window" of the bearing and disregarding the bottom box entirely by casting the bearing solid on the bottom, thereby obtaining increased bearing surface. The top slot, originally of about ¾x3-in. size, is then increased as nearly as possible to the area of the horizontal cross-section of the box. By so doing better contact takes place between the waste and the shaft; likewise, the wider slot makes it easier to inspect the shaft. With these changes, oil can now be fed to advantage through the top window.

In packing the box, oil-saturated waste is first forced in tightly against the shaft, after which oil is poured on top of this waste; then more waste and more oil is added, finishing with a piece of waste at the top to which no oil is applied. This top waste, often called a "dust plug," serves as an auxiliary to the spring cover in keeping water and dirt out of the bearing. In packing, as much waste as possible should be forced into the boxes, but care must be taken that the cover closes tightly and that all strands of waste are inside the box; otherwise, oil will be syphoned from the box through the strands hanging over the side.

Various methods are in use for lubricating the bearings of "down-feed" motors. Sometimes felt is used to fill the bearing slot completely and the oil-saturated waste is then packed on top of this felt. Felt tends to glaze quickly and therefore this practice can not be looked upon with favor. Then again, grease is employed to fill the "window," above which waste impregnated with both oil and grease is packed, and more oil thereafter poured on top of this waste. The idea back of this method of packing is that, in case the bearing warms up, the grease will liquify to such an extent as to permit the oil to reach the bearing. Then when the bearing cools, the grease will solidify and once more hold back the flow of oil.

Another method involves the separation of the grease box into two parts, one of which is filled with oil, the other with waste. A wick connecting the two thereupon syphons the oil upon the waste. A grease cup similar to a "pin-oiler"—in this instance the pin being a ball that opens and closes the hole in the bottom of the oiler as the shaft rotates—has also been used. Placing a container filled with oil or saturated waste in the "grease" box, and having means for syphoning this oil into the bearing, either down the sides of the box or down a pipe through the center of the box, represents another practice. The fact that dirt can find its way into the bearing easily is an objectionable feature to each of the lubricating methods just mentioned.

Melbourne Moves Toward Noise Reduction

PARTICULARS of efforts being made in Melbourne, Australia, to reduce noise from electric car movement are given in a recent report by T. P. Strickland, chief engineer Melbourne Metropolitan Tramways Board. According to the report, as printed in the *Electric Railway and Tramway Journal,* the operation of any steel-tired wheel on steel rails must make a considerable amount of noise. The noise is greater than that of a railway train because the street car runs along paved streets, flanked by high buildings, and because the rails, except after a shower, nearly always are covered with grit, blown on them from the street. The non-resilient rail foundation, used in Melbourne, is also a material factor in increasing the noise. Smooth, hard pavements also appear to magnify it.

The noise between the tire and rail is increased by rail corrugation, which the Melbourne system is trying to keep down through grinding and by hardening the heads of the rails by the sorbitic process. Some recent track was laid on a continuous bed of timber with a layer of elastic material between the rail base and the timber. Another section is being laid on composition ties, and on another a noise deadening material is being placed under and alongside the rails. These trials are aimed to develop a track reasonably cheap to maintain and one which will not corrugate rapidly yet be as quiet as possible.

Experiments have also been conducted with various types of wheels and different types of gearing to reduce noise, but with no definite result as yet. Other experiments being tried are the replacement of brake pull-rods with wire ropes, with the object of removing a rattling part; the use of fiber washers in place of steel on all parts of the undergear where practicable, and the use of drum brakes. The latter have been applied to two worm-drive cars.

The author is of the opinion that some of these changes are effective but the practical results are masked by the effect of corrugations, the removal of which will eliminate the worst of the noise now caused by the tram cars.

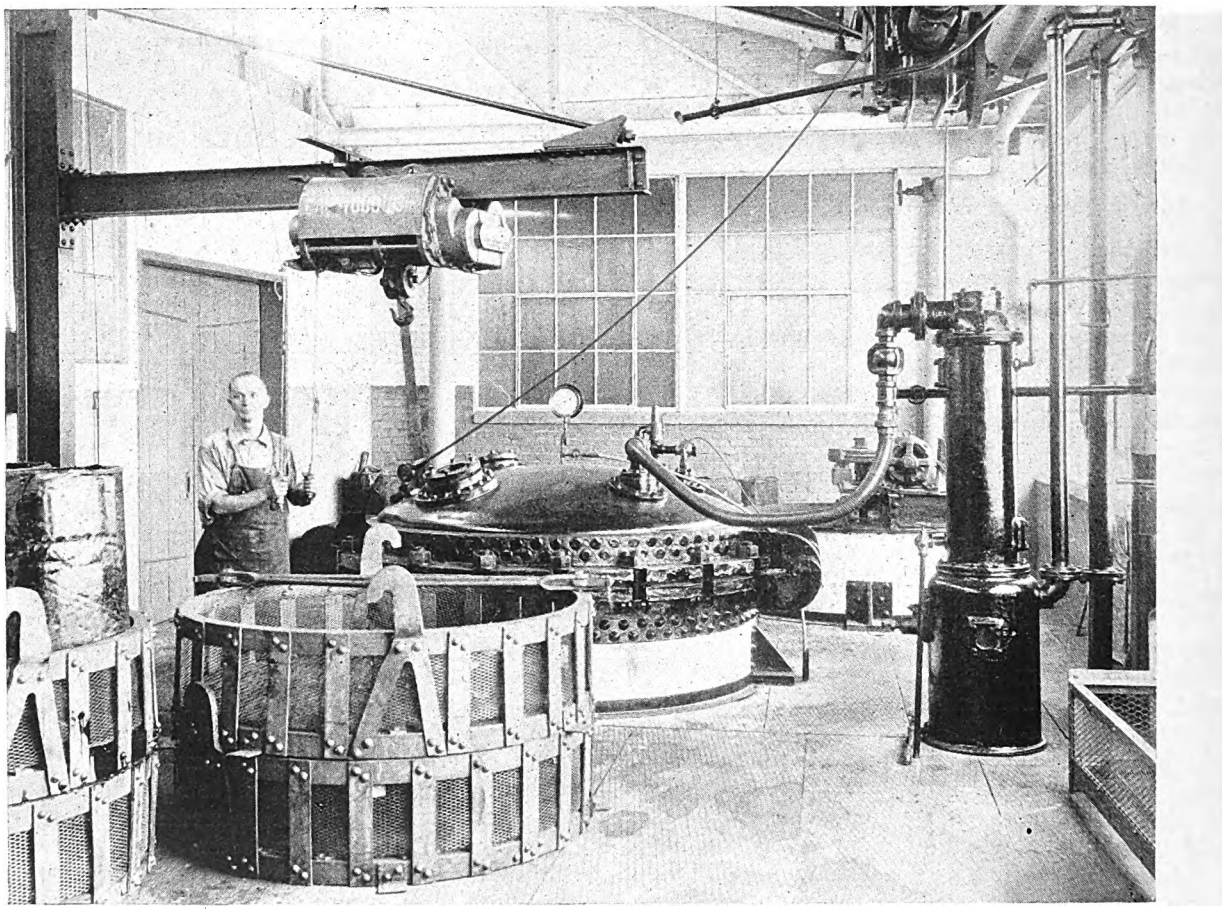
Careful Maintenance of Field Coils Pays

Terminals and leads of railway motor field coils are annoying sources of trouble. Proper attention to them and frequent inspection will reduce troubles greatly

By Jesse M. Zimmerman
Maintenance Sales Engineer Westinghouse Electric & Manufacturing Company
Chicago, Ill.

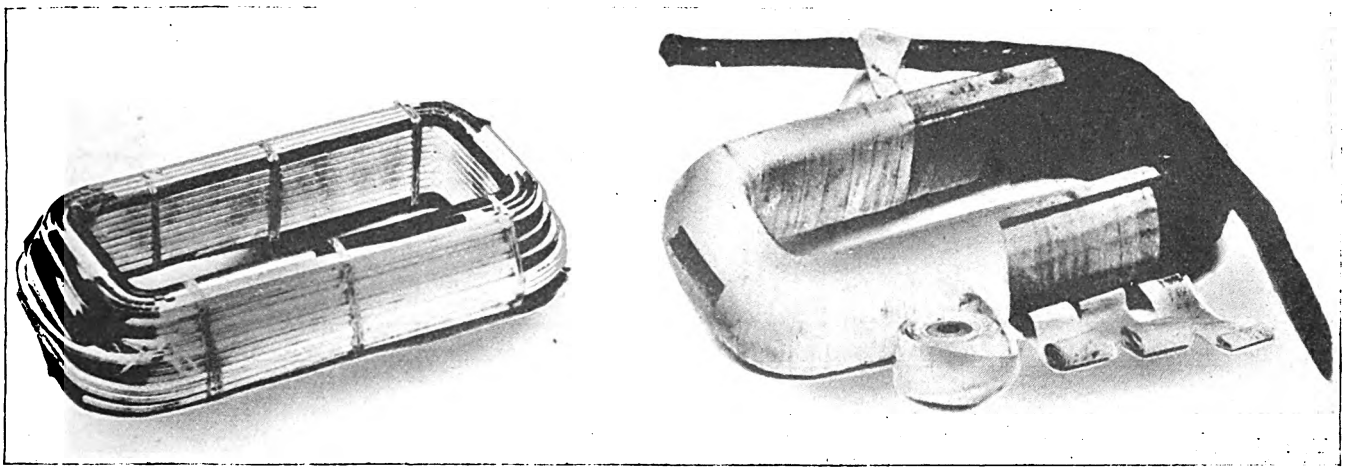


Vacuum outfit for impregnating field coils

PROPER maintenance of field coils is essential to good operation of a motor. Many motor troubles, such as flashing and overheating, may be caused by a weak magnetic field, but these can be corrected if proper repairs are made. The torque is proportional to the field strength times the armature current, so that a weak field must be compensated by an increased armature current if the same torque is obtained. The increased armature current distorts the main field to such an extent that flashing will be inevitable at the least fluctuation in voltage. The increased overload also causes the armature as well as the fields to run hot. This weak field is caused sometimes by reversed field coil lead connections. In many cases it may be caused by a portion of the turns in one or more of the field coils being short circuited due to poor insulation. In either case careful inspection and proper repairs will be profitable.

It is the standard practice of motor manufacturers to insulate, impregnate, dip and bake all railway motor field coils to form a perfect seal against moisture. This seal is obtained by impregnating with a gum, which must meet a rigid specification, with the aid of a vacuum impregnating tank. The coil is then insulated with treated cloth tape and surgical tape or cambric and mica

Digitized by Google



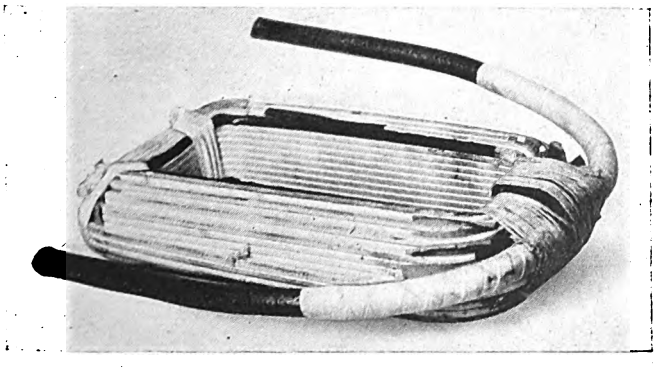
Fishpaper protecting strips should be used at the top and bottom of the coil and insulation should be stepped back when terminals are replaced by cable leads

tape, and asbestos tape, according to the application. Better results are obtained by using narrow tape because it permits narrower laps and forms smoother layers around the corners. The varnish can make a tighter seal where the laps are narrow. This increases the cost of the taping operation, but this is more than offset by the results obtained. Around the corners, the tape is "cut out" so it does not build up on the inside of the corners. The coils are dipped three times in a high-grade plastic baking varnish and baked thoroughly after each dip.

Field coil repairs can be divided into two classes: (1) External and (2) internal. External repairs, such as replacing terminals or coil leads, and insulation around the coil, can be done at a reasonable cost. If the internal insulation is in first-class condition it pays to make these repairs. After the external insulation has been removed the coil should be tested for short circuits. The cable leads should be retied and the coil reinsulated in the manner described in the preceding paragraph.

Operating data have shown that internal troubles such as short turns can be repaired permanently only by completely reinsulating the conductor, because the insulation around the conductor usually is badly charred. Removing the old insulation and reinsulating the conductor requires a large amount of labor and material, after which the coil must be rewound. The cost of performing this work will be as much as that of a new coil. In addition to this the quality of the copper and its cross-sectional area in places becomes questionable. In many cases these coils have given trouble in service, making it necessary to remove the motor from the truck to replace them.

It was the practice on old types of motors to solder terminals to the coil ends of all field coils, but cable leads are used now when the design permits. The field coils were connected after being assembled in the motor by jumpers held into the terminals with setscrews. Due to vibration the jumpers would work loose or break, thus causing an open circuit. This difficulty has been eliminated by soldering a piece of flexible cable directly to the ends of the field coil conductor and securely tying them to the coil body. These flexible coil leads are connected by soldering them into a copper sleeve connector. In this manner every possible chance of an open circuit in the field coil wiring is eliminated.



Cable leads should be tied securely before the coil is impregnated

The disadvantage of using terminals is that the terminal, like a toe, will have its stubs, resulting in poor contact with the field coil proper, thereby causing local heating. The terminals also form convenient handles for a workman to pick up a field coil and result in unnecessary strain on the soldered connection. If a field coil is handled by its cable lead the stress is put on the twine tying the lead to the coil and not to the soldered connection. However, field coils with cable leads should not be handled by the leads as it breaks the seal, thereby permitting moisture to enter the coil.

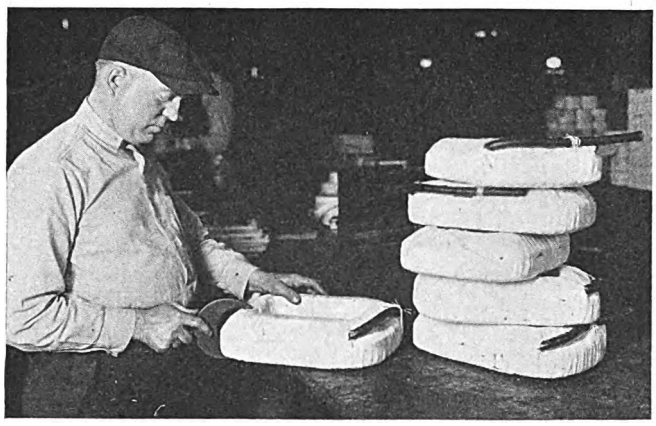
Terminals often break off due to vibration and it is very difficult to insulate these terminals properly when assembling coils in the motor due to the lack of space. Loose cable connections caused by screws backing out of terminals result in local heating and burning off of the leads. The only advantage that can be claimed for terminals is the ease of renewing field coils at outlying barns where soldering equipment may not be available.

The superiority of the cable lead construction lies in the uniformity (no breaks) of the insulation up to the ends of the leads. Cable leads are also cheaper than terminals. The connections between coils with cable leads are more accessible and hence are made better and more readily.

To make the leads as secure as possible, the start and finish copper in the coil, at the ends, is of such a length as to insure that the maximum length of insulated cable will be taped into the end of the coil. In addition to giving added insulation, this construction permits binding the leads firmly to the side of the coils, keeping the shocks and stresses away from the soldered connection.

Field coils having terminals can be changed over to anchored cable leads at a very low cost, if it becomes necessary to replace the terminals. This is done by re-

Digitized by Google



To make certain that coils do not run over size they should be gaged accurately

moving the old insulation around the terminals. If both terminals are at the same end it may only be necessary to remove the insulation from that part of the coil by stepping it back. When the end of the coil is retaped with new tape these steps permit a perfect seal when the coil is dipped and baked. If the terminals are on the opposite ends of the coil it is best to remove all of the old external insulation.

After the old terminal has been removed a piece of flexible cable should be connected to each end of the field coil. This is done on coils wound with bare copper strap by forming the coil end around the cable wherever possible, otherwise by fanning out the ends of the cable and wrapping it securely to the end of the coil with small copper wires or by making a lap joint with a sleeve connector. This joint should be soldered carefully, for a good joint will eliminate heating at this point. Two pieces of fishpaper and mica should be placed with the two mica surfaces together, between the coil and the joint, and the leads should be tied securely to the coil with strong cord. Empty spaces which may exist around the leads should be filled with oakum. After reinsulating, the coil should be dipped three times in a good grade of plastic varnish, baking it thoroughly each time. The coils should be gaged for thickness and size.

How to Test Field Coils

A device for locating faults in field coils before they are assembled in the motor frame is shown in an accompanying illustration. The apparatus consists of an E-shaped electromagnet, which has a detachable yoke. The exciting coil is wound around the middle leg of the E. On the back of the E between the middle leg and each outside leg are wound two small coils. These two coils are connected so that under average conditions the electromotive force induced in them is opposite, thereby accurately balancing each other. A zero center wattmeter or ammeter is connected to these coils to register any unbalancing.

To operate the set a good field coil is placed over one of the outer legs while the coil to be tested is placed over the other. If it has no shorts or current leaks between turns the needle will remain at zero. If the insulation in the coil has given way so that an induced leakage current will flow between turns, this alters the distribution of the flux so that more will pass through the detecting coil on that side of the E, thereby inducing a higher voltage in it and causing a current to flow, the value of which will be proportional to the flow of leakage current. If the coil being tested has one or more short-circuited turns the needle will leave the scale. To obtain consistent results it is necessary that the field coils have the same number of turns, and be made on the same mold. It is also necessary to place them on the set in as near the same position as possible, for a slight variation in position and coils having very heavy copper will cause an unbalancing of the flux, which will in turn cause the meter to show an unbalanced condition. A little practice in handling this type of testing set makes it easy to avoid such misleading readings on the meter.

To locate the short in the field coil by heating, it is necessary to place the coil over the middle leg of the E and complete the magnetic circuit with the detachable yoke. The exciting coil is connected to the line for a short time with the meter shunted.

A very simple testing set can be rigged up to obtain the same results by using the portable growler which is used for testing armatures. An ammeter is connected in series with the exciting coil of the growler. A good field coil similar to the one to be tested is placed in the V-part of the growler, the magnetic circuit being completed by placing a laminated core through the coil so it touches the V of the growler. When the primary circuit is closed the current reading on the ammeter will be the exciting current. It will be different for various types of coils. The coil to be tested should be placed in the same position and the ammeter observed. If the current is higher than that of the good coil, there is an internal short or a current leakage between turns.

A simple resistance test set can be made by placing a similar standard or new coil in series with the one to be tested, across a direct-current line, a suitable resistance being used to limit the current. A voltage reading should be taken across each of the coils. If the voltage drop across the coil being tested is more than 10 per cent lower than the good coil it has short-circuited turns.

Painting cars and buses of Public Service Co-ordinated Transport at its Newark shops

Shop Methods Systematized for

Upkeep of 3,900 Vehicles

Same personnel at Newark shops of Public Service Co-ordinated Transport is responsible for overhaul and repair of 2,100 cars and 1,800 buses

By H. A. Benedict
Mechanical Engineer Public Service Co-ordinated Transport, Newark, N. J.

NEWARK shops of the Public Service Co-ordinated Transport form the center of activity for overhaul and repair of a total of 3,900 public transportation vehicles. Of this number 2,100 are street cars and 1,800 are buses. This is the largest bus fleet in the United States and one of the largest aggregations of street cars. Maintenance methods have been thoroughly systematized to take care of the large volume of work required of these shops.

1,234 Cars Overhauled Last Year

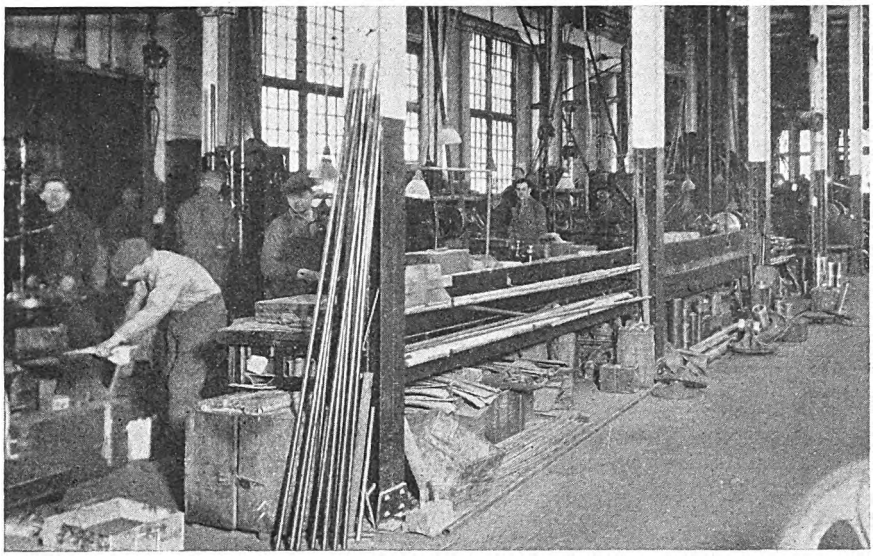
Cars in need of extensive body repairs or painting, and cars damaged in accidents are brought to the shops for rehabilitation. If the trucks and motors are in need of overhauling, the car is placed over a pit in the motor shop, the body is raised clear of the trucks by an electric hoist, and the trucks are run out from under the body and then dismantled and completely renovated. Motors are removed and overhauled, armatures, fields and bearings are inspected and put in first class condition before reassembling. All worn parts of trucks and brake rigging are repaired or replaced.

When wheel flanges were worn the former practice was to turn down the tread of the wheel in a lathe to an extent sufficient to allow the flange to be re-shaped. This method has now been discarded at the Newark shops. An electric arc-welder has replaced the lathe turning process. The flanges of both wheels are built up simultaneously as shown in an accompanying illustration.

Before cars are painted all necessary body repairs are made in the carpenter shop. Underframe, posts, body panels and moldings, floor platforms, ceiling and roof are carefully inspected for defects. Worn or damaged seats, destination signs, registers and sash are removed and are repaired by men who do only this class of work.

In the paint shop the washing-down, priming, surfacing, enameling, striping and lettering, and varnishing processes follow a rigid time schedule. As cars, after having been painted and trimmed, leave the paint shop, the lines of cars are moved down each day and more cars are

Digitized by Google



Machining bearings in the truck overhaul shop

brought in on the wash-stand at the other end of the shop.

During the time the car is in the shops all the air lines, air compressor and the various electrical equipment such as controllers, circuit breakers, heaters, buzzers and headlights, are inspected and tested and all necessary repairs made, so that after a final inspection the car is again in the best of condition and ready for service. During the year 1927, by means of this system, 1234 cars were thus rehabilitated.

Same Personnel Does Bus Overhauling

Another important activity of the shops is the re-conditioning of buses. At the present time the shops are completely equipped for the overhauling of all chassis units as well as for the manufacture and repair of fenders, hoods and radiators.

Nowhere else in the system is the principle of co-ordination of car and bus better exemplified than at the Newark shops. The same armature winders who during years of experience have become experts in rewinding and repairing car motor armatures now work on gas-electric bus generators and motors as well. Gas-electric controllers and resistances have no secrets for men who have spent years repairing similar equipment for cars. The same idea of co-ordination extends to the other departments like the carpenter and paint shops, where cars and buses stand side by side.

Parts Overhaul Is an Important Activity

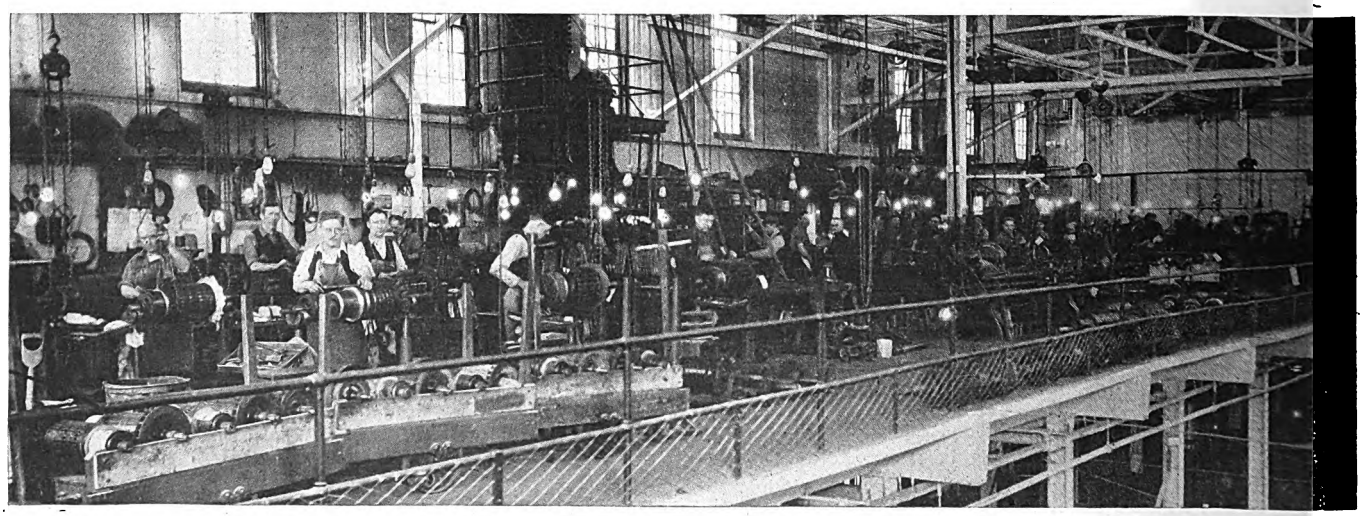
The overhauling and painting of bus bodies is carried out in much the same manner as that of cars. The bodies are completely overhauled and all necessary repairs made to fenders, hoods, radiators, wiring circuits, seats, sash and destination signs. The buses are then driven into the paint shop, and as in the procedure with the cars, the lines of buses are moved down each day until the finished buses, ready for the road, roll out the south doors. During 1927 there were 815 buses handled in this manner.

Still another function of these shops is that of the overhauling and general repairs to all units of the cars and buses. Among the many types of units re-conditioned at the shops for installation by the operating carhouses and garages are car wheels, armatures and fields, controllers, resistances, circuit breakers and other electrical units, compressors, axle and armature bearings, bus engines, transmissions, rear axle assemblies, gas-electric generators and motors, radiators, gasoline tanks, hoods and fenders. A complete ignition department overhauls ignition generators, starters, magnetos, carburetors and batteries. A completely equipped spring shop has just been established for the manufacture and repair of bus springs.

Hundreds of broken or worn parts are welded and machined each month in the blacksmith and machine shops. New castings are machined and put into stock for the use of the maintenance men in carhouses and bus garages. Every effort is made to utilize the most efficient methods known to modern shop practice.

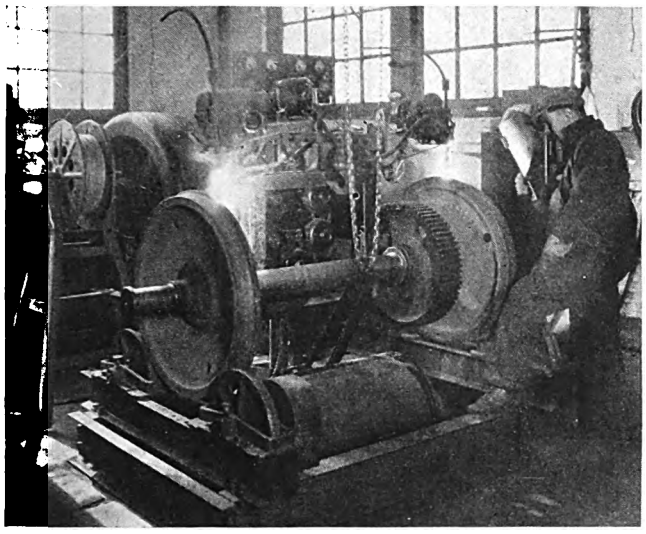
In addition to unit overhaul, many other activities of the most varied nature are carried on at the shops. Signs of all descriptions are lettered in the sign department of the paint shop. New buses bought complete from bus manufacturers arrive with only a priming coat and are finished in the paint shop.

During the past year many street cars and buses have



Rewinding armatures for cars and gas-electric buses

Digitized by Google



Building up wheel flanges by electric welding

been made "de luxe" by the installation of refinements, including more luxurious seats.

In 1924, after many years' experience in building cars, the shops turned their attention to the building of bus bodies. A design was adopted which has proved so satisfactory in operation, that with few modifications from year to year, 58 bodies were built in 1924, 189 in 1926, 65 in 1927, and at the present time a group of 331 are under construction.

Lays Rails for Double Track at Night

Without any delay to traffic Birmingham Electric Company completes 900 ft. of track reconstruction in eleven days

RECONSTRUCTION and repairs of track should be done with the least possible inconvenience to the public, in the opinion of the Birmingham Electric Company, Birmingham, Ala. Not only is it the opinion of the company, but it is an ideal that has been practiced by the company consistently. There is no need to expatiate upon the matter, but a recital of the facts about a recent typical instance will suffice to show how the company has gone about the task of putting into practice the doctrine which it preaches.

Recently the city decided to renew the paving on Twentieth Street from First to Fourth Avenue. At the same time the Birmingham Electric Company had to rebuild 900 ft. of double track. This track is in the heart of the city's business section, and more cars are run over it per hour than on any other line. Altogether, there are eight lines that use this track and during peak hours of travel, it carries an average of 51 cars per hour.

Work was begun Aug. 12 at 9 p.m. and finished Aug. 23 at 5:30 p.m. It included the complete rebuilding of the track and the return of the street to good condition. While the work was being done there were no delays to scheduled cars nor any accidents, although no cars were detoured while the track was being built.

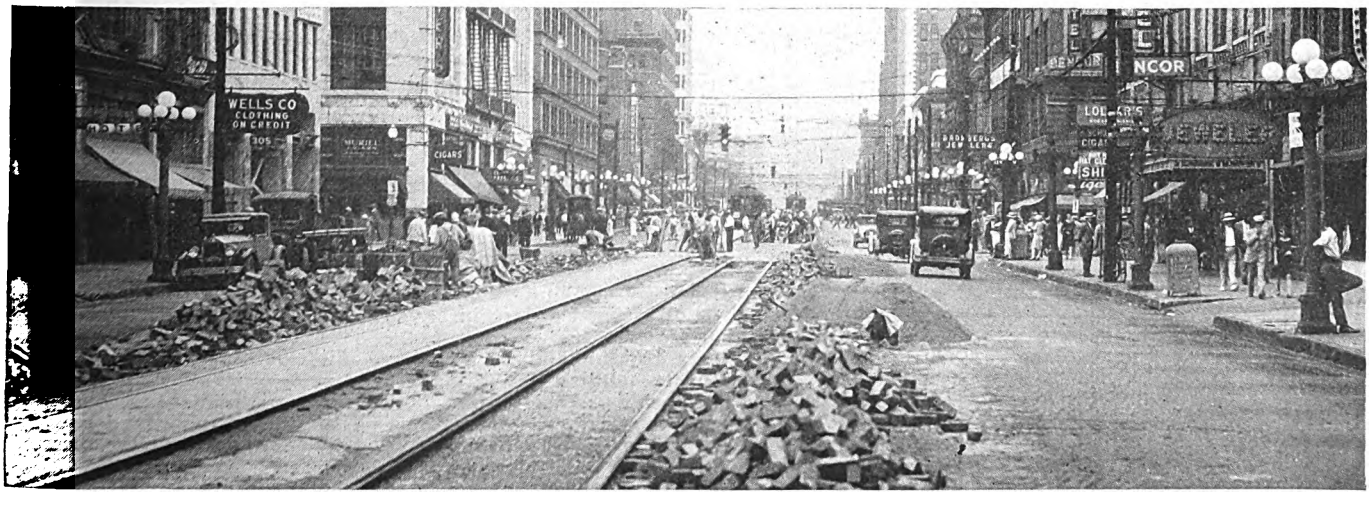
Parking Prohibition Helps Work

The old track consisted of 9-in. 95-lb. girder rail, laid on creosoted ties in concrete, with bolted and bonded joints. The paving was of creosoted wooden blocks. The new construction consists of A.E.R.E.A. 7-in., 122-lb. girder rail, on the same ties with brick paving. It was necessary to use a 2-in. cast-iron tie plate on each tie to raise the 7-in. rail up to the grade of the former 9-in. rail. All joints were thermit welded.

In the work of reconstruction the wooden blocks adjoining the old rails were removed; then the concrete around the 9-in. rail down to the ties was cut out with air hammers. This space was then thoroughly cleaned for the new rail. The latter, before being put in place, was laid on the street parallel with the old track and thermit welded and ground in lengths corresponding to a city block. Between the hours of 1:30 and 4:30 a.m., when there was only one-hour service on the line, the new rail was slipped into place. This was done without in any way interfering with the schedules of the cars.

While the work was going on, the city authorities prohibited parking on both sides of the street. During this time, the earnings on the lines that operate over this section of track showed a slight increase over the previous week. This gain was attributed to the restricted parking in force.

At the conclusion of the work the company received a most complimentary letter from the city engineer extending congratulations on the expeditious manner in which the work was done.



This double track in Birmingham was relaid down to the ties in eleven days without any interruption of car movement

ELECTRIC RAILWAY

New

Help Your Company to Win New Maintenance Trophy to be Awarded at Next A.E.R.A. Convention

Individual Cash Prize of $200 Offered for Best Maintenance Idea of the Year

Twelve Cash Prizes to be Distributed Among Maintenance Men in Various Departments

IN ANSWER to an industry-wide expression of appreciation of the value of ELECTRIC RAILWAY JOURNAL'S maintenance contest conducted in 1927 and extended in 1928, a new series of prizes and a bigger and broader contest have been arranged through the co-operation of the American Electric Railway Association and the committee of judges, for the purpose of stimulating increased recognition of the work of the maintenance man, and raising the standards of maintenance in the local transportation industry.

At a meeting of the committee of judges reappointed by F. H. Miller, president of the American Electric Railway Engineering Association, held Oct. 12, several changes in the contest were made to increase its value to the industry. These include first, the establishment of a trophy to be awarded at the next convention to the company making the greatest contribution to the improvement of maintenance practice through participation in this contest; second, an annual cash prize of $200 to the individual submitting the best maintenance idea. This award also to be made at the annual convention. Third, a series of twelve individual prizes of $25 each to be divided equally between maintenance men in the following four divisions; (1) Rolling stock and shops, (2) way and structures, (3) electrical and line, (4) buses and garage, including shop equipment for bus maintenance. Fourth, departmental certificates of merit to be awarded to each of the four departments making the best individual showing in the contest.

AS IN the previous maintenance contest, the purpose is to arouse interest among maintenance men in the development and adoption of improved methods for performing routine work, or new methods or fixtures that save labor, time and money in maintenance on a transportation property. All entries are to be made in the form of short articles describing briefly methods or devices that improve maintenance practice. These will be judged primarily on the value of the idea presented and its adaptability to the maintenance work of transportation companies. Special writing ability is not necessary. It is the intention to make the prizes available to men engaged in practical maintenance work. The form of presentation will be judged only as to the clearness with which the method or device is described and illustrated, and the extent to which information is given which would be needed by other properties interested in using the idea.

THE opportunities for individual men to win cash prizes include both the capital prize of $200 and the twelve departmental prizes previously outlined. The departmental prizes will be divided into three groups, as follows: (1) Four prizes of $25 each to be

Rules of the Contest—

1 The contest will be judged and the prizes awarded by a committee of the American Electric Railway Engineering Association consisting of A. T. Clark, superintendent of rolling stock and shops United Railways & Electric Company of Baltimore, chairman; Howard H. George, superintendent of research Cleveland Railway; F. McVittie, electrical engineer New York State Railways, Rochester, N. Y.; G. C. Hecker, special engineer American Electric Railway Association; Charles Gordon, editor *Electric Railway Journal*. All decisions of the judges in interpreting the conditions of the contest and in making awards will be final.

2 Any employee or official of an operating electric railway or bus company may compete for the prizes.

3 Each contestant may submit any number of items he desires, each of which will be judged separately. An individual may win several of the prizes.

4 The author does not necessarily have to be the originator of the idea, but it must be adopted and be in use on the property with which he is connected. The idea submitted may have originated on another property or may have been furnished by a manufacturer. No device or method a description of which, to the knowledge of the contestant or the judges, has been previously published will be eligible for this competition.

5 The competition is not limited to those who originated or developed the idea or apparatus described. Any employee, with the approval of the department head concerned, may submit a maintenance practice or device used on his property. More than one article covering the same device or method will not be accepted, however.

6 Where the management of a railway has a practice of requiring approval of articles sent out for publication such approval must accompany the manuscript. If written approval does not accompany the manuscript it will be assumed that such approval is unnecessary.

7 An article may be submitted by several persons or by a department, and need not be written by the person in whose name it is submitted. The prize will be awarded to the individual or department whose name appears on the manuscript, and may be distributed among the winners on any basis they may desire. Should there be a tie for any prize the full amount will be awarded for each of the articles involved in the tie.

8 Articles may describe any maintenance practice or device used by any department of a railway such as the maintenance of rolling stock, buses, shop equipment or methods and equipment for overhead line repairs, power distribution and power generation devices, signal work, track and way maintenance, etc. Unless manuscript submitted is marked to indicate the department to which it is to be credited, the judges will

JOURNAL *Announces* Maintenance Contest

READ the conditions of this new and bigger maintenance contest. Any employee or official of an electric railway or bus operating company may compete. No limit on number of items that can be submitted. Don't delay getting started. Winning company, department and individual to be honored at next convention. Contest starts Monday, Oct. 22, 1928, and ends midnight, Aug. 17, 1929.

READ CAREFULLY

determine the classification under he following divisions: (1) rolling tock and shops; (2) way and tructures; (3) electrical and line; 4) buses and garage.

9 Articles submitted for these prizes should be preferably 100 o 200 words in length and should e accompanied by one illustraion. Brevity consistent with a roper presentation of necessary nformation will be given weight n judging articles. In no event hould they be longer than 400 vords with not more than two llustrations. Articles will be pubished as promptly as space permits.

10 In rating the various articles the committee will consider he primary value of the method r device as of highest importance. he committee will also consider ts practicability, the advantages nd economies that are set forth nd the clearness and completeness ith which the idea is presented.

11 The original manuscript and illustrations will be turned ver to the committee of judges or making all awards. These ay, however, be published before r after prizes are awarded.

12 All articles must be in the English language and be ailed to the editor of *Electric ailway Journal,* Tenth Avenue nd 36th Street, New York City.

Items to be eligible for the first group of departmental prizes must bear a postmark not later than midnight, Jan. 15, 1929; for the second group not later than April 15, 1929; for the third group not later than July 15, 1929. All material bearing a postmark not later than midnight, Aug. 17, 1929, will be eligible for individual cash capital prize, company trophy award and departmental certificates of merit.

13 The announcement of winners of departmental prizes will be made in the issue of *Electric Railway Journal* devoted to maintenance and construction (the third issue each month) in the month following the closing date for each group of departmental prizes. Winners of the company trophy, individual capital cash prize and special departmental certificates of merit will be announced, and awards made, at the 1929 annual convention of the American Electric Railway Engineering Association.

14 Any material submitted may be published at any time after its receipt that the editors of *Electric Railway Journal* decide.

15 All articles submitted will become the property of *Electric Railway Journal* and no manuscripts will be returned.

16 A minimum of $5 will be paid for each item published.

[Additional copies of these rules and full details of the contest may be obtained upon application to ELECTRIC RAILWAY JOURNAL or the American Electric Railway Association.]

awarded for the best maintenance idea submitted before Jan. 15, 1929, from each of the four departments mentioned, namely, rolling stock and shops, way and structures, electrical and line, buses and garage. (2) Four prizes of $25 each for the best items submitted between Jan. 15, 1929 and April 15, 1929, divided between the four departments as before. (3) Four prizes of $25 each for the best items submitted from April 15, 1929 to July 15, 1929. Announcement of the winners of these departmental prizes will be made in the regular maintenance issues of the JOURNAL following each closing date. The annual cash prize of $200 will be awarded at the convention for the best single item submitted in the contest.

AS PREVIOUSLY stated, the annual company maintenance trophy will be awarded at the convention to the company making the greatest contribution to the improvement of maintenance practice through participation in this contest. In determining the winning company, the judges will consider; the total number of items submitted by employees or officials of a given company; extent to which each of the four maintenance divisions are represented in the items submitted; number of individual departmental prizes won; relative merit of all material submitted; extent to which the ideas presented are applicable to other properties; value to the industry of the maintenance ideas made available through participation of employees or officials in this contest.

In addition to the individual prizes and the company award, a special certificate of merit will be presented to each department making the best individual showing upon the same general conditions as outlined for the company award. These certificates, together with the capital cash prize, and the company trophy will be presented at the convention.

GENERAL INSTRUCTIONS

Write on one side of the paper only. Have your article typed if possible, but manuscript written long hand will be accepted. Write the article as though you were writing a letter to another maintenance man giving him your experience with a new method or device. "Fine writing" is not necessary. Give merely the facts and a description of the device or method. Include data on cost savings effected whenever possible.

Envelope and manuscript should be marked "Maintenance Competition." Any number of items may be sent in the same envelope.

Digitized by Google

Use of Carbon Brushes in Railway Service

By W. C. Kalb, *Chief Engineer*
National Carbon Company, Inc., Cleveland, Ohio

When carbon brushes were first used in electric railway motors the improvement in performance over the metal brushes was so marked that for a time it was felt that anything to which the name carbon could be applied was suitable for a brush. It was soon discovered, however, that certain compositions were decidedly superior to others, and a brush composed of a mixture of coke and graphite with a suitable proportion of pitch for the bonding agent became the standard railway brush. This brush was extruded in strips of the desired width and thickness, baked, sawed to required length, copper coated and considered a finished product. One sixty-fourth of an inch was considered a reasonable variation in thickness at that time, while limits of variation on width and length had not been suggested. This condition removed any necessity for grinding the brush to finished dimensions, since the shrinkage in baking could be controlled within those limits.

With progress in the development of electric traction, the demand came for a carbon brush of better quality than had yet been produced. Cars were being operated at speeds approximating those of the steam railways and the extruded carbon graphite brushes chipped badly at this high speed. Furthermore, commutator maintenance was unduly large and much of this was directly traceable to two things—failure of the brush to keep the mica flush with the commutator and the use of abrasive brushes in the effort to prevent high mica. Undercutting of the mica in the commutator made possible the use of a non-abrasive brush with much better wearing qualities than the type then in common use. Such a brush had been produced by the carbon manufacturers, it being a molded product, considerably harder than the extruded brushes then in use, and given its graphitic characteristics by graphitization in the electric furnace rather than by the incorporation of graphite in the original mix. This type of brush was not adapted for use on flush mica under the severe conditions encountered in railway service, since the process of graphitization removed all abrasive characteristics. Grades of this type could only be used successfully where the mica was undercut. The advantages were so evident, however, that the practice of undercutting electric railway commutators became general and the molded electro-graphitic brush the standard for railway service.

Small Clearance Found Advantageous

The advantages of small clearance between brushes and brush-holder boxes were realized at the same time. This resulted in much greater attention to the design and accurate construction of brush-holders than had formerly been considered necessary. It also led to the practice of grinding all faces of the brushes to close limits.

During the period of transition which accompanied the adoption of undercut commutators and greater emphasis on accuracy of brush and brush-holder dimensions it was decided that copper coating of railway brushes offered few advantages. When the brush wore down so that the copper coating came in contact with the commutator, beads of copper were formed which scored the commutator surface and often prevented removal of the brush from the holder. This led to the adoption of plain brushes as standard railway practice.

In the order of their relative importance, the requirements placed upon a brush for railway service are:

1. Maintenance of commutator surface in suitable condition at minimum cost.
2. Operation within normal limits of temperature.
3. Brush life.

While commutator maintenance per car-mile is small today in comparison with that experienced in the early history of electric traction, it is still an item of major importance that is influenced to a large extent by the characteristics of the carbon brushes. Commutation must be good, otherwise spotting soon develops on the commutator, necessitating resurfacing. Abrasiveness must be avoided, but the brush must be sufficiently hard to polish the commutator surface and sufficiently strong to withstand the mechanical stress encountered. Low friction is important in a railway brush, not only to maintain temperature within the desired limits, but also to prevent chattering with resultant breakage.

Side wear on certain types of motors becomes the limiting factor in brush life rather than reduction in length of brush. There seems to be conclusive evidence that side wear results from three distinct causes—vibration of the brush, abrasion from dirt drawn into the motor, and burning due to arcing between the brush and the sides of the brush-holder box. Side wear due to abrasion is most pronounced on ventilated types of motors where the air is drawn into the motor from the bottom of the frame directly onto the commutator and brushes. On some roads this condition has been corrected by closing the bottom ducts in the frame and using a perforated cover plate with a baffle plate immediately below it, preventing the incoming air from blowing directly onto the commutator. Where the side wear is traceable to arcing it may be overcome by the use of flexible shunts on the brushes. This adds appreciably to the cost of the brush, but may increase the life enough to more than offset the added cost.

Careful Workmanship Important

In the maintenance of commutator and brushes, considerable economy will be realized by placing emphasis on careful workmanship. The commutator surface should be finished in true cylindrical form and as smooth as possible, since the minute ridges left by turning or sand papering with coarse sand paper cause rapid brush wear. In undercutting it is important that no fins of mica be left in the sides of the slots. It is also desirable to chamfer the edge of the slots slightly in order to remove any burrs raised by the undercutting tool. Brush-holders should be kept to accurate dimensions, proper spacing and alignment, and free from any burrs which might interfere with the movement of the brush. Uniform tension should be maintained on all the brushes of a motor, the amount of pressure ranging from 3 to 8 lb. per square inch depending on the condition of roadbed and speed of operation.

While the present trend on railway motor design is toward the use of small-diameter motors of high angular velocity with compound gearing or worm reduction, necessitating emphasis being given to low coefficient of friction in selecting the most suitable grade of brush, the development does not indicate the need in the immediate future for a radical change from the type of brush now standard for electric railway service.

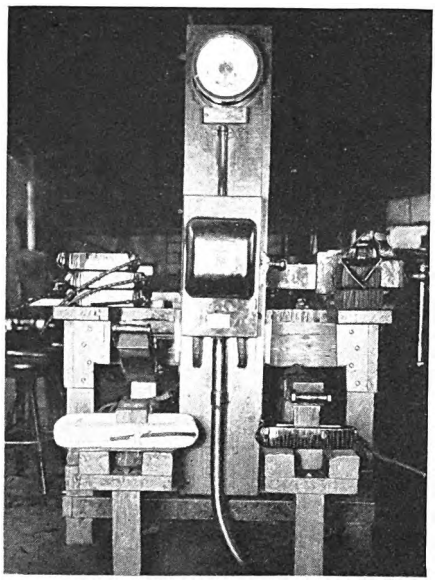
Pittsburgh Railways' Method of Testing Field Coils

MANY ways exist for testing field coils for short-circuited turns. The method used by the Pittsburgh Railways is simple and a large number of coils can be tested in a short time.

The test outfit consists of two separate cores, one for the main field coils and the other for commutating field coils. Each core has a separate primary coil wound for 110 volts alternating current. An ammeter is placed in the main circuit to read the current used in either coil. Only one exciting coil is used at a time and is connected in circuit by a double-throw safety switch. The width and thickness of the leg of the core over which the coil is slipped during testing is of a size that will take the smallest coil in that class. The distance between the two legs is such that it will also take the largest coil which must be tested.



Field coil in position for testing with the special outfit

These cores are mounted on a table so that the long side is horizontal. The top section of each core is hinged at one end and has a handle at the other. A counterweight connected by a rope through a pulley balances this part of the core so it can be raised or lowered with little effort.

The correct value of the current for the primary when the field coil is not short circuited can be determined by placing a field coil which is known to be good in its proper position and noting the reading of the ammeter.

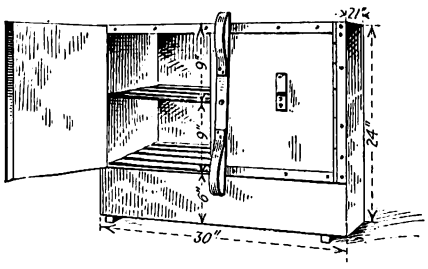
Armature Coil Oven

By R. S. Beers
Railway Engineering Department, General Electric Company, Schenectady, N. Y.

WITH the present practice of having armature coils fit just as tightly in the slot as possible, it is desirable that the coils be soft, pliable and flexible at the time they are installed in the armature. One way of assisting this is to warm the coils before they are installed. This softens them, making them more pliable, and reduces the chances of damage to the insulation when they are being put in the slots.



Armature coil softening oven in shop of the Schenectady Railway

An oven for this purpose can be of very simple construction and requires only a low heat. Any railway can make one in its tin shop and will find, when this oven is used, that the armature winder is able to do a better job with much less trouble.

Such an oven is shown in the accompanying illustration, with approximate dimensions. This particular oven has space for one set of armature coils. It is made of No. 16 gage sheet steel (0.0625 in.) and lined with sheet asbestos, the same as is used to insulate drum controller covers. Current for heating is taken from the trolley, and five 100-watt lamps are used for the heating elements. A temperature of about 150 deg. F. is correct. This temperature so softens the coils that they are pliable, and does not make them so hot that they are likely to burn the armature winder's hands.

The coils should be put in the oven 30 to 45 minutes before they are used, in order that they will have time to become heated all the way through. A good practice is to put ten to twelve coils in the oven, and, when they are heated, to take out one or two hot ones and replace them with cold ones.

The oven illustrated was built by the Schenectady Railway for its armature room. Other operators have built similar ovens, and in every instance the armature winders have found that the armature coils went in the slots better and could be settled into their proper locations with less hammering and rough treatment of the coil.

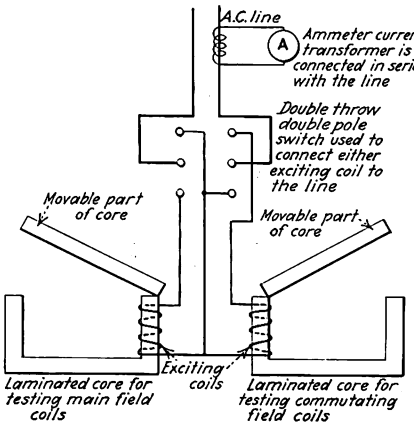
Pittsburgh Railways' Method of Testing Field Coils—Continued

This value will vary for different sizes of coils.

The field coil to be tested is placed over the vertical leg of the core and the magnetic circuit is closed by lowering the top section. If the field coil has one or more short-circuited turns the ammeter will show a current reading in proportion to their number. By leaving the short-circuited coils on the set for a few minutes the shorted part of the coil will begin to heat. In this manner it is possible to determine the location of the short. If the field coil has no short-circuited turns the ammeter will register only the exciting current.



Connections for field coil testing outfit

It is possible to use this outfit for testing open circuits merely by short circuiting the field coil leads. Immediately the ammeter should show a heavy current reading when the primary switch is closed. If the coil has an open circuit, the ammeter will only register the exciting current.

While the field coils are being clamped into the motor frame some of the coils may become short circuited. The Pittsburgh Railways gives every overhauled motor a load test before it is placed in the car truck. This load test will show up any faulty field coil which may have tested out O.K. before it was installed.

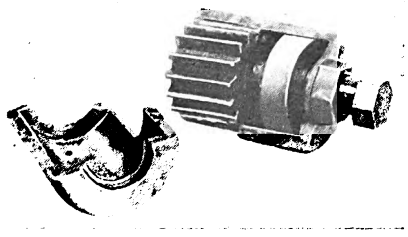
Screw Type Pinion Puller*

BY C. B. HALL
Chief Clerk Mechanical Department
Virginia Electric & Power Company,
Norfolk, Va.

FINDING that the old practice of using sledge hammers and wedges to remove pinions was damaging gearing, bearings and housings, Grafton Day, foreman of the machine shop Virginia Electric & Power Company, Norfolk, Va., devised a screw-type pinion puller.



Pinion removed from motor and puller opened up to show construction

The device includes a split steel casting with a concave hook to fit down over the back of the pinion when the puller is in position and a screw arranged so that it strikes directly against the end of the armature shaft. In operation the hooked end is placed back of the pinion and usually a single turn of a wrench on the hexagonal head of the screw will start the pinion so that it can be pulled off easily. One part of the housing is cut away so that the puller can remove pinions while they are still engaging the gears.

Slat Seats Replaced by Upholstered Type*

By J. E. Bodah
Master Mechanic Wisconsin Public Service Corporation, Green Bay, Wis.

"RIDE on leather" has become a potent slogan of those who travel on the common carriers in the districts served by the Wisconsin Public Service Corporation. This railway had a number of Birney cars with wood slat seats. Believing that the public was interested in a vehicle with a more comfortable type of seat, these were reconstructed. It was quite desirable to keep the expense low, and as a moderate priced leather upholstered seat costs about $36 each or a total of $504 for the fourteen seats in this size of city car, it was decided to utilize the existing slat seats in the reconstruction. A good grade of brown upholstering leather and long hair packing was obtained and a comfortable seat was turned out by the shop forces at a cost of but $10. In comfort, appearance and durability the reconstructed seat is equal to most of those on the market.

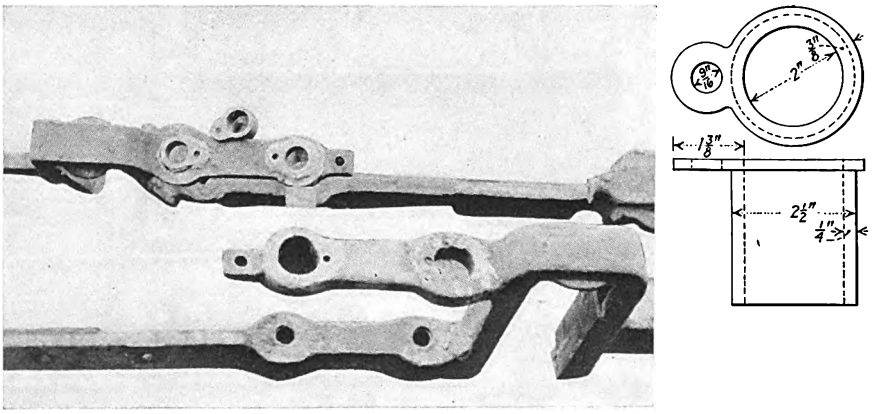
Welded Side Post Bushings

MANGANESE steel bushings are being used in Brill 22-E truck side post spring castings by the Jamaica Central Railways, Jamaica, N. Y. Originally these bushings were bolted to the casting but considerable trouble developed, as the bolts worked loose and left the bushing free to move. The bushings are now welded to the casting to overcome this trouble. A low welding heat is used to prevent crystallization of the casting. When the bushing is worn out, the weld is chipped off and a new one inserted.



The bushing itself is seen at the top, and two of them are in position. The welding has been completed on one end only. Below is shown a casting prepared for the reception of new bushings. The line drawing shows the manganese steel bushing for truck frame

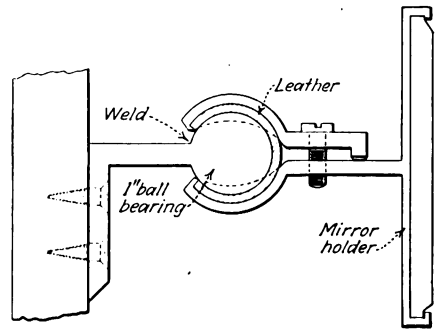
Preventing Theft of Rear Vision Mirrors*

By Farrell Tipton
Electrician San Diego Electric Railway, San Diego, Cal.

ONE of the many parts of automobile equipment that has been adapted to street car use is the rear vision mirror. The San Diego Electric Railway first installed automobile mirrors as manufactured, but experienced difficulty due to the large numbers that were stolen. To stop the loss the bracket shown in the accompanying illustration was devised. Since this type of bracket has been used no thefts have been reported.



Special clamp for adjustable rear vision mirror

The bracket is made of $\frac{1}{4}$x1$\frac{1}{4}$-in. mild steel. The sockets are formed by a die under the steam hammer. A 1-in. ball for bearing is welded to the body angle bracket, and a thin piece of leather placed between the ball and the socket provides a satisfactory clamp for holding in place.

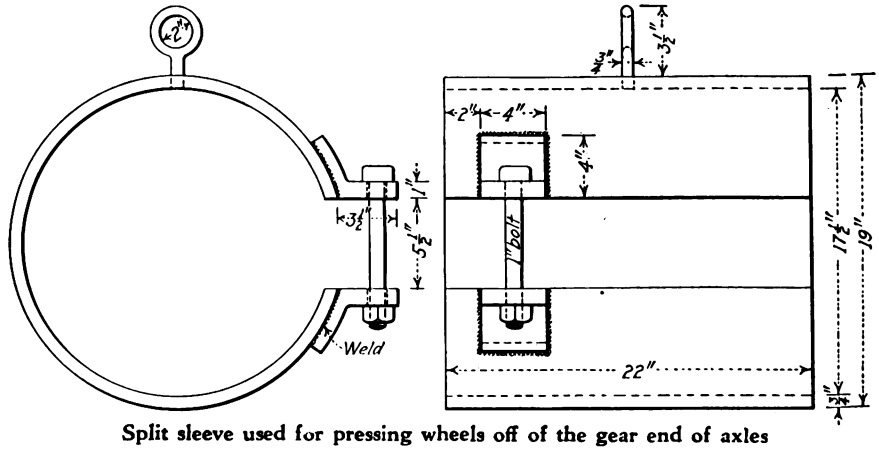
Split Sleeve for Pressing Off Wheels at Gear End of Axle*

By Charles Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

CAR wheels of the San Diego cars, of 26-in. diameter, are pressed off from the gear end of the axle with the aid of the split sleeve shown in the accompanying sketch. It was found impracticable to press the wheels off with tool steel pins passed through the four holes in the web of the gear, as the holes were not large enough to permit use of a pin of sufficient size to withstand the pressure required.

The inside diameter of the split sleeve used is such that it will go over the outside of the gear and the opening of the split is wide enough to slip over the axle. After the sleeve is in position a 1-in. bolt is passed through the holes in two brackets and is tightened to keep the sleeve from swinging open while under pressure. The bracket end of the sleeve is placed next to the wheel as the dish of the wheel tends to act as a wedge and forces the sleeve open while under pressure. This type of sleeve has been found superior to other methods of pressing wheels off as it is self-aligning and distributes the pressure evenly around the rim of the wheel.



Split sleeve used for pressing wheels off of the gear end of axles

ROLLING STOCK—MISCELLANEOUS—42

Preventing Accidents from Folding Doors*

By A. M. Lindsay
Superintendent of Rolling Stock Montreal Tramways, Montreal, Canada

WHERE cars are equipped with air-operated doors which fold to the outside there is a tendency on the part of passengers to use the outside edge of the door as a grab handle when boarding or alighting from the car. When used thus, there is danger of passengers having their fingers pinched in the hinges or cracks of the door. To eliminate this danger, all new folding doors on the Montreal Tramways system are now constructed with guards, as shown in the accompanying illustrations.

In this construction the outside edges of the hinge side of the doors are beveled at a 45-deg. angle, as high up as the center hinge. It has not been considered necessary to carry the bevel higher than this, although it can be if desired. The usual opening between the leaves of the door when open is closed by a dummy hinge which is installed between the center and bottom door hinges. This dummy hinge consists of a $\frac{1}{16}$-in. plate curved to a $\frac{5}{8}$-in. diameter on one side and screwed to one leaf of the door. The space below the bottom hinge where the door folds against the step riser when closed, is protected by a piece of reinforced sheet rubber attached as shown in the sketch. This type of construction is neat, inexpensive and effective.

TRACK AND WAY DEPARTMENT—36

Driver for Steel Fence Posts*

By D. H. Walker
Chief Engineer Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.

FOR several years the Terre Haute, Indianapolis & Eastern Traction Company has standardized on steel fence posts 7 ft. long, used with 47-in. woven wire fencing. The company has approximately 100,000 rods of fencing to maintain. Formerly two men were used for setting fence posts. They used a sledge to drive the posts, and a wooden horse or other device to stand on during the driving operation.

To provide a better method of driving posts, a simple driver was made in the blacksmith shop of the company. Use of this device now enables one man to drive these fence posts much faster than two men could drive them previously.

The driver consists of a 4-ft. length of 2-in. pipe with 6 in. of round steel rod welded inside at the top end. The cost of making a driver is $1.25, of which $1 is for material. An accompanying illustration shows how the driver is slipped over the post and how the pounding operation is carried out by one man standing on the ground. This type of driver also keeps the post straight during the driving operation and provides more accurate alignments.

TRACK AND WAY DEPARTMENT—36

Shock Absorbers for Electric Track Switch Connecting Rod*

By F. W. Drowley
Roadmaster Toronto Transportation Commission, Toronto, Canada

DUE to the uncushioned impact when tongues on electric track switches strike the casting at each movement, numerous breakages of the connecting rods have occurred on the lines of the Toronto Transportation Commission. As each broken connector involves a potential traffic delay a determined effort has been made to eliminate the trouble.

Several designs employing coiled springs were tried and proved unsatisfactory. An arrangement consisting of two heavy rubber blocks in steel retainers inserted on either side of the lug was tried and adopted. This latter device absorbs the shock and lessens the tendency towards crystallization of the metal in the connector. Injury from the bending to which the connection is subjected is lessened, due to the flexible nature of the connection. Further, as the insert is cut from solid truck tire rubber, the device is practically indestructible.

In placing the absorbers the connector nut is tightened up so that the $\frac{3}{8}$-in. cap is pulled about halfway into the retainer, compressing the rubber block about $\frac{3}{16}$ in. The whole is locked by a slot cut in the face of the nut engaging a ridge on the retainer.

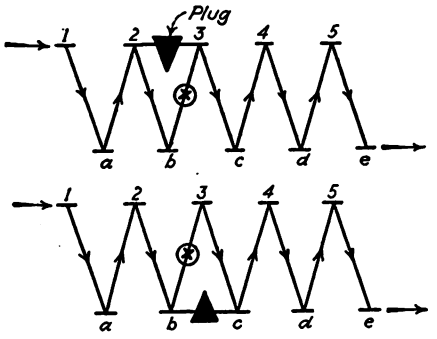
Helps for the Armature Winder

Avoid Plugging to Shunt Open Circuits

WHEN a four-pole, series-connected armature develops an open circuit, as indicated by flashing and by the burned appearance of the bars that include the open, the practice sometimes is followed of bridging the open by peening together the ends of the bars that are burned. This practice may do much permanent harm and should be avoided.

In each of the accompanying diagrams representing one of the paths



Figs. 1 and 2—Single plugging to eliminate the effect of an open circuit cuts out two armature coils

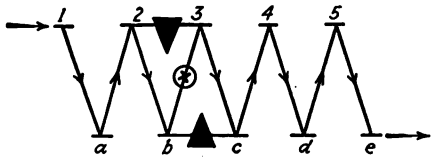


Fig. 3—Double plugging cuts out the open-circuited coil only and divides the normal current between the two adjacent coils

through a four-pole, series-connected armature, an open circuit is indicated at *X*. Each diagram shows a method of plugging to eliminate the effect of the open circuit. Fig. 1 shows bars 2 and 3 peened together and Fig. 2 shows bars *b* and *c* joined. In each figure, it will be noted that not only the open circuit coil is cut out, but also one of the coils adjacent to it.

The false conclusion is sometimes drawn that plugging the commutator on both sides, as shown in Fig. 3, would cut out three coils, the open circuited coil and one coil on each side of it. However, study of the diagram shows that double plugging actually cuts out one coil less than is cut out by single plugging. The two plugs form two paths around the open-circuited coil and each carries one-half of the regular current. For this reason the practice of double plugging, as well as that of single plugging, should be avoided.

Effect of Wrongly Counting Lead-Spread

GREAT care must be taken in counting the lead-spread of a four-pole, series-connected armature, the number of coils of which is a prime number. Placing the lead in the wrong bar may cause the two electrical paths to be very unequally divided and cause almost a direct short circuit between the brushes.

Fig. 1 shows a 17-bar, 17-coil armature, properly connected, with the number 17 bar divided only by itself and by number 1. The correct lead spread of any coil, the coil connected to bar 1 and 9, for example, is 1 to 9.

In Fig. 2, showing an armature wrongly connected, the first bottom lead has been placed in bar 8 instead of bar 9. Each bar has two leads in it, but in no case is a bar connected with the two bars directly opposite. Furthermore, to go from any bar to the adjacent bar on either side of it, it is necessary to traverse five coils in series instead of two coils, as in a properly connected armature. In a bar to bar test of an armature connected in the wrong manner, the meter would give a deflection $2\frac{1}{2}$ times that of an armature correctly connected; because, for a given current, the drop in five coils would be $2\frac{1}{2}$ times that for two coils.

In both diagrams the brushes are shown in their proper relative positions. Starting from bar 17 and tracing both paths between the brushes of Fig. 1, one path includes bars 17, 8, 16, 7, 15, 6, 14, 5, 13 and 4, and the other path, bars 17, 9, 1, 10, 2, 11, 3, 12 and 4. The two paths include approximately the same number of bars and coils.

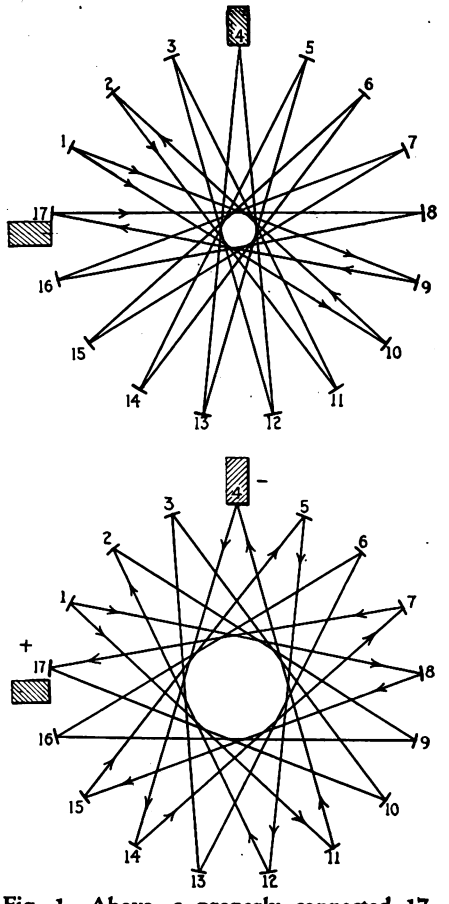

Fig. 1—Above, a properly connected 17-bar, 17-coil armature

Fig. 2—Below, armature with coils wrongly connected. One of the two paths includes only three coils, almost a direct short circuit

Tracing the paths of Fig. 2 in a similar manner, one path includes bars 17, 7, 14 and 4, while the other path includes bars 17, 10, 3, 13, 6, 16, 9, 2, 12, 5, 15, 8, 1, 11 and 4. The first of the paths includes only three coils and constitutes almost a direct short circuit between the brushes. An over count would give the same result.

In Banding, Take the Following Precautions:

1. Use a band wire that is strong enough to prevent movement due to high speed and vibration.
2. Secure the ends of all band wires under the clips.
3. See that the bands are below the surface of the core to keep them from rubbing on the poles.
4. In applying core bands, see that the tops of the coils are $\frac{3}{32}$ in. above the band groove, so that the bands pull the coils down even with the core. If coils are too high and the bands do not rest on the core, loose bands will result when the insulation dries out.
5. Wind all core bands in one operation.
6. Use a 4 lb. clean iron, well tinned.

PRACTICAL SHOP KINKS *from the* Coffin Prize

SEVERAL ARTICLES in recent issues of the JOURNAL *have given particulars of the operating practice of the Virginia Electric & Power Company, the winner of the 1928 Coffin prize. In this department this week are given some of the interesting maintenance methods and practices of the company, as told in its brief.*

High Art in the Machine Shop

THE machine shop of the Virginia Electric & Power Company is unique in more ways than one. Lightness and neatness are fundamental principles applied to these shops because these qualities are usual allies with efficiency, but the renovating policy of the company did not stop with lightness and neatness.

In September, 1927, taking a tip from the modern kitchenette, the company decided that tradition was the only reason why a machine shop should be dull and forbidding in color. The organization had seen such satisfactory results follow cheerful coloring on cars that there appeared to be no good reason why the lathe and the boring mill should not be glorified in the same way.

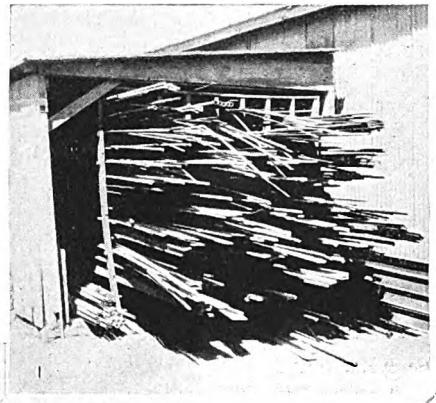
In contrast to an all-black machine, the new color plan calls for liberal use of reds and blues, with touches of yellow and black and backgrounds of green. The shop walls have been similarly treated, as were also foremen's booths, cabs and the transfer tables themselves.

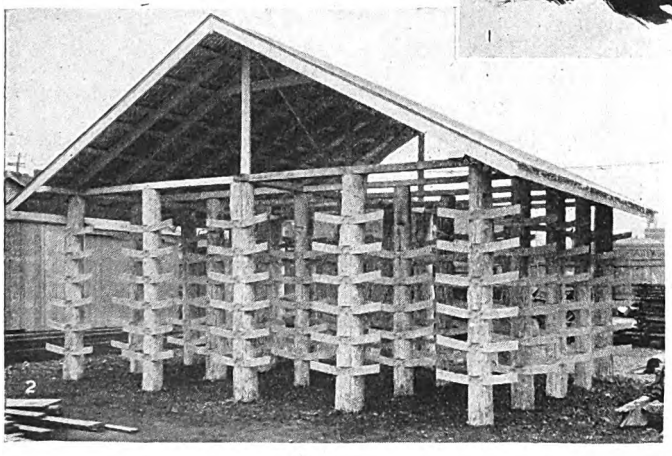
Since the painting up of the equipment in this way the machinists have shown an entirely new solicitude for their tools. They take pride in keeping their machinery attractive. Undoubtedly, also, the color contrast stimulates the brain and gives a sense of exhilaration, on the same principle that a dingy place brings forth dingy work.

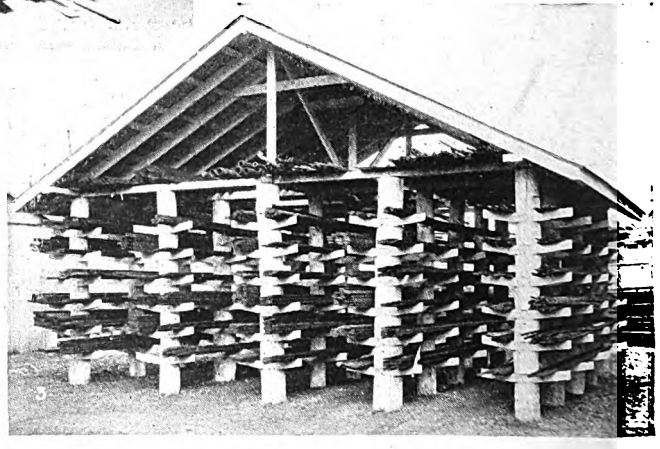
Pictures to show this kaleidoscopic effect would be useless. Instead, illustrations will be used to show some of the good housekeeping features, which characterize the shops of the company.

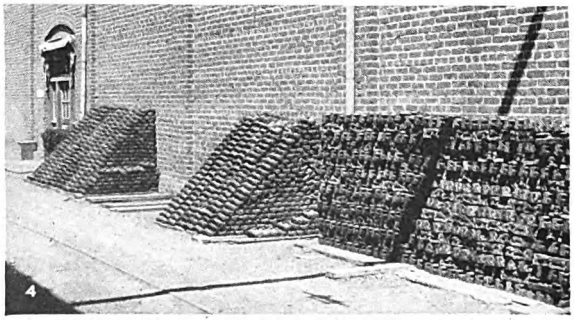
In former years, car parts after being repaired were often laid away in some corner with no attempt at methodical storage. Now they are taken promptly to the reclamation storage room where they can be obtained on requisition. Only parts under repair are permitted on the bench or floor of the shop.

The accompanying illustrations show the old and new ways of storing lengthy supply railway material. The old way was unsightly and laborious. It took a lot of pulling and shifting to get an article wanted. Now two men can select and remove the piece in seconds rather than in minutes. This is made possible by the change from rectangular divisions to yoke brackets. The rack









Old and New Methods of Storage

The method of storing as shown in No. 1 meant only "tug and pull." Now storage bins as shown in Nos. 2 and 3 have been built of discarded poles. No. 4 illustrates the method of stacking brakeshoes.

Digitized by Google

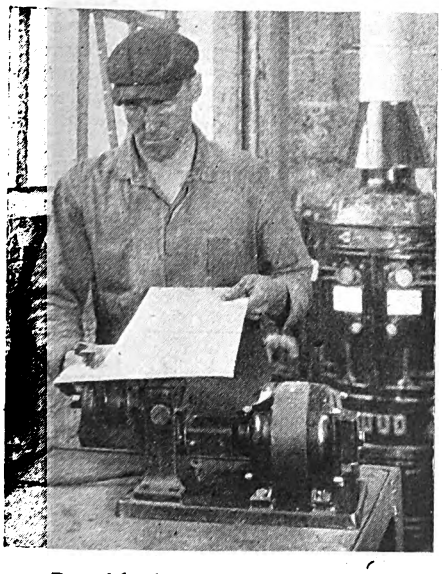
Winner

was made by cutting old power-light poles into 12-ft. lengths, and cutting or gaining them to take U-yokes of ½x3½x36 in. size. Another picture shows how brakeshoes are stacked outside so that they can be obtained quickly and with no waste of time.

In this same campaign of neatness, special attention was given to the washroom. Modern fittings were used, an interior finish in white enamel was adopted and the room provided with good natural and artificial lighting and ventilation. All individual lockers were assembled in or near this room instead of being scattered around the shop, as they were formerly.

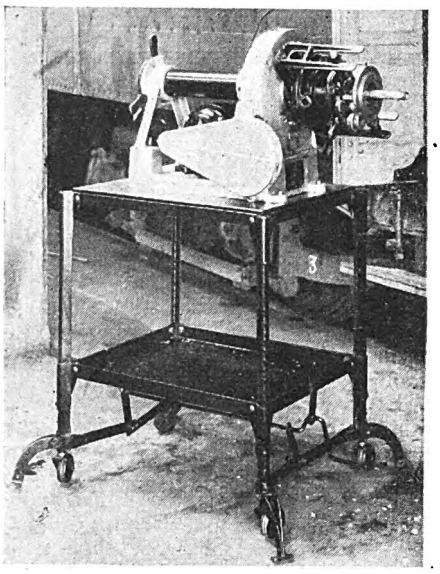
Saves Time in Metal Cutting

PORTABLE metal cutting is made possible on the property of the Virginia Electric & Power Company with the motor-driven "Unishear" shown in the accompanying illustration. It cuts No. 16 gage metal with the same ease and speed that the shopman's wife can sew a piece of cloth on a sewing machine. Since the machine can be carried around and operated from any lamp socket, it has proved a great saver of time.



Portable shear used in Richmond

Threading Pipes by Power



This power boy does better and faster threading and costs only 3 cents an hour for power

A CONVENIENT tool used in the shops of the Virginia Electric & Power Company is one used for threading pipe and similar work. It is shown above. It will take any type of hand stock and dies and eliminates the necessity of discarding such stock and dies.

It threads all sizes of pipe from ½ in. to 2 in., and with a special driveshaft it will operate any geared or reseating die stock up to 4-in. capacity. It will also drive any roller or square-end pipe cutter and can be used for turning up fittings. It is so convenient that it has been named in the shop the "Power Boy."

This machine eliminates two-thirds of the labor cost for threading pipe. Furthermore, the more uniform thread obtained over hand tools is reflected in fewer air failures from leaky pipe connections and in lower upkeep of compressors through conservation of air.

The power boy is run by a ½-hp. Universal reversible motor from any 115-volt a.c. or d.c. circuit and is mounted on a portable stand.

Increase in Armature Life in Richmond

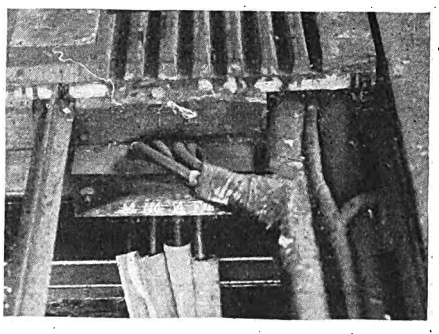
A FEW simple methods, adopted by the Virginia Electric & Power Company of Richmond, have gone a long way toward increased life for railway armatures. The first step was the introduction of dipping and baking equipment, in this case home made. An oven was built of scrap material and equipped with enough old car heaters to give a temperature of 325 deg. F. After the dippings, the armatures are baked for about sixteen hours at 226 deg. in a "sandwich" of 1-in. asbestos.

Another improvement has practically eliminated loose armature band wires. The old process was that of using insulating paper under the band wires. It is now the practice to use thin tin sheets which are held with cleats and sweated to the bands. Loose band wire disappeared with this change. In general, these and some other improvements introduced during the last two years have reduced the number of rewound armatures to one-half its former proportion. Reduction in pull-ins bear this out.

Although the GE-87 motor is a twenty-year veteran, improvements in lubrication have increased its bearing life from 10,000 miles to 75,000 miles and have cut axle-bearing troubles from 1,000 down to 200 per annum. Bearing life was lengthened by changing from lead to solid brass linings. Oiling was improved by closing the bottom axle cap, the old waste well being ineffective because the waste dropped away from the axle in a few days. Lubrication is now from the top.

Support for Motor Leads

CONSIDERABLE trouble was experienced at one time on the properties of the Virginia Electric & Power Company from broken motor



This car cable support has stopped the breaking of motor leads

leads. The cause seemed to be that through swaying, or perhaps chafing of the leads on some part of the equipment, the leads were brought into a condition where they broke easily.

At present, supports are being used for the leads so that they are brought much closer to the bolster center line than formerly. The accompanying illustration tells the story.

Association Activities

Philadelphia Engineers Discuss Movement of City Traffic

THE VALUE of the three E's, Engineering, Education and Enforcement, in the expedition and control of city traffic, was emphasized in a series of papers presented before the Engineers Club of Philadelphia on Tuesday, Oct. 16. The papers included discussions on efficient street use, city traffic engineering, requirements essential to adequate street transportation, the function of street railway and bus lines, parking, pedestrian education and safety, and traffic signaling and signal apparatus.

Far more drastic parking restrictions in metropolitan areas, the installation of parking areas outside of the business district in connection with trolley, motor bus, or, if possible, high-speed lines, and the development of faster means of mass transportation facilities were seen as necessary steps in the solution of the present traffic problem. The proper place for the motor bus as a supplement to street railways and the value of co-ordinated transportation under a single management were recognized.

The afternoon session of the club was presided over by Arthur H. Blanchard, who introduced as the first speaker Dr. Miller McClintock of Harvard University. Speaking on "Difficulties in the Way of Efficient Street Use," Dr. McClintock stated that the great underlying difficulty is a political rather than an engineering one. The customary attitude in the mind of the typical City Hall, he said, is that it is easier to do a thing without facts than it is to get such facts for a sound consideration.

An Engineering Problem

The common distribution of special parking privileges, the alderman's insistence that his ward have as many traffic lights as any other ward, regardless of location, and the feeling that "our city expects us to make a big show," which prompts the installation of a needless number of cheap and inefficient control devices, are examples of this political difficulty. Dr. McClintock urged that traffic control be taken out of politics entirely and be treated as an engineering problem.

The formal discussion of this paper was given by E. W. James, chief of the division of design, U. S. bureau of public roads. He spoke of the difficulty of locating federal-aid roads because of the insistence, particularly on the part of the small town, that the highway pass through the center of the town.

Burton W. Marsh, city traffic engineer of Pittsburgh, spoke next on "The Organization and Functioning of a City Traffic Engineering Bureau." If we ask how we are to bring order out of a universally recognized chaos, said Mr. Marsh, we shall get a great many answers and opinions based on isolated experiences. This shows the need of facts, which are best obtained by a scientific study. He cited by way of example the striking result of an investigation of Pittsburgh shopping habits, where it was found that only 2.8 per cent of shoppers parked their cars at the curb. Figures such as this should convince even the hitherto unmovable merchant that parking is hurting his business far more than it is helping it. Like Dr. McClintock, Mr. Marsh also urged that traffic engineering bureaus be created.

Few States Require Driver Tests

The next speaker, Morris O. Eldridge, assistant director of traffic Washington, D. C., told of the work being done in that city. Of particular interest was a form for reporting accidents so designed that the officer used nothing but check marks to tell the whole story. This obviously assists greatly in the compilation of statistics. Mr. Eldridge pointed out the rather striking fact that only sixteen states require tests to secure driving licenses.

H. M. Lewis, chief engineer of the regional planning commission of New York City and environs, spoke next on "Requirements Essential to Adequate Street Transportation." Mr. Lewis stated that no two communities are alike and that no standardized solution of the traffic problem can be made. A traffic survey is therefore necessary. He recommended also improving existing facilities, establishing new traffic routes, instituting night trucking, and preparing a proper zoning plan.

Lucius S. Storrs, managing director of the American Electric Railway Association, next delivered a paper on "The Function of Street Railway and Bus Lines in the Transportation System." Mr. Storrs called attention to the fact that whereas 75 per cent of the public uses the street cars and buses rather than private cars, they have no spokesman save the executives of the transit company. Consequently the public is inclined to think of parking and allied problems as matters of corporate rather than of civic interest. He stated also that wasteful duplication of service should be avoided by having street cars, buses and taxicabs under a single management.

Parking Space Valuable

Burton W. Marsh of Pittsburgh, who spoke at the afternoon session, presided at the evening meeting and introduced as the first speaker L. R. Brown, safety engineer of the New York State Railways, who spoke on "Where Shall They Park?" Mr. Brown presented some interesting figures on the value of street space used for parking which, he affirms, is the most valuable land in the city. He pointed out that if parking was allowed at all in the business district, the ideal time limit was that required to transact the average business. Hence a few minutes during business hours and two to three hours in the evening would be a fair arrangement.

In answer to the question "Where shall they park?" he said that since the downtown streets cannot accommodate more than 3 per cent or so of the total cars in a city, street widening, diagonal parking, and such remedies do not get at the root of the trouble. He recommended, therefore, that parking stations be installed at the end of subway and trolley lines where real estate values are cheaper.

Prof. Lewis W. McIntyre of the University of Pittsburgh next spoke on "Pedestrian Education and Safety." He believes that the pedestrian is not getting a square deal, but states that with conditions as they are it is impossible to give him a special traffic light or to allow him to cross the street in a manner both dignified and safe and at the same time to get traffic through. A compromise is therefore necessary, and the regulations provided by the Hoover model municipal ordinance seem to be as good as any that have been proposed. Professor McIntyre believes, however, that an extensive program of education is necessary in order that both motorists and pedestrians will agree upon and accept whatever necessary compromise is adopted.

Sidney J. Williams of the National Safety Council, who spoke next, echoed Professor McIntyre's sentiment that the pedestrian does not get a square deal and stated that, whatever his faults, the pedestrian has not one tenth as many as has the motorist.

G. C. Kelcey and K. W. Mackall, signal mechanism experts, then spoke of the various types of signals and their relative advantages. Mr. Mackall urged that signal systems be kept as simple as possible and that their adjustment be left in the hands of experts rather than traffic sergeants.

The meeting was concluded by an interesting informal discussion of various phases of the papers presented.

Change in Date of Iowa Meeting

OWING to Election Day falling on Nov. 6 the dates of the operating meeting of the Iowa Electric Railway Association at Cedar Rapids, Iowa, have been changed to Nov. 8 and 9. A great many who would like to attend would be unable to do so if the meeting were held on Nov. 7 and 8; hence the change to Nov. 8 and 9.

News of the Industry

First Electric Operation Into Boston

Conversion of railroad to Lynn, serving beaches en route, completed in fast time. More than $1,000,000 spent in work

TO THE Boston, Revere Beach & Lynn Railroad comes the distinction of being the first steam railroad to electrify into Boston. At a cost in excess of $1,000,000 the whole system,—line, stations and equipment—has been electrified and on the morning of Oct. 19, electrical train operation was started over the 14-mile route.

New Service Introduced Gradually

Important as was this event, both from the historic and economic viewpoints, it was marked by no ceremonies. As a precautionary procedure the management decided upon a gradual introduction of service by electricity, by placing only one electric train into commission the first day to take its turn among the seven steam trains that continued to make their usual scheduled runs.

One by one the steam trains will be withdrawn as, in the course of a few days, the electric trains prove satisfactory, and it may be a matter of one or two weeks before there is complete electrification over the whole main line between Boston and Lynn. The loop line has been electrified also, but was not quite ready for electric trains when the main line was opened to this new type of service.

So long as any steam trains remain on the line the present schedule will be followed, but a speeding up and an increase in frequency will become possible as soon as the electric trains have the lines to themselves. For a number of days and evenings the company's train crews have been taking the new trains over the line empty to test them, and to train themselves, and two days before the opening of the service to the public, officials of the railroad and of the General Electric Company made an inspection tour over the main line with a two-car train. Among the railroad officials in the party were Gardner F. Wells, president; George W. Wells, vice-president; Albert W. Hemphill, treasurer; Charles J. Curtax, assistant treasurer and secretary; and Charles A. Collins, a director. They expressed their entire satisfaction with the operation.

Running Time Cut

President Wells stated that with complete electric operation it will be possible to reduce the running time between Boston and Lynn by ten minutes, and with the inauguration of express service, by fifteen minutes, saving a third of the time required by the present steam schedule. He said:

Increased speed is not, however, the only advantage resulting from the electrification of the railroad. The new trains can be accelerated to full speed and stopped with exceptional smoothness; smoke, fumes and cinders have been eliminated; brilliant illumination is provided by the electric lights, and there is uniform distribution of electric heat.

Thirteen million people using this road annually, counting the passengers in both directions, will greatly appreciate this great advance and it undoubtedly will serve to increase the traffic over the line, as the road skirts the ocean and a number of beaches all the way and has stations at popular pleasure resorts. In addition to this it is destined to increase the commutation between Boston and Lynn, and one of the especially pleasant features is the elimination of smoke, fumes and cinders from the tunnel through which the line passes as it leaves the ferry pier in East Boston.

Work Started in Spring

The work of electrification was started early this year; the delays in train schedules were inevitable, but they have not been serious. "A great deal of thanks is due to our patrons," says President Wells, "for their patience during the construction period. The work has been completed in record time, without mishap or accident."

Boston has for many years advocated the electrification of the railroads entering the city, as is done in New York, so as to get rid of the smoke nuisance in the suburbs, city and stations. It has been urged also on the grounds of economy, it having been assumed that it would lessen the cost of operation. As a rule the Boston, Revere Beach & Lynn Railroad was left out of consideration in these campaigns for electrification, it being a narrow gage road, ferrying its passengers from East Boston into the city proper. Yet it remained for the "Narrow Gage," as it is popularly known, to do the pioneering work and completely electrify itself almost unexpectedly.

The Boston, Revere Beach & Lynn Railroad was planned 56 years ago, primarily to develop the land now occupied by East Boston and Revere. Actual construction was started on May 23, 1875. The Winthrop branch was started in 1877. At the present time the double-track railroad has more than 600 employees, four ferry boats and 96 passenger cars and 26 locomotives, which are now to be discarded in favor of the electric cars. In spite of the wealth of its equipment, the road has often been taxed to capacity, especially to accommodate the Sunday crowds journeying to and from Revere Beach.

Sixty of the 96 passenger cars of the railroad have been fitted out in the railroad company shops with two motor equipments, and ten additional cars are to be used as trailers. Power supplied by the Edison Electric Illuminating Company, Boston, and the Lynn Gas & Electric Company is distributed along the line after being converted at two substations.

The complete roster of present officers of the company are: Gardner F. Wells, president; George W. Wells, vice-president and manager; Albert W. Hemphill, treasurer; Charles J. Curtax, assistant treasurer and secretary; Daniel P. Abercrombie, Charles A. Collins, Walter Simonds and the president, vice-president and treasurer are the directors.

Use of Grand Rapids Street Cars Urged by City Fathers

THE public is urged by the City Commission to patronize the Grand Rapids Railroad, Grand Rapids, Mich., as much as possible following the utility's August report, which showed a continued decrease in revenue. The Commission's legislative committee said:

We recommend to the citizens that if they wish an up-to-date railway service they patronize the street cars as much as possible.

The August report shows a continued decrease in the number of passengers.

The commission adopted the recommendation.

Ordinance Discussion Resumed in Chicago

City purchase of Chicago surface and elevated lines by amortization over a period of 40 years was bitterly opposed by officials of the two systems at a joint meeting on Oct. 15, with the City Council's transportation sub-committee, the first important discussion to be held since the new ordinances were drafted by the committee last month. The companies' views were set forth by Leonard A. Busby, president of the Chicago City Railway, and by attorneys for the other lines.

Mr. Busby asserted that the amortization plan included in the proposed ordinance would add nearly 4 cents to every fare collected for the entire 40 years, thereby placing an unfair burden on the present generation of car riders. Patrick J. Lucey, counsel for the Chicago Rapid Transit Company, declared that the contemplated annual retirement of $16,000,000 was tantamount in effect to municipal ownership, maintaining

Digitized by Google

that it was financially impossible to amortize in 40 years. The ordinance provides for an initial capital of $265,000,000 and for the expenditure of further sums for expensions and betterments to bring the total stock and bonds to $635,000,000 in 40 years. This divided into payments to be laid aside for use of the city in purchasing the entire properties would amount to $16,000,000 a year. Both company representatives also attacked the new ordinance on the grounds that the rate of return permitted the consolidated system was too low.

Although the date for further discussion of the ordinance has not been fixed, the committee's engineer, Major R. F. Kelker, Jr., was instructed to confer with the company representatives with regard to counter-proposals.

Reward for Apprehension of Robbers

The International Railway, Buffalo, N. Y., has offered a reward of $1,000 for information leading to the capture of the three gunmen who robbed the garage of the company at Walden and Lathrop Avenues, and escaped with $2,500. The trio, masked and armed, held up the night watchmen and two other employees.

Temporary Advance Allowed in Los Angeles

The city of Los Angeles, Cal., on Oct. 15 was denied a stay of a lower court order effective that day for 7-cent instead of 5-cent fares on the lines of the Los Angeles Railway. The order made by Justice Sutherland of the United States Supreme Court in chambers means that the 7-cent fare will go into effect and will continue in effect while the Supreme Court is hearing the city's appeal challenging the legality of the 7-cent order.

The 7-cent fare was authorized by a three-judge federal court after the State Railroad Commission had refused to grant the increase. The commission and the city appealed the case together and placed before Justice Sutherland a plea for a stay of execution pending final decision on the appeal. Justice Sutherland placed the appeal before the full court on Oct. 13 and on Oct. 15 denial of a motion was the result.

This case has been the subject of comment before in ELECTRIC RAILWAY JOURNAL, notably the issue of Oct. 13.

Another Step in Baltimore Fare Case

The Maryland Public Service Commission has petitioned the United States Supreme Court for a writ of certiorari in the fare case of the United Railways & Electric Company, Baltimore. The case has been through the Maryland courts and the commission had previously filed a cross-bill with the United States Supreme Court from that filed by the United.

Supreme Court Refuses to Allow Appeal in Denver Case

The city of Denver on Oct. 15 was denied by the United States Supreme Court a review of its case against the Denver Tramway, unsuccessful in the lower courts. Contending that the lower courts had no jurisdiction to authorize a fare of more than 5 cents to be charged by the tramway, the city asserted that a contract providing for the 5-cent fare was still in force.

The case just decided dates back really to the time of the World War, and had its inception in the effort of the Denver Tramway to obtain a higher fare than the 5-cent rate allowed in the 1906 franchise. It was last December that the United States Circuit Court of Appeals handed down a decision upholding the federal district court, declaring, in substance, the Denver Tramway franchise to be perpetual. In so doing it was believed that the court had made final the district court decision restraining the city, but from the decision of the Circuit Court the city sought an order to reopen the case. This plea the Circuit Court denied. The city then sought relief before the United States Supreme Court, despite the fact that that body in January, 1927, had returned the issue to the local courts.

The progress of the issues involved in the litigation were reviewed in their main intricacies in the issue of Dec. 24, 1927, page 1163. The present fare of 8 cents, two rides for 15 cents, yields less than 4 per cent on the court's allowed valuation of $23,514,000

Franchise in Peoria Extended

A 50-year franchise was granted by the Peoria, Ill. City Council recently to the Illinois Traction System, which operates the Peoria car system. The new contract provides for the free use of 4½ blocks of track from a hub at Washington and Walnut Streets and requires the erection of a new depot prior to Dec. 31, 1929. A franchise adopted two years ago was for a 20-year period and the new one is a 30-year extension of that grant.

Duplicate Service in Cleveland Corrected by Rerouting

The first step in untangling the West Side car lines in Cleveland, Ohio, has been taken by the street railway committee of the City Council in unanimously approving a resolution to separate the West Fourteenth and West Twenty-fifth Street car line. The wasteful routing of the West Side lines, involving the operation of 900 duplicate car-miles a day, has been an obstacle to efficient railway management in Cleveland since the historic fights twenty years ago. Heretofore the City Council, which controls service under the Tayler grant, has refused to consider any sort of rerouting. The Council was induced to consider this step only because of the demand of thousands of car riders in the South Brooklyn district for better service. C. M. Ballou, street railway commissioner, backed by the Cleveland Railway declared that better service and regular schedules could not be obtained as long as part of the cars were operated over one route and part over another.

Even with the additional through service on the three branches of the West Twenty-fifth Street line, there will be a saving of $50,000 a year in operating costs, Mr. Ballou estimated. He referred to the substitution of a motor coach on the Scranton Road.

Rehearing Refused on Order to Install Safety Devices

The New York Transit Commission has denied the applications of several surface car lines for rehearings on the recently ordered installation of safety devices on one-man cars. The applications were made as a matter of form to enable the companies to take to the courts their protest against the commission's order, which called for the installation of "dead man's buttons" and other devices. At the request of counsel the commission postponed until the morning of Oct. 24 a scheduled hearing on the pending 7-cent fare application of the Dry Dock, East Broadway & Battery Railroad, a Third Avenue surface system subsidiary.

Fare Decision in Washington Expected Soon

It was stated at Washington, D. C., on Oct. 12 that the Public Utilities Commission of the District of Columbia on Oct. 15 would pass upon the matter of an increase in fare on the local railway lines, but Chairman John W. Childress, of the commission said that the decision would be announced in ten days in the shape of a formal order. This procedure was decided on Mr. Childress said, to give time for proper preparation of the order. He was quoted as follows:

It is preposterous to contend that we should have another valuation for this case. This is the first rate case that has come up since the Court of Appeals decided the Capital Traction Company's valuation as of Jan. 1, 1925.

Therefore the present valuation of the company is a current valuation. Are we going to say that because the company did not come in and ask for a raise five minutes after the court rendered its decision that it will have to go through another valuation now?

Of course I am not a lawyer and I am giving a layman's opinion, but it seems only common sense to me.

The present carfare rate is 8 cents and six tokens for 40 cents. The rate sought by the Capital Traction Company is 10 cents cash, four tokens for 30 cents. The Washington Railway & Electric Company, which did not ask for a raise, was made a party to the proceedings by the commission and any increase granted will probably be made to apply to both companies.

Moncton Desires Railway Continuance

Citizens of Moncton, New Brunswick, in a recent poll have refused to entertain the request of the Moncton Tramways Electricity & Gas Company for permission to discontinue the tramway service which, the company asserts, is now a losing proposition. The plebiscite held showed 1,250 electors desired the continuance of the service while 450 voted in favor of the company's request.

The company's proposition had previously been discussed at several meetings of the City Council, the application being made on the grounds that with the street cars and an independent bus company giving service, the railway was being operated at a loss of $10,000 a year. The company offered, if its request were granted, to make a payment to the city of $10,000 cash, transfer to the city its vested rights in the streets on which the cars operate, remove the rails from the unpaved streets and other appurtenances on the entire route and to recondition the streets where the rails had been removed.

Moncton has a population of 17,488.

Testify Decline in St. Louis Traffic—Women to Plead

The St. Louis Public Service Company, St. Louis, Mo., probably will request a straight 10-cent fare if all of the demands of the union workers are granted by the state commission. It is also possible that regardless of the outcome of the wage controversy the company may request a 10-cent fare for cash customers and 7½ cents for those using tokens compared with the present straight 8-cent fare for adults.

Exhibits furnished by the company in the wage case show a steady decline in street car traffic. The progressive decline since 1923 has been as follows: 1923, 292,671,781 revenue passengers; 1924, 279,222,520; 1925, 270,103,400; 1926, 269,555,730; 1927, 258,810,976, and 1928 (eight months) 167,842,381. The last figure is 5,373,989 fewer than the number of revenue passengers carried in the first eight months of the year 1927.

Stanley Clarke, executive vice-president for the company, testified Oct. 12 that the present 8-cent fare was not satisfactory and that a rate of two tokens for 15 cents with a cash fare of 10 cents would be much better. He estimated 95 per cent of the riders would buy tokens. He declined to commit the company to a specific rate it would deem satisfactory, stating this would depend on the outcome of the wage dispute, now before the Public Service Commission for settlement.

Apparently on the theory that the woman always must have the last word in all controversies the Amalgamated Association plans to close its case for increased wages for the carmen and shop workers of the company by placing the wives of the union men on the witness stand to furnish the Missouri Public Service Commission first hand information regarding the actual cost of living in St. Louis.

Shoppers Favored in Memphis

Free street car fares for shoppers on the opening day of its week of sales starting Oct. 6 was furnished by the New Bry's department store, Memphis, Tenn. Many city and suburban residents availed themselves of the opportunity to ride the cars of the Memphis Street Railway purchasing merchandise to the value of $1 or more and receiving two round-trip fare street car tickets.

Federal Inquiry Halted

Representatives of Electric Bond & Share Company challenge authority of Trade Commission. Decision as to right sought

REFUSAL by officers of the Electric Bond & Share Company of New York on Oct. 17 to answer question and produce records as directed by Commissioner Edgar S. McCulloch, who presides over the hearings of the Federal Trade Commission appeared at that time to be likely to result in a suspension of the Federal Trade Commission's investigation of public utilities pending a judicial decision as to the extent of the commission's power.

John F. McLane, counsel for the company, presented the company's objections, which were overruled by Commissioner Edgar S. McCulloch. Later when two officers of the company had refused to answer, Commissioner McCulloch ordered an adjournment until Oct. 23, at which time he ordered the witnesses to reappear for further questioning.

Commissioner McCulloch declared from the bench that "the Electric Bond & Share Company has been willing to co-operate in this investigation only to the extent that it suits its own officers."

"I can only indulge the assumption," the Commissioner said, "that in defying the commission they have something that they are unwilling to let the Senate of the United States known about and the people of the United States know about."

Commissioner McCulloch concluded by declaring that "the commission will proceed to compel its demands by law."

At the outset of the hearing, Mr. MacLane made this statement outlining his company's position:

> The Electric Bond & Share Company entered into this investigation in the spirit of complete co-operation with the Federal Trade Commission. Irrespective of the issue as to whether or not the Senate resolution applies to it, the company has furnished such books, records and data as were material to the inquiry. Since the beginning of the investigation five months ago the company has continuously made available at its offices to a large corps of examiners of the commission a vast amount of material. All of this has been done notwithstanding the great expense and inconvenience to the company and notwithstanding the fact that the commision less than one year ago completed an exhaustive examination of the company's affairs under Senate resolution 329, 68th Congress, without reporting the violation of any law.
>
> The representatives of the commission, however, in one form or another have demanded as a matter of right the privilege of examining all books and papers of the company, whether relevant to the investigation and without specification as to the object of their inquiry.
>
> The present demand leads the Electric Bond & Share Company to request the co-operation of the commission itself in obtaining a speedy judicial presentation of the issues or questions thus raised, to the end that the broad proposition as to the constitutional and legal rights of the government, of the commission and of the company may be promptly determined and delay thereby avoided.
>
> The company wishes only to have ascertained, as its duty to its clients and to its stockholders, its fundamental rights under the constitution and laws of the United States and the limitations upon the rights of the federal government or any commission or body acting under it to make the sweeping demand for a disclosure in detail of its private business and professional undertakings for its clients which are competitive in their nature and would involve the disclosure of costs, employments and transactions wholly private and confidential and not relevant to the inquiry.
>
> Through such co-operation it would seem

Digitized by Google

a most comprehensive decision might be obtained for the benefit of all parties.

Mr. MacLane then inquired of Commissioner McCulloch whether the subpoena directed to Mr. Smith was based on authority claimed by the commission under the terms of the Senate resolution directing the inquiry or upon authority conferred by the Federal Trade Commission Act. He also asked if there was any formal complaint before the commission involving the Electric Bond & Share Company.

When the commissioner replied that "I am not here to be catechized by counsel," Mr. MacLane then said:

The document entitled "subpoena" above referred to, is void and without authority of law and beyond the power of this commission to issue, and that the witness is not required to testify before this commission because:

(a) Neither the witness nor the Electric Bond & Share Company is engaged in "commerce" as defined in the Constitution of the United States or the Federal Trade Commission Act.

Because the pending investigation, so far as the same may be within the powers and jurisdiction of this commission, is being conducted under section 6 (a) of the Federal Trade Commission Act and not under section 5 or other sections of said act, and the commission has no authority to issue subpoenas in this investigation.

That this document entitled subpoena is related to and is merely a part of other documents entitled "subpoena" *"duces tecum"* directed to the witnesses A. E. Smith, comptroller and assistant-secretary, and E. P. Summerson, secretary Electric Bond & Share Company, and that said so-called subpoenas *duces tecum* are void and of no effect in that they are in substance general warrants for "unreasonable searches and seizures of papers and effects without 'probable cause' supported by no oath of affirmation, and not describing the place to be searched or the things to be seized, and constitute a deprivation of property without due process of law, all in violation of the Fourth and Fifth Amendments to the Constitution."

Back to Work After Five Months

Reference has been made before in ELECTRIC RAILWAY JOURNAL to the suspension of transportation service some time ago on the system of the Schuylkill Railway at Girardville, Pa. Of this suspension and the one at Pottsville, the *Motorman, Conductor and Motor Coach Operator,* official organ of the Amalgamated Association, said in October:

Division No. 165, Girardville, Pa., suspended work Sept. 29, 1927. At the close of this report, July 31, 1928, there has been no change in that situation. Later, locals upon these same properties, divisions Nos. 118, Pottsville, Pa., and 433, Lansford, Pa., suspended work on the morning of Jan. 6, 1928, under the endorsement of this board. A report upon the cause of this strike was submitted to the last meeting. It was the same cause that resulted in the suspension of work of the members of division No. 165. These two latter divisions were out five months. Under the settlement the members were returned to work on the 1927 wage scale and were to be replaced in employment as soon as the lines were placed in operation.

Interborough Fare Plea Presented

Supreme Court hears both city and company in case in which New York Railway contends five-cent fare to be confiscatory. Commission jurisdiction over city-owned lines the issue

THE claims of the Interborough Rapid Transit Company, New York, to an increased single fare for carrying passengers over the subway and elevated lines of New York City were presented to the Supreme Court of the United States on Oct. 17.

The members of the court listened to a presentation of the Interborough's case by George W. Wickersham and William L. Ransom of New York City. They concluded their arguments shortly before the adjournment of the court for the day. Upon conclusion of the Interborough's case, Charles L. Craig, counsel for the City of New York, started rebuttal arguments, for which he is to be allowed one hour's time, carrying the conclusion of the hearing of the case over until Oct. 18.

In opening the arguments for the Interborough, Mr. Ransom declared that despite all the details and ramifications of the case there was one central issue involved. This issue, he stated, might be phrased as follows:

"Does the public service commission law of New York apply to these rapid transit railways?" or

"Do the provisions of the public service commission law under the statutes of New York enter into and form a part of the fare stipulations in the contracts?"

Mr. Ransom explained that the court below held, that the provision of the law in question do enter into the contracts, under which the Interborough is operating subway and elevated lines through leases from the city. These contracts all provide that the rate of fare shall be 5 cents, and not more. Relative to the elevated lines, it was asserted that there never has been statutory authority to put into the so-called elevated extension certificate a fare stipulation.

Answering arguments of the city and the commission on the previous day that the suit in the lower court was premature, Mr. Ransom pointed out that counsel for the city had made a special and general appearance in the court below and had filed a cross-complaint and thus had submitted to the jurisdiction of the lower court. The City and the Transit Commission therefore are not precluded from complaining that the lower court did not have jurisdiction of the cause, it was declared.

Mr. Justice Brandies pointed out that the suit of the Interborough to restrain the Transit Commission from prohibiting a 7-cent fare was filed in the District Court while the application of the Interborough for an increased fare was pending. He said:

I fail to see where there was a cause of action in equity, the Transit Commission having 30 days, which had not expired at the time the suit was filed, in which to consider the application.

Mr. Ransom replied that the Public Service Commissions Law prohibited the charging of a fare that was unreasonable. By its terms, he said, the legislature delegated to the carrier the power to abrogate and supersede the rate of fare provided in the contracts when such rate became unreasonable and uncompensatory. The carrier could do so upon the filing of its new schedules, he said. He also pointed out that the Court of Appeals of New York had so construed the law in question.

Following the filing of new schedules, Mr. Ransom said, the law provides that the Transit Commission shall hold hearings thereon, 30 days being provided in which to consider and decide the application. At which point Mr. Justice Brandies said:

But you did not give the commission opportunity to pass upon the application before suit was brought.

Mr. Ransom said that before filing the suit the commission had authorized counsel to go into court and challenge an increased fare. That body had announced what it was going to do with the application, and had in every way violated due process before the Interborough brought its suit in the federal court, Mr. Ransom declared.

According to Mr. Ransom the commission had threatened to act so as to deny the Interborough its day in court for an orderly adjudication of its rights as to rates, and to obstruct and overthrow the various steps which the Interborough had from time to time taken, under statutory authorization, to obtain relief from the confiscatory 5-cent fare. Applications in 1920 and 1922 had been denied by the commission, he said. Mr. Ransom stated that the commission entered no order or determination as to the application filed in 1928, but "indicated in every way that the application would be denied." The commission did not hold hearings requested he said.

Mr. Ransom cited to the court various provisions of the public service commissions law of 1907 which, in his opinion, support the Interborough's contention that the contracts which originally call for a 5-cent fare come within its provisions so as to give the commission the authority and duty to make such changes in the rates of fare as will be reasonable and compensatory.

In discussing the decision of the lower court, Mr. Ransom stated that it decided that the public service commission law was applicable to rapid transit rates, and that the new policy as evidenced by the statute, applied to old transit fares as well as any new ones. The fare provisions are subject to the regulatory power of the commission as though the provisions for such regulatory power were written into the contracts in question, the lower court held, it was stated.

Fact-finding sub-committee of the committee on convention location on Monday, Oct. 15, inspected progress on new Atlantic City Auditorium

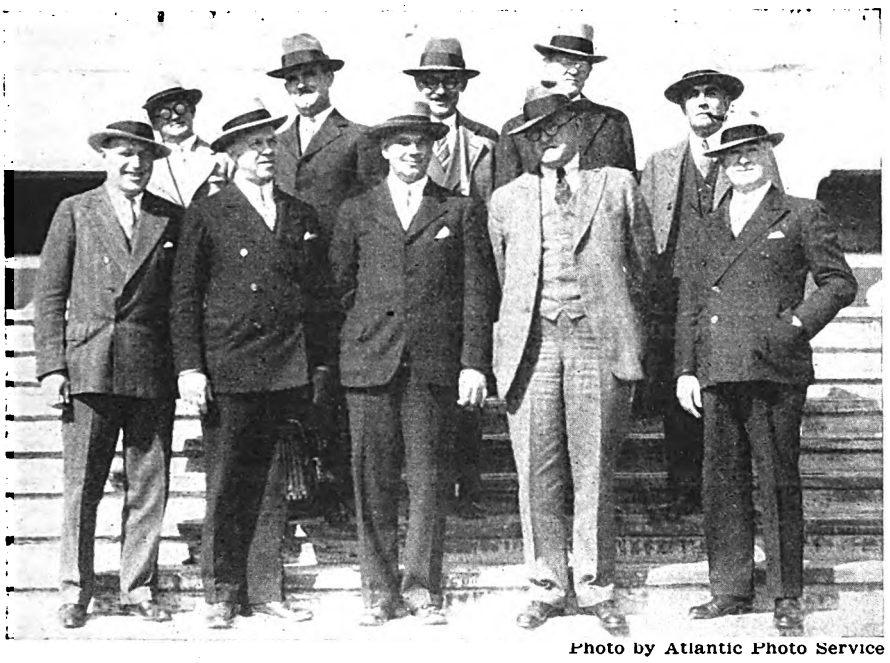

Photo by Atlantic Photo Service

Top row (left to right)—J. C. McQuiston, A. M. Robinson, Charles Gordon, L. S. Storrs and W. H. Sawyer. First row—L. Dickey, F. C. J. Dell, L. W. Shugg, J. P. Barnes, T. W. Casey.

The lower court further held, Mr. Ransom said, that the Interborough had done all it could do under the state laws to obtain administrative relief.

Mr. Justice Brandies inquired:

Isn't your position exactly as if there were no contracts?

In reply Mr. Ransom referred to certain pages of the Interborough's brief in which it is stated that "the fare stipulations of the 1913 contracts must be regarded as qualified by the then existing restrictions of the public service commission law, which expressly required that fares should be, and be kept, just and reasonable, and expressly prohibited fares which were or became unjust or unreasonable, whether excessive or because noncompensatory, and expressly provided that fares not conforming to this legislative standard should be unlawful, and delegated to the carriers the powers and duty of changing rates and terminating the contractual stipulation by filing and publishing tariffs in order to conform to the standard."

"If what you say is the construction of the law," Mr. Justice Brandies commented, "you are entitled to a new fare by reason of state law, and not by reason of the Federal Constitution."

Mr. Ransom further pointed out that though the Transit Commission had held it was without jurisdiction to alter the contract provisions for fares, it had exercised jurisdiction relative to the regulation of services, whereas both the regulation of services and of fares were provided for in the contracts under the same provision.

George W. Wickersham for the railway pointed out to the court the contentions of the Interborough that the present 5-cent fare was inadequate and did not allow the company a compensatory charge. After everything under State statutes had been tried without substantial results, counsel stated, the Interborough finally went into the federal court. This court, consisting of three judges familiar with the situation, he said, granted an injunction to prevent the Transit Commission from prohibiting the charging of increased fares.

In replying to certain questions asked before he began his presentation Mr. Wickersham stated the basis of the relief sought by the Interborough in the court below. Referring to the Public Service Commissions Law, he stated:

As I read the law in the light of the construction placed upon it by the New York Court of Appeals, it was not necessary that there be an order of the Public Service Commission before resort could be had to the Federal court.

This is particularly true, he said, when it is considered that two previous applications of the Interborough for increased fares had been denied by the commission on the ground that it had no power to act thereon, and that the commission, in considering the application made Feb. 1, 1928, had decided it had no power to act thereon and instructed counsel to institute suits in the state courts to enforce the contracts of the city with the Interborough. If the present rate is confiscatory and unreasonable, Mr. Wickersham asserted, a Federal court has jurisdiction of the complaint of the Interborough on the ground that property is being taken without due process of law.

Mr. Craig, counsel for the City of New York, whose presentation preceded that for the Interborough, contended that the rapid transit act, pursuant to which such contracts and elevated railroad certificates were made, is a comprehensive statute excluding any possible subordination to the public service commissions law. He traced the different statutory provisions pertaining to the owning and operating of rapid transit facilities from the rapid transit acts of 1891, by which the city was given the power to place before the people at popular referendum the question of whether the subway facilities should be constructed at city expense and leased out, to the latest legislation permitting the city to enter into a contract with the Interborough.

The Interborough was allowed preferential charges on its earnings in return for the promise of a 5-cent fare, not only for the present time, but for years to come, Mr. Craig asserted. If the city thought, at the time of the execution of contract No. 3, that the Interborough would not maintain a 5-cent fare, it would not have entered into the contract, Mr. Craig added.

The question of the city's power to enter into contract No. 3 was raised by the Interborough in the state courts in a taxpayer's action, brought and prosecuted at its instance, and financed with its funds, and to which it, as well as the city of New York, was a party, he stated. In such action, the power and authority of the city of New York was conclusively established, Mr. Craig pointed out.

The construction placed upon the rapid transit act and the public service commissions law by the statutory court gives such statutes an effect that is in violation of the local self-government provisions of the New York Constitution and the contract and due process clauses of the Federal Constitution, Mr. Craig added.

"The Men Behind Your Transportation Service"

In a 24-page pamphlet the Kansas City Public Service Company, Kansas City, Mo., has reprinted the series of newspaper advertisements dealing with the varied activities "of the finest street railway operating organization in the world," with a foreword by Lou E. Holland, executive manager of the Kansas City Chamber of Commerce, who expresses the opinion that the ads "can not help but build for your company that measure of good will which you seek through the commendable course of embellishing cold facts and making them interesting to your patrons and the public generally."

The ads are unusual in their conception and in their execution, since all of them feature "The Men Behind Your Transportation Service." The ads were very favorably received locally, and their publication in the present form is due in large part to the demand for their preservation in a form more permanent and more readily available for consultation than is afforded in their newspaper dress. The series was prepared for publication under the direction of Bert Sanders of the railway.

Pick Up and Delivery Service

Truck Transport to be co-ordinated with other services of the Pacific Electric Railway

ENTRANCE of the Pacific Electric Railway into the field of motor truck transportation was revealed on Oct. 12 upon the filing of articles of incorporation of the Pacific Electric Motor Transport Company with the Secretary of State at Sacramento. Later D. W. Pontius, vice-president and general manager of the railway, confirmed the fact that a plan of this kind was under way.

The objectives for which the new company is formed, the executive stated, include the right to own and operate motor trucks, the right to carry on the business of transporting freight, express and other commodities by motor truck or otherwise, and to conduct a general receiving, forwarding and warehousing business.

In the articles of incorporation as filed, Los Angeles is given as the principal place of business, and the capital stock consists of 5,000 shares of a par value of $100 a share. Officers of the company are not yet named, nor a definite date set by the company for beginning of operations.

In commenting on the organization of the new company Mr. Pontius made the following statement:

Motor trucks, like motor coaches to passenger business, have a definite place in the freight transportation field. One function is to act as feeders to rail lines, and to perform a service between rail stations and the shipper's place of business. To meet these needs the Pacific Electric Motor Transport Company, a subsidiary of the Pacific Electric Railway, is being organized, providing through the use of motor trucks in co-ordination with the rail lines of the Pacific Electric Railway, a thoroughly complete transportation service, including "store-door pick-up and delivery," in Southern California.

The new company will be, in its general character, an express company. It does not contemplate, for the present at least, the operation of trucks on the highways. Briefly the plan of operation is this:

The Pacific Electric Motor Transport Company will perform a complete service from shipper's store-door to consignee's store-door under a through rate that will cover the entire service. The Motor Transport Company's trucks will pick up shipments at the shipper's door and haul them to Pacific Electric Railway's rail stations where they will be transferred to rail cars.

Under a contractual arrangement the Pacific Electric Railway will make the line haul to the station of destination, where the load will again be transferred to the Motor Transport Company's trucks for delivery to the consignee's place of business. The transfer between motor truck and rail cars may be effected either by transferring the entire truck body intact from the truck chassis to specially equipped rail cars, as in the case of bulk freight, or by the usual method of handling between truck and rail car, as in the case of miscellaneous package freight.

The outstanding merit of the entire plan is that by co-ordination with motor truck operations it creates a greater and more efficient use for both motor truck and railway facilities that already are in existence or available.

Full details of the plan of operation will be announced later as will the date it is expected operations will begin.

Expansion in New Britain

The latest substitution of buses for trolleys by the Connecticut Company at New Britain involves the Farmington Avenue line where buses went into service Oct. 10. For the present, however, buses will furnish only a part of the service as trolley cars will be put into use during the rush hours and will be retained on schedule until a complement of buses has been arranged which can supply adequate and complete service. The bus route will carry a mile beyond the present Farmington Avenue trolley terminal.

Respite in Chicago

While motor coach company operates new north side extensions city pins faith on rehearing. State versus city control an issue

FEEDER bus controversies between the Chicago Surface Lines and Chicago Motor Coach Company seemed to reach a temporary standstill following the clash between the opposing parties before the Illinois Commerce Commission and the filing of a petition with the Federal District Court by a group of northwest side business men requesting that receivers for the Chicago Railways be instructed to establish feeder bus service at once in that section of the city.

While the commission announced that it would take no action on the motion of counsel for the Surface Lines to set aside its order of Oct. 2 granting permission to the Chicago Motor Coach Company to operate additional bus routes until after the completion of the present hearing, it refused, however, to order the citation to Leonard A. Busby, president of the Chicago City Railway, to explain by what authority he is seeking to operate feeder buses on the south side of the city.

Mr. Busby announced on Oct. 8 that his company would place fourteen new single-deck, pneumatic-tired feeder buses in operation on the southside streets where service was authorized in the recent ordinances passed by the City Council. James G. Condon, attorney for the Chicago Motor Coach Company, had immediately asked that the street railway executive be cited for contempt.

In taking under advisement the petition of the Northwest Business Mens' Association, on the other hand, Federal Judge James H. Wilkerson intimated that he would deny the motion, although he allowed the petitioners ten days in which to cite reasons for believing the commission order invalid and which might legally permit the court to disregard it.

The Chicago Motor Coach Company, continuing operation of its new north side bus extensions, announced this week that beginning Oct. 15 it would carry children between seven and twelve years at half fare, and children under seven, accompanied by an adult, free of charge, on all lines. Children were formerly charged the full 10-cent rate. The company's application to reduce fares for children was approved by the Illinois Commerce Commission.

By no means have the hopes of the city of Chicago to regain jurisdiction over the motor coaches which run over its streets been dispelled. In fact these hopes were revived on Oct. 5, when the Illinois Supreme Court granted a rehearing in the case of the city against the Chicago Motor Coach Company. If this rehearing should result in a reversal of the decision rendered against the city in the case last June, city officials believe that it will strip the Illinois Commerce Commission of its authority to allow buses on city thoroughfares without consent of the City Council and would compel the Chicago Motor Coach Company to obtain a city franchise.

In its ruling last June the Supreme Court reversed the decision of Circuit Court Judge Hugo Friend. The higher court held that under the public utilities act of 1913 the Commerce Commission has full authority to issue certificates of convenience and necessity for bus lines in the city.

In his petition for a rehearing Assistant Corporation Counsel Leon Hornstein pointed out that unless the decision was reversed the city would lose its constitutional right to control its streets. He argued that the city now has control over the street car lines, but under the court's decision would have no jurisdiction over the motor coach company, with a right-of-way built by the city itself.

The decision on the rehearing bears directly on the current dispute over bus service on the north and west sides of the city, since on Oct. 2, acting under a Commerce Commission order, the Chicago Motor Coach Company started service at a 10-cent fare on approximately 70 miles of new routes in that district, despite the fact that the City Council and civic and improvement societies had demanded feeder buses

Digitized by Google

operated by the Chicago Surface Lines on a 7-cent fare. Although the City Council had passed fourteen separate ordinances providing for this type of service, the measures were regarded as being nullified because of the superseding authority of the commission.

Bus Line Succumbs to Railway Competition

The "shortest railroad with the longest list of stockholders in the United States" has done the impossible. Its chief competitor, a bus line, the Andringa & Datema has thrown up its hands and yelled "quits."

Last spring the 700 stockholders of the United Suburban Railway, with 8 miles of track, running from Grand Rapids, Mich., southwest to the village of Jenison, Mich., gathered together to listen to the initial proposal of the bus line officials. The equipment and franchise were offered to the railway for $57,000, but the stockholders deemed the price much too high. They saw little value in purchasing the line. Recently another meeting was held and the price named was $20,000. To eliminate competition and if possible place the stock of the railway upon a dividend paying basis, it was agreed to purchase the bus line. The bus line proprietors agreed to take $16,000 in cash which likely will be raised by sale of stock in the railway and the remaining $4,000 in stock of the interurban line. The purchase involves taking over four buses together with the franchise rights and good will. Tentative plans for operation include running the buses as usual.

September receipts for the railway were reported from $225 to $250 better than in a similar month last year, and in some months this year the receipts were said to have exceeded operating costs by from $650 to $800. "If we can take in from $1,500 to $2,000 each month, in addition to operating costs," Mr. McCarrick stated, "our stock will represent a profitable investment."

The United Suburban Railway was started in July, 1927, about a year after the Grand Rapids, Holland & Chicago Railway succumbed to the competition of the bus lines. A year of bus service and the commuters decided to own their own line. Even though there may be no dividends this year the stockholders aver that the increase in value of property along the right-of-way and the better service justify its program.

To complete the purchase plans it will be necessary to raise $16,000 within the next 30 or 40 days. Application already has been made to the State Public Utilities Commission for permission to take over the franchise and a schedule will be filed with the commission. The old buses will be replaced as rapidly as possible with new lighter and faster equipment.

Upon motion of Wilbur S. Burns of Wyoming Park a resolution was adopted by a vote of 1,974 shares to 34 to give the board of directors power to raise funds to purchase the bus line.

Tentative plans for operation include running one bus from Grand Rapids to Grandville and the other buses from Wyoming Park to Grand Rapids via Beverly and Galewood. The interurban cars will continue to operate from Jenison to Grand Rapids, but if the line of the Michigan Railroad over which the cars operate from the city limits downtown is abandoned, arrangements will be made for bringing the cars into the city over the Grandville Avenue line of the Grand Rapids Railroad. This would necessitate laying a short stretch of track to connect the interurban line with the street car line at Clyde Park avenue. At present the railway is paying the Michigan Railroad about $1,700 a month rental.

Bus Line to Mozart Park

The Ohio Valley Transit Company, a subsidiary of the Wheeling Traction Company, Wheeling, W. Va., has been awarded a permit to operate a bus line to Mozart Park by the Public Service Commission. A 10-cent fare will be charged.

Burlington Will Go to Bus

The Iowa Southern Utilities Company has applied for permission to abandon the rest of its railway system in Burlington, Iowa, and is proposing for city service complete motorization by buses. Suspension of railway service may not be effective until next spring.

Financial *and* Corporate

Segregated from Parent Company by New Illinois Charter

The Chicago & Illinois Valley Railroad, a subsidiary of the Illinois Traction, Inc., was issued a new charter on Oct 1. The new company is incorporated for $1,000,000. Organization of the new company is regarded as indicating that the railway henceforth will be operated independently of the parent company, which recently assumed the name of the Illinois Terminal Railroad.

Formerly known as the Illinois Valley division of the Illinois Traction, Inc., the railway operates an interurban line from Joliet through Ottawa and LaSalle to Princeton, Ill., providing local street car and bus service in the cities of LaSalle and Peru.

The board of directors of the Chicago & Illinois Valley Railroad as listed in the charter of the company is made up as follows: Clement Studebaker, Jr., George T. Buckingham, H. L. Hanley, L. E. Fisher, Henry I. Green, E. W. Fowler, P. L. Smith, D. H. Holmes and E. S. Hight.

Bondholders of Old Kansas City Property Want Hearing

Attorneys for the holders of the second mortgage bonds of the Kansas City Railways, Kansas City, Mo., predecessor of the Kansas City Public Service Company, have applied for a writ of certiorari from the Supreme Court of the United States, in an attempt to get a hearing before that court. The plaintiffs are dissatisfied with being shut out of the reorganization of the property. The Circuit Court in June rendered a decision in favor of the Kansas City Public Service Company. The suit is a part of the receivership proceedings which have been in progress since 1920. Powell C. Groner, president of the Kansas City Public Service Company and its general counsel, is representing the company in resisting the application to the Supreme Court. The petitioning counsel are John W. Davis, Democratic nominee for president four years ago, Edwin S. S. Sundeland, Blatchford Downing and Albridge C. Smith.

Session on Indiana Merger

Inquiry into the proposed Insull power and railway merger, involving a $70,000,000 capitalization, got under way recently before the Indiana Public Service Commission. The first session was devoted to discussion of the proceedings to be followed in the hearing. Interested cities, organizations and individuals will have ten days in which to file objections or views with the commission. The entire question is summed up in whether the Terre Haute, Indianapolis & Eastern Traction Company will be permitted to merge with the Insull light and power interests in Indiana, the resultant corporation to be known as the Indiana Electric Corporation. The purpose of the merger, as stated by its supporters, is to simplify operation, improve service and obtain new capital for the interurban properties, which have been hard pressed for several years.

Six cities, three civic organizations, two labor organizations and an investment dealer entered appearances on the first day and representatives of most of these participated in the discussion on procedure. Cities and towns interested and served by the companies to be merged, total 284, according to a list filed with the merger petition.

While no decision was reached on the question of appraisals, representatives of some of the cities spoke in favor of a complete field appraisal, declaring that only in this manner could the commission be assured that the securities in the merger represented actual property. Attorneys for the Central Indiana Company, the Insull-owned group, said they had appraisals for all but one subsidiary. Attorneys for the railway group stated that they had assumed, since the merger involved noth-

Digitized by Google

ing but an exchange of securities, the question of appraisals would not enter, but they were ready to do whatever the commission desired in this respect.

L. E. Waterman, president of the Terre Haute Chamber of Commerce, was one who entered an appearance in favor of the petition. Frank P. Baker, an Indianapolis attorney, entered an appearance in behalf of the Indiana Federation of Labor and the local union of the Amalgamated Association.

Bankers Discuss Baltimore Situation

In a plea for fair play for railway, investment house states clearly the need for preserving the credit of the company

THE current monthly financial letter of Nelson, Cook & Company, Baltimore, Md., for August contained a discussion of the United Railways & Electric Company of Baltimore, its finances and its affairs in general. Necessarily this was brief in its treatment, but the relationship of earnings to credit has become a topic of such widespread discussion and concern that the banking firm was prompted to accede to requests to elaborate the article and discuss with frank detail the company's finances and its appeals to the Public Service Commission and the courts.

Accordingly, it prepared a supplement to the August financial letter written dispassionately, in the interest of fair play and harmony. As investment bankers Nelson, Cook & Company have on numerous occasions materially aided in the distribution of this company's securities to institutions and investors, but entirely aside from this the members of the local firm as citizens and taxpayers have the interests of the community before them. They said:

If anything we may evolve will help to bring home the seriousness of the situation to the Public Service Commission, the railway, the holders of the company's securities, and the public in general, we shall feel that we have not labored in vain. Conciliatory accord should take the place of present discord. The problems which face this corporation menace the welfare of Baltimore.

As the bankers see it the railway is confronted with two distinct problems—transportation and finance. The problem of transportation involves the loss of riders to whatever causes attributable. That problem requires tact, as well as ability, and must ultimately be solved to the satisfaction of all interests, the public as well as the company. At this time, however, finance is the more vital problem, and a restoration of the company's earnings to such a basis as may firmly re-establish its credit, is seriously essential. The bankers, however, devoted their attention to a consideration of the company's financial affairs rather than to its transportation needs. On this matter of credit they said:

Credit is the most important asset one may acquire. It is based on capacity. With a corporation, this means earning capacity. A credit situation reaches the acute stage as obligations approach maturity. The earliest maturity of the railway is Nov. 1, 1929, when $1,500,000 Baltimore Traction Company first mortgage 5 per cent bonds come due. These are followed four months thereafter, in March, 1930, by $2,500,000 three-year 6 per cent unsecured notes. Later, in October, 1931, there will mature $2,850,000 Maryland Electric Railways first mortgage 5 per cent bonds, this being the outstanding balance on Dec. 31, 1927, of an original issue of $4,000,000. Before maturity those bonds will be somewhat further reduced in volume by sinking fund operations. Thereafter still more subsequently, in March, 1932, there will mature $1,300,000 Central Passenger Railway first mortgage 5 per cent bonds. Or, the very considerable sum of approximately $8,000,000, more or less, in about 3½ years. These sums can not be obtained to refund unless the company's credit is restored now.

The majority opinion of the Court of Appeals of Maryland, which opinion was written by Judge Offutt, speaking of the company, uses the following language:

"It appears to be well and economically managed and the market prices of its securities indicate a continued public confidence in its stability as well as its ability to liquidate its obligations."

There may have been something in the record to warrant this statement, but so far as the market values of the securities are concerned the facts are exactly the reverse.

Since 1927, however, the company's most active securities have depreciated in market value in excess of $11,000,000, the average decline being about 20 per cent. Following the decision of the Court of Appeals a few weeks ago—notwithstanding Judge Offutt's attempt to reassure—market values declined about $2,250,000, with the result that the company's active securities are at war-time prices and lower. The bankers say:

It should be remembered further that perhaps $14,000,000 of these securities which have thus declined in value, were issued since the creation of the Public Service Commission of Maryland, and were authorized not only with approval as to price and security, but with language designed to attract the investor to these securities and inspire his confidence sufficiently to obtain his money for public service.

The Public Service Commission of Maryland acquired an excellent repute, its decisions were carefully weighed and were, on the whole, wise. The investor had confidence in the principles laid down by the commission and in the character and integrity of the personnel of the commission to follow up and apply the principles enunciated in its opinions. And so—in the case of the United, while other street railways were experiencing difficulty in selling securities, the Maryland public continued to buy United Railways issues with confidence. These securities have now declined heavily. We do not think the company is charged with any fault. We believe it is clearly and indisputably a failure of revenue—a correctable error, which has produced this result.

There are features about the present situation which are both good and bad. One good feature is that the company is steadily making progress toward the establishment of its right to earn a fair return upon the value of its property—a right which is essential to the immediate, as well as to the future, welfare of both the company and the public.

Some years ago the company was obliged to extend whatever service the Public Service Commission required and to accept any fare fixed by the commission practically without right of appeal on any fundamental issue, for neither the commission nor the railway was in a position to determine what was a just and fair return before the property was valued. Later, the commission by unanimous vote valued the property at approximately $75,000,000. This fixed a basis for determining the proper return to the company, and was the first step forward.

The second step—the rate of return—is now before the courts. The commission has fixed 6.26 per cent as a fair return. On appeal from the commission's decision, the lower court fixed 7½ to 8 per cent as a fair rate. On further appeal, a majority of the Court of Appeals of Maryland expressed an unwillingness to declare that the commission's rate of 6.26 per cent amounted to confiscation. Chief Judge Bond and Judge Parke, however, dissented, and in substance approved the decision that a return of less than 7½ per cent to 8 per cent was confiscatory. On this point the bankers say:

This seems to be in line with all the more recent United States Court decisions. A change of 1 per cent in return would make a difference in the company's revenues of approximately $750,000 a year, and that difference may result in success or lack of it in bankruptcy. To the individual the change in car fare from 8⅓ cents to 10 cents is actually not material, but to the company it may mean credit with service to the public or discredit with financial disaster and no service.

While the judges of the Court of Appeals differed as to the rate of return, they were unanimous in their opinion that the commission had erred in its method of determining depreciation, and they ordered a method which should add materially to the company's revenues and give some considerable reassurance to investors.

The bankers continue:

If the company is allowed a return of only 6.26 per cent instead of the 7½ per cent named by the lower court, new money, if obtainable at all, would probably cost from 1 to 2 per cent more in annual interest rate than it should. The commission and the public may not realize that the burden which this additional 1 or 2 per cent excess in annual interest charges will add to the cost of money will amount to many millions of dollars over a period of years. The question of credit thus means much not only to the company but to the car-riders and the public. As Judge Parke said so admirably in his dissenting opinion:

"A failure to grant such relief invites disaster, and stinted relief often simply

Digitized by Google

delays a crisis which when it arrives will prove immediately disastrous to the owners of the utility and in the end to the interests of the public."

Sounder doctrine never was more succinctly stated.

This much has been gained, however, to this point: (1) The valuation has been fixed; (2) a minimum rate of return of 6.26 per cent has so far been allowed; (3) the depreciation decision should add largely to the revenues of the company, and (4) the company now is on its way to a decision establishing a fair return on values.

On the other hand, the attitude of the public and of the Public Service Commission has been such as to create serious concern in the minds of investors. Public utility regulation is sound only to the extent that a commission which has the power to reduce rates, will raise them with equal promptness when earnings do not show a fair return. If rates are raised slowly, reluctantly, and with fearful ears turned to the public, which never wants to pay more, not only is credit destroyed but in the long run the public pays a much heavier bill. Commissions are created, in part at least, to protect the public against itself, and not to give people what at a passing moment they may desire. The public, if it gets what it wants, may be perfectly satisfied—with lack of foresight, not sensing the danger to itself; but there is a class which cannot be fooled and that is the experienced investor. Honeyed words mean nothing to him; he lives on facts. Promises he will accept only if a reputation for keeping promises is maintained and deserved.

In conclusion the bankers say in part:

STATESMANSHIP REQUIRED

We believe the property to be ably and economically managed, but there has been in the policy of the railway for the ten-year period of its travail, a desire to please the public and the commission. The car rider, despite the increase in fare, has always been considered before the owners of the company. The attempt of the company to "get along" on a 7-cent fare and then a 7½-cent fare, when conditions almost as inexorable as the law of gravity were dragging the company toward either a higher fare or financial disaster, is indication that the management, to say the least, was not avaricious. It is a situation which, in the interests of the public, requires statesmanship, frankness, freedom from short-sighted popular influence, and above all, prompt action.

Aside from the serious depreciation which investors have now witnessed in their securities, the future of transportation in Baltimore depends upon these investors being willing again to lend money for public transportation in this city. Destroy that confidence completely and it may be impossible to restore it. Meanwhile the public and the city of Baltimore, as well as the company and its security holders, will suffer. The commission and the railway officials should meet at once, consider the situation as it now exists—as of today—and agree upon steps to remedy this situation pending final adjudication of the different points of view now pending before the courts.

Latin American Holdings Sold to American & Foreign Power

Arrangements have been effected for acquisition by the American & Foreign Power Company, Inc., of public utility interests in Chile and Mexico now controlled by the Whitehall Electric Investments, Ltd., London, England. The principal properties in Chile include the electric power and light and the railway systems in Santiago and Valparaiso, while the properties in Mexico include the electric power and light systems in Vera Cruz, Tampico, Puebla and Orizaba. Railway properties in Vera Cruz and Puebla are also owned. The American & Foreign Power Company is affiliated with the Electric Bond & Share Company.

Would Abandon Ten Miles in New Hampshire

The Massachusetts Northeastern Street Railway has petitioned the New Hampshire Public Service Commission for permission to discontinue 10.84 miles of trackage in Salem, N. H. It is the contention of the company that the lines to be abandoned have not netted enough revenue to pay operating expenses and taxes.

Hearing of Stock Issue of Twin City Subsidiary

The Minnesota Railroad & Warehouse Commission has set Oct. 23 for a hearing on the request of the Minneapolis & St. Paul Suburban Railway, subsidiary of the Twin City Rapid Transit Company, to issue 5,000 shares of stock of $100 par value. The stock is to be awarded to the Twin City Rapid Transit Company in payment of suburban lines bonds which the Twin City Company bought and destroyed at maturity. Horace Lowry, president of the Twin City, says the amount has been carried on his company's books as an indebtedness.

Nebraska Interurban Bought; Survey of Service Ahead

George P. Abel, Lincoln, Neb., has purchased control of the Omaha, Lincoln & Beatrice Interurban, recently permitted by the Nebraska Railway Commission to cease operation because of insufficient patronage to pay running expenses. Mr. Abel has become president, Morris Freshman, vice-president and general manager, and P. J. Meehan, secretary-treasurer. Harvey Musser, Akron, Ohio, one of the original owners, remains a director. The part of the line which supplies trackage to transfer cars from industries in the northeastern part of the city, has never ceased operations.

The new owners expect to develop the industrial feature of the business.

Mr. Abel says that the principal object is to provide a belt line for the industries and to give freight service to the suburbs of Betany and University Place. His own material yards are located on the line. A survey will be made to ascertain if it is possible to secure patronage sufficient to warrant the resumption of passenger service. All the trackage into the heart of the city remains in place except for a strip of eight blocks on Y Street.

The End of St. Paul Southern

Wrecking of the St. Paul Southern Electric Railway between Hastings, Minn., and Inver Grove, a suburb of St. Paul began on Oct. 4. B. W. Harris and Leo Harris, Minneapolis, the most recent purchasers of the line, which was sold on Aug. 23 by court order, began to remove the rails at Hastings. The line mileage is 18.05. It cost more than $600,000 to build and equip, had been in receivership since 1918 and had lost money since 1923, owing to the use of private automobiles and buses. By order of the court the road ceased operation on Aug. 2 on account of lack of funds.

Losses in Muscatine Present Problem

John A. Reed, Cedar Rapids, president of the Iowa Electric Company, which has a contract to furnish transportation in Muscatine expiring on March 17, 1929, has invited the Council to assist him in devising means of continuing the railway lines or establishing bus service. He says the settlement of the transportation difficulties are urgent. Losses for the year ended Dec. 1, 1927, were placed by the company at $12,786 before depreciation.

Two P. R. T. Underliers Ratify Commission's Appraisal

A development in Philadelphia's transit field on Oct. 15 was the acceptance of the Public Service Commission's valuation of their holdings by two of the underlying companies of the Philadelphia Rapid Transit Company, namely—the Philadelphia Traction Company and the Continental Passenger Railway. Both subsidiaries would be taken over by the city under the proposed $139,000,000 acquisition of the underliers' stocks and bonds. The Philadelphia Traction Company holdings have been appraised at $26,287,448.

Stockholders of the Union Passenger Railway and the West Philadelphia Passenger Railway also have ratified the commission's appraisal of their holdings.

Ohio Line to Abandon Operations

Abandonment of service on the Springfield & Xenia Electric Railway has been authorized by the Ohio Public Utilities Commission, which has ordered the company to give the public 30 days' notice. Decreased revenues due to the advances of the auto and bus caused the company to request the right to suspend operations. Dismantling of the line was held up 60 days by the commission, which ordered the company to try to sell the property during that time to any concern that might desire to operate it. No protests against the discontinuance of railway service were made at the hearing by any person or community along the line.

Personal Items

Change in Los Angeles Line-Up

A complete reorganization of the transportation department of the Los Angeles Railway became effective recently.

The positions of superintendent of operation and assistant superintendent of operation were abolished. George B. Anderson retains the title of manager of transportation and R. B. Hill is now assistant manager.

All business pertaining to trainmen and their duties, including discipline, is now in the hands of the division superintendents and it is up to the platform men to satisfy their division superintendents in regard to their work. Any cases of appeal by trainmen from the decision of their division superintendent will be handled by R. A. Pierson, superintendent of the discipline and merit system.

J. H. Sheridan has been appointed superintendent of employment, instruction and safety. Both the safety department under Mr. Collins and the instruction department under Mr. Healy are now merged with the department of employment, instruction and safety under Mr. Sheridan.

L. A. Recappe, superintendent of schedules, and C. V. Means, traffic manager, report direct to George B. Anderson, manager of transportation.

R. R. Smith, formerly assistant superintendent of operation, has been assigned to special work for the manager of transportation.

The office of director of traffic has been abolished and W. H. Snyder has been placed in charge of the supervising force and the dispatchers' office, with the title of chief supervisor.

F. A. Richards Heads Metropolitan Railway Equipment

Ford A. Richards, formerly vice-president and sales manager American Car Company, St. Louis, subsidiary of J. G. Brill Company, has resigned to become president of the Metropolitan Railway Equipment Company, which will engage in the financing of equipment for electric railways, railroads and other transportation enterprises. Headquarters of the new company will be in St. Louis. Cars will be financed on a rental basis to make it possible for operating companies to acquire new equipment on advantageous terms.

Mr. Richards spent nearly his entire business life in the manufacturing side of the transportation business. He entered this field in 1898 with the Peckham Manufacturing Company. He joined the Brill organization in 1909 in the capacity of Pacific Coast district manager. In the fall of 1918 he was transferred to St. Louis as sales manager of the American Car Company and was subsequently promoted to vice-president.

In his new activity, he will continue in close contact with the local transportation industry. The new enterprise will broaden his interests to include the railroad equipment field as well as electric railways, since the new company expects to play an important part in helping electric railways to finance the replacement of present obsolete rolling stock.

C. Lewis in Salt Lake City

Colonel Lewis, formerly superintendent of the Phelps-Dodge railroads in New Mexico, has been appointed superintendent of the Salt Lake & Utah Railroad, Salt Lake City, Utah, with supervision over all operating department matters. His appointment is made in accordance with the company's policy of consolidating the operating department work under one head. Mr. Lewis' headquarters will be in Salt Lake City. He started his railroad career 30 years ago as dispatcher with the Chicago, Milwaukee & St. Paul. He had similar experience with other midwestern roads before going to New Mexico.

W. R. Hinchman West Penn Treasurer

W. R. Hinchman has been elected treasurer of the West Penn Electric Company, Pittsburgh, Pa., succeeding E. S. Thompson. Mr. Hinchman will be located in the Pittsburgh offices. For several years he has been connected with the American Water Works & Electric Company, New York City, and for the past three years has been assistant secretary and assistant treasurer.

D. P. Guest has been advanced from assistant treasurer to treasurer of the West Penn Power Company and West Penn Railways. Mr. Guest will continue as assistant treasurer of the West Penn Electric Company.

British Columbia Loses Services of R. M. Horne-Payne

After 31 years of service, R. M. Horne-Payne has resigned as chairman of the board of directors of the British Columbia Electric Railway, Vancouver, Canada. To the younger generation of utility men, this will appear only as another retirement but to others this news recalls a story of great courage and enterprise when a young man more than 30 years ago took over the bankrupt street railway systems of Vancouver, Victoria, and New Westminster, and in the face of great odds, financed, extended and broadened their operations into the great system of the present-day British Columbia Electric Railway and its subsidiaries.

The story of the young son of an English barrister, going to Canada to represent the firm of Sperling & Company, his meeting with Sir William Van Horne, president of the Canadian Pacific Railway, and his casual conversation with Sir Frank S. Barnard, at Kootenay Lake, which led to the formation of the British Columbia Electric Railway, is a real business romance.

Rudolph Ruzicka on Cincinnati Commission

Rudolph Ruzicka, president of the Oakley Bank at Cincinnati, Ohio, has been appointed a Rapid Transit Commissioner to fill the unexpired term of the late Richard Greninger. The appointment was made by Mayor Seasongood and confirmed by the City Council. The term of Philip O. Geier expires on Nov. 15, and its is understood generally that the Mayor will appoint some one else to take his place. Mr. Ruzicka has been active in Republican affairs. He was defeated last August for the nomination for the office of county clerk by Frank Lewis, the present Democratic incumbent.

W. J. Henderson, for the last nine years associated with H. C. Hopson of New York, is entering independent practice under his own name. As a consultant and analyst in matter affecting public utility accounts and finances, Mr. Henderson has testified before many courts and commissions throughout the country and is well known in the industry. It will be recalled that for five years Mr. Henderson was with the New York Public Service Commission.

Obituary

Alfred B. Kreitzburg, advertising manager for the Electric Storage Battery Company, Philadelphia, died on Oct. 15. Mr. Kreitzburg began his advertising career with the old Philadelphia *Press* more than twenty years ago. From there, he went to the Philadelphia *North American* and later, to the George W. Edwards Advertising Agency. His connection with the Electric Storage Battery Company dated from 1917. In 1920 he was promoted to the position he held at the time of his death. Mr. Kreitzburg was 43 years old.

Charles E. Jones, an employee of the Chicago street car lines for 46 years and for many years an official of the Chicago City Railway and the Chicago Surface Lines, died on Oct. 6. He began work in the street car service in 1882 as a gripman on the cable cars. Shortly afterwards he was promoted to the position of starter. Later he served as supervisor, assistant division superintendent and division superintendent. He was appointed assistant superintendent of transportation in 1921, but because of ill health returned to the 77th Street depot.

Material Market Remains Active

Track installations to be made. Three more articulated cars for Cleveland. Ithaca Traction may rehabilitate

DUE to several track extensions, a number of fairly large orders of track and line material have been placed during the past 30 days. To construct a city extension requiring 7-miles of double track, the Toronto Transportation Commission, Toronto, Ontario, has ordered 1,700 tons of grooved girder rails, 100 tons of 7-in. girder guard rails, L.S. section 140-468, and 50 tons of 7-in. girder guard rails, B.S. section 114-234. Other materials ordered for this extension include 14,000 standard Hemlock ties, 18,800 lb. of standard track bolts, 85,000 combination flat tie plates, 1,200 pairs of standard 122-lb. welding splice bars, 117,600 lb. of standard track spikes, and 950,000 granite paving blocks.

The City of Detroit, Department of Street Railways, Detroit, Mich., has ordered the necessary track material for 3 miles of double-track standard construction. Chicago Surface Lines, Chicago, Ill., has ordered an outside curve for Eighteenth Street, and Indiana Avenue, 130,000 lb. of special ground fireclay, 2,320 cast steel fish plates for 9-in. rails, 600 pairs of upset welding plates, 2,000 9-in., 130-lb. Lorain section No. 510, 32-in. standard 12-hole fish plates, 500 1⅛-in. hexagon moil points. Construction equipment ordered by this company includes 1 Smith No. 7S non-tilter, 1 bag concrete mixture, and one Thor No. 241 paving breaker.

Track to Be Constructed

Virginia Electric & Power Company, Richmond, Va., will reconstruct 4,000 ft. of double track on Main Street from Sims to Laurel Streets. Seven-inch 122 lb. girder rail on 7 in x 8 in. x 8-ft. white oak ties with Cary-elastic rail filler will be used in this installation. The Long Island Railroad, New York, N. Y., has been inquiring for 200 tons of steel for a bridge to be constructed in Brooklyn, N. Y.

Property has been purchased by the Oklahoma Railway, Oklahoma City, Okla., on West 44th Street, for use in connection with a freight line now being constructed by the company from West 39th Street to the Belle Isle power station. This will connect the Guthrie-El Reno Interurban Lines of the company which will be the last link in its trunk lines passing through the northwestern, western, and southwestern sections of the city to be used for electric freight hauling.

Omaha & Council Bluffs Street Railway, Omaha, Neb., is laying 1,740 ft. of new double track, including new rails, creosoted ties, and a new concrete base. The cost of this improvement is over $23,000.

Overhead Line Materials

The Pittsburgh Railways, Pittsburgh, Pa., has ordered 25,000 ft. of 7/16-in. soft annealed galvanized wire, 5,000 ft. of ⅜-in. soft annealed galvanized span wire, 5,000 15-in. line ears, 1,000 caps and cones, and 2,000 lb. of welding rods. Other line equipment ordered by this company includes 20 trolley frogs, 50 strain insulators, 300 24-in. trolley protecting armors, and 300 48-in. trolley protecting armors, 30 35-deg. solid crossings, 200 fiber approachs for section insulators, 100 72-in. cable bonds, and 50 No. 8 cone anchors.

In connection with its construction of 7 miles of double track, the Toronto Transportation Commission has ordered 10 tons of No. 00 hard-drawn round trolley wire, 25,000 ft. of 500 M.C.M. triple grade, weatherproof cable, 600 standard 5-in., 6-in., 7-in. x 30-ft. steel poles, and 3,000 brass trolley ears. The City of Detroit Department of Street Railways has ordered wire for 3 miles of double trolley. The Sacramento & Northern Railway, Sacramento, Cal., has ordered $3,500 worth of brackets and catenary construction material. Five No. 4700 low-floor center-entrance type cars are being remodeled for one-man operation by the Pittsburgh Railways.

Springfield Street Railways, Springfield, Mass., plans on purchasing five electric type 25-passenger buses for service on the roads between Springfield and Palmer. Wisconsin Power & Light Company, Madison, Wis., has purchased five A.C.F. urban coaches. Louisville Railway, Louisville, Ky., has accepted delivery of two Mack 6-cylinder 29-passenger city type buses and expects to receive, in the near future, several Studebaker buses.

Three Fageol A.C.F. urban coaches have been purchased by the Interstate Street Railway, Attleboro, Mass. The City of Detroit, Department of Street Railways, has ordered 25 A.C.F. buses.

Pittsburgh Railways has ordered one No. 40 Series Cincinnati all-steel press brake, and contemplates the purchase of two Blecker Blacksmith hammers.

More Cars for Cleveland

The City Council of Cleveland, Ohio, has approved the purchase by the Cleveland Railway of three additional articulated trains to fill out the schedule on Euclid Avenue, making a total of 28 trains for the company.

The operation of articulated trains on Euclid Avenue has resulted in clipping five minutes off the running time, according to Joseph H. Alexander, president of the company. The time is saved in loading and unloading, faster acceleration and deceleration and more speed between stops. Faster schedules have saved in reduced operating expenses the interest on the difference in price between the articulated trains and the old style of motor and trailer.

Deliveries are now being made by the G. C. Kuhlman Car Company of 50 motor cars of 55-passenger capacity. The cars are of the single-end, double-truck, two-man, Peter Witt type. According to Mr. Alexander, engineers for the Cleveland Railway are working on a complete aluminum design for articulated cars.

Lynchburg to Try Birney Car

One of the new one-man, 40-passenger Birney cars of the type exhibited at the Cleveland convention by the St. Louis Car Company will be placed in trial service during the next two months on the lines of the Lynchburg Traction & Light Company, Lynchburg, Va. The only other car of this type in service is being used by the Houston Electric Company, Houston, Tex.

Ithaca Traction to Improve

Steps will be taken immediately to improve the roadbed and equipment of the Ithaca Traction Corporation, Ithaca, N. Y. Announcement of the sale of this property and expected improvements was made in the Sept. 15 issue of the JOURNAL. Additional modern cars will be obtained in the future when it is expected a better schedule can be put into effect. A complete survey of the road will be made at once and as soon as the data are received and studied, a program for improvemen will be commenced.

South Shore Track Construction in Progress

Rail re-laying and siding construction work of the South Shore Line, planned during the latter part of summer, is now in full swing with four jobs in progress. Re-laying of rail in Michigan City from Michigan Street to Sheridan Street, a distance of about 2 miles, has been started. This work calls for 130-lb. rail and paving, with welded rail joints and base plates. The paving base will be concrete, and the ties, treated to prevent aging, will be set in the base. This job is to be completed about the first of the year.

In Gary two construction jobs have been in process for the past several weeks. One is an extension of the Virginia Street siding, a distance of 3,660 ft. eastward from the former switch-point, to make a new high-speed passing track for both passenger and freight

ELECTRIC RAILWAY MATERIAL PRICES—OCT. 16, 1928

Metals—New York

Copper, electrolytic, cents per lb.	15.25
Lead, cents per lb.	6.5
Nickel, cents per lb., ingot	35.
Zinc, cents per lb.	6.6
Tin, Straits, cents per lb.	48.50
Aluminum, 98 or 99 per cent, cents per lb.	23.90
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	53.00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	4.4
Somerset mine run, f.o.b. mines, net tons	1.9
Pittsburgh mine run, Pittsburgh, net tons	1.8
Franklin, Ill., screenings, Chicago	1.375
Central, Ill., screenings, Chicago	0.675
Kansas screenings, Kansas City	1.875

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.15
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.95
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb.	2.75
Sheet iron, galvanized (24 gage), cents per lb.	3.55
Galvanized barbed wire, cents per lb.	3.20
Galvanized wire, ordinary, cents per lb.	3.00

Waste—New York

Waste, wool, cents per lb.	18.
Waste, cotton (100 lb. bale), cents per lb.:	
White	17.25
Colored	13.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	10.8
White lead in oil (100 lb. keg), cents per lb.	13.25
Turpentine (bbl. lots), per gal.	$0.535
Putty, 100 lb. tins, cents per lb.	5.725

Wire—New York

Copper wire, cents per lb.	17.125
Rubber-covered wire, No. 14, per 1,000 ft.	5.3
Weatherproof wire base, cents per lb.	17.125

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.375
Cement, Chicago consumers' net prices, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered	3.375
Sand, cu.yd., delivered	2.125

Old Metals—New York and Chicago

Heavy copper, cents per lb.	12.375
Light copper, cents per lb.	10.875
Heavy yellow brass, cents per lb.	7.125
Zinc, old scrap, cents per lb.	3.25
Lead, cents per lb. (heavy)	4.75
Steel car axles, Chicago, net ton	$16.50
Cast iron car wheels, Chicago, gross ton	13.875
Rails (short), Chicago, gross ton	17.50
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.00

service, and the other is a new freight passing track between Buchanan Street and Bridge Street. The Buchanan siding, 3,800 ft. long and of 100-lb. rail, will be converted to main line track on completion, and the present eastbound main will become a center sidetrack. On the west end a No. 20 high-speed turnout will be installed to speed up freight operation.

Rail re-laying and repaving in South Bend is being carried on along La Salle Avenue and Colfax and Orange Streets, a distance of 2,785 ft. Treated ties, stone ballast and concrete paving base will underlie the 100-lb. rail and surface.

New England Transportation Company to Erect Office

New England Transportation Company, Boston, Mass., a subsidiary of the New York, New Haven & Hartford Railroad, is preparing to erect a two-story brick building for office use on the site it purchased several months ago, adjoining the Union Bus Terminal on Worthington Street, Boston. This property will be fitted up for rental and communications made to and from the terminal, so that part of the upper story of the terminal can be rented for offices, as well.

South Shore Adds Two Locomotives

Chicago, South Shore & South Bend Railroad, Michigan City, Ind., has added two more 80-ton freight locomotives to its equipment, the first of which has just arrived at the Michigan City shops. The second, or tenth of the large type Baldwin-Westinghouse engines to be installed in the last three years will arrive within two weeks.

The new locomotives are virtually the same as those now in service, the horsepower being 1,280, the weight 160,000 lb. and the maximum tractive effort 40,000 lb.

Two locomotives of this type were delivered to the railway last spring but due to increased freight, the eight then in service proved inadequate.

In addition to the large type locomotives, two 53-ton switching locomotives are being operated locally by the railway.

General Electric Orders Up

Orders received by the General Electric Company for the three months ended Sept. 30 amounted to $90,328,666, compared with $77,420,263, for the corresponding quarter of 1927, an increase of 17 per cent, President Gerard Swope has announced. For the nine months ended Sept. 30 orders received amounted to $260,686,463, compared with $233,076,091, for the first nine months of last year, an increase of 12 per cent.

Reorganization of Galena Oil

Reorganization plans of the Galena Signal Oil Company of Pennsylvania have been declared operative by the committee in charge in so far as the sale of certain assets to the Texas Corporation, the retirement of the funded debt and the transfer of the remaining assets to a new corporation are concerned. It is reported that more than 80 per cent of the outstanding preferred stock and more than 78 per cent of the common stock have been deposited.

Cincinnati Car and Versare to Merge

Directors of the Cincinnati Car Company and the Versare Corporation have voted affirmatively on the proposal to consolidate the interests of these two manufacturers of transportation equipment.

General plans for this move were prepared some time ago by committees representing the directors of the two companies. Negotiations between the two committees led to the formation of a working plan which was submitted to the directors of both companies. It is this plan which has now been approved by the directorates. Legal details are still to be completed. Consolidation of Cincinnati Car and Versare interests would put together two classes of transportation equipment which will enable the new company to offer a range of transportation vehicles suitable for various classes of railway and highway service.

The Cincinnati Car Company has been a pioneer in the development of distinctive types of light-weight city and interurban electric cars and trucks. Its products also include the new type of air-magnetic track brake which has attracted considerable interest as a means of meeting the hazards of present-day congested traffic conditions.

The Versare organization has pioneered the large capacity motor coach of distinctive design. More recently it has developed two types of trackless trolleys—one of six-wheel and the other of four-wheel design. An unusual feature of all Versare units is the duralumin truss type of body construction.

Thus the new company will be in position to offer a complete line of electric rail, electric highway and automotive transportation units suited to a wide range of operating conditions.

In the consolidation, executive, engineering and sales organization of the two companies will be combined. Announcement of organization of personnel is expected at an early date.

ADVERTISING LITERATURE

General Electric Company, Schenectady, N. Y., has issued bulletins on the subjects of arc welding in G. E. factories, electric drive for gas-electric buses and trucks, type WD-200A arc welder, CR 7009-B 12 across the line type of magnetic reversing switch, G. E. arc welder gas engine driven, type A. W. resistor arc welders, automatic arc welder for steel rail ties, and arc welding in industry.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has issued reprint 340 entitled, "a 660-hp., 87-ton Oil Electric Locomotive for the Long Island Railroad." This new eight-page publication completely describes the new oil-electric light-weight equipment recently placed in service. Copies of this booklet may be obtained from Westinghouse branch offices.

General Manager

Volume 72 New York, Saturday, October 27, 1928 *Number 17*

Important Rate Cases Before the Supreme Court

THREE important electric railway rate cases have recently been presented to the United States Supreme Court—those of the Los Angeles Railway Corporation, the Denver Tramway Corporation and the Interborough Rapid Transit Company. The Interborough case was heard last week. The Los Angeles arguments will be heard later, though on Oct. 15 the Supreme Court declined to enjoin the company from collecting a 7-cent fare, pending its hearing of the case. The Denver suit was settled when the Supreme Court, also on Oct. 15, refused to review the opinion of the Circuit Court of Appeals that the company was no longer bound to its 5-cent rate.

Although the Los Angeles case has not been finally settled, at least the historic 5-cent fare in that city has, for the time being been definitely broken. New York and San Francisco alone remain the last great strongholds in large cities, of the tempting political doctrine that the nickel fare is in the public interest. In New York the old fare remains pending a ruling by the Supreme Court, expected within a short period, in which final disposition will be made of the case by that body or it will be remanded to the lower court for final disposition. If the companies in Los Angeles and New York are ultimately successful in throwing off the economic restriction to better credit and the improved service which this in turn makes possible the final passing of the nickel as the price of a ride may be safely predicted. This seems to be a proper time for resolving that the fixed fare idea should never again be permitted to grow up in the public mind, regardless of whether the unit be a nickel or a dime.

Making the Most of the Convention

HISTORICALLY, the convention at Cleveland is a thing of the past, but as a topic of discussion the proceedings at the convention are still a thing very much alive. Tangible evidence of this is accumulating every day. Delegates from the Boston Elevated, for instance, were forewarned that they were expected when they returned to tell what they derived from the convention. By them the topics at the convention are being discussed and rediscussed so that those in responsible positions all along the line may have the benefit of any new ideas. This is an excellent practice, for the convention programs are so laid out as to be both general and specific in their appeal—general as regards what might be termed the over-all topics peculiar to the proceedings of the American Association, and specific as regards the special topics of interest to claims men, accountants, engineers and those in the traffic and transportation departments.

Similarly, other companies than the Boston "L" follow this practice of discussion. This year it was not possible for the Baltimore Company to send its men to the convention. As the next best thing committees were formed among them to comb the printed record of the program and discussions at the meetings, and of the exhibit. To overcome the handicap of not having attended the convention, every phase of the program and exhibit was thoroughly presented in conferences by men specifically assigned to cover various topics. Every idea was analyzed from the standpoint of its application to the Baltimore property. Of course, nothing can take the place of actual attendance at the convention, but on the other hand much of the investment in time and money is lost unless the ideas gathered by delegates are made the basis for action when they return. It is to be hoped that the practice of treating convention subjects as topics of intimate discussion at home will spread, since that is one of the most likely ways in which the good points brought out will be considered in the light of their possible local application. Not everybody can be an originator, but it certainly is possible to follow a given course after the route has been carefully charted by those who have pioneered the way.

Imagination in a Scientific Age

OWEN D. YOUNG has again invested with romance the record of the present age of research and scientific achievement by inviting an historical parallel in his comparison of the Elizabethan epoch with its continuations in our own times. The demand of the Elizabethan period was for imaginative literature, but the thinking that went into the period of the Renaissance, that prompted Columbus to sail uncharted seas and resulted in the voyages of Vasco da Gama and Magellan, playing havoc as these things did with traditional beliefs, finds its parallels today in an age regarded as machine-like and prosaic, but in which imaginative thinking takes its course along different lines.

As Mr. Young so aptly said, modern research reflects the intellectual bent of our times, for the present is the age of a combination of imagination and knowledge. In his own way but no less effectively than did de Kruif in his "Microbe Hunters," Mr. Young in his speech at the annual session of the University of the State of New York, at which the honorary degree of doctor of laws was conferred upon him, brought home the realization that the radio, X-rays and radium bear witness to the reality of the working of imagination along scientific lines. The imaginative thinking of the poets of the past finds its parallel in the work of Edison, Thomson, Rutherford, Langmuir and others. As the first strong race of discoverers may be said to have created a new world, so scientific research is creating a new universe

Digitized by Google

by its discoveries. In our own field, it was the imaginative pioneering of Edison, Field, Henry, Sprague, Van Depoele, Siemens and others that spread out cities by making communication easy.

The motor car replaces the horse, the flying machine conquers the air, and radio waves, knowing no physical barrier, become carriers of the valuable intangibles of life to all people everywhere. So the intellect of man blossoms again and makes amazing contributions to human welfare. In the present era of intense living most of us pause merely for a moment in wonder when a Lindbergh hops the ocean and a Zeppelin sails successfully over the seas. It is only when we stop to view these modern feats in perspective that we realize the parallel between our present era and those earlier periods in history when man's quickened imagination drove him forward to accomplishments that changed the course of human progress. We can only speculate upon the destiny toward which the modern world is headed as the result of the present coupling of imagination and science, for in Mr. Young's words, "never was the creative imagination of man working so fruitfully and multifariously."

Baltimore Case Presented to Investors

TO THOSE accustomed to dealing with them, statistics speak louder than words, but the words contained in the recent analysis of the affairs of the United Railways & Electric Company, Baltimore, made by Nelson Cook & Company and digested in last week's issue, should convince the people of Baltimore of the need for restoring the credit of that company. So far as the railway industry is concerned, the statement of the bankers is wide in its appeal since it presents most distinctly the need for preserving the credit status of transportation utilities.

Credit is an ephemeral thing. It is based on capacity —earning capacity. It is here today and gone tomorrow. In most business financial stability is fashioned by the acts of the management. If the management is alert and its fiscal policies sound, its credit rating will be high. But that is not altogether true in the utility business, since superimposed over the acts of the management is regulation by the state that may or may not be sound.

ELECTRIC RAILWAY JOURNAL shares the commentator's views of the situation in Baltimore that the property there has been ably and economically managed. The car rider certainly has been considered first, but the last ten years in Baltimore have been a period of travail. The management has certainly not been avaricious. The history of the fare changes there makes that plain. Still the available statistics show that the company's most active securities have depreciated $11,000,000 in market value since 1927.

The need for refinancing in Baltimore is not far off, yet the bankers say that under economic conditions comparable to those that now exist, new money, if obtainable at all, would probably cost from 1 to 2 per cent more in annual interest than it really should. This is serious. It is serious for the company and serious for the user of the service, since in the end interest and other charges can be met only out of earnings. These things, of course, are elementary, yet the bankers have felt called upon to reiterate them for the benefit of the whole city. Honeyed words mean nothing to the investor. He wants unvarnished facts. And that is what the Baltimore bankers have tried to bring out about one of the most aggravated situations of its kind in the United States.

Facts Seem to Play a Small Part

CLEAR-CUT and incisive was the statement of counsel for the Electric Bond & Share Company to the effect that it had entered into the Federal Trade Commission investigation in a spirit of complete co-operation with the commission, but that judicial determination would be advisable of the right of an inquisitorial body to make sweeping demands for disclosure in detail of its private business and the professional undertakings for its clients, competitive in their nature but wholly private and confidential and deemed not to be relevant to the inquiry. The right of the commission to make the investigation is not questioned.

This, of course, is very different from the construction sought to be put upon the company's position by certain commentators. But could much else be expected when the commission's counsel so far forgot himself as to say that "I can only indulge the assumption that in defying the commission they have something that they are unwilling to let the Senate of the United States know about and the people of the United States know about." That statement is especially unfortunate since no one is in a better position than Commissioner McCulloch to know the extent to which the company has co-operated with the commission in the past. Similarly was it in bad taste for the commissioner to say that "The Electric Bond & Share Company has been willing to co-operate in this investigation only to the extent that it suits its own officers." The remarks show an unwillingness to take into account possible honest differences of opinion over the question of just what is and is not proper. They were particularly unfortunate since, in a previous inquiry, the company was accorded a clean bill of health.

For the sinister aspect which commentators have attributed to the doings of the utilities, particularly their publicity activities, as brought out before the commission, that body is, of course, not responsible, but the commission's attitude has not helped matters. This is not to be construed into a defense of all that the utilities did. Their purposes were sound, but in specific cases their methods were open to criticism, which gave the opportunity for those who sought it to construe piecemeal testimony so as to give the idea of unscrupulous propaganda fostered by subsidized machinery.

To go into the whole matter again is not necessary. The commission cannot be censured for anything that newspapers may say on the testimony it brings out, but it should be on its guard constantly against any act on its part which might be seized upon for conversion into use that tends to misrepresent the attitude of the utilities. It was just here that the commissioners overstepped proper bounds for public agents. It was the apparent right of the company to seek to ascertain the authority of an inquisitorial body to make a sweeping demand for disclosure in detail of its private business and its professional undertakings. It was hardly the right, however, particularly since there was no animus in the objection of the company, of the presiding com-

Digitized by Google

missioner to inject comment into the proceedings that characterized the company's attitude to be in defiance of the commission. The general assumption, even in the case of a culprit, is that he is innocent until he is found guilty. The commission's primary function is that of a fact-finding body. But the general results of this investigation, at least so far as the effect upon the public mind is concerned, seem to have little relation to facts. It is obvious, however, that as far as Senator Walsh's political objectives are concerned the investigation is nevertheless proving successful.

Not in Accord with the Spirit of Mr. Cochran's Speech

RECENT distortion of facts by a newspaper, done with apparent deliberation, raises anew the question of whether or not the frankness on the part of utilities toward the newspapers urged by Negley D. Cochran, editor of the *Scripps-Howard News,* in his speech at Cleveland results in fair treatment. There is no need to cite the city. It is important, however, to say that in it a vigorous war is under way among the newspapers for circulation. It may not be that the railway is being picked as the most likely victim for a campaign in the interests of the "peepul," but it certainly does appear that way.

Singled out for special attack has been the de luxe bus service of the railway. So unfair has the characterization of this service been that the conclusion is inescapable that the editor responsible for the publication of the items condemnatory of the service is "out" to get the railway, since the company has been at great pains to make the nature of this service plain. In this particular case the utility has not dealt with the public through lawyers, politicians, lobbyists or so-called publicity experts, but as Mr. Cochran advocated at Cleveland, the matter has been handled by practical operating men who, to use Mr. Cochran's own words, have employed "candor, fairness, honesty and above-board dealing." True, the case is somewhat isolated, but it is one where the railway wants nothing more than a square deal.

Similarly, there is another case before the industry today in which remarkably good work has been done by a company with franchises about to expire which wants an indeterminate permit so that it may be removed from the machinations of politics while the city makes up its mind whether or not it will take over the property and combine the road now run privately with one that is publicly owned and run by the city. Surely this is a reasonable request, yet even the paper that lauds the company for its good work in the past frowns upon the only proposal that would permit the railway to continue giving good service.

Editors are not expected to see eye to eye with the utilities at all times, but since the application of logic on the part of the railways has apparently failed in each of these instances, the question arises whether Mr. Cochran was not over-sanguine about his brothers of the fourth estate always being amenable to the spirit of justice and the square deal. If in these instances the public interest was uppermost in the minds of the editors and their hearts are in the right place, it would take a strange process of reasoning to explain the attitude of these newspapers. On the other hand, it would be comparatively easy to explain if the question of the circulation of these papers overshadowed that of the real public interest with respect to transportation.

Coffin Award Winner Acclaimed Locally

INSTANTANEOUS recognition from all local quarters greeted the announcement by the Virginia Electric & Power Company in the territory which it serves of its having been named to receive the Coffin Award. Of course, one of the criteria that led to the selection of the company was its good work in bettering public relations, but even those who knew well the high esteem in which the company is now held were hardly prepared for the vociferous and laudatory acclaim that followed the announcement that the company was the winner of this coveted honor. One of the leading dailies in Richmond opened its commendatory editorial with this sentence:

"The record that won the Coffin Award for the Virginia Electric & Power Company has been based on the rarest of the world's commodities, consistent common sense."

Comment by the press of the territory has been profuse, but the public response is adequately illustrated by the spontaneous comment from a citizen, a printing concern, and a large corporation since they represent a typical cross-section of the praise that has poured into the Virginia company's office since Sept. 25. Nor is the praise confined to letters. When the buses and cars displayed an announcement that the company was the winner, the most frequent verbal comment was "I'm glad they got it." Typical statements follow:

"I can assure you that the improvement had long been noted, before the above (the award) happened"....

"We have noted with pleasure the development of your company since its change in management along the lines which won this trophy, and we feel certain that the award was justly earned.". . . .

"No wonder our company is willing to invest trust funds in the organization. There is a reason behind all its business transactions."

This is some of the concrete evidence of an outstanding reversal of public opinion in the history of a public utility. The editorial mentioned previously crystallized the sentiment of the people toward the company when it thus gave the reason for the metamorphosis:

"Its president has practiced and has preached the doctrine that if a public utility reasonably presented its reasonable requests, it would find councils, executive officers and the public amenable to reason. . . . From the hour this slow-speaking South Carolinian arrived in Richmond, he has dealt candidly with everyone. Always accessible, always good-humored, always on the job, he has probably made as many friends as any man ever did who has lived in the city so short a time. He displays common sense because he has uncommon sense."

The important point is that the directing head of the company has imbued the entire personnel of his outfit with the same spirit and qualities. It is not to be wondered then that the public is unqualified in its praise of the company or that the railway industry has honored with its highest award that common sense which is the product of uncommon sense.

Many Factors Affect

Car Development

By Charles Gordon
Editor *Electric Railway Journal*

This article is based upon an address prepared for presentation before the American Electric Railway Engineering Association at the recent Cleveland convention. Discussions of the paper, prepared by representatives of three car-building companies, will be published in next week's issue

IT IS probably no exaggeration to say that electric railway rolling stock design is one of the most important questions before the industry. The strenuous effort that has been made during these past three years to achieve an adequate and representative car exhibit at the annual convention is strong evidence of the importance attached by the industry to car development. In the fact that many operating companies have been willing to withhold cars from service, and in some instances to defray part or all of the cost of shipping and exhibiting this equipment, there is convincing proof of an interest in the improvement of cars by those who buy them.

Until quite recently, at least, some of the manufacturers and particularly some of the car builders have shown less initiative in car development than have some of the operators. Perhaps that is in a measure justified by the fact that the operator is closer to the car riding public and senses more keenly the need of the times. In any event it is a fact that the car builders have followed rather than led in this movement toward improved rolling stock, and since I make that statement it is only fair to the manufacturer that we go further than the mere discussion of the probable trend or development and examine some of the conditions within the industry itself that exert a strong influence in determining what it is possible to accomplish.

Trade Conditions Are Serious

First of all, the car builders and some of the other manufacturers have been facing a very serious trade situation which has been growing progressively worse for several years. This condition has been considerably aggravated by the present widespread interest in radical developments in cars and trucks. There are a number of contributing factors, for some of which the manufacturers themselves are at least partly responsible. The others are traceable to the practices of some operating companies.

Purchases of cars and car equipment have been at a low ebb for several years. During the first half of this year the number of cars built was at the lowest point of which we have any record. The recession in car buying was first caused by the unsatisfactory financial situation of operating companies and later to some extent by the rapid development of the bus. But during the past eighteen months, there has been a sudden further drop in new car orders, which is now generally attributed to the fact that many properties are holding off needed purchases, while awaiting the outcome of recent experiments in designs and construction. All of this has had a cumulative effect which has aggravated an unsatisfactory trade situation and has put some car builders and equipment manufacturers in a position which is almost desperate.

This situation has a great deal to do with future rolling stock. The progress of an industry such as ours is closely associated with that of its manufacturers, particularly the builders of its principle units of equipment. Unless they are in a position to function as sound business enterprises, the industry suffers through a lag in developments to meet changed conditions. It suffers likewise, from the failure to attract new blood and new ideas. Unless an industry offers an attractive market, those who supply its products turn their attention to other fields or go out of business. New manufacturers, or manufacturers in other fields are discouraged from entering and the stimulus of fresh development and healthy competition is lost.

Since the trade situation in the industry has a strong influence on the development of equipment, it is important, therefore, in considering future rolling stock that we consider practices by operating companies that stand in the way of progress. First of these is a form of rivalry between operating men, particularly equipment men which seriously retards progressive development. At first thought it would seem that this would accelerate improvement. That does not follow, however, because the demand for special ideas in each lot of cars that are built takes the initiative out of the manufacturer's hands and, though there are many changes, they "get nowhere" due to the many individual ideas and the lack of continuity.

Buying Practices Increase Cost

It takes only a casual survey of the wide variety of car widths and lengths, window spacing, door arrangement, wheel sizes, and motor and control equipment, to say nothing of structural details, to realize the serious condition that exists. Not only is quantity production of cars themselves impossible, but the same limitation is encountered by electrical and specialty manufacturers.

Digitized by Google

In exaggerated cases an order for a group of 50 cars means a special design job, not alone for the car builder but for a host of other manufacturers of equipment and parts ranging from motors and control to seats, door equipment and body fittings. It is impossible even to approximate the cumulative effect of this situation. There is little question, though, that it has retarded rather than helped the progressive improvement of cars to meet the competition of other vehicles. Furthermore, it has increased the cost of cars. This in itself discourages the replacement of obsolete equipment.

But there are other reasons why some properties continue to hang on to their old cars and why practically a third of the rolling stock now in service is continued in operation long after it has outlived its economic usefulness. Sometimes these cars represent the ideas of a master mechanic or a general manager who takes pride in the claim that they will never wear out. How often have you heard a railway man point out a car and proudly exclaim: "There's a real street car! We bought those back in 1908 and they're in better condition today than when they first went into service." The expression or the date may vary but the general attitude is the same. The more he dictated the design, or the more he had to do with the actual construction, the greater is his pride in that particular car! Here is at least one of the explanations for the dogged determination with which some properties continue to hang on to obsolete equipment. This explains in part also why some properties are spending thousands of dollars in remodeling old cars, which, though they may be equipped with more comfortable seats, sanitary floor coverings or a different color of exterior paint, are still awkward in appearance, noisy, slow and excessively costly to operate.

Car Builders Are Contractors

Car building has become largely a contracting rather than a manufacturing business. The builder influences the details of construction, but rarely sponsors the complete unit as a distinctive manufactured product. He usually builds to the operator's specifications. Consequently, the operator, particularly on the smaller properties, is sometimes sorely perplexed to know just what kind of a car he ought to have. This I believe, exerts a strong influence in discouraging the small property, not equipped with suitable engineering talent, from undertaking to replace obsolete equipment.

For several years I have urged upon car builders the necessity for taking the initiative in developing distinctive cars which could be sold as other manufactured products are sold. But I have been told, however, that street cars cannot be sold in that way because the operating companies will continue to insist upon specifying their own designs. I do not agree with that view particularly as applied to cars designed for service in small and medium-sized cities. The bus manufacturers contended with a similar situation early in their experience and are successfully overcoming it. That doesn't mean that buses are all they should be or that all the bus manufacturers have been successful. The bus is being developed into a practical transportation vehicle and is finding its proper place in the scheme of transportation much faster than would have occurred had the manufacturers given way to the pressure for special designs for every customer. The pressure itself is, of course, a good thing. It forces the manufacturer to recognize the weaknesses that operating experience uncovers in his product. He is, however, not guided by the experience of any single operator. He sifts and studies complaints and troubles and gradually improves his design as a whole.

When I speak of the advantages of buying standard cars from the manufacturers, I mean distinctive models developed by each manufacturer, and gradually improved from time to time as experience and changes in operating conditions seem to make this necessary. There is a definite move now under way to market cars on this basis. The manufacturers who are undertaking to bring about this change in car marketing methods are entitled to commendation and co-operation from the operating men of the industry. I believe, further, that the general character of the street car of the future will be influenced to a considerable extent by the success or failure of this move to change the basis upon which cars are built and sold.

Home Manufacture Bad Practice

A practice upon which there has been entirely too little discussion, and which works directly against the encouragement of development, is that of home manufacture of cars by operating companies. This is only rarely, if ever, in the best interests of even the operating company itself. Most of the reasons advanced are outweighed by other considerations that are frequently overlooked. I have studied this practice carefully on several properties, and have yet to find the electric railway where it can be justified as an economy. There are several simple reasons for the practice. One of them is local pride or personal ambition on the part of the management or the shop executive. The existence of a well-equipped shop is always a temptation to undertake car construction. Another contributing cause is the fact already mentioned, that car builders have been content to serve merely as contractors and have been unwilling or unable to accept the full responsibility for the design and performance of their completed products.

It seems to be the prevalent idea among many operating men that the maintenance executive who shows ability as a manufacturer enhances his reputation in the industry and in the eyes of his superiors. I am sorry to admit that in some instances that seems to be true. But it is not sound, nor is it a good thing for an individual railway or for the whole industry. The maintenance forces on a railway property are not there to manufacture equipment. Their primary function is to keep the equipment already in service at the highest possible state of efficiency and reliability at the lowest possible cost. When a property undertakes to manufacture many of its supplies or its cars most of the supervisory staff is occupied with manufacturing problems while maintenance lacks the supervision which its importance warrants.

On too many of these properties the number of shop and carhouse employees runs high in comparison with other properties operating a comparable number of cars. The cost of maintenance per car-mile is high, and the pull-in record does not compare favorably with other roads. Among the companies that show the best records of low maintenance cost and freedom from equipment failures, manufacturing activity is held to a minimum. When these frequently overlooked elements in the cost of home manufacture are compared with its assumed advantages—which frequently do not actually exist except in the mind of the man responsible for the practice—home manufacture is usually proved to be, at best, an expensive luxury. It can be proved to be unjustified from the standpoint of the individual property, but its harmful effect is even more pronounced in cutting down

Digitized by Google

the available market for cars, thereby reducing the stimulus to needed developments in rolling stock.

What are the reasons that dictate some of the recent radical departures from conventional truck and car design? One primary objective stands out above all others. Electric railways must compete with individual automobile transportation, and their cars must be suitable for that purpose. They must meet the requirements of modern conditions, both in their performance and in the impression which they make on the public. They must be in keeping with their surroundings in the modern city. They must be able to keep up with other traffic on the street, and must meet the demand for quick transportation. They must by their very appearance and by the impression which they make on an observer, create the desire to ride in them. There must not be the slightest hint of being out of style. The American public refuses to be associated with anything which gives even the impression of being out-of-date, and it will tolerate such a thing only so long as it is forced to do so. Future rolling stock must be quiet in operation. It must be smooth, and pleasant to ride in. It must be comfortable, convenient, and easy to use. It must, in fact, meet the automobile on its own ground, for the public has become automobile-minded. It must do all this at the lowest possible cost—far below the cost of individual transportation.

This is rather a sizeable order but one which I believe can be filled successfully. Through some of the recent progress that has been made, we are just beginning to see the possibilities. We are feeling our way carefully, but we are going at a rate much faster than some of us who are close to the problem may perhaps realize. It needs only a mental review of the last three exhibits at the conventions to realize how far we have progressed in that comparatively short time. But it is none too fast. The very existence of the industry is dependent on developing equipment to meet the demand of the times.

Large Field for Small Unit

In its general conception there was nothing wrong about the one-man Birney car. In fact, the idea of a comparatively small unit, operated on frequent headway by one man, is, I believe, fundamentally sound for a great many lines in the vast majority of cities in the country. Only when traffic densities go up considerably above the average, are larger units necessary or justified. The electric railway man has always been subject to the temptation to use large units. It seems such a simple way to reduce the cost per seat, or per passenger carried. But of what good is a reduction in cost, if it is achieved by driving away business? Frequency of service is, I believe, equal even to speed in its effect upon the volume of riding. Even from the standpoint of speed, small units have an advantage over large cars, for speed is affected by the number of stops. The smaller the total load carried on a single vehicle, the fewer will be the number of stops which it is required to make. Put this whole matter another way: the smaller the individual unit that is operated, the closer does the service given approximate that of the individual automobile.

The load factor on the system is all too often overlooked in yielding to the temptation to make sure, when selecting new cars, that they are ample in size. The use of larger equipment in the rush hour is, of course, frequently required, but there are cars now available on most properties for that purpose, and in any replacement program, first consideration should be given to equipment for all-day service. This question of the proper size of cars is an important one in considering future rolling stock. There are many comparatively small properties that are saddled with large, heavy and expensive cars, that are losing out rapidly in the race with the automobile, simply because they followed the Scotchman's example of buying No. 12 size shoes since they seemed to be a better buy at the price than the No. 7's though the latter would have been a proper fit.

To repeat, the idea behind the single-truck safety car was sound for a great many lines in many cities, so far as its small size and the implied objective of frequent headway are concerned. But the limitations of the existing type of four-wheel truck were a serious handicap. The appearance and riding qualities suffered. It gave the public too much the impression of a Toonerville trolley. It looked too much like what it actually was—cheap transportation. It is one of the idiosyncracies of human nature, that though we demand economy and an attractive price, we refuse to buy a thing that looks cheap as well, if we can possibly scrape up the money to buy something that "looks" more expensive or luxurious.

The effort to achieve a four wheel car which will overcome some of the limitations of the former one-man safety car is, in my judgment, a step in the right direction and its ultimate success will depend entirely upon its ability to stand up in service and to perform properly over curves and special work and when there is ice and snow on the ground. The advantages of this type of car are so obvious that it seems to justify every possible effort to make it successful.

Need for Improvement Is Urgent

In the field of larger double-truck cars, the present trend toward radical changes from conventional practice dates back only slightly more than a year. Some of the original experimental cars were conceived and built before that, but the industry became genuinely interested in this trend only at the 1927 convention, following the showing of a number of new ideas in cars, and no less than five examples of radical departures from conventional truck practice. The entrance of automotive manufacturers into this field has given additional stimulus to the movement—and some controversy to the discussion.

Obviously, it is unwise to indulge in a wave of enthusiasm for something new and comparatively untried. Nevertheless, the need for improved performance is urgent, and the interest in the new ideas is justified, provided it is not carried to the extreme of holding up all necessary car replacements pending the outcome of experience with the new designs. The tendency toward the latter policy has become very clearly apparent during the past year. It is the subject of grave concern in the industry, especially among progressive operators as well as manufacturers. Needed replacements should proceed while awaiting the outcome of new experiments. Some forward looking properties are buying new equipment on conventional trucks with an eye to the fact that they cannot longer afford to postpone the benefits of new equipment, recognizing that if the new designs should prove to have all of the advantages they promise, there are so many cars to be retired that the worst of them can be profitably replaced now with conventional equipment, which will more than repay its cost in operating savings. The more radical types of construction can then be adopted for the remainder of the replacement program as fast as they are tried and proved in service.

Digitized by Google

By co-operating in this work to the extent of purchasing trial equipments, many progressive operators have acted wisely, and have helped to stimulate the continuation of this needed development work.

After all, the great question regarding radical truck and motor designs, is the justification for the change from conventional practice. The objectives sought in these designs are reduced weight and noise, faster and smoother starting and stopping with lighter equipment, and reduced unsprung weight. The latter factor has led to considerable discussion. Reduction in unsprung weight is expected to reduce both noise and the wear and destruction of expensive special work and track. It has been contended by some of those opposed to the new designs that they do not actually achieve lower unsprung weight. To my mind, the functioning of the springs is as important in the consideration of the effect of a given design upon track wear as is the actual weight below the springs themselves.

Many Elements Affect Appearance

As to bodies, the great change will be in appearance, equipment and fittings. Again, this is attributable to the need for meeting public fancy. Only during the past few years have we been giving the question of car appearance serious consideration. In this we have been forced to feel our way slowly, because relatively little attention was formerly given to the appearance of street cars. We are only beginning to understand some of the elements that influence the general effect produced by a car and our progress toward beautiful cars will be accelerated as our experience increases. We are beginning to ask the engineers to fit structural details into a design to produce a given appearance, instead of letting the latter take care of itself after the structural elements are determined. We are in the process of learning just how each element of the design affects the final impression created by a car. A new art of car architecure is getting under way.

We are learning how to use paint effectively to accentuate long, smooth lines in the body. The former practice of car painting was in accordance with the dictates of precedent rather than to achieve any given effect. The object now is to carry color on a car in uninterrupted horizontal bands and to avoid breaks and offsets in the lines at door openings or at the vestibules. There is some tendency to use wider and lower windows and to decrease the width of the letterboard and the arch of the roof so as to avoid giving the car a top-heavy appearance. The distance between the belt rail and the bottom of the side sheets is being carefully studied in relation to the height of windows and the distance to the top of the roof, so as to achieve proper balance in appearance. Attention is being paid to the relation between the bottom of the side sheets, the steps, and the bottom of the bumper so as to avoid awkward breaks and to produce smooth, sweeping lines. In fact, there is consideration being given to many factors that were rarely considered before and these are all for the purpose of making a street car a thing of beauty rather than an eyesore. That this is good designing and good business is proved by the same trend in every other branch of industry from the building of ocean liners to the manufacture of 10-cent store novelties. "Making it look right" is becoming as important to the modern designer as making it work right.

Manufacturers are, in the last analysis, dependent, in making needed improvements, upon the suggestions of the operating man that come from his experience with their equipment in service. Despite all that the manufacturers may endeavor to do, it is, in the last analysis, the equipment men and the operating men on electric railway properties who will determine, through the cars they buy and the cars they do not buy, the future trend of electric railway rolling stock. Right now the manufacturers need active suggestions and co-operation. This is a very critical period in the history of the industry, and without the active co-operation of the equipment men, little will ultimately be accomplished in the present attempt to bring about improvement of rolling stock. But there must be some unanimity of opinion between individual equipment men before any general progress can be made. Individual views and opinions should be co-ordinated and the manufacturer should be able to check the proper course of his developments. This course should be determined by the operating results to be achieved. That is the only sound basis from which to determine the desirable characteristics of future rolling stock.

Attention, Maintenance Men!

DON'T MISS the opportunity offered by ELECTRIC RAILWAY JOURNAL's new maintenance prize contest. Send in descriptions of maintenance ideas developed on your property. In addition to winning an individual prize, you are sure to acquire greater prestige and you will encourage others to submit ideas that will help you to make further improvements in your own practice.

Read the conditions of the new contest, published in last week's ELECTRIC RAILWAY JOURNAL. On every property and in every department there are valuable ideas that have never been made available to the industry.

Get started early! No limit on number of items that can be submitted by any individual, department or company. For the best single item submitted $200 will be paid! Twelve individual prizes of $25 each. Help your company win the maintenance trophy to be presented at the next convention. The JOURNAL will pay $5 for each item published, whether or not it wins a prize! First prizes to be announced in February. Items will be published as rapidly as possible after they are submitted. Don't delay! Win one or more of these valuable prizes. See last week's issue of the JOURNAL for full details.

Six Applications of Motor Haulage to Track Machinery

Keeping Up Track in Virginia

How the Coffin Prize Winner this year was enabled to maintain its track at high efficiency and low cost

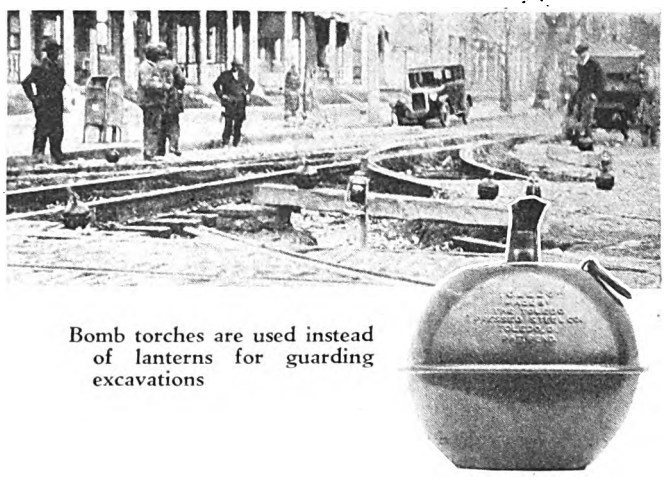
THE foundation of low car maintenance and of comfortable car riding is good track. The notable record of the Virginia Electric & Power Company (published in the Oct. 6 issue) of combining improved track maintenance with higher wages and lower maintenance costs, calls for more details than were possible in that article. Much of the saving came from the use of power-operated, instead of man-operated, track tools. Another gain was from speed in getting the equipment to the job. The accompanying information on the subject has been compiled from the company's brief for the Coffin prize this year.

Track repairs differ from car repairs in that with the latter the job is brought to the shop, while in the former the shop has to be taken to the job. To facilitate the latter practice, the Virginia Electric & Power Company puts a great deal of its track machinery on wheels, so that it can be hauled readily to any track repair undertaking needed. Typical apparatus under such movement or prepared to go are illustrated in the accompanying six pictures. One shows the reciprocating joint grinder unit, consisting of truck, grinder and grinder trailer. Ordinarily six men would be required to load a grinder of this size on a truck, but by the use of the special trailer shown, it is moved about by the two men who operate it. It hooks on to all motor equipment. Another view is of an asphalt heating kettle with wheels and handle by which it can easily be attached to the end of an automobile truck. A third view shows a motor generator welding unit starting out for a job. Its use on a trailer is considered more economical than if it was mounted on its own auto driving equipment. As with the reciprocating grinder unit, the trailer has a low platform to make placing easy. Originally this truck had solid tires, but these have been replaced with pneumatic. Portable concrete mixers and portable air compressing units are also mounted on wheels for easy transport. Still another illustration is of a thermit welding unit of trailer and truck. This is especially useful as thermit is now the standard of the company for all new jobs and some reclamation work.

Bomb Torches and Manganese-Tipped Tampers

When the construction gangs leave a street excavation or obstruction in the evening, they use quite extensively bomb torches instead of lanterns, as a warning to users of the street. One advantage of these torches is that they burn crude oil instead of kerosene. Another is that as they are self righting and unbreakable. They cannot be extinguished unless the flame is smothered. A third is that they can be placed within the track area as readily as outside it. This makes it possible for the track gang to place them more favorably for the warning of traffic.

Reference can appropriately be made here also to a method used by the company to prolong the life of its tamping tools. These tools, as they are purchased from the manufacturer, often wear down after one week of use. Instead of then being discarded, they are tipped with manganese steel. The material used is that employed for manganese switches, and the tip is fastened on by an arc welder. The contact face of the bar is left somewhat rough to secure better work. So repaired, a tamping tool will last six months.



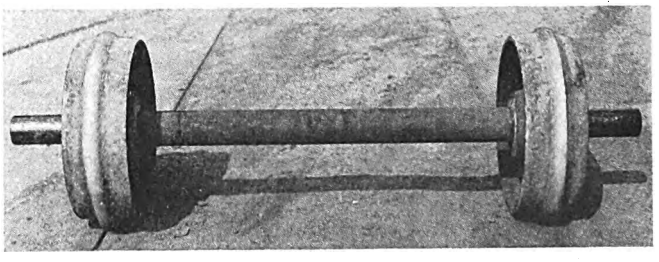
Bomb torches are used instead of lanterns for guarding excavations

Wheels for Making Grooves in Asphalt

In connection with the subject of tools, mention should be made also of a device developed by the way department for forming grooves in asphalt which has been freshly laid directly up to the rail heads. It accomplishes directly what the car wheels would have to do if this device was not used. It consists of an axle with a pair of special wheels with center flanges of proper contour to make the correct indentation in the fresh asphalt.

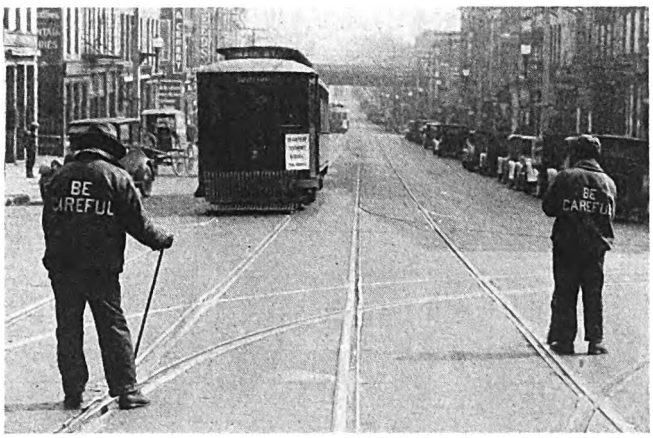
Waterproof Paving Developed in Richmond

Due to continuous vibration from heavy trains passing over steam railroad crossings on paved streets, the company found it difficult to prevent surface water from entering the foundations of its track in Richmond, where the bond between the crossing and paving usually breaks down. This has been overcome by developing an asphalt and crushed stone mastic, using an asphalt of such high penetration that it remains plastic enough to be sealed by heavy traffic. This paving consists of one 2-in. layer of 2-in. broken stone. After this has been well tamped, all voids are filled with natural lake asphalt. A second



A pair of specially flanged wheels makes flangeways for car wheels in Norfolk

Digitized by Google



Track greasers and switchmen are safeguarded by bright red jackets bearing the safety slogan "Be Careful"

layer 2 in. thick is made up of ¾-in. stone. After this has been tamped, all voids are filled with more asphalt of the same penetration. Then the top is covered with ¼-in. stone chips, which are rolled in to complete the job. The paving as a whole is carried on the company's standard foundation of 6 in. of ballast and 5-in. concrete slabs.

Track Men Wear Red Jackets

While at work in the street the track men are protected by being permitted to wear bright red jackets. This plan was adopted because, with the congestion which prevails on the streets of Richmond, as in most cities, motorists get into the habit of looking out for other automobiles and often forget that railway switchmen, track or track repair men may be at work. The red jacket used in Richmond makes them conspicuous. In addition, the back of each jacket bears in white 2-in. letters the words "Be Careful." In the view published one of the men is a switchman, the other a track greaser.

Through the co-operation of the local newspapers, this scheme has been given good publicity. Now the public knows that the man on the street wearing a red jacket is working on the track and is not likely to have time to watch out for passing automobiles.

Reclamation a Science

Reclamation is used extensively in the track department. In one part of the track yards are several concrete salvaging bins into which old bolts, nuts and similar fittings are deposited. They are carefully picked over by a man who soon becomes experienced in selecting the good from the bad. Those found available for re-use receive oil and then are sent to live storage.

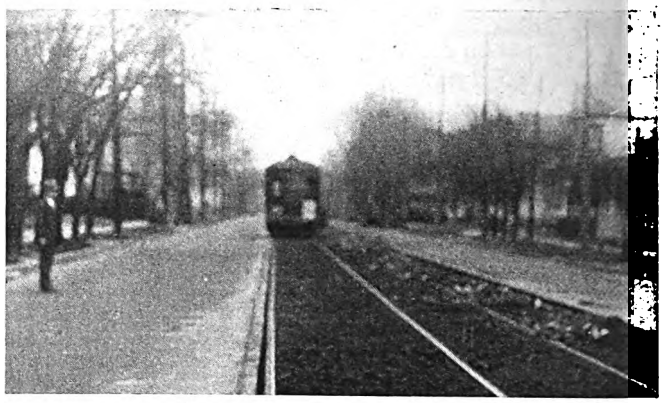
The company has even found a use for old ties and bridge lumber. Instead of being thrown away, they are now hauled to a power saw, where the old timber is cut into fuel lengths to be used under the sand dryer and to heat asphalt. This effects a large saving in labor as well as in the cost of operating the sand dryer.

Several concrete bins are provided for salvaging bolts and nuts

Crowding Two Tracks Into a Narrow Mall

This article will conclude with an account of the way in which a peculiar track problem on the Norfolk division of the company was solved.

A single track, which was laid in a mall between two paved sections of the street was found to be inadequate for the service, and the company wished to substitute double tracks. The mall was only 16 ft. wide, and it was not practicable to secure permission to make it broader by cutting down the width of the paved portions on each side. The track gage in Norfolk is 5 ft. 2 in.



Two tracks replace one within this narrow mall

It was found by careful measurement that if the outside rails were set close to the curbing of the paved portion there would be sufficient clearance between cars on a double-track layout. This was the solution adopted. The outer ends of the ties for each track were sawed off flush with the rail base. The latter was then placed on spiked plates which were lipped around the outside of the base. A concrete footing about 12 in. wide was poured to give extra support to the shortened ties.

This gives a track with a standard centering of 9 ft. 6 in. It is true that the cars slightly overhang the paved portion of the street on each side, but this offers no special operating difficulties.

High Speed Trains in France

RECENT figures on schedule running times of various steam and electric trains in France during the summer of 1928 indicates that high speeds are attained over runs of considerable length. The highest speed listed is for a steam train on the Nord Railway between Paris and St. Quentin, which makes the run of 95.75 miles in an hour and 32 minutes or at a schedule speed of 62.4 m.p.h. The second and third highest speed trains, both electric, are on the Midi Railway between Bordeaux and Dax. This distance is 92.19 miles. One train makes it in one hour and 29 minutes and the other in one hour and 31 minutes. These correspond to a speed of about 62.1 m.p.h. and 60.8 m.p.h. Other high-speed electric trains listed are for the same trains just mentioned but on the return trip from Dax to Bordeaux. On this run one of the trains makes a schedule speed of 59.5 m.p.h. and the other 58.7 m.p.h. The Orleans Railway has an electric train from Aubrais to Paris, covering a distance of 74.37 miles in one hour and 19 minutes.

Havana Carries On

Railway system in Cuba's capital had operating ratio of 78½ per cent in 1927 with 5-cent fare and two trolley wires. Need for jitney regulation if transit facilities are to keep pace with growth of city

By Henry W. Blake
Senior Editor *Electric Railway Journal*

FOR many years the electric railway system in Havana was owned by the Havana Electric Railway, Light & Power Company, which also owned the gas and electric light and power system in that city. On Sept. 1, 1926, however, these utilities were separated by the sale of the electric railway system for cash to a new company. It is known as the Havana Electric Railway Company and was incorporated under the laws of Maine in 1926. The same company also acquired the entire capital stock of the Insular Railway Company, which operates an interurban line from a suburb of Havana, known as Vedado, to Marianao. The new company also owns the local electric railway lines in Santiago and Camaguey, Cuba.

The electric lighting and power company is an Electric Bond & Share property, but the Havana Electric Railway is not, its only connection with the Electric Bond & Share Company or the subsidiaries of that company being through several common officers and directors.

Thus, Frank Steinhart, who for many years has been a prominent figure in Cuban electrical affairs, is the president of the Havana Electric Railway Company and is also vice-chairman of the light and power company. S. R. Inch, E. P. Summerson and William Darbee, respectively vice-president and secretary of the Electric Bond & Share Company and vice-president of the American & Foreign Power Company, are also directors of the Havana Electric Railway. Messrs. Inch and Darbee are also vice-presidents of the latter company and Mr. Inch is a member of its executive committee.

Of the railway systems owned by the Havana Electric Railway Company that in Havana is by far the largest. Including the line to Marianao, with which the Havana city lines are physically connected, the property has 95.24 miles of equivalent single track, as compared with only 11.68 miles in Santiago and 8.6 miles in Camaguey. As will be noticed, the track mileage in Havana, including the interurban line, is less than 100, a comparatively small amount when compared with American trackage for a city with nearly 600,000 inhabitants. But within recent years the conditions for making extensions to the property have not been particularly favorable.

Nevertheless, Havana is growing rapidly and needs more local railway transportation. From a population in 1907 of 297,159 inhabitants, the city grew to 363,506 in 1919, and in 1925 to approximately 563,000. It is the capital of Cuba, has fine buildings, boulevards and hotels, and is becoming more and more a winter resort for Americans, especially since the Volstead act was passed. Commercially also, the city holds a leading position. It has an excellent harbor, and in the city are located the large exporters of the principal agricultural products of the island, sugar and tobacco, as well as the principal distributors of the goods imported into Cuba.

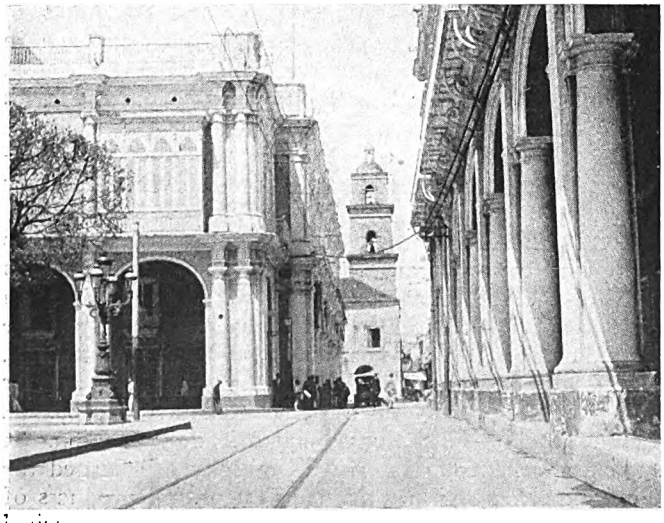
Two factors have combined to retard the physical

Digitized by Google

A typical downtown street in Havana with its narrow sidewalks and trolley track at one side of the street. The railway feed wires are supported on struts between the buildings on opposite sides of the street

growth of the railway system. One is the fare on the city system, which is still 5 cents. The other is the larger number of jitneys and low-priced taxis which have been allowed to operate in the city.

The jitneys came in part as the result of the existing business depression in Cuba, caused by the low prices for sugar which have prevailed in the markets of the world now for several years. The Cuban Congress has made several efforts to increase the price of sugar by prohibiting the breaking of new ground for sugar crops, authorizing a limit to the total production in successive years, and in other ways. Owing to the predominant position the sugar industry has in the island its reduced prosperity has been followed by a retrenchment in many other lines of commercial activity, with consequent acute unemployment. Quite a number of workmen normally employed in established industries were forced to seek a means of livelihood more or less precarious by engaging independently as bus operators. During 1927 and the early part of 1928, approximately 800 jitney buses were operated in the city of Havana and adjoining districts. Most of them were owned by their drivers, or by small companies having not more than a few buses, and passengers were carried for 5 cents.



On many streets the sidewalks are within colonnades. Here, as elsewhere in narrow streets, the span wires are attached to walls of buildings, rather than to poles

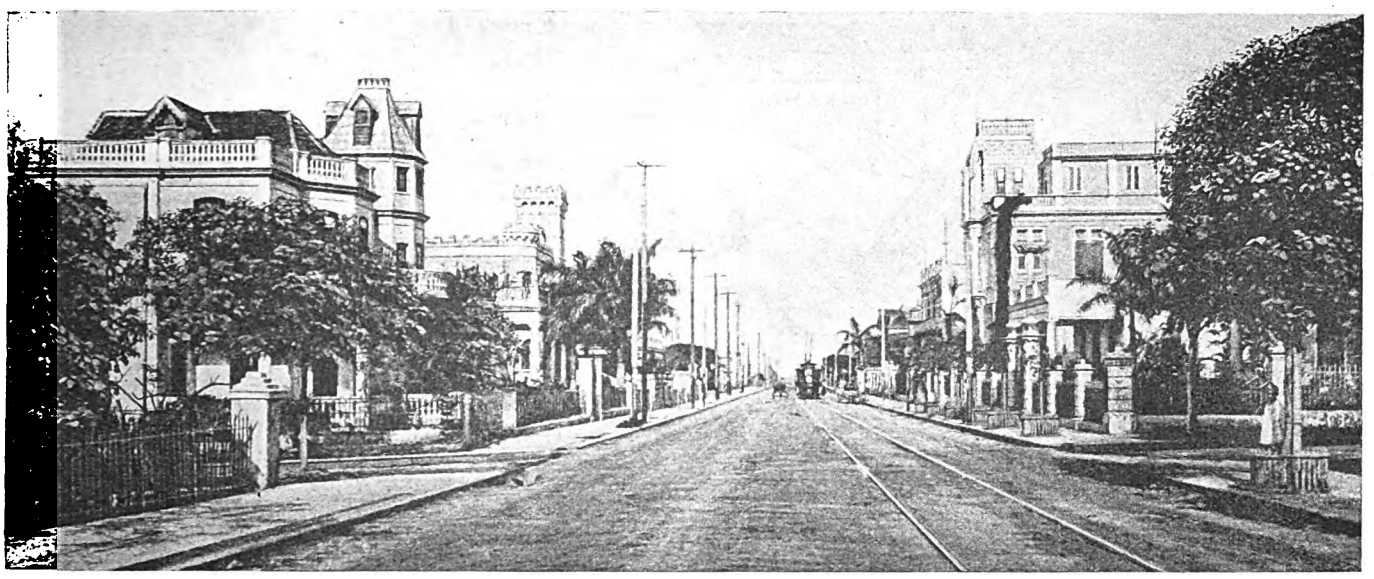
Mayor Issues Decree

The chaotic condition brought about in local transit by the operation of this type of bus, however, finally moved the city authorities to take steps to reform it On March 20 of this year the Mayor of Havana issued a decree calling for a number of changes. According to the decree, future licenses for bus operation are to be issued only to companies or individuals having no less than eight buses, which all must be of the same model and size and painted the same way. To secure safety, the buses have to comply with certain specifications. Operators must specify the route on which they intend to operate, the fare to be charged and the capacities of their buses. Passengers must not be admitted in excess of this specified capacity. Each licensee must operate his route between 5 a.m. and midnight and must post a copy of the proposed schedule in each bus. The times that the buses leave and return to their terminals must be registered and must be reported weekly to the authorities. A conductor as well as a driver must accompany each bus. Ninety days were specified in this decree as the time permitted jitney operators to comply with its regulations. As a result of this decree, the number of independent buses have considerably decreased during the last few months and the railway earnings have improved.

Before the issue of this decree the jitney buses operated in Havana were of a great variety of types but the body usually seated from 20 to 24 passengers and was mounted on a truck chassis. These chassis were of all makes and ages. Besides these jitneys, one bus company in Havana operates 44 modern Mack buses of considerably larger capacity than the jitneys mentioned.

It is hard to tell whether these jitney buses were profitable during this period when they were free to make their own schedules. Probably some of them were, and are still, because the first cost of the equipment could not have been very much and the operators were also the owners and willing to work for ten or eleven hours a day. But whether they made money or not, they undoubtedly took a great deal of traffic from the railway. Since they did not have to file any reports it is impossible to give a definite statement of the average number of passengers carried daily or annually. Local estimates credited them with carrying about 125,000 passengers a day. As the railway carries about 275,000 passengers, it will be seen that the jitneys were doing about 30 per cent of the local business and the railway about 70 per cent. It was very easy for a jitney operator to get a franchise, as he only had to specify the route on which

Digitized by Google



There are many broad streets and fine residences in the newer portions of Havana

he expected to run and then start in carrying passengers for 5 cents each.

While these buses in many ways have been a nuisance, in a sense some of them are a public convenience, in that they have been supplying transportation to certain sections of the city which at present do not have railway service. The reason for this is partly because Havana has expanded so rapidly during the past few years that it has outgrown its railway system, and partly because very little new track has been built during the past few years. The jitney competition and the low fare have discouraged the construction of extensions.

Taxicab Fares Are Low

Besides the jitneys, the electric railway system has to contend with the taxicabs, the fares in Havana being unusually low. The city is divided into districts, and the fare on the lowest price taxicab, when the trip is within one district, is 20 cents for one or two passengers. As the greater part of the downtown section of Havana is within one district, this minimum fare is very common. By the hour, the charges for one or two persons are $1.60, for three people $1.70, and for four persons $1.80. These prices apply to the small taxicabs, such as Fords and other small cars. There are a few larger cars which charge a higher rate.

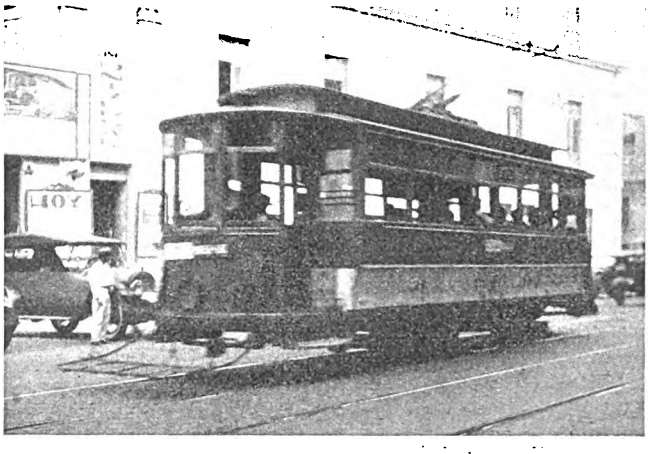
Equipment

All of the cars of the electric railway line of Havana are mounted on single trucks and are designed for two-man operation. There are two types, one seating 32 passengers, and the other 36 passengers. An experimental one-man car is being built.

Most of the bodies of the present cars were built in the company's shops. One reason for this has been lower unit costs of labor and material. Hard woods are particularly cheap in Cuba, for many, including mahogany, are native. Another reason for home construction is the tariff and shipping charge on car bodies that have to be imported. The trucks are generally McGuire or Brill, with 30-in. cast-iron wheels. The motors are General Electric.

The Havana street railway system was electrically equipped during the American occupation in Cuba, following the Spanish-American War in 1898, and at the insistence of the American military officers then in control, the double trolley system was adopted. It is still in use, making Havana one of the two large cities anywhere, where this system is employed. Cincinnati is the other. Over some tracks in Havana two No. 000 hard-

Some jitneys in Havana are of this type with cross-seats. Others have closed bodies with longitudinal seats



Short cars are necessary in Havana because of the small clearance on many curves in the downtown streets. The standard Havana car is mounted on a single truck and of course has two trolley poles

The city of Havana is surrounded on three sides by water and growth has been westward. The finer residences are in the northwestern part of the city in the direction of Vedado and Miramar. This map shows the local electric railway lines

drawn copper wires are used overhead, and over some track a smaller bronze wire is employed.

The double trolley construction requires, of course, two trolley bases on the roof of the car. At one time the company had some trouble with electrical leakage and short circuits between these two poles, hastened by dirt and grease which collected between them. By the heavy rains which occur in summer a film of water was caused to form on the trolley bridge. The difficulty was finally overcome by the design of a special trolley base support which is thoroughly protected from the weather by being painted with a special varnish. The method was described in the ELECTRIC RAILWAY JOURNAL for Nov. 12, 1927, page 907. On the other two properties of the company, at Santiago and at Camaguey, the single trolley is used with ground return. The double trolley is also used on the interurban line of the Havana Electric Railway from Havana to Marianao, and the single trolley on the electrified steam lines operating out of Havana.

The track in Havana is built with an 89-lb. grooved section rail, laid on a concrete foundation.

FINANCIAL STATISTICS AND OPERATING CONDITIONS

An abstract of the operating report of the Havana division of the Havana Electric Railway from Sept. 1, 1926, when the company took over the operation of the system, to Dec. 31, 1927, is given in the accompanying table. The Cuban dollar is of the same value as the United States dollar and American paper currency is used extensively throughout the Republic of Cuba.

While the streets in the more modern portions of Havana are wide, some of those in the old sections are so narrow that they permit only one line of traffic.

OPERATING REPORT OF HAVANA ELECTRIC RAILWAY
(HAVANA DIVISION)

	Sept. 1—Dec. 31 1926	Jan. 1 — Dec. 31 1927
Operating Revenues		
Transportation revenues	$1,918,756	$5,478,196
Non-transportation revenues	17,985	96,005
Total operating revenues	$1,936,741	$5,574,201
Opera ing Expenses and Taxes		
Maintenance	$220,165	$617,290
Transportation	1,164,653	3,345,747
General, including taxes	133,878	413,228
Total operating expenses and taxes	$1,518,696	$4,376,265
Net revenues from operation	$418,045	$1,197,936

When a broad automobile passes through, there is little space between its sides, and the sidewalks. Typical views of narrow streets with car tracks accompany this article.

On the water front the belt line of the company has to cross the entrances to a number of the principal piers. To avoid interference with traffic, it is carried on this portion of its route on an elevated structure. Passengers board and leave the cars at stations.

The railway operates from 36 to 38 different routes and has an ingenious system of route designation for the cars. As shown by the map, the city is in the form of a fan, and all car routes, with one exception, after leaving their terminals in the outskirts, loop through the city, and return to the same terminal from which the car started. The route that is the exception loops through the city like the others but returns to a different terminal.

Every car route sign carries both a number and a letter. There are six letters, indicating terminals, and seven numbers, each number indicating a different loop.

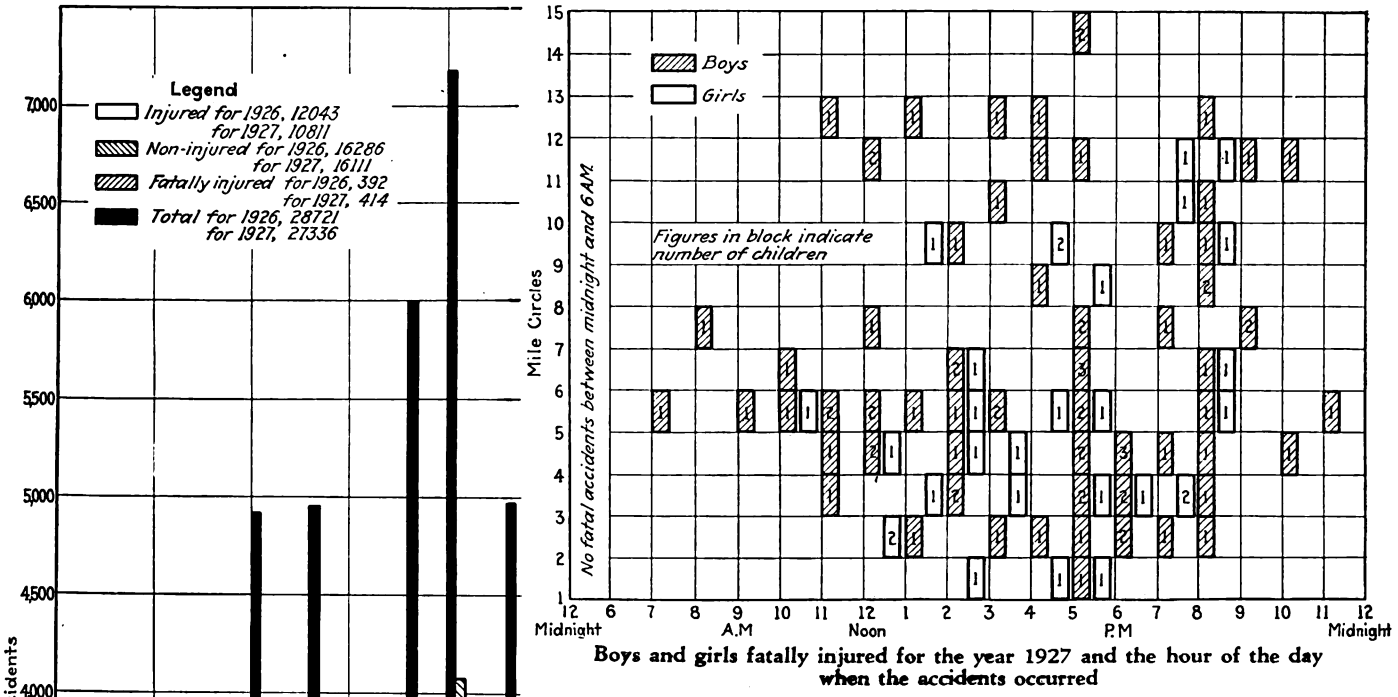
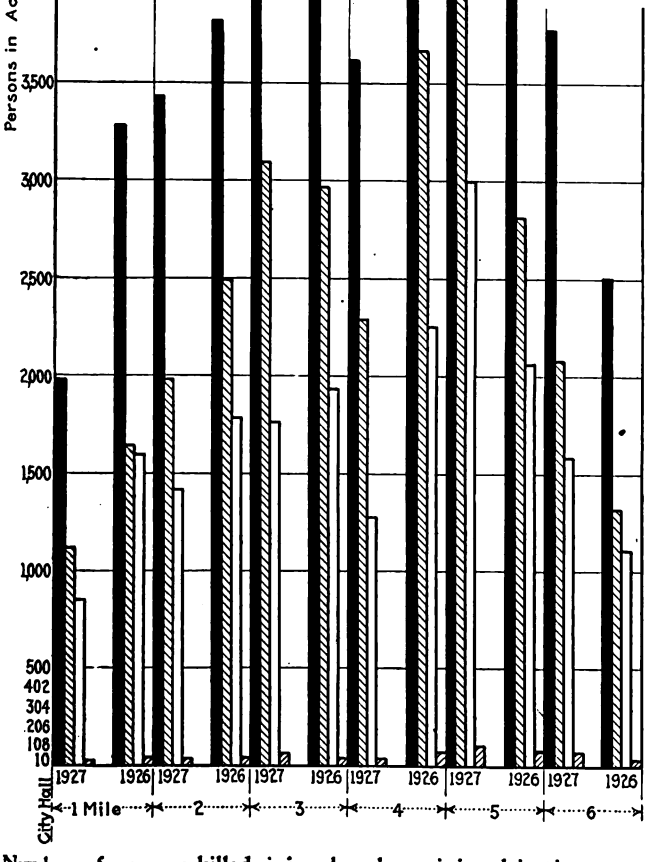
Making Detroit Safe from Accidents

CHARTS prepared from accident data of the Police Department of Detroit have been circulated among interested groups for the purpose of enlightening the public as to the causes of accidents and how to avoid them. The Police Department maintains accurate records of all accidents that occur, and summarizes this information each month and each year. One of the recommendations in the recent Detroit traffic survey, conducted by H. M. Gould, was to put to use these data to reduce the number of accidents in the city. This recommendation has been followed out and accident information has been broadcast by means of charts and articles, presented through various mediums.

Newspapers have taken an active part in the movement by publishing articles concerning the findings. Other publications, as the *Detroiter* and *Trucking News*, also have published articles from time to time on the subject.



Boys and girls fatally injured for the year 1927 and the hour of the day when the accidents occurred



Number of persons killed, injured and non-injured in six zones, during the years 1926 and 1927

The accident bureau prepares bar graphs which are sent out to all interested persons and organizations, such as police departments, safety bureaus, insurance companies, automobile clubs, civic groups, etc. The bar graphs, one of which is shown in an accompanying illustration, show the number of persons injured, non-injured and killed for yearly periods, in mile circles. By segregating the accidents by mile circles, it is possible to trace the districts in which the greatest danger exists. Comparison of the figures for any one zone and for two successive years shows whether any improvement has been made in that zone.

Other forms of charts have been helpful in bringing before certain groups the information that interests them alone. For example, a chart was prepared showing the children fatally injured for the year 1927, over a twenty-four-hour period. This chart, shown in another illustration, not only segregates the boys and girls, but also indicates the time of day when each accident happened.

Bulletins also have been prepared and distributed for individual groups. One of these gives the number of children of school age killed in traffic accidents for the years 1921 to 1927, inclusive, their ages, and the number of blocks from school at which each accident occurred.

It has been suggested that the city of Detroit be divided into six districts, each to be presided over by a traffic supervisor to study and investigate all traffic details and accidents. This would make possible a still further analysis of the causes and would contribute considerably toward reducing the number of accidents in the city.

Interior of a reconditioned Capital Traction Company car. Individual leather seats have been installed

New Comforts for Washington Car Riders

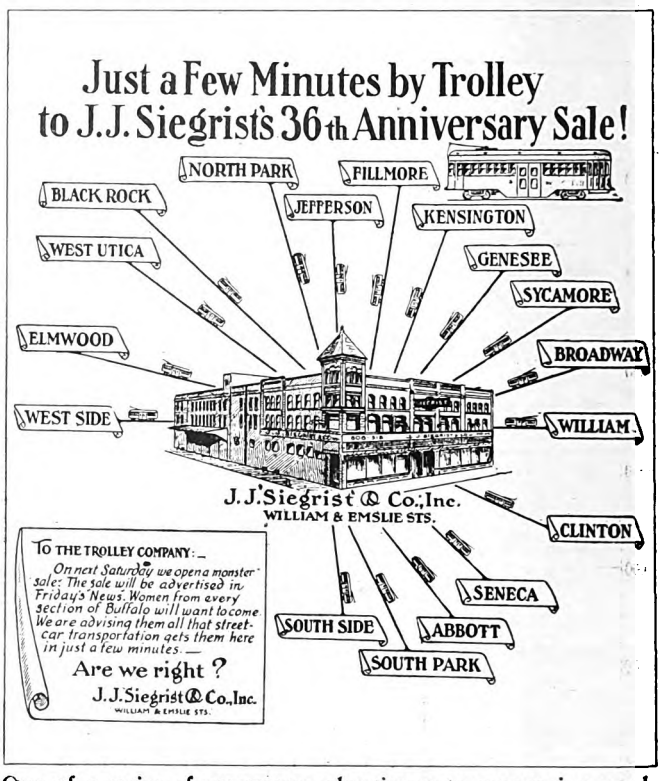
SEVERAL of the latest cars operated by the Capital Traction Company, Washington, D. C., have been reconditioned recently. Attractive features added include a new color scheme and new leather seats. The old color scheme of the company was solid green outside. The new one is a combination of gray and green with a line or two of red to give a warmer touch.

The cars reconditioned are of the double-end pay-within type, 44 ft. over bumpers and with a seating capacity of 48. The motors are equipped with helical gears and pinions. Flexolith floors were put in to deaden the noises of the trucks and to make the interior more attractive. This floor can be cleaned more easily than that previously used. New seats are of a design worked out by the company's engineers. They are reversible and are upholstered in green leather. Cushions are soft and there is ramp enough to the backs to make the seats very comfortable.

Inside, from the floor to the top of the windows, the woodwork is finished in walnut, and from there to the ceiling a light shade of gray is used. The ceiling is ivory. The whole appearance when the car is lighted at night is unusually pleasing. The reconditioned cars have attracted much attention on the street and public comments received by the company have been favorable regarding both appearance and seating arrangements.

Merchants Boost Street Cars

REALTORS as well as merchants in Buffalo, N. Y., are beginning to take cognizance of the very essential part the local transportation facilities play in the direct development of their own businesses. The newspaper advertising which has appeared recently rather indicates a conscious effort on the part of business men to capitalize

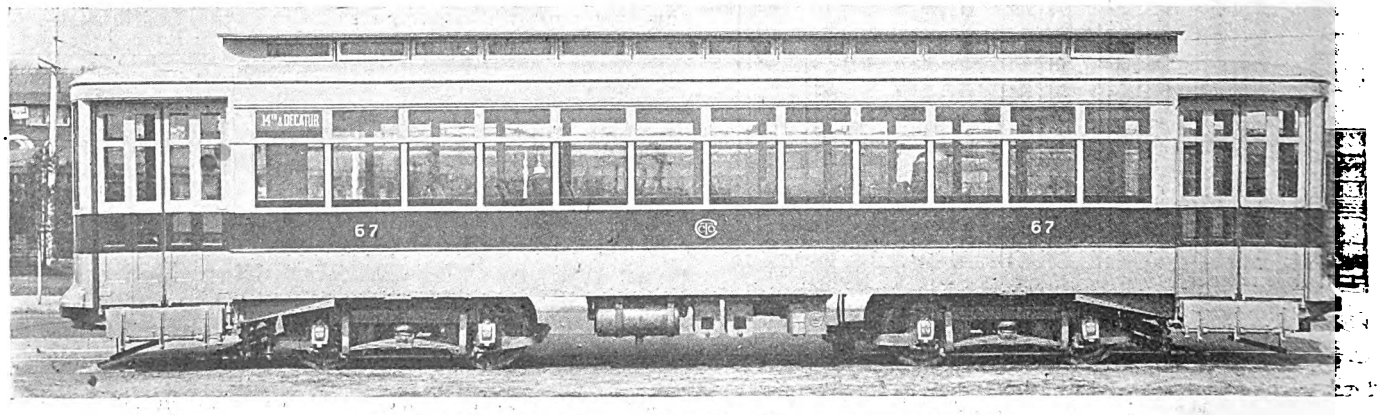


One of a series of newspaper advertisements announcing a sale by a large Buffalo department store, and in which traveling to the store by trolley was encouraged

the availability of street car service being provided by the International Railway for its prospective customers.

Typical of this advertising is a series of ads carried by J. J. Siegrist & Company, announcing a large anniversary sale in its department store. Two of the ads in this series are shown in accompanying illustrations.

The advertising of special occasions, like the department store sale referred to, is supplemented by advertisements of realtors, which appear throughout the year. Most of the advertising is used to promote new suburban districts and among the advantages listed for establishing homes in these districts is named accessibility. A typical ad, emphasizing accessibility, is reproduced.



One of the repainted cars. Outside colors are gray and green

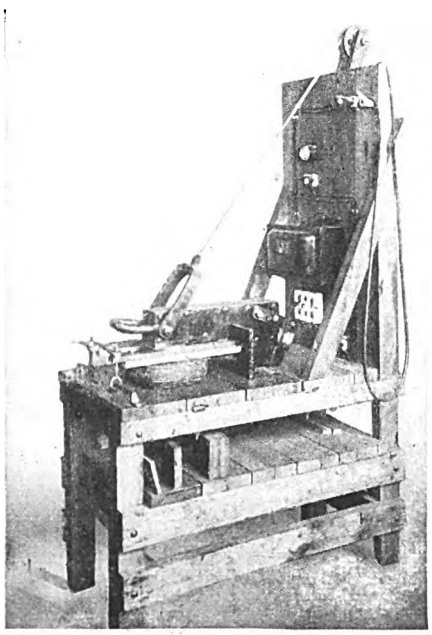
Maintenance Ideas That Save LABOR,

Testing Field Coils

By R. S. Beers
Railway Engineering Department
General Electric Company,
Schenectady, N. Y.

EVERY operating man is well aware that a poor field in a motor distorts the flux through the armature and is a source of commutation troubles and armature break-downs. Realizing this, some kind of a test is made of the field coils whenever an armature is changed or when the motors are overhauled. Various tests are used for determining whether every turn in a field coil is active. Probably the most common is a resistance measurement, either with a voltmeter and ammeter, a Wheatstone bridge, or a Century tester. The most effective method, however, is to use a transformer. The advantage of the transformer method is two-fold. First, it is a very simple test without the necessity of laboratory accuracy in measurements that is present with the resistance method. Further, it is feasible with this method to use a sufficient number of volts per turn so that incipient cases of failure will be detected, which the resistance measurement method will not do.

A "growler," or transformer, may be manufactured in the car shop at relatively small expense. It is necessary to obtain an ammeter, some knife switches, a small amount of double cotton-covered wire and sheet steel for the magnetic circuit. One that has been made by the Schenectady Railway and used by it with excellent success consists of a table with back and instruments as shown by the picture. On this are mounted a 60 amp. safety switch, fuses, a 30-amp. alternating current ammeter, and knife switches for short circuiting the ammeter and selecting the number of turns in the transformer winding. The transformer is made of No. 20 gage 0.0375 in. sheet steel. The cross-section of the iron is 4x5 in. or 20 square inches. The inside of the rectangle is 9½ in. vertically and 12 in. horizontally. The top horizontal member is hinged and counterweighted so that it may be moved up and down readily, providing a free space for putting a field coil in place for test and at the same time making it easy to close the iron circuit during the testing. The front vertical leg is flush with the surface of the table.



Field coil testing equipment as used by the Schenectady Railway

Two or three sizes of removable pieces should be made for the portion of the iron circuit between the short vertical leg and the moving horizontal member. The largest should have the same cross-section as the remainder of the transformer. The others should be of less cross-section so that they will pass through the hole in the field coil. The largest that may be used should be selected. The winding is wrapped around the portion of the iron under the table. No. 10 B. & S. gage double, cotton-covered, wire was used.

The winding has 180 turns with taps, so that by means of knife switches either 60, 90 or 180 turns may be used. The regular testing shou'd be made with the 90-turn winding. The 60-turn winding is useful in burning out a shorted turn quickly. While the 180-turn winding is useful when repairing a shorted coil, as it will indicate badly shorted turns with less heating than either the 60 or 90-turn winding, the final test should be made with the 90-turn winding. This winding is suitable for an alternating-current circuit of 100 to 120 volts, 60 cycles. With higher voltages, such as 220 or 440, a correspondingly greater number of turns should be used for the winding.

Obviously this tester is useless for field coils where more than one turn

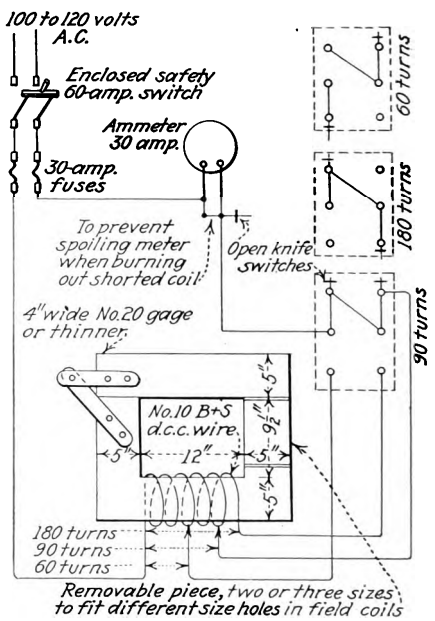


Diagram of connections for field coil tester

is fastened to the terminal or those wound on brass spools unless there is a saw slot through the spool, as otherwise these act exactly like shorted turns. In order to approximate actual conditions it is desirable that pressure be applied to the field coil when it is tested. If this is not done, coils with poor insulation may show clear under test and give trouble from shorts when installed in the motor case. The picture shows the clamping device used on this tester. A scheme using a lever would be fully as effective.

A field coil is tested by putting it on the table and closing the iron circuit of the transformer. Pressure is applied to the coil by means of the clamps and then by closing the safety switch the transformer is energized.

Digitized by Google

TIME and MONEY

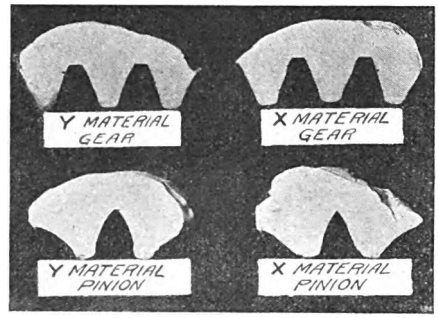
Next, the knife switch connected across the ammeter should be opened. If the field coil has no shorted turns, the ammeter will show a current of exactly the same value as it does without a field coil on the transformer. This is known as the magnetizing current. If the field coil has any shorted turns the current will be greater. The degree of short is indicated by the ammeter reading. It is for this reason a switch short circuiting the ammeter is used because a badly shorted coil will show an ammeter reading in excess of 30 amp.

Visualizing Gear Wear

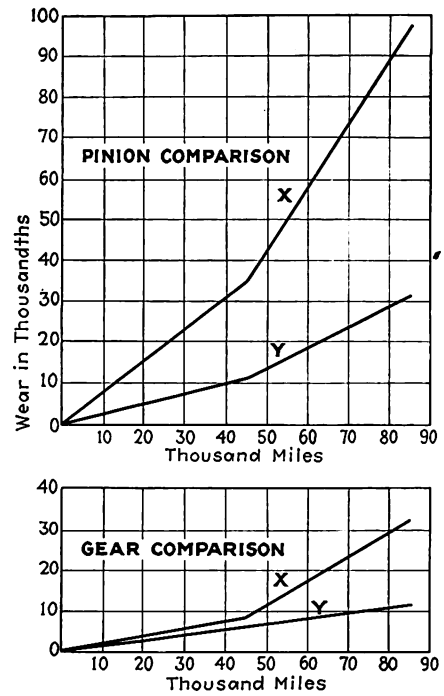
By E. S. Sawtelle
Assistant General Manager Tool Steel Gear & Pinion Company, Cincinnati, Ohio

ACCURATE comparisons of the quality of different grades of material in gears are difficult to make, and if made are rather difficult to interpret. Even when a limited number of gears are compared it is found there are always discrepancies between the wear of the individual cases, and the averages are the only method possible for making a fair expression. To one accustomed to using gear tooth micrometer calipers and dealing with the measurements of gear parts the figures are quite illuminating, but many a railway manager is not familiar with these and the mass of figures often convey little.

A test was conducted recently on an electric railway system where four cars were equipped with different grades of gears on opposite motors and the readings were obtained with accurate micrometer measurements. These measurements were then plotted. The graphs show the average service obtained during the first period to be approximately 45,000 miles, and the average during the second period to be approximately 40,000 miles. They also show the relative life of two grades of gears, and give interesting light on the question as to whether gears wear better for the first half of their life than they do later on. The type of gear and pinion designated as *X* gave much less life than that designated as *Y;* also the type designated as *X* gave considerable less miles per thousandth of wear in the latter part of its life than in the early stages.



Plaster of paris cast to show wear on gears and pinions of different grades of material



Graphs showing wear of gears and pinions of two different qualities

To visualize this test, plaster of paris casts were made of one gear and pinion which in wear was about typical of the average. These casts were then sawed into thin sections, mounted and photographed. The dark space shown in the accompanying illustration represents the gear teeth, one of which was beginning to wear quite decidedly. One of the pinions was worn to a knife edge.

Plaster casts are made by cleaning off the gear tooth, oiling it a trifle, and then pouring on wet plaster of paris. After about one hour it sets sufficiently to be removed, and if taken off carefully gives an exact reproduction of the gear tooth.

Wanted: Suggestions for Improved Shop and Maintenance Equipment

AT ITS MEETING in Cleveland the new executive committee of the American Electric Railway Engineering Association called attention to the widespread need for better machines and equipment for the maintenance of cars, buses, track and line. It was suggested that this situation be called to the attention of manufacturers through action by the maintenance men of the industry in pointing out what new devices are needed and improvements that should be made in available maintenance equipment.

ELECTRIC RAILWAY JOURNAL is glad to co-operate in carrying out this suggestion of the executive committee. It offers its pages as a clearing house of ideas for the improvement of maintenance facilities. By co-operation on the part of operating men themselves the limitation in shop and maintenance equipment can be brought forcibly to the attention of interested manufacturers.

Here is a challenge to operating executives of the industry. Electric railway shop equipment is notoriously deficient in comparison with modern production facilities in other industries. What improvements are needed most? Send in your suggestions. They will be published in this department in the hope of stimulating other operating men to enter this discussion of the need for better maintenance equipment. Letters are requested from anyone who has a suggestion to make regarding needed improvements in existing equipment or new devices that should be brought out.

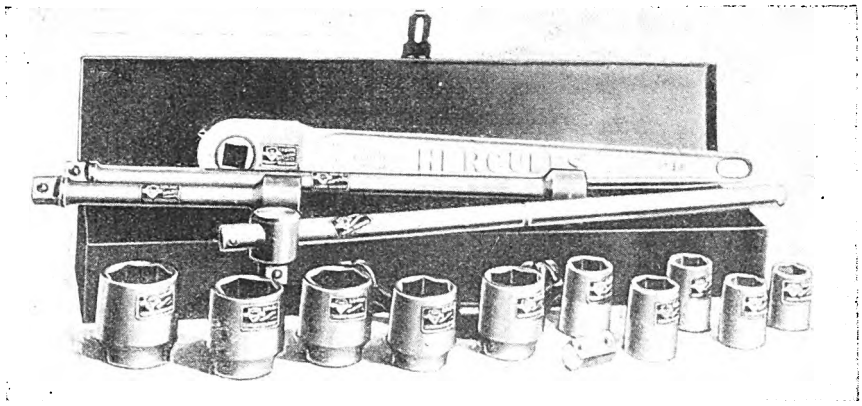
What's New in Maintenance Tools

Heavy Duty Set of Socket Wrenches

TEN chrome vanadium steel sockets ranging in size from a $\frac{15}{16}$-in. to $1\frac{5}{8}$-in. opening are included in a socket wrench set now listed by the Bonney Forge & Tool Works, Allentown, Pa. The set is designed for extremely hard service, and is proportioned so that although light in weight it has a very heavy reserve strength factor. The set includes ten sockets, a ratchet handle, and a short and long extension sliding T-handle.



Set of chrome vanadium steel sockets

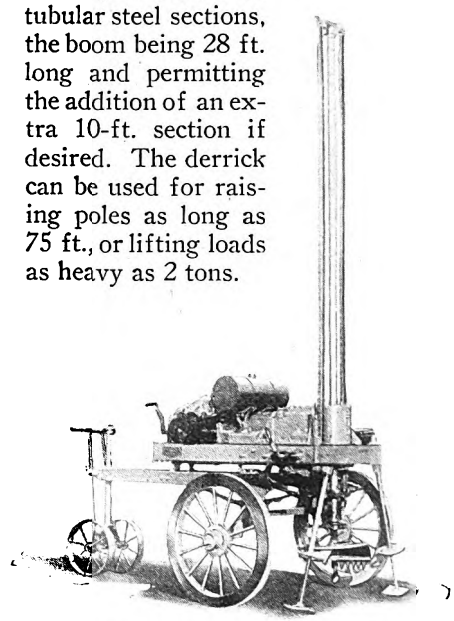
Improved Earth Drills

SUBSTANTIAL economies are effected, it is claimed, in digging holes for pole setting and other similar purposes with the Buda-Hubron earth drill, manufactured by the Buda Company, Harvey, Ill. This improved machine is rigidly constructed to resist the shock delivered by the engine, the rating of which is larger than that formerly used. Large clutches carried on spline shafts and operated by ball-bearing throwouts are provided.

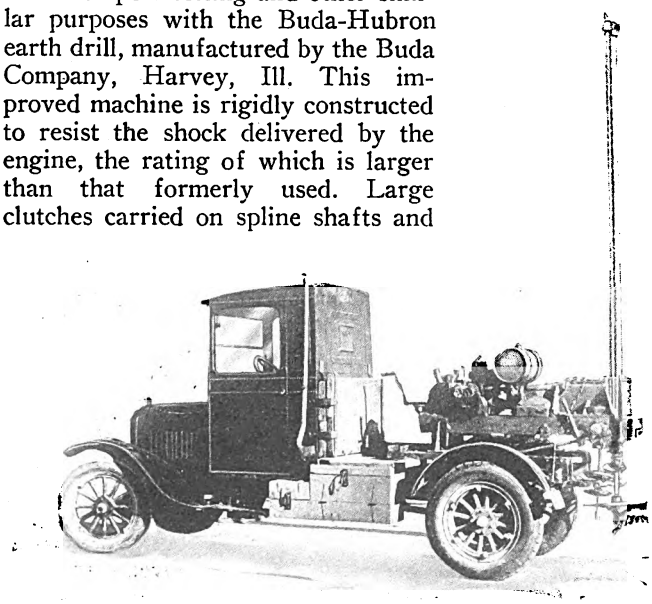
An improved type of lifting mechanism is used, two roller chains being provided for lifting the earth from the hole. A chain is located on each side of the spindle, and is suspended between springs, so that each carries its share of the load. The advantage in the use of chains is that no mud or dirt can lodge in them to cause excessive wear. Holes as large as 24 in. in diameter can be drilled to a depth of 10 ft. Drills $1\frac{3}{4}$ in. in diameter can be supplied for drilling blast holes in rock.

These drills are available in three different models, the trailer type, the truck type and the tractor type. Both the trailer type and the truck type are self-contained units, being powered by a two-cylinder, opposed-type, air-cooled, four-cycle engine, provided with force-feed lubrication.

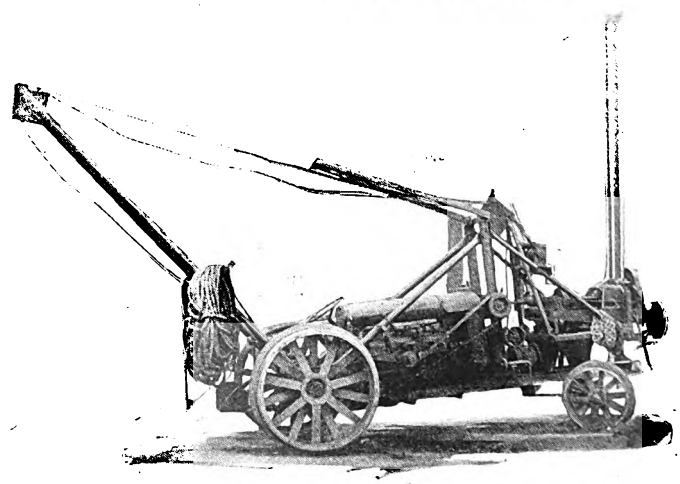
The tractor type consists of a tractor with an extended frame on which the drilling mechanism is mounted. The wheelbase is 108 in., and wheels with solid rubber tires and rims are provided, so that the machine will travel on cross-country right-of-way, as well as on highways. Power is furnished by means of a belt to the drill mounted on the front end. A pole-raising winch is mounted on the front of the tractor directly behind the drilling mechanism, power being used both for raising and lowering the load. The derrick, which is mounted over the rear axle of the tractor, is made of tubular steel sections, the boom being 28 ft. long and permitting the addition of an extra 10-ft. section if desired. The derrick can be used for raising poles as long as 75 ft., or lifting loads as heavy as 2 tons.



Trailer type of Buda-Hubron earth drill



Earth drill arranged for mounting on the platform of any standard auto truck



Drill mounted on a tractor with winch and derrick for setting poles

Association Activities

New Englanders Discuss Making Transportation Salable

Means of increasing attractiveness of cars and buses theme of Portland meeting. Purchase of new rolling stock urged by President Slade in his address

PESSIMISTS in electric railway economics found few sympathizers at Portland, Me., on Thursday, Oct. 18, when the New England Street Railway Club journeyed to the metropolis of the Pine Tree State to meet and discuss ways and means of making transportation salable through improvements in car and bus design. President Walter C. Slade occupied the chair, and in accordance with the current plan of holding regional meetings Past-President Fred D. Gordon arranged the program. A total attendance of 105 was recorded.

At the afternoon session two papers were presented: "Modern Cars," by R. T. Foster, superintendent Wason Manufacturing Company, Springfield, Mass., and "Better Service and Maintenance Make Bus Transportation More Salable," by John H. Walsh, superintendent rolling stock and shops Middlesex & Boston Street Railway, Waltham, Mass.

At the club dinner held in the evening President Slade spoke briefly on rolling stock developments and the need for placing more orders with manufacturers. Toastmaster Fred D. Gordon then called on Hon. Charles E. Gurney, chairman Maine Public Utilities Commission, and Hon. George L. Emery of the Maine bench, who addressed the assemblage on public relations and current problems of the transportation industry. The tone of the entire meeting was filled with vigorous optimism, and when adjournment came many expressions of satisfaction were heard that the club's major theme at the next meeting to be held would be transportation merchandising, with its various aspects.

Modernization of Equipment All-Important

In his paper on the use of modern cars, R. T. Foster stressed the importance of modernizing all equipment to meet present-day competition. He pointed out the advantages of purchasing up-to-date cars and cited examples of railways that had become profitable and secured the good will of their public by obtaining new cars and offering better service. An abstract of Mr. Foster's paper will appear in a subsequent issue of the JOURNAL.

"By increasing speed and enhancing comfort of riding," said J. C. Thirlwall of the General Electric Company, in discussing Mr. Foster's paper, "much can be done to build gross revenue. Modernization of rolling stock is one of the most important means of attacking this problem.

At Pittsburgh the use of new cars for three weeks showed a 14 per cent increase in gross revenue and reduced operating costs. The use of new, light-weight cars, with upholstered seats, at Attleboro, Mass., has been instrumental in increasing patronage and turning red figures into black. The revenue in that city for the year ended Aug. 31, 1928, was $215,754 compared with $173,700 for the previous year. In two months the net revenue showed a loss of $1,400 with old cars but the corresponding two months, a year later, showed a balance of $5,700 with new car service, or a total gain of $7,100."

Better Service and Better Maintenance Necessary

"To make our transportation salable," stated John H. Walsh, in his paper on buses, "we must be everlastingly on the alert to take advantage of each and every opportunity to improve our service and better our product. Only after making our service reliable and comfortable can we hope to educate our patrons who own automobiles to use our service more frequently." Mr. Walsh spoke of the advances made in bus design and pointed out the necessity of properly maintaining equipment. He dwelt at some length on inspection methods and the use of lacquer. An abstract of his paper will appear in a later issue.

G. E. Pellissier, superintendent of equipment Holyoke Street Railway, expressed the need of careful study by the industry of the specific field of service of buses and cars, and said that comparisons should be made between modernized cars and modern buses rather than between old cars and new buses.

Purchase of Cars Urged

President Slade opened the evening meeting by summarizing the afternoon proceedings and commenting upon their significance in relation to rolling stock developments. He pointed out the need of modernizing methods of management, operation and property to make the transportation product salable, and spoke of the rapid development of automotive equipment, compared with the development of electric railway equipment in the same period. He referred to the development of the new light-weight cars and particularly urged that operators encourage the car manufacturers with a few purchases of equipment at the present time.

After a short entertainment, Toastmaster Gordon called upon Chairman Gurney of the Maine Commission, who spoke sympathetically of the problems of the industry as viewed by the commission. Mr. Gurney pointed out that if the public prefers to ride by private automobile, the transportation companies are not required by law to furnish a non-paying volume of service, but that the proper service must be determined by careful testing and no uncertain judgments reached. The speaker suggested that the institution of a 5-cent fare for a limited congested area in the heart of city districts might be a traffic stimulator for the railways. Turning to public relations matters be reviewed the work of the commission in relation to the regulation of the utility security

COMING MEETINGS OF *Electric Railway and Allied Associations*

issues, and stated that in the past seven years these have totaled $119,000,000 in the state without a single default or objection from the investment standpoint. The confidence of the public in the commission is high, and the commission's finding that the books of an operating company are honestly kept suffices.

JUDGE EMERY COUNSELS PATIENCE

In a whimsical speech based on long study of human nature in history and in modern life, Judge Emery declared that the American public is today on a kind of economic "spree," the outcome of which must in time be a resort to less costly means of living. He maintained that the private automobile cannot be looked upon as other than a luxury, and that if the modern transportation company guides its affairs ably and with a keen sense of how to appeal to the public with its service, better days will come. The advent of air travel is likely to prolong extravagant habits, however. Patience with the lack of mass understanding of public utility problems will be rewarded. Popular indifference can be overcome by frank treatment, good service and modern managerial methods. In due time the three great branches of American industry—agriculture, manufacturing and transportation—will reap their proper rewards. Meanwhile the railways must seek profitably to stay in the game, make themselves worthy competitors of the new outlets for human expenditure and trust in the ultimate return of the public to economic sanity and common sense, which will usher in a new and better era.

To Discuss Shipping on Skid Platforms

On Thursday, Dec. 6, at 2 p. m. there will be held a special session of the annual meeting of the American Society of Mechanical Engineers at the Engineers Building, 29 West 39th Street, New York City. Six papers have been prepared, treating from different angles the problem of shipping materials on skid platforms. Mechanical methods of handling, common in plants throughout the country, have recently entered the distribution field and the Department of Commerce has sponsored a movement to standardize equipment and provide interchangeability in use. The keynote paper will be delivered by Mr. R. L. Lockwood, of the Department of Commerce, who will trace the development of shipping material on skid platforms, outline the possibilities for growth and explain the importance of interchangeability in the equipment. Other speakers will be as follows:

J. V. Miller, assistant general storekeeper, Chicago, Milwaukee, St. Paul & Pacific Railroad, "The application of skid shipment to the stores department of a large railroad and the economies obtained"; George B. Wright, freight traffic manager, Detroit & Cleveland Navigation Company; "Material handling by an inland waterway transportation company"; C. B. Crockett, industrial truck department, The Society for Electrical Development, Inc., "Economic aspects of skid shipment from the standpoint of the user"; F. J. Sheperd, Jr., treasurer, Lewis-Sheperd Company, "The part played by the manufacturer of trucks and skids in the adoption of interchangeable equipment," and F. E. Stocker, resident manager, McCormick Steamship Company, "The application of skid shipment in the field of ocean transportation."

One-Man Car Operation from a Safety Viewpoint*

BY D. A. SCANLON
General Superintendent of Railways
Northern Ohio Power & Light Company, Akron, Ohio

DURING the past five or six years most railways have established one-man car service to some extent. In a few of the larger cities the cars of this type are operated only in sparsely settled districts, where few passengers are carried and traffic is not congested; however, this car is proving its efficiency to such an extent as to justify its exclusive use in some urban centers. Not only has it proved successful in urban service, but it is now being used exclusively on some interurban lines with a marked degree of satisfaction. Examples of such operation are the lines from Buffalo, N. Y., to Erie, Pa.; from Alliance to Canton, Ohio; from Akron to Wadsworth, Ohio; and from Canton to Massillon, Ohio. The last-mentioned line maintains a fifteen-minute schedule during an eighteen-hour day and operates at high speed. Automatic spacing signals are used, and during the three-year period this line has been operated with one-man cars, we have not experienced even the slightest car collision. In fact, accidents of all types have been fewer than when two-man cars were operated. The Stark Electric Railway, operating from Alliance to Canton, Ohio, reports a similar experience since changing to one-man operation.

The Pittsburgh Railways started to operate one-man cars in 1926 and has since steadily increased this service and, according to its report, experienced a slight increase in the number of accidents per 10,000 miles operated as compared to two-man operation; however, it is also stated the company experiences fewer serious accidents with the one-man cars than with the two.

A very interesting report of successful operation of one-man cars was received from the Houston Electric Company, Houston, Tex., showing that the per cent of accidents per 10,000 revenue car-miles operated for the four-year period 1924 to 1927 had fallen from 6.33 per cent to 5.62 per cent on one-man cars and from 7.71 per cent to 6.96 per cent on two-man cars. The company further stated:

We are completely sold on the use of one-man cars on this property and our plans are for the elimination of two-man operation as soon as possible. It is our opinion that an operator on a one-man car is more apt to avoid accidents through being kept busy, than with two-man operation which does not require both men to be alert at all times.

The Kansas City Public Service Company, Kansas City, Mo., while not submitting comparative statistics, reports a very favorable experience in accident prevention since the adoption of one-man cars.

The Wisconsin Power & Light Company, Fond Du Lac, Wis., reports as follows:

It has been our experience in operating one-man cars to find that our accidents have been decreased; has made better operators of our men and has built up better relations with the public, due to the fact that all operators come in contact with the traveling public. Like other utilities, we have found a few minor objections to one-man operation, but on the other hand the advantages of operating them offset the disadvantages and are the winner by far.

The Gary Railways, Gary, Ind., reports as follows:

Since the latter half of 1927, our property has been 100 per cent one-man operation and our number of accidents and incidents for the first six months of 1928 have been reduced over the similar period of 1927, with approximately 60 per cent one-man operation, from 479 to 315 accidents.

It would hardly be fair to believe that this decrease is all due to one-man operation, as we have constantly endeavored to reduce accidents by the installation of safety devices, safety programs and rigid safety discipline of trainmen.

The important feature of one-man operation from a safety standpoint is that all one-man cars should be equipped with every known safety device. We know of no accidents on our property that can be attributed to the one-man operation of cars.

From the Virginia Electric & Power Company, Richmond, Va., where a mixed service is maintained, came a statement to the effect that during the year 1927 a total of 7,958,231 car-miles were operated, of which 71.19 per cent were by one-man cars, and that of the total number of accidents on the system approximately 69 per cent were on the one-man cars. In the city of Norfolk a total of 5,070,544 miles were operated of which 59 per cent were by one-man cars. Of the total number of accidents reported 56 per cent were on the one-man cars.

On the property I represent, we are

**Abstract of a paper presented at the Seventeenth Annual Safety Congress, held at New York, N. Y., Oct. 1-5, 1928.*

Digitized by Google

operating one-man cars exclusively in three cities, namely, Akron, Canton and Massillon, and also on two suburban lines, serving an aggregate population of approximately 500,000, and, generally speaking, we have found such operation advantageous from every viewpoint, particularly in the reduction of the number and seriousness of our accidents.

Safety Devices Have Contributed

Since the advent of one-man cars many mechanical safety devices have appeared which have contributed to their safe operation. We have placed floodlights across the entire front ends of our equipment, as a result of which head-on collisions with other vehicles have been materially reduced. Ratchet gongs have been installed on all city type cars. This has proved an effective safety measure. All cars have been equipped with automatic treadle exit doors, which assists greatly in maintaining schedules; in fact, the treadle doors, which operate only when brakes are set and power off, have eliminated entirely the possibility of passengers falling from moving cars. With the two-man operation this class of accident presented serious possibilities.

Our door accidents are continually decreasing as the car operators and the riding public become more familiar with the operation. I cannot say we experienced an increase in accidents of this nature since operating one-man equipment, as door accidents were more or less frequent before that time. All cars are equipped with automatic power and brake control so that they cannot be moved while any doors remain open.

During the past two years our number of miles run per accident has risen from 1,785 to 2,920, while the number of passengers carried per accident has increased from 11,859 to 19,579. I do not credit this entirely to the one-man cars; a good deal is due to the intensive training the men have had in accident prevention. In conclusion, I am thoroughly convinced that one-man car operation is practical, economical, and a good business from a safety viewpoint.

Brady Contest Date Extended to Nov. 15

ARRANGEMENTS have been made to extend the closing date for the submission of entries in the Anthony N. Brady Safety Contest to Nov. 15. Many properties which have improved their accident record during the past year are thus given time, following the annual convention, to prepare information for submission in the contest. No elaborate brief is necessary. A complete statement of facts regarding actual success in increasing safety and in reducing accidents is all that is required. Full details may be obtained by application to the American Electric Railway Association. No further extensions of the closing date are possible and all entries must be made by Nov. 15.

Safe Bus Operation*

By R. W. Meade

President People's Motorbus Company, St. Louis, Mo.

WHEN, a little more than 21 years ago, the gasoline motor bus was introduced in New York as a new medium of public transportation, there was very active discussion among street railway men as to whether the street car accident record at that period would not be greatly outdone by the motor bus. Far from piling up a record of costly collisions with vehicles or pedestrians, accidents of a serious character were comparatively rare, and the pedestrian accidents were almost completely confined to cases of drunkenness or gross heedlessness on the part of the victim, who usually walked into the side of the bus after the front of the vehicle had passed. Our few fatalities were nearly all of that character. In the first ten years of operation during which our buses ran more than 25,000,000 miles and carried nearly 100,000,000 passengers there was but one fatal accident to a passenger and three cases of serious injury, while accidents involving persons other than passengers totaled 16 fatalities and 24 cases of serious injury. These results proved that, given proper organization and supervision in a city with adequate police traffic regulation, the motor bus makes a highly favorable showing from the point of view of safety, both of its passengers and of others.

Inasmuch as the experience gained and the methods pursued in New York have been largely followed in the organization and operation of bus service in other cities, an outline of some of the basic factors involved in the operation in this city may be of interest.

1. *Standard Rules* — In the very beginning the standard rules of the American Electric Railway Association for city street car operation were taken as the basis for the rules for the operation of motor buses. Thus the underlying principles that had been found valuable in street car operation were applied to the motor bus so far as practicable.

2. *Tried System of Discipline Employed*—In the enforcement of the rules, the methods developed in the steam and electric railway fields, under which a cumulative record of every man is kept and can be reviewed, were employed and have proved their value.

3. *Training and Promotion* — The practice of employing every man first as a conductor, where we have a chance to observe his general habits and reactions before he is permitted to drive a bus, with all the responsibility this entails, has been of the highest importance. We have always maintained a differential pay rate in favor of the driver, and this has proved a strong incentive to the man working on the rear end to give meritorious service and win promotion to the position of greater responsibility and remuneration. We have also found that the man who has served on the rear end when promoted to driver shows a greater sympathy with his team mate, and this makes for greater safety. Nothing is more important to safety than the character and thoroughness of the training the prospective driver receives. Only the best men can be safely entrusted with that important duty, and on the principles and practices absorbed by the new driver during this process his success in safe and economical handling of his vehicle will largely depend.

4. *Physical Examination of Crews*—The physical examination of men employed as drivers and conductors of motor buses is of the highest importance. While the term "physical" is employed, our examinations have always gone beyond the literal interpretation of that word, our physicians being particularly alert to eliminate men with mental or psychopathic tendencies that would render them unfit for this exacting service.

5. *Incentive to Longevity in Service*—Our experience shows that, in general, the longer a man remains in our service, the better he is, and this applies in the matter of safety as well as other characteristics of his work. Therefore it is not only simple justice but good policy from the economic viewpoint to increase his pay according to his length of service, and this has always been a feature of our policy.

6. *Mechanical Excellence of Equipment*—Nothing but the very best equipment obtainable, regardless of its cost, has ever been good enough for our use. Absolute safety can only be assured by using vehicles competently designed for the service they are intended to perform and built conscientiously of material capable of withstanding the arduous duty and heavy strains imposed in public service.

7. *Mechanical Inspection and Repair*—Possessed of equipment capable of withstanding the arduous service to which it is subjected, the next requisite is to keep it continuously in the best of condition. The system employed by the London General Omnibus Company and adopted by us has been aptly termed "mechanical prophylaxis" — in other words, anticipation and prevention of trouble instead of waiting for it to occur. This consists of a periodical inspection and overhaul of every vehicle based on the performance of a certain mileage, varying from 2,000 miles up,

*Abstract of a paper presented at the Seventeenth Annual Safety Congress, held at New York, N. Y., Oct. 1-5, 1928.

Digitized by Google

and regardless of the vehicle's apparent condition at the time. In addition to the foregoing, every vehicle is subjected to an annual overhaul, equivalent to a rebuilding, during which every element in it is brought up to the latest standard.

8. *Means to Prevent Skidding*—Slippery pavements and skidding accidents are two of the worst dangers of bus operation, and this refers not only to the bus itself but to all other vehicles on the street. After providing vehicles that by excellence of design are reasonably free from skidding tendencies, careful training of drivers in methods of handling their vehicles on slippery pavements is the first requisite. The third line of defense is to so treat the pavement at critical points as to minimize the skidding of any vehicle.

9. *Safety Organizations*—It is necessary to keep the idea of safety prominently and constantly before the entire organization and to secure the co-operation of the rank and file in maintaining it if accidents are to be kept down to a minimum. For this purpose a wide variety of expedients may be employed in the form of financial bonuses, prizes, contests, etc., but the basis for any of them and the most effective, year in and year out, is some form of safety organization. This can vary widely in its make up and functions so long as it provides for the free and active participation with the supervisory and executive forces of the rank and file, that being the essential characteristic without which it would not differ materially from or properly supplement the operating organization.

10. *Records and Statistics*—It is of course important to keep complete records of accidents and to classify them, the most important objective of such records and statistics being to diagnose the direct and underlying causes, and thereby be able to apply preventive remedies. I have often felt that the ability to make readily at any time such special classifications as are only possible by means of some selective mechanical system would be exceedingly helpful in this direction, and on a large system might easily repay the rather high expense involved.

Bus Operation from a Railway Man's Point of View*

By Arthur T. Warner
General Manager in Charge of Traffic
Public Service Co-ordinated Transport, Newark, N. J.

IT HAS taken between ten and fifteen years to turn the local transportation agencies to a point where they are ready to accept the bus and bus operation as part of their job. Since 1923 or 1924 this change has been under way very rapidly and we find now that practically all of the larger local transportation agencies are giving at least a portion of their service with buses.

I have been advised that I should dwell upon the safety element in bus operation. I hardly need to say that operation, to anybody raised in the railway business, is always safe operation. With us safety has been the first element of service. Every railway slogan has had safety in it somewhere. Safety always; safety first; safety, service and efficiency; safety, courtesy and loyalty. There are dozens and dozens of them, but safety appears in each. So when we started to consider the bus as a vehicle with which to carry our patrons, as a means by which we could furnish a service such as we were accustomed to give with our trolley cars, we looked at the high, light, single tire, often brakeless, vehicles and wondered what elements of safety they contained—and we set about to develop what in the first place was a safer vehicle.

I will not go into a long technical discussion describing the various stages in the development of the bus of ten years ago to the vehicle of today. Let it be sufficient to say that the modern bus is a safer, more comfortable and more dependable vehicle from all points of view. Chassis have been lowered, which has brought down the center of gravity; we find dual wheels on the rear, which has done away with skidding; four-wheel air brakes are now in order; buses are now well lighted; good ventilation exists; all of which, in brief, gives the patrons a ride which will compare favorably indeed with that in an expensive limousine.

Gas-Electric Drive Permits Safer Operation

My own company is one of those which is strongly in favor of the gas-electric drive, which by the elimination of the transmission and all gear shifting has, we believe, additional safety features. The operator's hands, being free from gear shifting, are just that much more available for other duties. The lack of gear shifting also gives freer acceleration, eliminates the jerking of the passengers, which comes from sudden gear shifting and consequently gives a safer and more comfortable ride.

Of course, all my observations are based largely upon my own experiences in New Jersey. Five years ago today we had less than a dozen buses running on two short country lines. Today we have over 1,700 buses which will operate over 55,000,000 bus-miles this year and carry over 325,000,000 passengers. So you can see we have certainly opened our arms to the bus as a means of modern transportation within the last five years, and today the system in London is the only one in the world that surpasses ours in size.

We have found in the development of an operating personnel, that the same intensive methods of training are necessary with bus operators that we have always used with our car platform men, except that, as a rule, a would-be bus operator comes to us with a driver's license and some bad habits of driving, which he must unlearn before he can become a first-class bus operator. Our schools of instruction are flooded with ex-truck drivers and ex-taxicab men and we find that our first duties are to make these men overcome bad habits that they have acquired in the earlier employment. This is something we never had to do with the trolley operator.

Cars and Buses Co-ordinated Wherever Possible

I want to digress from the strict discussion of safety to give you a brief picture of the different ways in which we are using buses in New Jersey at this moment. In our larger communities such as Newark, Jersey City, etc., the trolley system is still carrying the backbone of our mass transportation. We have inherited sizable bus operations that parallel these car lines and we use this bus service co-ordinated with the car service in such places. We are rerouting these bus lines to adjacent parallel thoroughfares so that there will not be a duplication of service on the same street and the bus will be placed on a highway not occupied by car tracks, so that it may develop to some extent a territory of its own.

In other municipalities, such as Paterson, Plainfield, New Brunswick, etc., we have discontinued our street car service and replaced it with bus service. These have been on lines of comparatively light traffic, where street car operation was over single track with turnouts and where the flexibility of bus operation has been developed to its fullest extent. We have installed new bus lines as feeders, crosstown routes, extensions into new developments and to open up new territory.

We have also placed in operation a considerable number of so-called "de luxe" bus lines. We call them "Super Service" lines. These are vehicles specially designed for greater comfort and interior attractiveness. They differ from the regular bus in the same way that the parlor car differs from a day coach. There are individual seats, well upholstered, and extremely comfortable; there are curtains in the windows, mirrors in the panels and interior finish of a pleasing design. These vehicles furnish the patron as comfortable a ride as in his own limousine. We charge a higher fare for this service and it is furnished on a basis of a seat for every passenger. Routes such as these, chosen so as to serve neighborhoods that would naturally patronize more expensive and higher class service, are developing rapidly in our ter-

**Abstract of a paper presented at the Seventeenth Annual Safety Congress, held at New York, N. Y., Oct. 1-5, 1928.*

Digitized by Google

ritory and give evidence of having great future possibilities. This is a field for the bus that the street car never had.

I have just cited a few of these cases to show that the bus has and is creating more and more a distinct appeal of its own with the traveling public. There are small elements in bus service that the trolley cannot give, that the steam road cannot give, and if the local transportation agencies are to meet the competition which the privately owned automobile is giving today, they must go to the buses, because the bus gives the service which more nearly approaches that of the private car.

The bus has now reached the point where it must be and is accepted as a part of the transportation industry. The vehicle is being developed rapidly. It is being continually improved in design to give a greater safety, greater comfort and a wider range to its use. Its adoption by so many transportation agencies has led to the use of modern operating methods, of operating forces trained for their work, and continually under the eye of executives who have been brought up with safety as their watchword.

I would, however, be lax indeed, if I allowed this occasion to pass without an appeal for the greater co-operation in our safety campaigns from those who have, after all, the greatest power to produce safety results. All our states, all our larger municipalities, all governmental agencies that exist, have passed and now have in force, laws, ordinances and regulations governing the use of highways in the interest of safety. These laws should be uniformly enforced. I refer not only to speed regulations but to parking ordinances, jay-walking, the elimination of left-hand turns, in fact every kind of so-called traffic rule. The work of the Hoover conference has been a great step in bringing about a uniform system of traffic control and regulation. We in New Jersey are now enjoying the first fruits of this conference. Our legislature within the last three months has passed a uniform traffic act. We have, we feel, enough laws and regulations and the thing remaining for us to do, is to enforce, uniformly, justly and fully the laws we now have so that the bus, the car and private automobile may each use the public highways so that each may travel with safety.

Housekeeping for Substations and Storehouses*

By H. B. Harmer

Safety Engineer Philadelphia Electric Company, Philadelphia, Pa.

HOUSEKEEPING for power houses, substations, storehouses and utility properties in general, embraces many varied elements that cover a surprisingly large field of activities. The importance of this subject cannot be too strongly emphasized. Good housekeeping is fundamental to maintaining continuity of service and is essential to successful and economic operation of utility properties.

There are two outstanding features of good housekeeping—orderliness and cleanliness. These are never accidental but are the results of planning, system and supervision. Then comes the most important element—inspection. Intelligent, earnest study of inspection methods plus hard conscientious work by every person in the organization is necessary to secure the best results. A system of inspections should be started and maintained.

Buildings, grounds and outdoor structures require constant supervision to maintain them in a proper state of repair and in satisfactory condition. Without this constant supervision unhealthy conditions of the physical properties will arise. Prolonged neglect will surely result in such dilapidation as to require replacements in many cases when comparatively simple and inexpensive repairs made at the proper time might have prevented deterioration. Both the inside and outside of building structures should be rigidly inspected and any defect, no matter how small, should be given immediate attention.

The careless and untidy storing of materials in storerooms and plants may occasion both fire and accident hazards. Often when a shipment of material arrives the cases are opened and allowed to remain unpacked for several days, and the excelsior, sawdust or paper packing constitutes a very serious fire hazard. Special care should be exercised that material piled near aisles and passageways is not likely to fall, or to be knocked over; the piles should not be too high; neither should parts extend into the passage or roadway where passing men or trucks may strike against them.

Avoiding Fire Hazards

Proper provision should be made for the storing and handling of miscellaneous oils, paints, etc., and when small quantities are withdrawn for use, any portion left over from the day's supply should be returned to storage. The practice of storing materials in operating rooms of power houses, substations, etc., constitutes a serious fire hazard and should not be permitted.

The lighting and ventilation systems should be maintained in good operating condition. A well designed artificial lighting layout is an essential upon which too much stress cannot be laid and this applies equally as well to ventilating by natural or artificial means. Poor ventilation and bad lighting result in physical and mental reactions which are detrimental to service and cause diminution of alertness.

Cleanliness Given Too Little Attention

The desirability of cleanliness in and about stations and buildings is so unquestionable that no particular argument need be advanced in support of it, but even so it frequently happens that too little attention is given to attain this end. The necessary cleaning supplies such as tools, brooms, dust pans, mops, mop pails, sponges, etc., should be furnished unstintingly. In the larger stations it has become recognized as economy to install modern labor saving appliances for the use of the clean-up crew. Having provided the necessary equipment and clearly defined the standards of cleanliness in and about the buildings, steps should be taken to see that the established standards are maintained.

It is sometimes difficult to prevent accumulations of litter and dirt, particularly in basements, at the bottom of elevator shafts, under piles of materials and other out-of-the-way places. Such conditions, however, can be prevented if proper measures are taken. Extreme care should be given the storage of rubbish and useless material, and prompt removal from premises should be the rule. Wooden boxes should never be used for temporary disposition of these materials.

Greasy and oily waste is subject to spontaneous ignition and the greatest care should be taken in its disposition. Unless it is immediately burned after use, waste should be deposited in standard metal waste cans. The construction of the waste can is of vital importance, and non-standard cans are of but little value. The old-style wooden closets, lockers and enclosures are sometimes used as a catch-all for discarded and greasy garments, all of which increases the fire hazard. Substantially constructed and properly ventilated metal lockers for employees' clothes should be installed.

Cleanliness of machines and other equipment, such as transformers and oil switches is another housekeeping requirement that is particularly important. Machines covered with grease and oil are dangerous for operators and repairmen to work around. Where oil and grease are allowed to collect on a machine, the floor usually becomes soaked, thus increasing both fire and accident hazards.

The education of the operating force along these lines and the gradual attainment of these standards is no light task and requires both energy and tact in no small degree, but once this mental attitude of good housekeeping is developed it is a comparatively simple matter to maintain it. "Good Housekeeping" should be a slogan constantly in mind and rigid adherence to its basic principles will result in continuity of service.

News of the Industry

Ruling in Louisville

Court of Appeals upholds both operating ordinances granted recently to Louisville Railway Company

IN AN opinion written by Judge M. M. Logan and concurred in by the entire court the Kentucky Court of Appeals at Frankfort upheld on Oct. 16 the validity of the two ordinances under which the Louisville Railway operates. This decision was the result of a suit brought by George E. Poggell and others, representatives of the Portland Civic Club, filed in the Jefferson Circuit Court in February of this year by J. Franklin Fairleigh, attorney.

An injunction to prevent the railway from operating under the new franchises given by the city of Louisville was asked in the suit. Reasons for this request were held to be that the General Council had no right to repeal the old state franchise; that the ordinance in effect lent the credit of the city to the company and that powers not properly belonging to it were given the board of public works. The court held that the ordinance of 1922, granting a new franchise, and that of 1926, repealing that franchise and granting another, changing the fare-fixing method, were entirely within the law.

The franchises in effect before 1922 were to last for ninety years, while the new ordinance allowed only twenty years. Mr. Poggell asserted the General Council had no power to shorten the franchise. In the court opinion, Judge Logan held that while the Council could not extend the term, it was within its rights, provided the action was taken under a mutual agreement to shorten the life of the grant.

While Mr. Poggell's suit charged that the ordinances in effect gave to the railway the credit of the city in the provisions for refunding bonds and that this credit would be used in handling a $6,000,000 bond issue, Judge Logan pointed out that the city had not agreed to guarantee payment of the bonds and that it was in no way liable for them.

The suit alleged that the General Council could not repeal old franchises, granted by the General Assembly, under which the railway was operating at the time the 1922 ordinance was passed. Judge Logan's opinion was that so long as the General Council did not violate any State or federal laws, it could pass such ordinances as it pleased.

None of the points brought up by the plaintiffs was sustained, the court said in its opinion. It held that the city had a right to sell a new franchise to the company on the expiration of its old franchise and found that there was no merit in the contention that it had not acted legally.

The court found no evidence that the ordinance lends the credit of the city to the company, but held that the provisions regarding bonded indebtedness were such as to allow the city to keep an eye on expenditures chargeable to capital account. It also found that no legislative powers had been delegated to the Board of Public Works.

Refused an injunction in the Jefferson Circuit Court, Mr. Fairleigh appealed his motion for the order and lost again in the higher court. The case was then submitted on its merits.

One phase of the franchise attacked was that which provides that if an increased fare request is not acted on within 60 days by the General Council it may become automatically effective. This and the regulatory power given to the board of public works were alleged by the plaintiffs to deprive the General Council of its legislative powers.

Old franchises granted by the General Assembly under which the company was operating at the time the 1922 ordinance was passed could not be repealed by the General Council, the suit alleged. In all of these points the court decided in favor of the company and the city.

In Fairness to Illinois Traction

The certificate of convenience and necessity issued by the Illinois Commerce Commission to the National Roadway Lines, Inc., to operate buses between East St. Louis and Chicago has been set aside by Judge J. S. Baldwin in the Decatur Circuit Court on petition of the Illinois Traction System, the Wabash and the Illinois Central railroads and the Nokomis Bus Lines, Inc. The court held that there was an insufficient showing of financial ability to operate and maintain the route, and contrasted the present $15,000 capitalization, which the bus promoters say will be increased to $150,000 if the certificate is issued, with $3,000,000 recently expended by the Illinois Traction in improvement of its service in the territory proposed to be served by the bus carrier and $349,000 taxes paid in the territory by the railway. The court also cited resolutions from various communities that the state highways were already overcrowded, that bus traffic would menace travel on the highways and that such operation be not provided until provision was made for the bus companies to pay adequately for the use of roads.

Veterans See San Antonio

Local public service company does wonderful job in handling American Legion delegates. Traffic rules tightened

AN INTERESTING experience in handling large crowds during an emergency is found in the way in which the San Antonia Public Service Company of San Antonio, Tex., maintained schedules on street car and bus lines during the recent American Legion national convention. Engineers of the railway, co-operating with city and American Legion officials, worked out a plan whereby a maximum amount of bus and railway service might be rendered at all hours, without interfering with the crowds attending the convention.

It was decided to block off the entire business district, prohibit parking at any point and in some instances restrict traffic. This ruling was so interpreted as to permit street car and bus traffic on the congested areas until 9 o'clock in the morning so as not to deprive downtown office workers of a service to which they have been accustomed.

Houston Street was closed to traffic from Soledad Street to Alamo Plaza, while sections of St. Mary's and Navarro Streets were also closed. Street car traffic was maintained on Commerce Street throughout the week, thus bringing passengers within a short two blocks of the main business section.

By thorough planning in advance every man allied with the railway was well informed of the plans that had been prepared and there was no confusion. Street car and bus transportation on all lines went on uninterrupted during the week, with little change in the routes.

In addition to this, special parties carrying delegates of the Ladies' Auxiliary from the Plaza Hotel to their meeting place at the First Baptist Church were transported with efficiency and dispatch. Many bands and drum corps were taken to the drill grounds where competitive contests were held.

Written notices of all changes from standard practice were printed and distributed to all interested parties, and publicity was given to any changes in street car and bus routes so that the public might not be inconvenienced. Preliminary plans of the committee of traffic regulations, final plans, maps showing restricted districts, streets closed during the parade, and other information were freely distributed.

Traffic during the week was well above normal. Tuesday, the day of the parade, was the largest in the history of the company, more than 104,000 passengers being transported by street car and bus. The report for the week

Digitized by Google

showed an increase of approximately 73,000 over the similar period for the year 1927.

Telephones installed at logical points enabled information concerning the line of march to be transmitted quickly in the interest of bettering the regulation of traffic. Special arrangements, planned before the convention, enabled the company to transport passengers promptly to vantage points along the line of march.

During the week practically every piece of rolling stock of the company was called into play, including 71 buses. Despite the emergency nature of much of the service supplied there was little if any confusion. Such confusion in the handling of special parties as did result was due entirely to the emergency measures resorted to by the sponsors of such parties, and even in these cases was not the fault of the sponsors, but more of the individuals making up such parties, since conventionites are especially likely to be dilatory.

Virtual Dismissal of Fare Plea in Washington

The Public Utilities Commission of the District of Columbia has decided to dismiss the Capital Traction Company's petition for a higher fare on the ground that the other railway serving Washington, the Washington Railway & Electric Company, has not requested formally to be made a party to the increase. The dismissal decision, which has the approval of the commission's legal advisors, does not deny the Capital Traction Company's application for a 10-cent fare but merely refuses to make the increase mandatory on the lines of the other company. The effect is the same as a dismissal, however, since the officials of the Capital Traction Company stated during the public hearings that they would not take advantage of a higher fare unless the increase was made to apply also to the lines of the Washington Railway & Electric Company.

The present rate of fare is 8 cents cash or six tokens for 40 cents. Both companies introduced evidence showing that they are not now earning a fare return on their investments. The Washington Railway & Electric Company, however, has not so far expressed a desire for a higher fare. There seems little doubt, according to utility experts, that the Capital Traction Company will carry its case to the courts where its valuation has been adjudicated already at $25,000,000. The valuation of the Washington Railway & Electric Company, which has a much larger trackage and operates more cars, has not been fixed upon by the courts.

Those conversant with the transit situation in Washington believe that the commission has adopted this procedure in order to postpone the necessity of passing on a fare increase until Congress at its coming session has had an opportunity to dispose of the merger plan for the two lines.

Westinghouse message in "Cleveland Plain Dealer" during convention

Company Files Reply Brief in New York Fare Case

In a reply brief filed in the Supreme Court of the United States on Oct. 22, the Interborough Rapid Transit Company, New York, made a special effort to show that a federal question was involved in the effort to obtain a 7-cent fare and that the Supreme Court could properly take jurisdiction of the case. The question of federal jurisdiction was raised by the city and Transit Commission.

When oral arguments were heard by the court during the week ended Oct. 20, Chief Justice Taft gave the Interborough four days in which to file a reply brief. The city and Transit Commission have three days remaining in which to file briefs. The time of the Interborough was up on Oct. 22 and its counsel presented a brief of 73 printed pages to the court.

In its reply, counsel for the Interborough charge that the reply briefs heretofore filed by the counsel for the city and the Transit Commission contain much new matter and are not confined to supplemental arguments. They criticize this injection of new matter and at the same time seek to answer it.

Counsel for the Interborough say that they do not believe the conclusion can be escaped "that the commission's refusal of relief upon the two applications made by the appellee under section 49 gave the appellee the right to resort to the federal court at any time thereafter."

Because the Interborough did not go to the federal court in 1921 or 1922 does not destroy its right to resort to the Supreme Court, the reply brief asserts further. It says the 5-cent fare is shown to have been confiscatory in 1922 and to have been so ever since. The Interborough says:

> The appellee had a right to call upon the commission for relief in 1928 under the various provisions of the statute, and then go to court when it appeared that the commission had violated all the requirements of due process and judicial hearing and had, in fact, predetermined a third denial of relief.

The Transit Commission's course is sharply assailed, and it is denied the Interborough hurried unduly into the federal court. The Interborough said:

> The appellee did not "rush" to the federal court. It went there only when it became clear beyond doubt that the commission had again withheld any relief and had determined to prevent any review of the merits in any court. The "spear-head" of its offense was the virtual "lynching" proposed under section 57. The commission's device was to "reject" the 7-cent schedules in secret, and then, before serving its determination on the appellee and giving the appellee any chance to resort to any court, to start a summary proceeding and obtain *ex parte* therein a temporary injunction to prevent the appellee from charging more than the 5-cent fare and from attempting to compel the payment of a higher fare.

Among other things, the present brief of the Interborough says that the commission, in a reply brief it filed during

Digitized by Google

the week ended Oct. 20, has belatedly challenged Comptroller's Berry's figures. It says the commission's reply is conspicuous for abandonment of any effort to sustain the immutability of the 5-cent fare on the elevated lines or to show that the 5-cent fare is adequate or remunerative on the elevated lines. The Interborough says:

In desperation the Transit Commission's reply brief makes a vicious personal attack upon the comptroller of the Interborough company, because of the figures submitted in his affidavit concerning the company's operating results.

It points out that the Transit Commission charged the company's figures were "juggled and distorted" and that the company's earnings are in fact highly satisfactory. The figures of the comptroller are defended, and it is pointed out that Dr. John Bauer, an economist employed by the city, testified that the comptroller had accurately presented the facts as to revenues, operating expenses and the like.

Franchise Negotiations to Be Renewed in Jacksonville

Negotiations between the city and the Jacksonville Traction Company, Jacksonville, Fla., in connection with a new franchise for the company probably will be resumed soon. The Council committee, representatives of the railway and the city attorney will draft the new franchise for the company. It will then be submitted to the Council as a whole for acceptance, after which it must be submitted to a referendum vote.

Tentative franchises have been drawn by a Jacksonville citizens' committee and by Peter O. Knight, counsel for Stone & Webster interests in Florida. The final franchise probably will be a compromise between the two.

The previous negotiations between the city and the company came to an abrupt close last April. In August Mr. Knight appeared before the Council and asked for the appointment of the committee headed by Councilman Hemphill. Since that time the Council has been busy considering the 1929 budget and has been unable to handle any other major legislation.

Wage Hearings Ended in St. Louis

Testimony in the wage arbitration case of the St. Louis Public Service Company, St. Louis, Mo., and its union employees, was concluded before the Missouri Public Service Commission, on Oct. 18. The commission has allowed each side ten days in which to file briefs after the transcript of the testimony is completed. Then a date will be fixed for the closing oral arguments and the final submission of the dispute. Both sides have agreed that any wage contract and working agreement the commission may recommend shall be for only one year and subject to renewal annually.

Keeping the Cleveland Discussion Green

CONDITIONS were such that the United Railways & Electric Company, Baltimore, Md., could not send any representatives to the American Electric Railway Association convention at Cleveland this year, but the officers of the company were determined not to lose the benefits of the convention, so a committee was appointed, consisting of about ten members of the staff, and a portion of the convention was assigned to each member of this committee.

It was the duty of each committeeman to dig out everything that he could possibly find in the technical journals, committee reports, bulletins, advertisements, etc., relating to this subject, and then to report to the assembled staff, consisting of about 65 members. In this way it has been able to cover both the exhibits and the speeches.

To date four two-hour interesting and inspiring sessions have been held, the remarks of each speaker being followed by lively debate. Each speaker has attempted to show the application of what went on at Cleveland to the Baltimore property and this has added greatly to the interest. More two-hour sessions are in prospect.

Seven Cents in Effect in Los Angeles

A 7-cent fare went into effect on Oct. 21 on the lines of the Los Angeles Railway, Los Angeles, Cal. There is an appeal pending at this time before the United States Supreme Court as to the legality of this fare raise. Until this appeal has been decided passengers wishing to pay one cash fare are charged 7 cents and receive a coupon entitling them to a 2-cent rebate if and when the pending appeal against the increased fares is decided against the company. Passengers wishing to purchase four rides may buy four tokens for 25 cents and are furnished with a rebate check good for 5 cents, total refund, if the transportation corporation loses its case. School children may ride under a third system of rates by purchasing a coupon book for $1.40 entitling them to 40 rides. With the book is issued a slip which will be honored for 40 cents refund in event the increased fares are later declared illegal.

Although additional revenue gained from an increase in fares from 5 cents to 7 cents will not be available until a Supreme Court decision releases it, the Los Angeles Railway, through George J. Kuhrts, president, has announced extensive improvement in its service. Sixty-five new cars with 150 additional men are to be placed in service immediately according to this announcement. Arrangements also are being made with the city officials to give street cars greater freedom in traffic, thereby speeding up the service.

New Paving Plan in Effect in Portsmouth

Gangs of the Virginia Electric & Power Company, Richmond, Va., have begun the work of removing tracks on County Street, west of Court Street, Portsmouth, as the first step in an extensive repaving program mapped out by the city. By virtue of an agreement between the city and the company, the city has taken over the company's paving obligations as concerns replacements between the rails of street car lines that have been abandoned upon consideration of a cash payment of $7,000. The company will remove the rails at a cost of approximately $12,000, which is about $9,000 less than the estimated cost of the project as originally devolving on the company to carry out.

By the change in the agreement with the company, the city was able to alter its plans as regards the repaving between the rails. It originally was provided that not only the rails but the ties would have to be removed and the street between the tracks repaved in a manner similar to that on both sides of the tracks. After a full investigation, it was decided that this provision called for a great deal of unnecessary labor and it now is proposed merely to remove the rails leaving the ballast intact as the base of the new pavement. It was found by tests that ties do not deteriorate appreciably when encased in concrete and as the rails are from 5 to 9 in. high, there will be this amount of concrete, equivalent to the thickness of ordinary concrete paving, above the ties.

Higher Fares Necessary in Kansas City

The necessity for higher fares in Kansas City was set forth in a message to employees of the Kansas City Public Service Company in a recent issue of the *Railwayan*. While 136,000,000 people were carried in 1922 only 124,000,000 were carried in 1926. Not more than 114,000,000 passengers are estimated for 1928 and the decline, which has been progressive for many months, still continues. The fact that 239 cities in the United States, each with a population of more than 25,000, have 10-cent fares, was emphasized. One of the difficult features in the situation is that while Kansas City service contrasts favorably with that rendered in any comparable city in the United States, it has fewer people per mile of track upon which to draw for patronage than most any other similar system. Powell C. Groner, president of the company, is expected to report on the situation to the City Council within a short time. According to Mr. Groner "our company has a real problem to solve, since the city can not exist without good street railway service."

Sioux Falls Company Must Pave

The South Dakota Supreme Court has affirmed the decision of the Minnehaha County Circuit Court in the action brought against the company by the city in the paving suit. The Supreme Court held that the Sioux Falls Traction Company has failed to prove its inability to comply with a writ of mandamus issued to force it to pave along its tracks on Van Eps Avenue.

The company, in a franchise with the city, had agreed to pave at its own expense between the rails of its tracks and 1 ft. on each side on such streets as the City Council should order paved. In July, 1923, the Council ordered a section of Van Eps Avenue paved.

The company contended it could not comply with the terms of the franchise regarding paving, and a proceeding was brought by Roy D. Burns, then city attorney, to compel the action through a writ of mandamus. The court found in favor of the city and awarded a peremptory writ of mandamus, from which an appeal was taken to the Supreme Court on the ground that the company was financially unable to comply with the order.

In its opinion, the Supreme Court found that the issue of the writ of mandamus was discretionary and therefore proper, and then discussed the advisability of issuing it if the company was unable for financial reasons to comply. The court agreed with attorneys for the company that this was the issue in the case, but disagreed with them in their statement that if the company is compelled to pave it would amount to practically a confiscation of its property, saying that the company assumed the obligation when it accepted the franchise, and that taking property to satisfy legal obligation is not confiscation.

In its review of the matter the court said:

So long as the franchise is retained the public is entitled to consideration. Duties to the public requiring an outlay of money are properly considered in fixing rates, which should be high enough to permit the company to fulfill its obligation and receive a fair remuneration on the investment, but it will not do to say where the rates are not high enough public duties may be ignored.

It was also set forth that there was no evidence to show that the current assets, or a part of them, cannot be made immediately available, nor that a large part of the monthly income cannot be used for paving. Because of this opinion, the Supreme Court affirmed the order.

Colorado Petition Granted

The Grand River Valley Railroad running between Grand Junction and Fruita, Col., has been authorized by the Public Utilities Commission to cease carrying passengers and to confine its freight business to carload lots. All concessions asked were allowed because the company was losing money.

The commission simultaneously granted the Western Motor Ways, Inc., permission to carry passengers by bus from Grand Junction to Fruita.

Slogans to Win Baltimore Riders

Attention of the public in Baltimore is being brought strikingly to the parking situation in that city by the United Railways & Electric Company urging owners of automobiles to use its cars. To this end Raymond S. Tompkins, assistant to the president of the company, prepared a number of slogans, each of which asks a question and then supplies the answer. The questions asked do not open the way to a negative answer. They have been the subject of a great deal of favorable comment and the company reports that it has received no adverse criticism. Mr. Tompkins said that other slogans would be added from time to time. The posters bearing them are attractively planned and it is impossible for the public to miss them since they are being used as dash signs on all company cars.

Hard to Park?—Take a Street Car
Curbs Crowded?—Take a Street Car
Often Tagged?—Take a Street Car
Traffic Tire You?—Try a Street Car
No Parking Space?—Try a Street Car

Slogans Already Used

Radio Program Sponsored in Fort Worth

The Northern Texas Traction Company with headquarters in Fort Worth, have sponsored a radio program to be broadcast over radio station WBAP of Fort Worth. A musical concert goes on the air Sunday between the hours of 8 and 9 p.m.

Five-Cent Zone Extended in Brooklyn

Extension of the Broadway surface line in Brooklyn, cutting the fare by surface car from Broadway Ferry to Cypress Hills from 10 cents to a nickel, is announced by the Brooklyn-Manhattan Transit Corporation. The Broadway line will be extended from East New York to Cypress Hills and the present Fulton-Crescent line will be discontinued. At present each of these lines charges a 5-cent fare and there is no transfer between them. The new arrangement is to be undertaken as an experiment for six months. It will provide a single 5-cent fare from Broadway Ferry to Cypress Hills via Broadway, Fulton Street and Crescent Street, but there will be no transfers at Crescent Street and Jamaica Avenue between the Broadway line and the lines that run to Jamaica.

Can't Louisville Have a Sunday Pass?

One of the newspapers of Louisville, Ky., recently carried a story from a person signed "A Street Car Rider," who favors the Cincinnati idea of an all-day Sunday pass on street cars at the price of 25 cents. In part the letter read as follows:

Cincinnati and a number of other cities reaching from Boston to Atlanta have a 25-cent fare for Sunday travel. In Cincinnati all cars carry a big card bearing the slogan, "A Sunday Pass Is Cheaper Than Gas." The idea is to encourage Sunday travel. These passes are yellow cards good on the first day of the week for traveling all over Cincinnati between the hours of 5 a.m. and 12 midnight. They are transferable to others during that entire day. The only restriction is that you must be able to show the card, if called upon to do so, while traveling on a car. This is done to prevent it being handed to anyone else during the journey.

Position of Company Explained to Indianapolis Men

Replying to a demand of a committee of employees of the Indianapolis Street Railway, Indianapolis, Ind., for an increased wage scale and improved working conditions, Joseph A. McGowan, acting president of the company, has presented to the committee a letter in which he announced the company at this time could not grant the demand. He said that the wage scale now in effort wast fixed by the Indiana Public Service Commission at a hearing some months ago and that there had been no change in conditions which would permit an increase in the wage scale now. The company's revenues had not increased, but on the contrary, constantly were decreasing, and the situation would not justify a rise in the scale of wages. As to the demands for better working conditions, Mr. McGowan said the working conditions now in effect were prescribed by the Public Service Commission and he said there apparently was no basis for improvement in the conditions as they now exist.

The employers' committee, in its demand, had asked that certain of the company officials be discharged because they had discriminated against employees who were affiliated with the Amalgamated Association and had threatened to discharge employees because of their membership in the association. Mr. McGowan pointed out that the committee had failed to specify names or instances of such acts.

The committee had presented the demand a week ago to James P. Tretton, superintendent of the company, as the first step toward an appeal to the commission for a new hearing on wage scale and working condition demands. The agreement between the company and its employees provides that a demand of this kind be presented first to the superintendent and then to the president with final appeal to the Public Service Commission.

Progress Made by St. Louis Survey Commission

The Transportation Survey Commission of St. Louis at a meeting held on Oct. 23 decided on two initial steps—the immediate preparation for introduction at the next Legislature of an enabling act to give St. Louis powers to proceed with a rapid transit system, and also the early appointment of an engineer to act as technical adviser to the commission. City Counselor Muench and E. R. Kinsey, president of the Board of Public Service, will draft the legislative measures sought by the city for submission to the state lawmakers when the General Assembly convenes at Jefferson City on Jan. 2 next.

Erastus Wells, vice-chairman of the commission, advocated immediate action by the commission on problems that really do not require the services of an engineer. He heads a committee that is studying existing transportation facilities. He suggested that the commission divide its work into two divisions, one for an engineer and the other for general matters.

Among other things he said there was no doubt but that transportation facilities should be owned by one company. "All you have to do is to drive west at 5 p.m.," he said, "and find the buses and street cars getting into each other's way. In my opinion this is a matter of common sense—no engineer is needed."

Freight Rates Fixed for Texas Electric Railway

Rates ranging from 6½ cents to 33 cents for 100 lb. for distances of 5 to more than 950 miles respectively have been prescribed by order of the State Railroad Commission for application on shipments of corncobs, maize and kafir pummies, corncob meal and pummy meal, in straight or mixed carloads, jointly between points on the Texas Electric Railway and the Texas & New Orleans Railway. Rates ranging from 5 cents to 33 cents a hundred for the same distances were prescribed for local application between points on the respective lines. The Texas Electric Railway a few months ago became the first operating electric railway in Texas to be designated as a common carrier, subject to freight regulations of the Railroad Commission. The program of the company for developing business of this kind gradually is being developed.

Greater Winnipeg Through Power Development

"What will they do with the power" has been answered in Winnipeg, Man., Canada, by the construction of a railroad to Seven Sisters Falls with thousands of tons of Winnipeg-made products to be used by hundreds of Winnipeg wage earners to build one of the most modern hydro-electric power plants on this continent. The sum of $25,000,000 will be invested in this new plant.

It was at the annual meeting of the Young Men's Section of the Winnipeg Board of Trade held two years ago that A. W. McLimont, president of the Winnipeg Electric Company, first publicly announced his company's plans for future power development. At this year's annual meeting Mr. McLimont, unable to be present, advised by letter that the Seven Sisters Falls project was no dream, but that the power developed there would give steady employment to more than 50,000 wage earners, would increase the population by more than 200,000 and would add $50,000,000 per annum to Greater Winnipeg's payroll.

A Corporation's Rights

THE Electric Bond & Share Company has not objected to being investigated. It has, however, objected to a type of investigation which the Supreme Court has characterized as a "fishing expedition into private papers on the possibility that they may disclose evidence of crime." This the court has held to be contrary to both letter and spirit of the Fourth Amendment.

In authorizing the utility investigation, the Senate resolution did not allege any violation of law, but the Federal Trade Commission interpreted its assignment not as a fact-finding investigation on definite points, but as a general search for evidence of law violation. It demanded access to all files of utility companies, regardless of whether they contained evidence pertinent to the declared objects of the investigation and regardless of the private and confidential nature of much of any company's correspondence.

The Electric Bond & Share Company has raised an issue of fundamental importance to every citizen, an issue which far transcends the question of whether any utility has been engaged in practices either reprehensible or contrary to public interest. It has asked the court to decide whether the Constituton of the United States protects corporations, their clients and stockholders, from the prying eyes of a federal agency and from a forcible public presentation of information which it feels will hurt its business. If, because of a whim of suspicion, one House of Congress is to be allowed to order an investigation by a commission which assumes judicial powers when no crime has been charged, then no individual is safe from an unconstitutional usurpation by one body of our three separate branches of government. — *Wall Street Journal.*

Free Tickets to Sale in Atlanta

The J. M. High department store, Atlanta, Ga., and the Georgia Power Company, co-operated on Sept. 24 in an idea which resulted in increased sales of tickets for the company and a record sales day for the store. Arrangements were made by R. M. Dorsen, manager of the store, to secure as many car tickets as it might need for the day. Little books with perforated coupons good for two tickets from the J. M. High Company were provided each conductor. Whenever the conductor took in a cash fare or a ticket, he presented the patron of the street car with one of these coupons. The coupon was not good unless redeemed by the J. M. High Company.

The interest of the department store was safeguarded, for no coupon was redeemed with tickets unless the customer showed a purchase slip certifying that at least $1 worth of goods had been secured. The important thing about the event from the standpoint of the railway was not the extra tickets sold but rather the fact that thousands of shoppers were shown that via the street car they could shop without concern at leisure.

Status of Youngstown Commissioner Defined

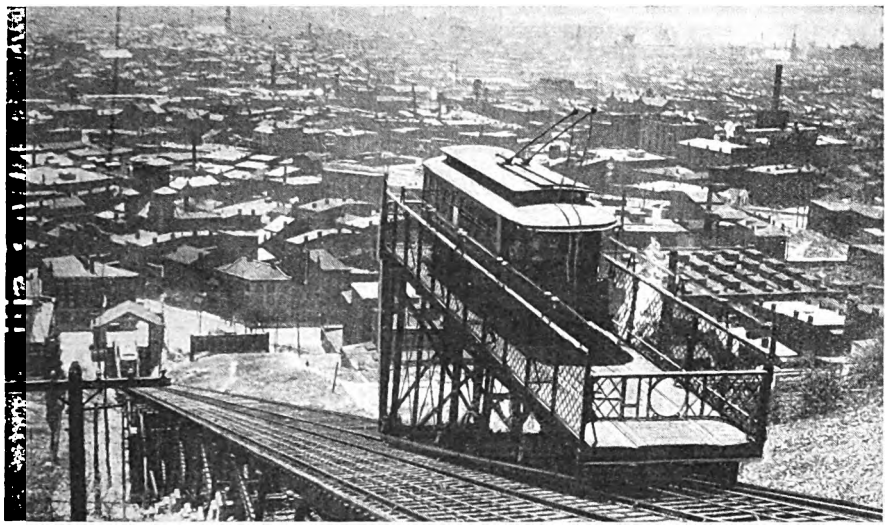
No contracts involving the lines of the Youngstown Municipal Railway may be entered into without approval of City Traction Commissioner Harry Engle, according to a recent ruling of the Ohio Public Utilities Commission. The ruling followed refusal of the City Council to allow Mr. Engle's request for authority to arbitrate the question of the traction commissioner's power to approve or disapprove such contracts. The commission further held that it would not be legal for the railway to make dual contracts involving the so-called municipal lines and the subsidiary lines. The question of the traction commissioner's authority was brought to a head by action of the company in making certain contracts for service for a three-year period, although its franchise expires in December.

Suburban Traffic at New York

Declaring that the subject of suburban passenger rapid transit is a bistate problem, the City Club of New York in the October number of its *Bulletin* announces that it is about to undertake a campaign for enabling legislation which would give to the Port of New York Authority the necessary power toward finding a solution. In outlining the problem of suburban traffic the *Bulletin* states that on each working day the volume of suburban traffic to Manhattan from New Jersey is 302,700; from Westchester, 76,500, and from Long Island, 154,000. The *Bulletin* says:

The number of commuters from outside the city limits has approximately doubled in

Digitized by Google



Foundations of incline, showing platform

the last ten years. The indications of the containuance of this growth are so clear as to be alarming. Unless some solution of the problem of suburban transit is found quickly the conditions probably will become within the next five years just as intolerable as the conditions of municipal transit are at this time.

Inasmuch as it is a bistate problem, an official agency with bistate functions and equipped with knowledge of the transit requirements of the entire region must be charged with the task.

The City Club's committee on suburban affairs decided that:

"The Port of New York Authority should by appropriate legislative enactment be authorized and directed to take up the subject of suburban passenger rapid transit, to investigate all phases of the problem involved and to recommend to the legislatures of the respective states and to the existing agencies involved, all necessary steps which in the opinion of the Port of New York Authority should be taken to provide a satisfactory solution of said problem, and that it be provided with the funds and equipment believed to be required for that purpose."

Co-operation in Indiana

A joint conference of representatives of Indiana electric railways and a special committee appointed by the Indiana State Chamber of Commerce for the purpose of improving co-operation between steam railroads and electric railways was held on Oct. 19 in Indianapolis. Those present concluded that public convenience and necessity would be helped by greater co-operation to the extent of joint arrangements for handling less than carload shipments and publication of joint through rates between points located on steam lines.

Members of the special committee decided to pass a resolution addressed to representatives of the electric lines advocating interchange of freight in less than carload traffic between the two classes of carriers. This resolution, it is reported, also will be submitted to the electric lines for their use before the Central Freight Association committee when it meets in November.

Cincinnati Landmark Replaced

Replacing the power house of the old Bellevue inclined plane, a landmark since 1876, the Cincinnati Street Railway, Cincinnati, Ohio, has just completed and placed in operation its new line department building on McMicken Avenue at the head of Elm Street.

For many years Central Station, located at 1323 Walnut Street, housed the street railway line department equipment and the central substation, which supplies power to the downtown business district. In rearranging the power system of the railway, the Walnut Street location was regarded as the logical place for the power dispatcher, under whose supervision the nineteen new automatic substations will be controlled. The vast amount of switching equipment required to operate these automatic substations with supervisory control required all of the space heretofore used by the street railway line department, thus making it necessary for the latter to secure new quarters. Abandonment of the old Bellevue incline furnished the necessary site for the new line department building, which also required a fairly centralized location.

The new building has just been completed at a cost of approximately $50,000. All line department power trucks and emergency cars are stored and serviced there. The department is equipped with all modern conveniences for washing, greasing and inspecting the various emergency trucks. The first floor front is arranged in four bays, each with a separate exit to the street. Each bay houses a trouble truck, three of which make emergency runs for overhead or trolley troubles, covering the downtown and Brighton districts. The fourth is a street car emergency truck which handles street car troubles downtown.

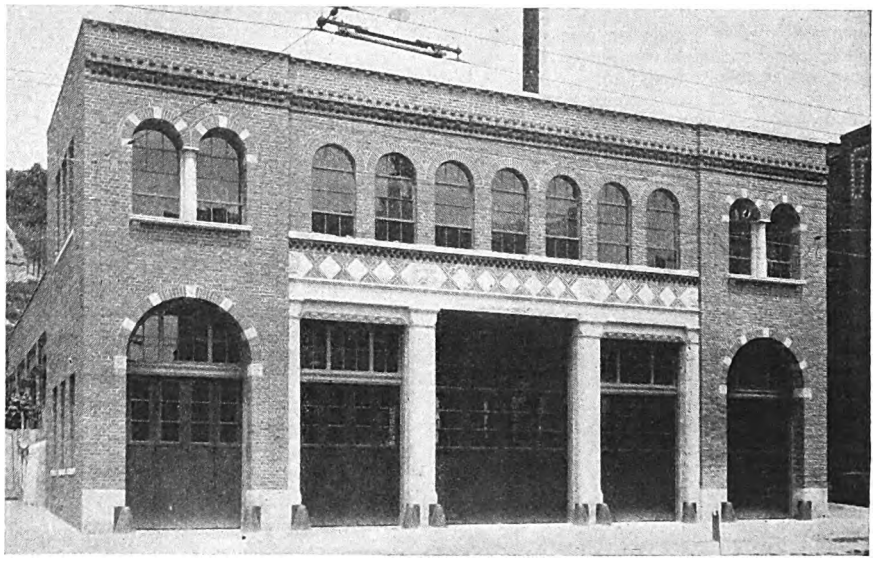
In the basement of the building are the heating plant and reservoirs for the stock of tools, supplies and salvaged material.

On the second floor are the lockers for linemen, clubroom, shower baths and toilet facilities, and the office of the line department foreman and the electric signal and switch maintenance force.

F. J. Venning, superintendent of power, has charge of the new building on McMicken Avenue. Harley L. Swift, superintendent of substations, assisted in designing the building.

Interchange by Milwaukee Company

Arrangements have been made by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., to establish freight connections and car interchange between the East Troy-Burlington rapid transit line and the Chicago & Northwestern and the Chicago, Milwaukee, St. Paul & Pacific Railroad systems. The connection with the Northwestern road is to be made just south of West Junction, and with the Milwaukee road about 1 mile north of that point. This system will effect a saving of about $9.50 per carload of freight between points on the interurban line and points on the two steam railroads.



Another monument to modernism in Cincinnati

Employees of Key System Urged to Sell Pass

President A. J. Lundberg of the Key System Transit Company, Oakland, Cal. has expressed his pleasure at the interest shown by patrons in the Sunday and holiday pass and has urged every employee to do everything possible to create a greater use of the pass. A recent bulletin issued by Vice-President J. P. Potter, in charge of company operation, says:

Responsibility for the success of the "Sunday-Holiday pass" rests with the men in charge of the cars and buses. If you men get in and sell the pass you will help to retain the present service. Something must be done to get more riders.

In this connection the *Key Note*, official paper of the company, says:

The success of the Sunday and holiday pass depends upon the individual effort of each one of us. In particular its success depends on the man on the platform who is meeting the public, our patrons. Our ever-present slogan should be: "Sell the Sunday Pass." It requires salesmanship; but there is no reason why the 10,000 sales mark cannot be reached.

The paper says further:

The pass idea is not a difficult one to sell. Our patrons are interested in what you have to say to them regarding the pass and its advantages. The Sunday and holiday pass has many desirable sales features.

First of all it's a great buy. It sells for 25 cents. It is transferable. Anyone can use it, irregardless who the original purchaser was. It is a ticket over the entire street car and bus system of the Key with unlimited riding privileges on the day of purchase. It is good for any number of rides, any time and any place. (It is not good on transbay lines.)

How about the sightseeing angle? Have you talked this slant of the pass idea over with any of our riders? The Sunday and holiday pass affords an excellent opportunity for sightseeing. This point should be stressed in urging our patrons to use it. Just think of it—there are over 270 miles of sightseeing awaiting the pass user. The parks and beaches of Alameda and Oakland, the University of California, the fruit and agricultural sections of San Leandro and Hayward, the home sections of Piedmont and East Oakland, the marine view from North Berkeley, and the industrial sections of Richmond—all await the pass user. Tell our patrons about the sightseeing possibilities with a Sunday and holiday pass.

Buy a pass and save gas! Need we say more in regard to the economy of using the street car in place of the family automobile? And then there's traffic and parking relief. How about this point? Have you told 'em about that? When you use a street car there's no parking to worry about and no traffic congestion and wild drivers to cause you concern. Buy a pass and save gas!

Contesting Income Tax in Cleveland

Upon the authorization of the City Council of Cleveland, Ohio, the city law department will assist counsel for the Cleveland Railway in contesting in the Federal Circuit Court of Appeals at Cincinnati the ruling made by the United States Board of Tax Appeals about the railway's income taxes on the so-called interest or fare barometer fund, which regulates street car fares. The internal revenue bureau has a claim of $498,000 against the railway. A final judgment against the company which would require it to pay this amount would probably mean an immediate increase in the rate of fare.

The United States Board of Tax Appeals ruled that the interest fund, though held in trust for the benefit of all the car riders, was subject to taxation. The city has entered the case on the theory that the citizens have a vital interest in the outcome of the suit.

The city law department, however, recently received a letter from Attorney C. M. Charest, general counsel for the United States bureau of internal revenue, asserting that a three-party argument would confuse the court and that the city's interest is not sufficient to make it a party defendent. The city intends to ask the court for permission to intervene, in spite of Mr. Charest's objections.

Foreign News

Increased Traffic in Aberdeen

A total of 52,937,480 passengers was carried on the cars and buses of the tramways department of the city of Aberdeen, Scotland, during the year ended May 31, 1928. This figure compares with 47,120,025 carried on the cars and buses for the year ended May 31, 1927. Revenue earned by the combined tramways and motor bus undertakings was £219,023, compared with the previous year's total of £195,468, This increase was accounted for by the elimination of a large number of privately-owned buses for hire entirely within the city in opposition to the tramway undertakings. These facts were disclosed in the report for the year addressed to the members of the tramways committee. The net profit from the tramways for the 1927-1928 period was £6,184 and for buses a balance of £11,028 was carried to the depreciation and renewal account. Total tramway car mileage in 1928 was 2,702,548, against 2,564,718 in 1927. The buses ran 1,598,758 miles in 1928, compared with 1,309,461 miles the previous year, or an increase of 289,297 miles.

New Depot at Liverpool

More than two years ago the work of erecting a new tramway depot and car works in Liverpool, England, was begun and the buildings are about to be opened for service. They cover an area of about nine acres. The cost has been about £400,000.

Highway Powers for British Railways

Bills promoted by the four main line British railways to give them enlarged powers to carry passengers and goods on the public roads have now been passed by both Houses of Parliament. Accordingly it is expected that before long the railway companies will be running both buses and goods vehicles in many parts of the country in competition with the road transport companies which have taken away so much traffic from the railways, and also with municipal tramways outside of municipal boundaries.

Street Railways Planned in Canton

It is reported that the Kwantung Tramway will soon begin laying tracks for a new street railway in Canton, China. Some years ago the local government granted a franchise to the Kwantung Tramway to build and operate street railways in Canton. After considerable delay a shipment of steel rails was received from Germany but no further progress was made and the rails have been kept in storage.

Cleansing Equipment for London Cars

All the depots of the Metropolitan Electric Tramways, London, England, have been fitted with the latest type of car-washing equipment which was first installed, some months back, at Wood Green depot. The equipment consists of what are known as "water pistols" which are attached to flexible pipes coming from iron water pipes in the roof of the depot. These "water pistols" can be attached to brushes and mops for cleaning the outside of the cars from top to bottom. They can likewise be used for cleaning trucks and undergear; high water pressure being obtained through powerful pumps. By the new equipment it is claimed that a tramcar can be thoroughly washed in less than two minutes.

Recent Bus Developments

New California Service Authorized

A certificate of convenience and necessity has been granted by the California Railroad Commission to the Pacific Coast Motor Coach Company to operate a thorough-car auto stage service for the transportation of passengers and their baggage between Long Beach and Newport Beach, Laguna Beach, Serra and Juan Capistrano. This company is a subsidiary of the Pacific Electric Railway. The certificate is granted on condition that no local service be conducted between Long Beach and Newport Beach, nor shall passengers be transported from Serra to San Juan Capistrano, but pasengers may be transported from points intermediate thereto. The commission also authorized Pacific Coast Motor Coach Company to unite this service with its present operations.

The commission denied the application of Pickwick Stages System for authority to extend its auto stage service between Long Beach and San Diego and intermediate points, via the Sea Shore and Coast routes, and to consolidate and merge the same with its existing operations. Commissioners Carr and Decoto, in their concurring opinion, served warning on the Pickwick Stages System that its application is being denied because it has violated the terms of its existing certificates, authorizing it to serve the terminals involved, via the Santa Ana route and that its disposition to observe or disregard the decisions of the commission must be taken into consideration when extensions of its service are applied for.

In its decision the commission finds that public convenience and necessity do not require the service proposed by the Pickwick Stages System, but that it does require the service proposed by Pacific Coast Motor Coach Company and that the certificate should be issued to that company, provided more modern and efficient equipment is placed in service than is now used by that company in its operation between Newport Beach and Laguna Beach. The commission makes its certificate effective when the Pacific company has procured 29 to 33 passenger stages for this service, as proposed in the hearing before Examiner W. R. Williams of the commission.

New Rochelle Line Goes Over to Bus

The Public Service Commission authorized the Westchester Electric Railroad on Oct. 23 to substitute bus operation for trolley cars eastbound on its tracks from the Mechanic Street terminal in New Rochelle to the city line and westbound from the city line to the terminal. New Rochelle consented to the change by resolution of its Common Council on Aug. 14, and evidence submitted to Commissioner Van Namee showed that operations on the East Main Street line had been at a loss and that there was an operating loss on all lines of the Westchester Electric Railroad for the first six months of 1928 and for the years 1918-1927 inclusive.

Commissioner Van Namee, in a memorandum approved by the commission, said that the local consents permitted the charging of a 10-cent fare on this line, an increase of 5 cents over the trolley fare. Transfers were to be furnished to all lines in New Rochelle without additional cost and from all other lines to the bus lines at an additional cost of 5 cents. He added that this arrangement would provide additional revenue and improve the financial condition of the company. It is felt this change of mode of operation meets the demands of the times and serves the needs of the public.

Chartered Bus Service Grows

Phenomenal business being done by New Jersey Company in supplying transportation of this kind. Buses for funerals

DURING the first eight months of 1928, the chartered bus business of Public Service Co-ordinated Transport, Newark, N. J., continued its rapid growth. On July 12 the North Jersey Street Railway Benevolent Association chartered 63 buses for its annual excursion to Asbury Park. All records were broken, however, on July 19, when the Prudential Life Insurance Company Athletic Association engaged 80 buses to take its members and friends on an excursion to the seashore. More than 2,300 people went on this seashore trip. Eight extra buses were enlisted in the fleet to provide against any possibility of delay due to tire trouble.

One of the most interesting trips which the department has yet operated, began Oct. 7, when 150 members of the Allgemeiner Deutscher automobile club of Germany left New York City in seven Public Service buses for a two weeks' tour in the eastern half of the United States and Canada. The party was to visit the Ford and the General Motors plants in Detroit, making a first hand study of motor conditions in the United States. The total length of the trip was to be about 2,000 miles.

During the twelve months of 1927, the total number of miles operated on chartered bus trips amounted to 356,687. Compared with this figure, results for the first eight months of 1928 show a total of 358,888 miles operated, or an increase of 2,201 miles over the full twelve months of 1927. Growth in the business is further shown by the size of the individual orders. During 1927 only three orders were received exceeding 25 or more buses, whereas in 1928 the department operated ten trips requiring more than 25 buses.

The charter bus and car department was organized as an integral part of the transportation department, under the supervision of a passenger agent. Each of the Co-ordinated Transport's seven division managers actively assists the agent by assuming full responsibility for operating all chartered or special buses within the limits of his particular division. To assist in this work each division manager has appointed a member of his staff to devote part time to chartering buses. The division managers and their assistants also help the agent to solicit new business.

Selection of men to operate chartered buses is also in the hands of the division managers, who maintain an active list of regular operators available for this service. Experience, personality, skill in driving, knowledge of roads, and inclination for the work, are some of the qualities making a good chartered bus operator.

Harold B. Whitman, passenger agent of Public Service Co-ordinated Transport, writing about the chartered service in *Public Service News*, the company's own publication, says:

If the rapid increase in the size of chartered bus parties has been remarkable, the wide variety of new uses to which it is being put is no less astonishing. Almost every day or so someone calls at the chartered car and bus office and hires a bus for some new purpose. Recently, the representative of a walking club chartered a bus for a two-day hiking trip. Traveling by bus into the mountains, the club members, put their heavy clothing in the bus and sent the driver 15 miles beyond to await the arrival of the hikers.

Here are just a few of the purposes for which Public Service buses have been chartered: Athletic events, conventions, picnics, weddings, funerals, political meetings, inspection trips, lodge meetings, real estate developments, skating parties, to carry children to school, natural history trips, religious services, theater parties, and to carry men to work in industrial plants located away from regular lines of transportation.

Service by Bus to Be Continued on Ohio Route

The oldest electric line in Ohio, the Sandusky, Milan & Norwalk Electric Railway, is to be abandoned. A delegation of Milan citizens recently appealed to the Erie County Commissioners to obtain assurance from the Lake Shore Electric Railway that they will have transportation from Milan to Sandusky and Norwalk when the tracks are torn up. L. K. Burge, vice-president and general manager, said that buses operated since the storm last March would continue to run.

New Service in Amsterdam Will Not Compete with Railway

The Public Service Commission recently granted a certificate to Charles Vollmer for operation of a bus line in the city of Amsterdam, N. Y., from East Main and Market Streets. According to a consent granted by the city. Mr. Vollmer, under the certificate granted, will not pick up passengers eastbound in East Main Street, whose destination is south of the corner of Vrooman Avenue and Forbes Street as the Fonda, Johnstown & Gloversville Railroad is now furnishing service in that section. The railway company opposed operation of the bus line in that section northeast of Lyon Street where it operates its Market Street line.

The commission, however, finds that the bus service will be convenient to residents of that section. Another section of the bus line will give service in that part of the city where the trolley line has abandoned service. A 10-cent cash fare with three tickets for 25 cents is planned by the bus operator and school childrens' tickets will be sold at fifteen for $1.

Permission for New Boston Route Sought

The Boston Elevated Railway, Boston, Mass., has filed a petition with the Public Utilities Commission for the approval of a proposed bus line involving the operation of a belt line from Fields Corner and return. Authority is sought to operate seven buses all the time and ten buses when traffic warrants. Plans for this bus line have already been approved by the State Department of Public Works and the Boston City Council.

Buses Replace Cars on Illinois Lines

The East St. Louis & Suburban Railway replaced its street cars between Collinsville and Edgemont and Collinsville and Edwardsville, Ill., with buses on Oct. 12 in accordance with authorization by the Illinois Commerce Commission. The street cars had been in service for 30 years. An hourly service will be maintained until traffic warrants a shorter schedule.

Emergency Service on Washington Route

Temporarily the Pacific Northwest Traction Company has abandoned its interurban service between Bellingham and Mount Vernon, Wash., due to the condemnation by company engineers of an approach to its Skagit River steel bridge. The gap has been filled by operating additional buses. Several months may pass before service is restored, according to Harry M. Sewall, Bellingham manager of the company. Pending repairs, to the bridge, Mr. Sewall said the company would operate interurban freight service to Burlington. Freight consigned to Mount Vernon will be handled by the Great Northern Railway, and passenger service will be by bus.

Stark Electric Opposes Bus Company

The Ohio Public Utilities Commission has dismissed the answer and cross petition of the Stark Electric Railroad, Alliance, and so disarmed the company and left an opening for the Salisbury Transportation Company, a bus line, to press its attack against the Stark Electric schedule.

The two companies are operating interurban lines between Alliance and Canton. Both are after business between Canton and Louisville a distance of 5 miles, where the bus line operates parallel to the railway.

Some time ago the Stark Electric adopted a fifteen-minute schedule between Louisville and Canton. The Salisbury Transportation Company filed a protest with the Public Utilities Commission at Columbus, claiming that the fast schedule was not warranted and that it had been adopted only to force the bus line out of business.

Officials of the bus company also say that the railway was diverting from the proceeds of a bond issue money to be used only for permanent improvements prescribed by the State Utilities Commission.

In retaliation, the Stark Electric, through Attorney C. M. Shetler, Canton, filed an answer and cross petition, claiming that Attorney S. L. Geiger, Alliance, secretary and treasurer of the bus line, had conspired with the Ohio Public Service Company to put the railway out of business.

After considering the two complaints, the state board ordered the Stark Electric's cross petition and answer stricken from the records, leaving only the Salisbury charges to be decided when the case comes up for an official hearing.

Boston-Billerica Scene of Contentious Route

The Eastern Massachusetts Street Railway and the Boston & Maine Railroad continue to contend for the right to operate buses between Billerica and Boston, Mass., with developments in favor of the railway. The Board of Selectmen of the Town of Billerica on Oct. 17 granted the Eastern Massachusetts licenses to operate in that town, after having the application on the table for the past several months. Burlington, Winchester and Arlington have already passed favorably on licenses for the railway towns through which the buses would pass. The City Council of Woburn has granted a license, which, however, has not been signed by the Mayor. Cambridge has refused the street railway, while Burlington and Woburn have turned down petitions by the Boston & Maine. The city of Boston has petitions from each company but has not acted.

Trial 25-Cent Route in Cleveland

A 90-day trial of a 25-cent fare express motor coach route has been authorized by the City Council of Cleveland, Ohio, over protests of the Cleveland Railway. The company is anxious to experiment with express motor coach operations, but does not believe the route chosen will show the best results. It also may refuse to carry out the order of the Council on the ground that it has insufficient equipment.

The Council directed the company to operate coaches from the Public Square to the eastern line of the county border, by way of Lake Shore Boulevard, a distance of about 15 miles as the bus travels. Stops will be made within the city of Cleveland only in the downtown district and at important intersections. Objection was made because the route chosen will parallel a local Cleveland Railway route and a through intercity bus line in Euclid Village and also will parallel the Clifton-Carnegie bus line in the downtown section of the city.

The railway urged an experimental express route from Lakewood, but the Council declined to pass legislation of this kind because Lakewood has declined to enter into negotiations for a revision of fare along the lines recommended by the Metropolitan Transportation Commission.

Company Concedes Jurisdiction Over Pittsburgh Bus Service

A. W. Robertson, president of the Philadelphia Company, says that organization will facilitate any move to place the operations of the Pittsburgh Motor Coach Company, subsidiary of the Pittsburgh Railways, under the jurisdiction of the Traction Conference Board. An open letter to him explaining the matter closed by stating that its object was to eliminate all red tape and to make it as easy as possible for the Council or the conference board to get any facts they may desire. The text of the letter follows in part:

I noticed in the newspapers that the Council has given some attention to the matter of a contract between the city and the Pittsburgh Motor Coach Company, similar to the present contract between the city of Pittsburgh and other municipalities, and the Pittsburgh Railways. We would be very glad to co-operate in any way to expedite the execution of such a contract.

We had always assumed that for all practical intents and purposes the Pittsburgh Motor Coach Company was subject to the terms and provisions of the present agreement with the Pittsburgh Railways, although in the absence of an agreement the Traction Conference Board would have no formal authority.

So, without waiting for a formal contract to be prepared and executed between the parties, we will be very glad indeed to furnish the Council, or the Traction Conference Board with any and all information which may be desired in regard to the Pittsburgh Motor Coach Company, and submit the company to the jurisdiction of the Traction Conference Board the same as though the agreement were executed.

Financial and Corporate

Purchase of Texas-Louisiana Power by General Waterworks

The General Waterworks & Electric Corporation, New York, formerly General Waterworks Corporation, operating in Idaho, Texas, Indiana, Kentucky and Pennsylvania, has acquired all the common stock of the Texas-Louisiana Power Company, which operates among other services transportation properties in Texas, Louisiana, Kentucky, Arizona, Oklahoma and New Mexico. The purchase price was not given in the announcement made on Oct. 13 by A. P. Barrett, chairman of the board of directors of both companies.

The present management of the Texas-Louisiana Power Company will continue to operate and direct that corporation and also will manage and operate the General Waterworks & Electric Corporation, said Mr. Barrett, formerly president of the Texas-Louisiana, who has become chairman of the boards both of that company and of the General Waterworks & Electric Corporation.

Allen J. Smith, who has been general manager of the Texas-Louisiana Power Company, has become vice-president and general manager of both companies. A. D. McNab, who has been treasurer of the Texas-Louisiana, has become secretary-treasurer of the Texas-Louisiana and assistant treasurer of the General Waterworks & Electric.

Headquarters and general offices of both companies will be in Fort Worth.

Lincoln Traction Under Delaware Laws

All property of the Lincoln Traction Company, organized as a Nebraska corporation, has been transferred by deed for a consideration of $1 to the Lincoln Traction Company, recently organized under the laws of Delaware. The company is a United Light & Power subsidiary. C. N. Chubb, president, says that no changes in the company's financial structure or personnel are contemplated. All other United company properties are organized as Delaware corporations because of certain advantages and material benefits attaching.

Interstate Would Offer Securities

The Interstate Public Service Company, Indianapolis, Ind., has petitioned the Public Service Commission for permission to issue $1,255,600 in par amount bonds and 7,217 shares of no par value common stock to reimburse the company for funds expended in additions and improvements to its properties.

The bonds would be first mortgage and refunding bonds bearing 5 per cent interest and would be sold at not less than 91½ per cent of par. The no par value stock would be sold for $75 a share.

From Jan. 1, to Sept. 30, according to the petition, $1,690,177 was expended for improvements. From this amount, $16,020 was deducted because it was spent on leased properties for which no bonds may be issued.

Loss on Third Avenue

President Huff states fare under present conditions insufficient to make return. Bus operation valuable

FOR the fiscal year ended June 30, 1928, the operating revenue from the railway lines of the Third Avenue Railway System, New York, N. Y., was $15,599,602, an increase of $227,053 compared with the fiscal year ended June 30, 1927. The increase in operating expense was $429,136, due largely to an increase in wages of about 5 per cent which became effective April 3, 1927, and an increase in the amount set aside to cover the cost of damages and legal expenses of 1 per cent of gross receipts. The company suffered a deficit for the year of $43,761 against a net income last year of $276,815.

On the subject of cost of damages and legal expenses S. W. Huff, president, in the annual statement to the stockholders explains that a reserve of approximately $500,000 had been created on the basis of 7½ per cent of the gross receipts. The increased cost of accidents in recent years, due to greater congestion in the streets and larger verdicts of juries, had resulted in a cost in excess of the amount set aside and this excess cost had absorbed practically the entire reserve. For the past fiscal year the percentage was increased to 8½ per cent. At the same time a persistent drive had been made to reduce accidents and accident costs, with the result that during the year a reserve of approximately $200,000 had been created.

The operating revenue from the bus lines of the system was $742,951 while the operating expenses of these lines was $783,515. The net loss of this operation after adjustment for intercompany transactions noted in the accompanying consolidated income statement constitutes a deduction from the gross income of the railway system. The bus revenue and expense are not included in, but are an addition to, the revenue and expenses of the railway system. Referring to the bus system of the Third Avenue Railway Mr. Huff remarked that previous to the past year the bus operation of the system had been confined to scattered lines in Westchester County with a fare of not less than 10 cents. During the past year, however, the Bronx system of 58.18 miles, requiring about 125 buses, had been put into operation on a 5-cent fare with two 5-cent zones on one line and three 5-cent zones on another. He said the time had not been sufficient to determine just what the result of the operation of buses on a 5-cent fare would be. The receipts have been somewhat larger than anticipated with a 5-cent fare, and the operating expenses are greater than they should be due to the cost of instituting a new service and the necessity of operation from temporary garages. Approximately $6,000 a day is being collected from buses operating in the Bronx.

The established bus routes have conclusively proved their values as feeders to, or extensions of, electric lines; and where proposed bus lines, independently operated, threatened serious competition with electric car lines of the system. He said the immediate problem before the management was the systematizing and refinement of bus operation so as not only to prevent this operation becoming a drain upon the railway operation but to have it contribute to the net earnings of the system. In concluding his statements Mr. Huff referred to the inadequacy of the 5-cent fare under present operating conditions to provide a proper return upon the investment, and the efforts being made to secure relief through an act of the Legislature and relief also from unjust taxation in the matter of paving.

CONSOLIDATED INCOME STATEMENT OF THIRD AVENUE RAILWAY AND CONTROLLED COMPANIES

Operating Revenue:	1928	1927

New Service in Amsterdam Will Not Compete with Railway

The Public Service Commission recently granted a certificate to Charles Vollmer for operation of a bus line in the city of Amsterdam, N. Y., from East Main and Market Streets. According to a consent granted by the city. Mr. Vollmer, under the certificate granted, will not pick up passengers eastbound in East Main Street, whose destination is south of the corner of Vrooman Avenue and Forbes Street as the Fonda, Johnstown & Gloversville Railroad is now furnishing service in that section. The railway company opposed operation of the bus line in that section northeast of Lyon Street where it operates its Market Street line.

The commission, however, finds that the bus service will be convenient to residents of that section. Another section of the bus line will give service in that part of the city where the trolley line has abandoned service. A 10-cent cash fare with three tickets for 25 cents is planned by the bus operator and school childrens' tickets will be sold at fifteen for $1.

Permission for New Boston Route Sought

The Boston Elevated Railway, Boston, Mass., has filed a petition with the Public Utilities Commission for the approval of a proposed bus line involving the operation of a belt line from Fields Corner and return. Authority is sought to operate seven buses all the time and ten buses when traffic warrants. Plans for this bus line have already been approved by the State Department of Public Works and the Boston City Council.

Buses Replace Cars on Illinois Lines

The East St. Louis & Suburban Railway replaced its street cars between Collinsville and Edgemont and Collinsville and Edwardsville, Ill., with buses on Oct. 12 in accordance with authorization by the Illinois Commerce Commission. The street cars had been in service for 30 years. An hourly service will be maintained until traffic warrants a shorter schedule.

Emergency Service on Washington Route

Temporarily the Pacific Northwest Traction Company has abandoned its interurban service between Bellingham and Mount Vernon, Wash., due to the condemnation by company engineers of an approach to its Skagit River steel bridge. The gap has been filled by operating additional buses. Several months may pass before service is restored, according to Harry M. Sewall, Bellingham manager of the company. Pending repairs, to the bridge, Mr. Sewall said the company would operate interurban freight service to Burlington. Freight consigned to Mount Vernon will be handled by the Great Northern Railway, and passenger service will be by bus.

Stark Electric Opposes Bus Company

The Ohio Public Utilities Commission has dismissed the answer and cross petition of the Stark Electric Railroad, Alliance, and so disarmed the company and left an opening for the Salisbury Transportation Company, a bus line, to press its attack against the Stark Electric schedule.

The two companies are operating interurban lines between Alliance and Canton. Both are after business between Canton and Louisville a distance of 5 miles, where the bus line operates parallel to the railway.

Some time ago the Stark Electric adopted a fifteen-minute schedule between Louisville and Canton. The Salisbury Transportation Company filed a protest with the Public Utilities Commission at Columbus, claiming that the fast schedule was not warranted and that it had been adopted only to force the bus line out of business.

Officials of the bus company also say that the railway was diverting from the proceeds of a bond issue money to be used only for permanent improvements prescribed by the State Utilities Commission.

In retaliation, the Stark Electric, through Attorney C. M. Shetler, Canton, filed an answer and cross petition, claiming that Attorney S. L. Geiger, Alliance, secretary and treasurer of the bus line, had conspired with the Ohio Public Service Company to put the railway out of business.

After considering the two complaints, the state board ordered the Stark Electric's cross petition and answer stricken from the records, leaving only the Salisbury charges to be decided when the case comes up for an official hearing.

Boston-Billerica Scene of Contentious Route

The Eastern Massachusetts Street Railway and the Boston & Maine Railroad continue to contend for the right to operate buses between Billerica and Boston, Mass., with developments in favor of the railway. The Board of Selectmen of the Town of Billerica on Oct. 17 granted the Eastern Massachusetts licenses to operate in that town, after having the application on the table for the past several months. Burlington, Winchester and Arlington have already passed favorably on licenses for the railway towns through which the buses would pass. The City Council of Woburn has granted a license, which, however, has not been signed by the Mayor. Cambridge has refused the street railway, while Burlington and Woburn have turned down petitions by the Boston & Maine. The city of Boston has petitions from each company but has not acted.

Trial 25-Cent Route in Cleveland

A 90-day trial of a 25-cent fare express motor coach route has been authorized by the City Council of Cleveland, Ohio, over protests of the Cleveland Railway. The company is anxious to experiment with express motor coach operations, but does not believe the route chosen will show the best results. It also may refuse to carry out the order of the Council on the ground that it has insufficient equipment.

The Council directed the company to operate coaches from the Public Square to the eastern line of the county border, by way of Lake Shore Boulevard, a distance of about 15 miles as the bus travels. Stops will be made within the city of Cleveland only in the downtown district and at important intersections. Objection was made because the route chosen will parallel a local Cleveland Railway route and a through intercity bus line in Euclid Village and also will parallel the Clifton-Carnegie bus line in the downtown section of the city.

The railway urged an experimental express route from Lakewood, but the Council declined to pass legislation of this kind because Lakewood has declined to enter into negotiations for a revision of fare along the lines recommended by the Metropolitan Transportation Commission.

Company Concedes Jurisdiction Over Pittsburgh Bus Service

A. W. Robertson, president of the Philadelphia Company, says that organization will facilitate any move to place the operations of the Pittsburgh Motor Coach Company, subsidiary of the Pittsburgh Railways, under the jurisdiction of the Traction Conference Board. An open letter to him explaining the matter closed by stating that its object was to eliminate all red tape and to make it as easy as possible for the Council or the conference board to get any facts they may desire. The text of the letter follows in part:

I noticed in the newspapers that the Council has given some attention to the matter of a contract between the city and the Pittsburgh Motor Coach Company, similar to the present contract between the city of Pittsburgh and other municipalities, and the Pittsburgh Railways. We would be very glad to co-operate in any way to expedite the execution of such a contract.

We had always assumed that for all practical intents and purposes the Pittsburgh Motor Coach Company was subject to the terms and provisions of the present agreement with the Pittsburgh Railways, although in the absence of an agreement the Traction Conference Board would have no formal authority.

So, without waiting for a formal contract to be prepared and executed between the parties, we will be very glad indeed to furnish the Council, or the Traction Conference Board with any and all information which may be desired in regard to the Pittsburgh Motor Coach Company, and submit the company to the jurisdiction of the Traction Conference Board the same as though the agreement were executed.

Financial *and* Corporate

Purchase of Texas-Louisiana Power by General Waterworks

The General Waterworks & Electric Corporation, New York, formerly General Waterworks Corporation, operating in Idaho, Texas, Indiana, Kentucky and Pennsylvania, has acquired all the common stock of the Texas-Louisiana Power Company, which operates among other services transportation properties in Texas, Louisiana, Kentucky, Arizona, Oklahoma and New Mexico. The purchase price was not given in the announcement made on Oct. 13 by A. P. Barrett, chairman of the board of directors of both companies.

The present management of the Texas-Louisiana Power Company will continue to operate and direct that corporation and also will manage and operate the General Waterworks & Electric Corporation, said Mr. Barrett, formerly president of the Texas-Louisiana, who has become chairman of the boards both of that company and of the General Waterworks & Electric Corporation.

Allen J. Smith, who has been general manager of the Texas-Louisiana Power Company, has become vice-president and general manager of both companies. A. D. McNab, who has been treasurer of the Texas-Louisiana, has become secretary-treasurer of the Texas-Louisiana and assistant treasurer of the General Waterworks & Electric.

Headquarters and general offices of both companies will be in Fort Worth.

Lincoln Traction Under Delaware Laws

All property of the Lincoln Traction Company, organized as a Nebraska corporation, has been transferred by deed for a consideration of $1 to the Lincoln Traction Company, recently organized under the laws of Delaware. The company is a United Light & Power subsidiary. C. N. Chubb, president, says that no changes in the company's financial structure or personnel are contemplated. All other United company properties are organized as Delaware corporations because of certain advantages and material benefits attaching.

Interstate Would Offer Securities

The Interstate Public Service Company, Indianapolis, Ind., has petitioned the Public Service Commission for permission to issue $1,255,600 in par amount bonds and 7,217 shares of no par value common stock to reimburse the company for funds expended in additions and improvements to its properties.

The bonds would be first mortgage and refunding bonds bearing 5 per cent interest and would be sold at not less than 91½ per cent of par. The no par value stock would be sold for $75 a share.

From Jan. 1, to Sept. 30, according to the petition, $1,690,177 was expended for improvements. From this amount, $16,020 was deducted because it was spent on leased properties for which no bonds may be issued.

Loss on Third Avenue

President Huff states fare under present conditions insufficient to make return. Bus operation valuable

FOR the fiscal year ended June 30, 1928, the operating revenue from the railway lines of the Third Avenue Railway System, New York, N. Y., was $15,599,602, an increase of $227,053 compared with the fiscal year ended June 30, 1927. The increase in operating expense was $429,136, due largely to an increase in wages of about 5 per cent which became effective April 3, 1927, and an increase in the amount set aside to cover the cost of damages and legal expenses of 1 per cent of gross receipts. The company suffered a deficit for the year of $43,761 against a net income last year of $276,815.

CONSOLIDATED INCOME STATEMENT OF THIRD AVENUE RAILWAY AND CONTROLLED COMPANIES

Operating Revenue:	1928	1927
Transportation	$15,142,297	$14,858,299
Advertising	150,000	150,000
Rent of tracks and terminals	18,503	23,448
Rent of buildings and other property	188,098	230,633
Rent of equipment	52,300	58,482
Sale of power	8,403	11,686
Total operating revenue	$15,559,602	$15,332,549
Operating Expenses:		
Maintenance of way and structures	$2,468,773	$2,085,564
Maintenance of equipment	1,518,073	1,416,736
Depreciation accruals	*196,126	210,305
Power supply	980,973	928,374
Operation of cars	5,218,544	5,029,683
Injuries to persons and property—expended	1,087,966	1,183,028
Injuries to persons and property—reserved	199,718	.....
General and miscellaneous expenses	645,359	640,453
Total operating expenses	$11,923,282	$11,494,146
Net operating revenue	$3,636,319	$3,838,402
Taxes	1,123,101	988,460
Operating income	$2,513,217	$2,849,942
Interest revenue	222,577	222,713
Gross income	$2,735,795	$3,072,655
Deductions from gross income:		
Interest on first mortgage bonds	$513,080	$513,080
Interest on first refunding mortgage bonds	879,620	879,620
Interest on adjustment mortgage bonds	1,126,800	1,126,800
Track and terminal privileges	17,851	19,041
Miscellaneous rent deductions	8,071	8,747
Amortization of debt discount and expense	23,354	24,298
Amortization of limited franchises	8,294	8,270
Sinking fund accruals	33,480	33,480
Bus operation—net loss	38,553	34,153
Miscellaneous	130,450	148,347
Total deductions	$2,779,557	$2,795,840
Net income	*43,761	$276,815

*Deficit.

On the subject of cost of damages and legal expenses S. W. Huff, president, in the annual statement to the stockholders explains that a reserve of approximately $500,000 had been created on the basis of 7½ per cent of the gross receipts. The increased cost of accidents in recent years, due to greater congestion in the streets and larger verdicts of juries, had resulted in a cost in excess of the amount set aside and this excess cost had absorbed practically the entire reserve. For the past fiscal year the percentage was increased to 8½ per cent. At the same time a persistent drive had been made to reduce accidents and accident costs, with the result that during the year a reserve of approximately $200,000 had been created.

The operating revenue from the bus lines of the system was $742,951 while the operating expenses of these lines was $783,515. The net loss of this operation after adjustment for intercompany transactions noted in the accompanying consolidated income statement constitutes a deduction from the gross income of the railway system. The bus revenue and expense are not included in, but are an addition to, the revenue and expenses of the railway system. Referring to the bus system of the Third Avenue Railway Mr. Huff remarked that previous to the past year the bus operation of the system had been confined to scattered lines in Westchester County with a fare of not less than 10 cents. During the past year, however, the Bronx system of 58.18 miles, requiring about 125 buses, had been put into operation on a 5-cent fare with two 5-cent zones on one line and three 5-cent zones on another. He said the time had not been sufficient to determine just what the result of the operation of buses on a 5-cent fare would be. The receipts have been somewhat larger than anticipated with a 5-cent fare, and the operating expenses are greater than they should be due to the cost of instituting a new service and the necessity of operation from temporary garages. Approximately $6,000 a day is being collected from buses operating in the Bronx.

The established bus routes have conclusively proved their values as feeders to, or extensions of, electric lines; and where proposed bus lines, independently operated, threatened serious competition with electric car lines of the system. He said the immediate problem before the management was the systematizing and refinement of bus operation so as not only to prevent this operation becoming a drain upon the railway operation but to have it contribute to the net earnings of the system. In concluding his statements Mr. Huff referred to the inadequacy of the 5-cent fare under present operating conditions to provide a proper return upon the investment, and the efforts being made to secure relief through an act of the Legislature and relief also from unjust taxation in the matter of paving.

Bankers Optimistic About Electric Railways

John P. Baer, Baltimore, chairman of the public service securities committee of the Investment Bankers' Association, in session in Atlantic City, N. J., during the week ended Oct. 22, said that a review of conditions in the industry, including a forecast of the near future, should give ample satisfaction that the next few years will see an even greater development in electric light and power than ever before.

Despite decreasing patronage and growing traffic congestion in the cities, the electric railway industry of the United States faces the future with more optimism than it has felt for the past few years, which undoubtedly have been dark ones. Six years ago electric railways were spending virtually nothing for advertising. In 1928 their expenditures probably will reach $7,000,000, or $1,000,000 more than in 1927. Despite the dismal outlook, the report continues, they planned to spend more on better service during 1928, and their outlay for additional cars, better track and faster schedules probably will total close to $250,000,000 for 1928, or $25,000,000 more than in 1927. The report deplored the "5-cent fare fetish," pointing out that since 1914 operating costs went up nearly 200 per cent, while fares went up little more than 50 per cent. The committee says:

Not even the most optimistic street railway man believes the industry is out of the woods yet or anywhere near it, but they are all now certain that any idea of extinction was merely a nightmare, that the bottom has been touched and the way is now upward.

The committee recommended that further action on a uniform public utilities act be deferred for the present; the status remains unchanged from the action taken at the annual meeting in Seattle last July, when it was recommended that no action be taken because of a substantial lack of unanimity of opinion as to the desirability of regulation of utility securities by utility commissioners.

Concerning the investigation of public utilities by the Federal Trade Commission and the issuance by the latter of a questionnaire requiring voluminous information, the report says:

Your committee takes the stand that the industry has nothing to fear from a non-political, fact-finding investigation and approves all education work, whether by way of news articles, by way of paid advertisements or by any other fair means, provided the subject matter is presented truthfully and fearlessly.

Your committee feels that the public management can be depended upon to discourage any effort to include in their education program ambiguous statements or subject matter that may mislead or may convey an incorrect impression. Your committee believes that the utility corporations as a whole are honestly managed, and have been and are one of the forces of primary industry which has made America great, and we feel that if the effort to federalize or nationalize public utilities is successful, a great calamity will have fallen upon this country.

We now reaffirm the position so often taken by the Investment Bankers' Association of America that we are entirely opposed to the entry of the government into business and we feel that, both as to quality and cost of service, the people of this nation are better served under private than under public ownership and we reaffirm our belief in state commission control rather than federal administration.

Successor to Detroit United Now Functioning

In commenting on the completion of the Detroit United Railway reorganization, A. L. Drum, president of the Eastern Michigan Railways, said recently that the new company was now in possession and that he expected that the full interest on the new adjustment mortgage bonds would be earned and paid when due on April 1.

Canadian Roads Make Good Showing

According to the report of the Canadian Bureau of Statistics, electric railway mileage decreased 32.03 miles in 1927 and the number of passengers carried increased by 32,687,358, to a total of 781,398,194. The average fare 6.25 cents remained unchanged, but the gross passenger revenue increased by $1,993,038. On the other hand freight and other revenue decreased, making the total net increase $1,783,202. The total bus mileage of all railways in Canada was 8,263,498. Twenty-six out of the sixty electric railways reporting showed losses aggregating $1,212,796 and only seven paid dividends.

Although there was a net increase in the passenger traffic of all the railways, many of the smaller systems showed a falling off in the number of fare passengers carried. The Peterboro Radial ceased operations on March 31, and the Chatham, Wallaceburg & Lake Erie ceased operating passenger cars on July 1, but continued a freight service. The Schomberg & Aurora, a branch of the Toronto & York Radial, also ceased operation on June 20, and the Kitchener & Bridgeport Railway, which was purchased on Oct. 1, 1923, by the city of Kitchener, was operated along with the Kitchener & Waterloo Railway as the Kitchener Public Utilities Street Railway Department.

For the first time in the past 27 years no passengers were killed in electric railway accidents, but seven employees and 71 other persons were killed.

The numbers of other persons both killed and injured were larger than for any year since 1920, which is probably due to the increased congestion of traffic on the streets that has been caused mainly by the automobiles and by the motor trucks.

The aggregate gross revenue received by all electric railways in 1927 was $53,506,401 and net operating income $15,889,833. This compares with $51,723,199 and $15,269,490, respectively, in the preceding year.

More Mitten Securities Offered in Philadelphia

Another block of Mitten Bank Securities Corporation preferred stock, cumulative and participating, of a par value of $25, is being offered to the public. The preferred pays a first return of 6 per cent, after which the preferred stock shares equally with the common in all dividends declared. The common receives no dividend until the preferred pays more than 6 per cent and cannot receive more than the preferred until the preferred pays over 7½ per cent. At present the preferred is earning a dividend of 7 per cent per annum. Dividends are payable Feb. 15 and Aug. 15.

T. E. Mitten, president of Mitten Management, Inc., in a letter to the people of Philadelphia dated Oct. 16, 1928, said in part:

You have invested more than $30,000,000 in Mitten-managed properties in recent years, much of it through Mitten Bank Securities Corporation.

The proper direction of these millions of savings is to us a solemn trust. But it does not stop there. Our organization is behind MBSC not only with its ability and integrity, but with its money as well.

Mitten Management's success in Philadelphia has led to its frequent mention as the possible operator of large transit systems in other cities. But whatever may develop elsewhere it will never affect our responsibilities here. My personal means and energies, as well as those of my associates in Mitten Management, will continue to be directed toward strengthening the structure which we have built up here through many years of service.

MBSC was formed a year ago to bring public, men and management into one investment group. The resources of Mitten Management have since been so administered as to best advantage MBSC. PRT employees have transferred to MBSC the very large holdings which they formerly had in PRT, with great advantage both to their own investment fund and to MBSC. Besides owning preferred stock men and management together hold a majority of the common stock of MBSC. The common receives no return until the public's investment in preferred has received its dividend, nor can the common dividend increase except as the preferred dividend increases.

This is what makes MBSC so attractive to the small investor. It is not often that he can invest directly in an industry where management and workers back his investment with their money as well as labor.

Acquisition of California Line by Western Pacific

The Sacramento Northern Railway, a subsidiary of the Western Pacific obtained permission on Oct. 25 to take over and operate the 87-mile electric line of the San Francisco-Sacramento Railroad between Oakland and Sacramento. The cost of the property was placed at $1,675,000. It was held probable by the Interstate Commerce Commission that the San Francisco-Sacramento would not be able to operate as an independent line, whereas as a unit of the Western Pacific operations could be maintained.

$199,781 Deficit on Municipal Railway, Research Bureau Says

William H. Nanry, director of the San Francisco Bureau of Governmental Research, in a report on the San Francisco Municipal Railway, San Francisco, Cal., for the fiscal year 1927-1928, just issued, says that the financial situation of the railway is slowly moving to a crisis. According to Mr. Nanry the bureau has completed an extensive study of the Municipal Railways, its finances, management and accounting and operating policies. This study leads the bureau to believe, Mr. Nanry states, that the maintenance of the 5-cent fare will require radical readjustments or a resort to taxation to meet deficits. The report says in part:

The official statement shows a net income from the year's operations of $34,100; eliminating profit on the sale of securities, this is charged to a deficit of $3,781. Such deficit is exclusive of bond redemption charges. Taking account of the year's requirements of $196,000 for the redemption of bonds, the net deficit of $3,781 is increased to $199,781.

The official statement included as a profit the difference between the book value and the market value of securities (in which depreciation fund balances were invested) which were sold during the year. The bureau does not consider that the increased value of the securities occurred during the period covered by the statement and therefore does not include the profits, amounting to $37,881 net, as an earning. The bureau understands that the firm of accountants making the audit takes the same position. Should this profit be included, however, the net deficit after provision for redemption of debt, but before "comparison charges" are deducted, would be $161,900.

Passenger revenue for the year increased $63,675 over 1926-1927, compared with an increase of $2,237 for 1926-1927 over the previous fiscal year. The increase may be largely accounted for by an increase in operations for the year, amounting to 3,936 car-hours and 19,359 bus-hours.

The cost of operation shows an increase of $142,987. The ratio of operating expense to operating revenue increased from 84.4 per cent for 1926-1927 to 86.9 per cent for 1927-1928. The year's increase in operating costs, being more than double the increase in operating revenues, resulted in a decrease of $77,654 in net operating revenue as compared with 1926-1927.

The official statement does not show the payments made from railway funds for the redemption of the bonded debt of the railway, which has always been met by railway revenues. For 1927-1928 redemption payments totaled $196,000.

The operative fund shows a cash deficit of $13,867, offset by "accounts receivable" of $100,385, of which $82,124 is due from the city's general fund on account of past advances from railway funds for Twin Peaks and Stockton Street tunnel costs.

City officials and representatives of municipal railway employees have frequently stressed the maintenance of the 5-cent fare, usually because of an assumed advertising value to San Francisco, sometimes as a practical necessity until the city shall have acquired the existing privately owned systems. As has been pointed out by the bureau in the past, the financial situation of the railway is slowly moving to a crisis.

Decentralization in the management and control of the railway has affected operating costs and conditions and extension policies, and has been urged, by both citizens and officials, as one of the principal arguments for a properly constituted Public Utilities Commission.

Conspectus of Indexes for October, 1928

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Unearthing Facts in St. Louis Reorganization

J. K. Newman of New York and New Orleans, who helped to bring about the formation of the St. Louis Public Service Company and the termination of the receivership of the United Railways, has been subpoenaed to appear before the Missouri Public Service Commission in connection with the application of the City & Suburban Utility Company of Delaware to purchase and retain a larger block of the stock in the railway. Mr. Newman will be asked to explain what services the holding company proposed to extend to the street car system and the charges to be imposed for this service, and any other information that may shed light on the relations that would exist between the railway and the holding corporation.

Former Judge Henry S. Priest of St. Louis, as counsel for certain minority stockholders, has opposed the application of the City & Suburban Utility Company.

September 1928-1927 in Rhode Island

A net income for September slightly higher than that received in August, but almost 50 per cent lower than that taken in during September of last year, was reported recently by the United Electric Railways, Providence, R. I. The net income for last month was $24,429, compared with $21,762 for the month previous and $45,182 for September, 1927. For the nine months ending Sept. 30, 1928, the net income was $359,185, an amount $13,148 below the figure reported for the corresponding period last year. Total operating revenue and total operating expenses for September each show a slight decrease compared with revenue and expenses for the similar months in 1927.

Lower Net Income in Brooklyn

For the three months ended Sept. 30, 1928, the total operating revenue of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., was $11,851,025 against $11,691,318 for a similar period of last year. Total operating expenses increased from $7,914,744 to $7,978,219 for this year's period. After the consideration of total income deductions a net income remained of $1,231,591 in 1928 against $1,270,608 for the three months' period ended Sept. 30, 1927.

Purchases Stock of California Company

The Pacific Electric Railway, Los Angeles, has applied to the California Railroad Commission for authority to purchase all of the outstanding capital stock of the Pacific Coast Motor Coach Company, amounting to $45,000. The coach company has operated motor coach service as an auxiliary of the Pacific Electric Railway under the same management.

Seattle-Tacoma Interurban to Abandon Service

Interurban service between Seattle and Tacoma over the line of the Puget Sound Electric Company, and between Seattle and Renton, over the Renton branch of the company, is scheduled to cease on Dec. 30. An order to that effect has been signed by Judge Edward E. Cushman in United States District Court at Tacoma. Judge Cushman also set Nov. 26, as the time for a hearing at which he will fix the date for sale of the property.

Under the order, representatives of receiver Scott Z. Henderson and the Old Colony Trust Company, trustee for the holders of bonds, must appear at this time. The court ordered copies of the order served on the Governor, the Attorney General and the Department of Public Works, so that ample time may be allowed in which to protest the discontinuance.

The order to discontinue the line's service follows operation of the system for several years at a loss. The book valuation of the line as given in the receivers' report was $5,777,365, but the report of the appraiser, Henry L. Gray, placed the actual valuation at $489,541.

Lower Assessment on Railway Property in Missouri

The Missouri State Tax Commission and the State Board of Equalization have fixed the final valuation for taxes in 1928. Street railway property is assessed at $63,485,552, a decrease of $4,601,973.

The St. Louis Public Service Company is assessed at $45,614,269, compared with $47,348,250 in 1927, while the Kansas City Public Service Company must pay taxes on $12,010,224, compared with $14,598,104 in 1927. The McKinley Bridge of the Illinois Traction System at St. Louis is assessed at $970,757.

Personal Items

L. N. Spears Handles Legal Matters in Tennessee

Lawrence N. Spears, appointed attorney recently of the Tennessee Electric Power Company, Chattanooga, Tenn., is supplementing the work of the present attorneys of the company in the continued expansion of the company serving new communites and adding to its facilities. Considerable work of a legal nature is involved in the acquisition of easements, rights-of-way and purchase of property. His office and department will be a "clearing house" and all local managers, attorneys and employees are expected to co-operate with the new department and keep it informed on suits and proceedings filed against the company. In reality Mr. Spears is not new with the Tennessee Electric Power Company. He represented that company during the building of the Hales Bar lock and dam. Upon his graduation from Cumberland University Law School at Lebanon, Tenn., 25 years ago he opened law offices at Jasper, Tenn., with his father. Eighteen years ago they moved to Chattanooga, maintaining law offices in that city until recently.

Herbert Clark Hoover Honored

The John Fritz Gold Medal, the highest honor bestowed by the engineering profession of this country, has been awarded for 1929 to Herbert Clark Hoover. According to the announcement by Alfred D. Flinn, director of the Engineering Foundation, the choice of Mr. Hoover ended a process of selection begun a few years ago. The board sought to express the appreciation of Mr. Hoover's professional brethren for his distinguished attainments as an engineer, particularly in mining operations in this and other countries, and his great service as a man to his fellows.

The award was tentatively made a year ago by the John Fritz Medal Board, which is composed of sixteen recent past-presidents of the four national societies of Civil, Mining and Metallurgical, Mechanical, and Electrical Engineers, having together a membership of nearly 60,000.

The citation accompanying the award reads:

"To Herbert Hoover, Engineer, Scholar, Organizer of Relief to War-Stricken Peoples, Public Servant."

The medal, a memorial to the late John Fritz of Bethlehem, Pa., long a leader in the American iron and steel industry, will be presented to Mr. Hoover at the annual meeting of the American Institute of Mining and Metallurgical Engineers in the third week of February next in New York.

During recent years Mr. Hoover has been made an honorary member for life of the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, and the American Society of Mechanical Engineers.

This is the 25th award of the John Fritz Medal. The first was to John Fritz, in 1902, in celebration of his 80th birthday.

LEO N. BLAGOVESCHENSKY was recently appointed assistant general engineer of the Georgia Power Company, Atlanta, Ga. He was formerly connected with the Mexican Light & Power Company, Mexico City.

W. D. SHANNON of Seattle has been elected superintendent of construction by Stone & Webster for the new $5,000,000 steam power plant to be built by the Puget Sound Power & Light Company on Lake Union. Mr. Shannon recently had charge of construction of the hydro-electric plant on Baker River for Stone & Webster, who built it for the Puget Sound Power & Light Company.

JOHN V. STRANGE, operating manager of the Carolina Power & Light Company, Raleigh, N. C., and in charge of bus operation, has been appointed a vice-president of that utility. Mr. Strange has been connected with the public utility industry in the East for only four years, having spent the early years of his engineering career in the West. He has been affiliated with the Portland Gas Company and the Pacific Power & Light Company, becoming assistant general manager of the latter company with headquarters in Portland, Ore. He relinquished his duties in Portland in 1924 and went to Raleigh. The Carolina Power & Light Company operates more than 35 miles of electric railway.

FRANK H. MILLER, vice-president of the Louisville Railway, Louisville, Ky., has been appointed a member of the city planning and zoning commission by Mayor Harrison. He succeeds Ernest Horn, who resigned because no longer eligible to the commission on account of being a member of the Board of Councilmen.

OBITUARY

JOHN FOGARTY, chief dispatcher of the Chicago, South Shore & South Bend Railroad, Michigan City, Ind., died on Oct. 14. He started his career as a telegraph operator on a steam line and after serving for a time with the Chesapeake & Ohio was appointed dispatcher for the South Shore line two years after this railroad had begun operation as the Chicago, Lake Shore & South Bend Railroad. Mr. Fogarty was 49 years old.

W. L. BURNHART, manager of the publicity department of the National Surety Company, with which he had been connected in New York and Philadelphia for ten years, died in Englewood, N. J., on Oct. 23. An address of Mr. Barnhart, "Combating the Present-Day Criminal" delivered before the Accountants' Association at the convention of the American Electric Railway Association in October, 1927, revealed the results of a special survey of the principal causes of loss in the electric railway field conducted by his company. For many years Mr. Barnhart had been making a study of crime conditions. He was a frequent contributor to *System, Forbes Magazine, Printer's Ink, Sales Management, Success* and similar publications. He was 45 years old.

Track Projects Provide Continuous Market

Several new projects are planned. Pacific Electric improvements are approved. Public Service silences cars

ALTHOUGH orders for material and equipment have apparently diminished in both quantity and unit volume, numerous construction projects permit no indication of an unusual slackening market. The Reading Transit Company, Reading, Pa., is engaged in constructing an entirely new track on South Fifth Street between Spruce and Bingaman, which is a continuation of the new track construction made earlier in the season. The track now being installed includes new ties, heavier rails, welded joints, a concrete foundation, and asphalt paving. Approximately $75,000 was spent this year for track construction by this company.

The Portland Electric Power Company, Portland, Ore., has ordered 5,000 tie plates, 200 poles, and two carloads of wire. Four Chicago-Pneumatic type MM back fill tampers were included in the track construction equipment ordered by the Washington Railway & Electric Company, Washington, D. C.

Track Projects Contemplated

The Dallas Railway & Terminal Company, Dallas, Tex., contemplates the purchase of 4,000 pine ties. The City Utilities Committee of the Seattle City Council, Seattle, Wash., has instructed George D. Avery, superintendent of public utilities, to confer with the Citizens Transportation Committee, relative to the construction of an extension of the Beacon Hill car line. Provided this line is extended up Beacon Avenue to Columbian Way, property owners of that district have offered to absorb the discount on street car utility bonds, to finance the construction. The extension will be between ½ mile and 1 mile in length, depending upon which route is chosen.

Springfield Street Railway Company, Springfield, Mass., has petitioned for permission to relocate tracks in connection with a street widening program. The petition asks that the street railway be allowed to relocate tracks from Benton Lawn to conform with the city's terrace plan. The petition was taken under advisement and no opposition is expected.

The Pacific Electric Railway Company, Los Angeles, Cal., has placed orders with the Union Switch & Signal Company for alternating current block signaling materials to be installed between Valley Junction and Ramona, Cal., comprising seventeen color light signals, 31 impedance bonds, 19 track relays, 27 transformers, and accessories.

The St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., has finished one block of new track work at Park Place and is now planning to install new track on Sixth Street from Edwin to Francis Streets. The San Antonio Public Service Company, San Antonio, Tex., has completed the work of reconditioning its track on Easton Street. Seven-inch 103-lb. rail were laid, and the old wood block paving was replaced with asphalt. The cost of this construction was $18,574.50.

British Columbia Electric Railway, Vancouver, British Columbia, is building a number of spur tracks from its main line to various industrial plants. One of the most important of these tracks is 2,000 ft. in length, to the Sumas reclamation area. Saskatoon Municipal Railway, Saskatoon, Saskatchewan, is laying a second track on a number of its lines. The length of these tracks are 1,800 ft., 1,300 ft., 1,200 ft., of which 400 ft. is being laid in concrete, and 900 ft.

The Cleveland Union Terminal Company has been receiving bids for the erection of a signal tower in the new terminal development at Cleveland, Ohio. This company has also awarded a contract for the steel work in connection with track elevation at East Cleveland.

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., plans to construct tracks, bridges, and a subway for the new Menominee Valley short cut to the west side of the city. However, construction cannot be started until the complete right of way is acquired. Application has been granted by the Wisconsin Railroad Commission to construct the tracks.

Cars and Buses

The Public Service Co-ordinated Transport, Newark, N. J., has completed a test car in which an attempt has been made to eliminate noise. The changes made in this car will be applied to all of the 2,500 cars in the system as soon as possible. It is expected that this work will be completed within a year.

Washington Railway & Electric Company has ordered seven 31-in. steel wheels and fifty 33-in. steel wheels.

The Northwestern Pacific Railway, San Francisco, Cal., has been inquiring for five electric cars and five electric trailer cars.

The Illinois Power Corporation, Chicago, Ill., has received a 230-in. wheelbase A. C. F. parlor coach.

The Los Angeles Railway Corporation, Los Angeles, Cal., has ordered three 6 cylinder street car type Fageol coaches.

Washington Railway & Electric Company has ordered four type Z 29-passenger coaches from the General Motors Truck Company, and the Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., has received one A.C.F. urban coach.

New York Railways Corporation, New York, has filed plans for the construction of a two-story motor bus garage, and repair building, at Lexington Avenue and 100th Street, New York City. This building will cost about $100,000, including the equipment. The Baltimore & Ohio Railroad has made plans for a group of electrically operated pumping stations. A new one-story car and locomotive repair shop at Tiburon, Cal., to cost $45,000 with equipment is planned by the Northwestern Pacific Railroad, San Francisco, Cal.

In connection with its electrification plans of a portion of its suburban system from Hoboken to Dover, N. J., the Lackawanna Railroad, New York, has secured property on the Hackensack River, and is considering the construction of a steam operated electric generating plant, to cost about $4,000,000.

Toledo to Buy Buses

Community Traction Company, Toledo, Ohio, ordered six 33-passenger White buses following tests made recently. Additional buses will be purchased following completion next month of a garage holding 150 buses. It is expected that the White Motor Company will obtain a contract for the majority of buses needed.

New Cars for Los Angeles

Los Angeles Railway, Los Angeles, Cal., coincident with its 7-cent fare rate has announced through its president, G. J. Kuhrts, that 65 new cars are to be placed in service immediately. This will bring the total number of cars in service to between 870 and 875 during the peak hours. It was further stated that new cars of the multiple type are being built and are soon to be put in service.

Additional Pacific Electric Improvements Outlined

Work orders calling for the expenditure of a sum aggregating $77,682, were approved by the Pacific Electric Railway, Los Angeles, Cal., during the month of September, covering improvements and betterments at various locations over the entire system. The work will be done as early as possible.

On Sunset Boulevard between Echo Park Avenue and Glendale Boulevard, the railway will reconstruct and pave outbound track, renew present 72-lb. construction with 128-lb. grooved girder rail; install treated ties, tie plates; renew crushed rock ballast and pave with asphalt concrete pavement, at an estimated cost of $9,691.

On West Sixteenth Street from Figueroa to Georgia Street, it is planned to reconstruct and pave tracks, renewing

Digitized by Google

present 72-lb. construction with 128-lb. grooved girder rail construction; install treated ties and tie plates, renew crushed rock ballast and asphalt concrete pavement, estimated cost $7,904.

On Sixth Street, from Los Angeles to Broadway the company will reconstruct and pave approximately 2,213 feet equivalent single track, replacing present 72-lb. construction with 128-lb. grooved girder rail construction, renew crossover and turnout, diamond and curve at northeast corner at Sixth and Main Streets; replace redwood with treated ties, renew crushed rock ballast and asphalt concrete pavement, at an estimated cost of $30,131.

Pacific Avenue Loop, Long Beach, will be reconstructed and paved to the extent of 689 ft. equivalent single track and shift 40 ft.; also shift track from 11½-ft. to 12-ft. centers between Ocean Avenue and First Street. Sixty pound and 72-lb. construction will be replaced with 128-lb. grooved girder rail construction; replacing redwood with treated ties, and gravel with crushed rock ballast; 7-in. asphalt concrete with 8-in. asphalt concrete pavement, at an estimated cost of $9,093.

In order to conform to improvements being made by municipalities the following street crossings will be improved:

On San Pedro Lumber Company Spur, Long Beach Line, Los Angeles, the railway will reconstruct and pave tracks serving the San Pedro Lumber Company across Compton Avenue and across first alley west of Compton Avenue, replacing present 60-lb. construction with 128-lb. grooved girder rail construction, redwood with treated ties, installing crushed rock ballast and 7-in. asphalt concrete pavement, the cost to be about $1,621.

Myrtle and Olive Avenues, on the Monrovia Line, Monrovia, Cal., it is planned to replace present 75-lb. construction with 128-lb. grooved girder rail construction, replace redwood with treated ties, oil macadam with asphalt concrete pavement; remove and replace automatic flagman; install rail top concrete culvert and make changes to existing culvert, etc., estimated cost $2,874.

In order to avoid hazard of accident and to improve operating conditions it is planned to renew the following special work:

At Delta Station, Vermont Heights line the company will replace present 70-lb. with 75-lb. C.S.R. split switch turnout; install 100 additional 75-lb. tie plates, at an estimated cost of $1,038.

In Gardena, on the Watts-Redondo line present 60-lb. A.C.S.E. will be renewed with 75-lb. C.S.R. split switch turnout; renewing tie plates, estimated to cost $922.

At Pacific Electric-Southern Pacific Station, San Bernardino, it is planned to renew a single track turnout and curve on connection from the San Bernardino-Colton line on Third Street into station grounds; replace present 72-lb. material with 93-lb. and 128-lb. material; renew gravel with crushed rock ballast and redwood with treated ties, at an estimated cost of $3,037.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

	Oct. 23, 1928
Metals—New York	
Copper electrolytic, cents per lb.	15.275
Copper wire, cents per lb.	18.125
Lead, cents per lb.	6.5
Zinc, cents per lb.	6 60
Tin, Straits, cents per lb.	48.75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.40
Somerset mine run, f.o.b. mines, net tons	1.90
Pittsburgh mine run, Pittsburgh, net tons	1.825
Franklin, Ill., screenings, Chicago, net tons	1.375
Central, Ill., screenings, Chicago, net tons	0.675
Kansas screenings, Kansas City, net tons	1.875
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.3
Weatherproof wire base, N.Y., cents per lb.	18.625
Cement, Chicago net prices, without bags	2 50
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10 5
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal	$0.5925

Track Projects in Dallas

Approval by the City Commission of the purchase of fifteen blocks of right-of-way on the Vickery car line by the Dallas Railway & Terminal Company, Dallas, Tex., from the Works-Coleman Land Company, for $10,000, opens the way for expenditure of $56,000 by the street car company in improving the line.

Under Everman plan No. 5, the street car company is to spend the $56,000 from reserves, in the year ahead, double-tracking and paving trackage on the Vickery line. Just when this work will begin has not been determined.

The next large project contemplated under the plan is the double-tracking and paving on Cole Avenue, from Lemmon Avenue to Knox Street — work which will cost the company $109,795. This probably will be delayed for six or eight months, until storm sewer and street structural work contemplated by the city street department is completed.

Detroit Car Order Restrained

The Cummings Car & Coach Company, Chicago, Ill., has obtained a temporary injunction restraining the city of Detroit, Mich., from contracting to purchase 100 street cars from the Perley A. Thomas Car Company, High Point, N. C., after the Council had unanimously decided to award the contract to the Thomas company. It is alleged that the charter had been violated when the Thomas company was permitted to change its bids after all bids had been opened. The circuit court has set the hearing on legality of contested bid for Oct. 27.

Weekly Business Conditions

The volume of business during the week ended Oct. 20, as seen from data on check payments, was greater than in the previous week but showed a small decline from the same period of last year, according to the weekly statement of the Department of Commerce. Activity in steel plants, though showing no change from the high level of the previous week was considerably higher than in the same period of last year. Prices for iron and steel continued to show further slight recovery, reaching for the first time this year, the level which prevailed a year earlier. Prices for copper were stronger than in either the previous week or the same period of last year.

The value of new building awards during the week showed a higher daily average than in the previous week, but was lower than in the same period of last year. Bond prices showed a slight gain over the previous week but were lower than last year. Interest rates for time funds showed a decline from the previous week but were higher than a year ago. Call loan rates, however, showed no change from the previous week, but were higher than last year, Stock prices averaged higher than in either the previous week or the same period of 1927.

The production of bituminous coal during the week ended Oct. 13 showed gains over both the previous week and the same week of last year. Petroleum production, though showing a decline from the previous week, was greater than in the same period a year earlier.

To Lecture on Welded Buildings

A lecture tour covering a large part of the United States is soon to be made by Professor Frank P. McKibben, well-known consulting structural and bridge engineer, in response to invitations from various societies throughout the country. The lectures, during the winter months, will be on the application of electric arc welding to the noiseless construction of buildings, based on the experience of the General Electric Company and other pioneers in this field who have erected a number of these structures.

LOUIS F. STOLL, *General Manager*

Volume 72 New York, Saturday, November 3, 1928 *Number 18*

Can the Public Understand the Facts?

IN THE Omaha newspapers last week there appeared full-page statements by the Omaha & Council Bluffs Street Railway outlining the company's position with reference to its toll bridge which links the two cities. Agitation for a free bridge is not a new thing in Omaha or in Council Bluffs, but its injection into the franchise negotiations can be credited largely to Senator Howell of Nebraska, who apparently would seize what appears to be a golden opportunity to wrest political advantage from an already difficult situation.

In President Shannahan's explanation of the intricate details of the bridge ownership by the Council Bluffs company and its leasing by the Omaha company, the complete story of the bridge lease, the financial set-up of the Council Bluffs company, the obligations of the Omaha company, the financial service performed by the toll bridge for both cities, and the effect upon Omaha and Council Bluffs of a competing non-toll bridge are clearly detailed. It is very frankly the intent of this message to enlist the sympathetic comprehension and support of the citizens of both cities in finding a satisfactory solution to a situation which is in no wise the creation of the present management, yet threatens now to jeopardize the granting of a new street railway franchise without which the Omaha & Council Bluffs Street Railway cannot continue to render efficient transportation service.

Threatened more or less seriously with a proposal by some citizens that Omaha and Council Bluffs co-operate to build a free bridge, the street railway officials are very wisely taking the public into their confidence, openly publishing the facts in the case, and asking for a square deal. The clear-cut, frank explanation of the position of the company and its attitude must commend it to every thinking citizen. The Omaha company has expressed clearly its willingness to co-operate to the fullest extent in effecting an arrangement which will be satisfactory to the public it serves. "We trust the public," declared Mr. Shannahan. "While we are aware of its desire for a non-toll bridge, we also have confidence in the public's intention to be fair with us. We believe that the public will be willing to pay for the bridge on its fair and just value. We likewise believe that the public will be willing to have this value determined in an impartial manner."

Here again is an expression of confidence in the attitude of the American public. Whether or not the public in Omaha will in this instance deal fairly with its railway, only time alone will tell. Usually the man on the street has been handicapped by lack of facts. Here, however, he has the facts; clearly, openly and succinctly stated. The question is not one of the fairness of the public. It is instead a question of whether the public is able and willing to deal with facts and to detect in the glittering promises of those who seek to strike a popular chord by promising something for nothing, the hidden motive of personal advancement at the taxpayer's expense.

Co-ordinating Building Development with Transit Facilities

LITERARY license is the right of Deems Taylor. Still it came as a surprise to discover the editor of *Musical America* and the composer of the music of "The King's Henchman" writing for *Vanity Fair* an article "The City That Died of Greatness." He is an alarmed New Yorker who discusses what the skyscrapers are doing to his home town. Imaginative artist that he is, Mr. Taylor closes by indicating that perhaps the best thing to do after all would be to wait ten years until New York is so hopelessly congested that no one can move at all. The population will then migrate in a body, and New York can be set aside by the government as a national park—the city that was so prosperous nobody could afford to buy real estate; that was such an ideal place of business, nobody could transact any business; the metropolis so greedy for population, it choked itself to death.

Mr. Taylor points out that however fast new subways may be built, the skyscrapers outstrip them so that a new line is jammed beyond its theoretical capacity almost as soon as it is opened. This, of course, is not a new observation. Best of all, Mr. Taylor takes a shot at the Babbittry which always supplies the optimistic note by proclaiming that a way will be found to solve this and other problems arising from the magical development of skyscraper districts such as that best or worst evidenced in New York, but with its counterpart in nearly every other city of first magnitude today. But the thing which Mr. Taylor fails to point out, and it was not to be expected that he would do so, is that no one has taken the trouble to find the basic economic laws that lie at the root of the whole traffic and transportation evil.

That the problem is primarily an economic one is almost self-evident. No one will dispute the possibility of providing sufficient transit facilities if the necessary money were available. And the sad part of the whole situation is that this lack of funds is more apparent than real. It is not attributable to lack of resources, but to failure to put the transit load where it belongs. Take for example the very problem presented by the transportation requirements of the skyscrapers referred to by Mr. Taylor. Why limit their height? In order that population density may be held down to the capacity of subways built with public funds? Let's examine that for a moment.

Why impose an artificial restriction on the development of property through an arbitrary building height

Digitized by Google

limit when the same result can be accomplished with far better economic balance through permitting natural economic laws to exert their influence? An arbitrary building limit tends to hold down property value through limitation in the allowable intensity of use of the land upon which the building stands. There is nothing the matter with this as a point of equity, if it becomes necessary to the welfare of the community. But what is the proper allowable building height limit? There the controversy starts, and there the policy of limiting building heights breaks down at its weakest point. Would not the same ultimate result be achieved without a building restriction, by assessing as a property benefit the cost of providing sufficient rapid transit capacity, whether the requirement be one level, two levels or even more? If the construction cost of providing sufficient transit facilities to serve these modern skyscrapers were put where it belongs—on the property which makes these facilities necessary—would not this financial load serve as an automatic check on the height of buildings that would be erected? And is this method not preferable to that of arbitrarily limiting building heights, since it permits the free action of natural economic forces and thereby permits a proper economic balance to be reached between building heights and transit facilities?

Obviously, the subject is too involved to be exhaustively presented here. But engineers in every large city that have given serious thought to the fundamentals of rapid transit economics are almost a unit in agreeing that the special assessment principle is the only sound method of financing rapid transit. It is doubtful, however, if there is any general conception among those who have not studied the subject thoroughly, of how far-reaching would be the effect of the application of this principle in relieving many phases of the transit problem that clamor for solution in every metropolitan community.

To revert to Mr. Taylor, he sees the skyscraper as another proof of the fact that man's cleverness is generally far in advance of his intelligence; that his ingenuity in devising new instruments of civilization is by no means always accompanied by the resourcefulness or imagination needed to handle them intelligently. The quarrel is not with the skyscraper, but with the lack of vision displayed in co-ordinating building development with transit facilities.

Under the Pressure of Necessity a Broader Vision Is Born

SOME few months ago the attention of those who follow the sophisticated pages of the *American Mercury* was called to the plight of "The Troubled Trolley." With gentle irony the author poked a little harmless fun at the ballyhoo and the seeming loud whistling within the local transportation industry to keep up its courage. But he failed to point out that the troubles of the trolley are merely surface reflexes of the terrific struggle of the modern American community itself, to avoid strangulation from a simultaneous overdose of skyscrapers and automobiles.

To the credit of the trolley may it be said there is every evidence today that leaders of thought in the industry are looking for the solution of their troubles, not so much to palliatives and expedients to give temporary relief, but to a broad understanding of the relation between transportation service and community development. In that they are endeavoring to serve not only their own best interests, but the interests of American communities, with the welfare of which their own destinies are inseparably linked.

No thinking man can read the article by President J. P. Barnes, printed elsewhere in this issue, without being struck by the breadth of the approach which is being made to the transportation and traffic question by those who see in this outstanding problem of the community, an opportunity for the transportation man to play his part as a public servant in the highest sense of that term. To those immersed in the routine of daily detail who may be inclined to scoff at this as merely ballyhoo may it be said that the program of fundamental research outlined by President Barnes is already much further under way than may perhaps be realized by those who have not followed closely the course of the association's activities during the past few years. Mr. Barnes gives the reader merely a glimpse of what is going on in the minds of the men who are thinking beyond the present and looking toward the future. But in that mere glimpse there is unmistakable evidence that the pressure of necessity is leading transportation men to more fundamental thinking and a broader vision.

A Major Extension of Electrification

INTIMATIONS have not been lacking in the past that big things were in prospect on the Pennsylvania system in the realm of future electrification, but the public and the engineering fraternity were hardly prepared for a program of the magnitude indicated in the announcement made by the company on Thursday morning and outlined elsewhere in this issue. The extent of the work now authorized, covering more than 325 miles of line and 1,300 miles of track, and the fact that the single-phase system is to be used are the outstanding features of the announcement. The first of these makes the proposal the biggest of its kind so far to be attempted since the Milwaukee electrification. The second represents an extension of that form of propulsion used on the Pennsylvania's suburban lines operating out from Philadelphia as well as on the section of main line between Philadelphia and Wilmington, just recently completed.

Among the reasons given for the change is increase in track capacity through the more expeditious handling of trains. This is deeply significant. For passenger trains it means smoother and more comfortable operation and fewer switching movements. For freight trains it means higher speed, a most important gain in the case of perishable freight and one which under electric propulsion should open up new markets for fruitstuffs—a service that should gladden the South to the tips of the Florida Keys.

More than likely the intimate information about the project will soon be divulged and will be of the greatest interest to the railroad technician, both mechanical and electrical, but the facts so far made public are significant in the light of what they portend generally. In that the proposal is intended among many other things to anticipate the service requirements of a metropolitan community of 30,000,000 people extending into Pennsylvania Railroad territory from New York as far south as New Brunswick, it reflects the discounting of time by a management that has been unusually wide awake to its opportunities and obligations.

Digitized by Google

Practical Planning for the Future

IT IS just as important for the management of every large business corporation to plan for the future as to carry on current operations. Community transportation is no exception to this rule. Fortunately, it is much easier to do this now than it was a few years ago, because the place of the bus is much better defined. The principles governing the determination of a proper fare are also more thoroughly understood. Experience has shown in the first place the necessity of co-ordinated service. In the second place, it has taught the need of a flexible fare—one which will change with the cost of producing the transportation.

On many properties the present is a period of readjustment, during which both of these matters can well be considered. The present, then, is pre-eminently the time for preparing for the future. An example of such constructive planning is shown by the San Antonio property, in an article in this issue. Before the advent of the bus this company's trolley lines gave both a city and suburban service on a flat fare, but left considerable areas within the city unserved. Then came the bus with its potential danger as a competitor but with great possibilities if co-ordinated with the electric car service. It was to the latter usage that it was applied in San Antonio, i.e., to supplement the local electric cars and also to give a special suburban express service. To carry out this plan some electric track was abandoned, and car operation was confined to the area within a 3-mile radius from the center of the business section. Within this district a flat fare is charged. The higher fares for the longer rides on the buses are collected on the zone system. This means that as the length of run increases with the growth of the city, the fare can keep pace with the longer rides given.

In too many cities in this country transportation has had a haphazard growth. Definite city planning, particularly as to transportation, has been almost unknown. As a result development and expansion have frequently brought an increasing burden in the form of rising costs, with no corresponding provision for added revenue. In a growing community there is a constant pressure for the extension of transportation lines, sometimes into comparatively thinly populated areas. The very flexibility of the bus, which constitutes perhaps its greatest advantage as a transportation tool, opens wide the door to this pressure for extensions to thin territory. Only through the establishment of broad policies which will anticipate the future as well as provide for the present, can there be assurance of orderly growth and permanent stability.

Uniform Interpretation of Accidents Needed

WITH the increased traffic which our city streets are being called upon to handle there has developed, as was inevitable, a constantly increasing liability to accidents involving street cars, vehicles and pedestrians. Concurrently, these accidents have become more and more diversified in character—with more elements of the unusual entering into their happening.

Many companies are undertaking to keep extensive accident records, including the assigned causes, with a view to developing preventive measures from an analysis of these data. Much good work has been accomplished by this process. The interest and co-operation of platform men on many properties have been enlisted in the cause of safety. Electric railways have established a record that has earned the street car the right to be called the safest place on the street. But despite all of this, the hazards of constantly growing congestion and higher-powered motor cars demand still greater alertness and attention to accident prevention measures on the part of those charged with the management of public transportation systems.

Comparison of the performance of several electric railways of the same general characteristics and size offers a means of directing attention to the need for still further reducing accidents on some properties. But to accomplish this there is need for a more uniform plan of reporting and recording accident statistics. The fault does not lie with a lack of a standard classification for accidents. Such a classification, with fourteen main heads and many subheads, was adopted in 1916 at a joint meeting of the Claims and the Accountants' associations. But occurrences which would be considered accidents on some properties are not so designated on others. Furthermore, the determination of chargeable and non-chargeable accidents for the purpose of classification and record keeping is subject to wide variations in interpretation.

"Wanted—A Horse Car"

"WANTED, a horse car of former days, with or without running gear, with clock and stove, if possible." Thus read an advertisement in the Oct. 6 issue of ELECTRIC RAILWAY JOURNAL. The purpose to which the old car, if acquired, is to be put was not disclosed, but a guess may be hazarded. As the running gear is not considered essential, it is evident that the car is not to be used for the transportation of passengers, or even for exhibition. The proposed purchaser is not inspired to preserve this relic in its pristine condition for the benefit of posterity. He is not a Henry Ford. For either of these purposes, wheels are essential. Evidently this chariot of former days is to be still for the remainder of its life, after the new owner comes into possession of it.

However, the latter part of the advertisement offers a clue to the purpose of the advertiser. "With clock and stove, if possible." These would not be needed unless the car is to be used as a habitation of some kind, though not necessarily one for human beings. Fancy can easily picture it mounted on sturdy posts, some distance from the residence of its owner, and used perhaps as a playhouse for his children or grandchildren. Then again, it would make an excellent watchman's shanty, and both the stove and clock would be useful. As a kennel or chicken house one might find reasons for the stove but would be at a loss to explain the specified clock.

Old cars are very well suited for such uses, as the timber of which they are constructed is usually of a very durable nature, the posts often being of oak. Many old electric cars still in operation could well be dedicated to a similar purpose. They have long outgrown their value in attracting traffic. They are too heavy to be operated economically. They are of a design too obsolete to warrant rebuilding. Their day has passed; their sun has set, and they should be replaced by more modern equipment. As was the practice with the horses of the old horse railway they can well be sent to the farm after they had outlived their usefulness. Let them end their life amid pastoral surroundings, still being serviceable as playrooms for children or as chicken houses. There they would be economically useful, but for passenger carrying service they are a decided liability.

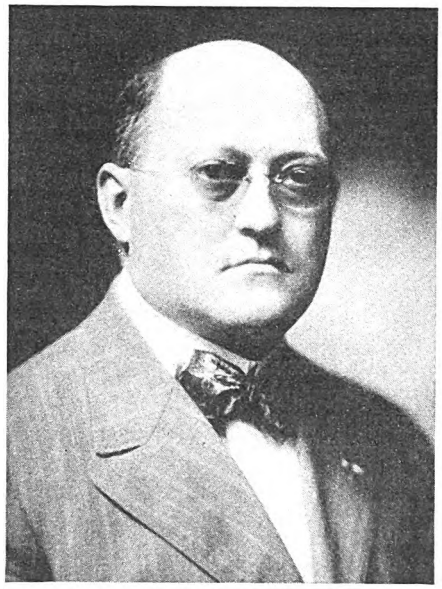
Expedients Have No Place in Solution of

Modern Transportation Problems

By J. P. Barnes
President American Electric Railway Association

A strong appeal for more fundamental thinking and a broadened conception of the problems of community transportation and traffic congestion is made by President Barnes in this article, which is based upon an address delivered before the Public Utilities Association of West Virginia

TO CONSIDER the history of the development of mass transportation in the light of present-day conditions is to note a strong tenacity of purpose, a high degree of devotion to public duty, and a great courage in performance. Ours is an industry of enormous vitality. Were this not true, it would have been an utter impossibility for the street railways of the country to have survived the tremendous economic strain to which they have been subjected by the changed and changing conditions of modern times. The public carriers of people in the city streets have doggedly fought an up-hill fight and have in the main fulfilled their obligation to the public, though in many instances at the price of appalling sacrifices. In that fight they have not had the needed sympathetic understanding and co-operation from the public.



J. P. Barnes

Ours has been the problem of how to do, without new money and without the assistance of enlightened public support, the tremendous job of revision which has been and largely still is necessary to meet the shifting needs of a rapidly developing civilization. Beset by obstacles and lacking the very sinews of war in the form of adequate credit, with a fixed investment in fixed forms of physical facilities, our industry has maintained its integrity in the midst of a world economically and physically changing with greater rapidity than any earlier civilization has experienced. Change is the order of the day—change in habit, change in ideals. Novelty is popular and stability is no longer static, but is achieved only by continuous development. Automobiles, telephone, radio have so broadened man's horizon that the measuring sticks of a generation past are good today to measure nought but failures.

C. F. Kettering, vice-president of General Motors, said at the recent Cleveland convention that the business of the advertiser today is based upon keeping people dissatisfied with what they have. The cry of mankind today is for something better, something bigger, something different. The world has stepped on the accelerator and is going somewhere. Are we in the procession?

Inertia Is a Powerful Force

It has been said that inertia plays a large part in governing human affairs. Physical inertia is the tendency of a body to continue in its state of rest or motion. The human mind is likewise subject to mental inertia which follows closely this same physical law. Inertia resists a change of direction as positively, if not as powerfully, as it resists change in speed. To correct an error in direction, however, it is not necessary to follow the heroic process of completely stopping one line of development and starting all over. When an adjustment becomes necessary, shouldering from one direction toward a more constructive direction often is the quickest and safest method of correction.

In our industry there has been little rest for the past decade or so, but it seems wise to wonder whether we have always moved in the right direction. Perhaps the most important change which is affecting the inertia of the public transportation industry is the increase which has taken place in the use of the private automobile. In the last ten years the number of private automobiles has increased from 35 to 170 per 1,000 of population—an increase of nearly fivefold in ten years. In the same period rides per capita on public transportation vehicles have remained practically constant. Surely all of these automobiles go somewhere and someone rides in them. Enormously more transportation is being used by the public year after year. The effect of inertia has been the increase in the use of the private automobile while the riding in public transportation vehicles remains prac-

Digitized by Google

tically constant. Our problem is one of diverting the direction of our development to coincide with changing public preference. We must get back into the line of advance.

Broader Conception Needed

Transportation is more in demand today than ever. Transportation is our business. Yet we're marketing no more than formerly. We have fought to maintain our place on the public streets and in the public heart; we have fought to obtain a fare at least as large as that we had before the war. In neither battle have we been wholly successful. We enjoy no such freedom from physical interference as in the past. Measured by the 60 per cent increase of commodity prices the nickel of yesterday is 8 cents of today. Measured by the 120 per cent increase in labor costs, it is 11 cents of today. The demand for a 10-cent fare is not a demand for increase in fare, but for maintenance of fare.

We have seen the development of the automobile as a private transportation agency. We have seen this agency move toward and into the field of public transportation. Yet with the single exception of the automotive bus, which is after all merely one particular type of automobile, there has been no general adoption, and in fact no general discussion of adoption or adaptation, of these new agencies into the field of public transportation. It is true that a few of the most progressive street railways have with trepidation entered the field of taxicab operation. But, in the main, we have insisted upon the efficiency and sufficiency of the services hallowed in our minds by tradition and have not followed the public urge toward newer, faster and more convenient transportation by amplifying our basic service.

Our discussions of merchandising transportation have centered too much about the merchandising of the type of transportation we have been offering, and not enough about the changing or amplifying of local transportation service to meet the broader requirements of modern cities. We have tried to market tallow candles in a world which has learned to use electricity.

Security of Industry Rests on Meeting Public Need

We have insisted upon the preservation of the integrity of our investment devoted to public transportation. In this we are justified if we render and continue to render a needed public service. If our service should ever cease to meet a public need our claim to co-operation and conservation of our physical assets would be vain. If, on the other hand, we found the security of our properties upon the principle of continued advance and improvement to meet changing conditions, then our effort to maintain the integrity of our assets will be successful to the extent that we meet the public need and win public approval and support. These things cannot be accomplished superficially or on the basis of expediency. We must think fundamentally, we must get to the basic economics of our problems, in order that we may anticipate successfully future trends and requirements.

One of the speakers at our recent convention, N. D. Cochran, editor-in-chief of the *Scripps-Howard News,* flung a fair challenge to us when he said, "Perhaps you've been trying to win a battle, not to solve a problem." Yes, we have battled—to hold our place. And in a measure Mr. Cochran is right in intimating that perhaps we have not fully understood the public's point of view in our attempt to improve the condition of our industry. But the problem is not simple nor single. Permanent improvement in transit conditions is dependent upon the interest and co-operation of many groups in the modern community which have as yet failed to grasp the causes and the nature of the malady that is producing acute congestion of traffic and impotence on the part of public transportation. A thorough organic examination is needed to prescribe a permanent cure. Temporary remedies fail to reach the root of the trouble.

Take the single difficulty of traffic congestion, for example. The enormously increased use of the automobile has brought with it the conspicuous increase in congestion in our city streets. This is attributable to use of existing highways for a new and essentially modern vehicle in the same way and under the same general plan as for the older, slower and much smaller number of vehicles of the past generation. Present street space may have been entirely adequate for movement and storage of the buggy and wagon of the past generation. This was due entirely to the smaller population in the streets. Three and four-story buildings were the rule, for the simple reason that people would not climb more than two or three flights of stairs. Streets were accordingly designed for the accommodation of traffic based upon the population of such buildings. But with the development of vertical transportation through the perfection of the elevator came a tenfold multiplication of population within a given area, and with it a straining of the facilities for horizontal transportation. Traffic has become a problem in three dimensions, and, for those who care to follow Mr. Einstein, its effect upon the fourth dimension, time, can be readily observed in the course of an attempt to pilot a vehicle through the high building section of any American city.

Traffic Problem Not Faced Squarely

Inertia on the part of the public has operated here, and there has been little effective effort to meet the changed conditions. Branch stores, branch banks and neighborhood shopping centers have spread rapidly with little or no recognition by business men or by the public that these things have been largely necessitated by outgrown downtown streets or the out-of-date practice of wasting, instead of using, the capacity of downtown streets. This is no wail against the so-called parking evil. Even a moron knows that automobiles cannot stand and run upon the same space simultaneously. The choice is deliberate and the merchant can blame no one but himself, if his insistence upon the parking privilege sends more customers to outlying centers than it brings to his own door.

My point is that the traffic and transportation situation is affecting the fundamental character of city growth, of population distribution, of business development and social habits. (I do not say whether for better or for worse.) It is a distinct credit to our industry and our association that our leaders of thought have the vision to see beyond the limits of immediate operating problems to the greater and broader factors which are vitally important, not alone to transportation men but to every constructive agency in modern cities. We are trying to win a battle to conserve our investments. But we also are endeavoring to take a leading part in solving a vital community problem and in fulfilling the broadest possible interpretation of public service. The transportation problem before American cities today is not a problem of one agency or one group, but of all the people. It is obvious that whatever measures will expedite the movement of street cars will expedite the movement of all

Digitized by Google

traffic, for street cars cannot move faster than vehicular traffic in busy streets, nor can vehicular traffic move faster than street cars.

Association Undertaking Broad Study of Fundamentals

Last year a committee of the American Electric Railway Association, appointed to study "street traffic and mass transportation," found from its preliminary discussion the need for a broader study than its original assignment, and that committee is now engaged in a broad investigation of the fundamental subject of "street traffic economics."

This represents a transition from the superficial study of symptoms to the fundamental study of underlying causes. Constructive and effective treatment of transportation and traffic congestion demands the discovery, interpretation and intelligent application of the basic economic principles which govern the use of available street facilities. We must construct a suitable foundation before we can erect a proper and stable superstructure.

Additional committees are being appointed this year for a study of the economics of fare structure and for an analysis of transportation research. The organization of economic studies in other fields directly affecting the broad problem of community transportation is under discussion. As an association and an industry today we are endeavoring to cut through superficial expediencies in an attempt to find fundamental remedies for present-day difficulties. Engaged as we are, in a business for which there is a continued and continuing need, we have too often sought the easy and temporary solution, and too seldom insisted upon the fundamental remedy. We are engaged in the business of public transportation, and the type of transportation demanded has changed and is changing from day to day. We must follow that change if we would build our business upon that permanence which is continuous improvement.

Need to Improve Load Factor

Turn for a moment to the topic of one of this year's new committees, that on "fare structure." May I suggest that in all parallel public utilities, in the electric power, light, gas, telephone and telegraph services, there has been a recognition in the rate structures of the importance to those industries of satisfactory load factor. In every one of these industries off-peak service is obtainable at such rates as are calculated to attract additional volume of business and thereby improve the load factor and the gross revenues of the business.

How many fundamental attempts have been made to improve the load factor of the public transportation industry? The weekly pass, the daily pass, the nickel card, the reduced-rate ticket, have all been tried, usually in some combination dictated by expediency or a compromise in public hearing rather than by any basic study of the economics involved. We are almost wholly ignorant of the effect upon load factor, and hence upon gross earnings, of the many possible modifications of rate structure. We are almost wholly ignorant of the effect upon load factor, of varying or alternative forms of service at various hours of the day, or of variations in the public's use of our service.

We do not see deeply into the psychology of the traveling public. We can guess, but we cannot demonstrate the considerations which urge vast numbers of individuals to use a private vehicle at greater expense, and in some respects at greater inconvenience to themselves than would be occasioned even by our present services. We need more of the psychology of the small boy who, when asked how he succeeded in finding the lost horse, said, "Why, I just thought what I would do and where I would go if I were a horse, and I did, and went, and there he was." We must get at the ruling motives which determine the character of transportation chosen by the public of today. We must put ourselves in a position to offer that type of transportation which the public wants. This is a problem of research, if you please. It is a problem of sales psychology. It involves the study of a mental attitude whose self-analysis and self-expression is neither candid nor correct.

All these things, in one form or another, have been expressed in the addresses, articles and committee reports presented to the industry in the last few years. The 47th convention of the American Electric Railway Association at Cleveland in September was a high spot in the history of the association and the industry, not because it was the largest convention ever held, but because in the course of its meetings there were expressed more conclusions based on courageous, independent and fundamental thought than in any other similar meeting of the association.

Must Get Rid of Inhibitions

What I am trying to say is that our association and the individual companies engaged in the public transportation business must rid themselves of those inhibitions which are based upon precedent, habit or inertia. We must take inspiration from our potential customers who are today our competitors. We must step on the gas and go somewhere. But we must know where we are headed. We must base our program firmly on the fundamentals of public transportation. We must study and understand the economics which underlie the growth, development, habits and movements of the modern community. Everything, in short, which bears directly or indirectly upon the public transportation of a community must be weighed, analyzed, and properly fitted into the structure of the public transportation business, if that business is to continue and is to render a maximum of public service.

We must view the problem in perspective. We must regard as the tools of our trade every vehicle which rolls, or slides, or can be pushed or pulled, or driven, on the surface, under the surface, or above the surface. And, we must fit these various elements into the composite public transportation system, which will serve, as nearly as may be, the entire public transportation requirement of the modern community, with maximum public convenience, with minimum expense, and with a true spirit of public service. This accomplished, public recognition and public reward will surely follow.

Toward this program of fundamental thinking the industry has for the past several years been steadily progressing. To this program of fundamental thinking it stands today committed. It is no over-night or week-end program. Earnest, untiring, patient and undiscouraged effort must, and will, be brought to its accomplishment.

It is said that the three hardest words of the English language to pronounce are "I was wrong." These words we will learn to pronounce whenever we find ourselves to have been in the wrong. An error admitted is half corrected. By the correction of errors, by the comprehension of fundamentals and by the courageous application of ideals, we propose, as an industry, to push forward toward the fulfillment of our inherited destiny.

San Antonio

Plans for the Future

as Well as for the Present

Houston Street is one of the principal business thoroughfares of San Antonio

Electric cars supply transportation for the greater part of the area 3 miles from the business center. Buses furnish all service beyond this limit. The company has developed its system so as to be in a position to provide for future expansion of the community which it serves

SAN ANTONIO occupies an area 6 miles square in extent, with its business district practically at the center of this rectangle. With the addition of the suburbs, which also must be served by local transportation, the actual district involved is approximately 65 square miles. The population of this entire area is about 265,000 inhabitants. Home sites are relatively cheap and practically every family lives in a single house. Even in sections where people of moderate means are living, the lots are comparatively large. There is only one apartment house in the city, and it has 28 apartments. The climate is almost ideal for automobiles. These facts place a handicap on public transportation systems in that more lines of public transportation are required to cover the city, and less frequent service on each line is justifiable.

The manner in which this problem was approached and solved by the Public Service Company, the operating company in San Antonio, is told in its Coffin prize brief for 1928. The solution is notable because of its comprehensiveness. It involved the adoption of a system of fares which would not only be satisfactory at the time but which would remain so in the future with the probable expansion of the city in area and population. It comprised changes in car routing and an application of the bus to give a necessary supplementary but not competitive service. It included provisions by which extensions of bus and car service could be made in the future without material change in the existing arrangement. The statements in the brief are summarized in what follows.

Combines Electric, Gas and Railway Property

The Public Service Company in San Antonio operates the gas and electric utilities also. So far as the transportation department is concerned, this has been a mixed blessing. It has enabled the transportation department to continue in business for a longer time without drastic action, and the public good will brought about by efficient service in the gas and electric departments have been of help to the railway. On the other hand, transportation policies have had to be determined for the good of the company as a whole, and only the most conservative methods could be used. It has therefore taken the railway longer to accomplish results than might have been possible if more drastic action had been open to the transportation department.

The transportation policy is based on a principle that applies in all merchandising, i.e., that to make a sale the article must not only be of value to the customer but of greater value than similar articles that can be obtained elsewhere. It must also be convenient for the customer to obtain the article. In the company's study of its own situation it has been gratifying to find that in most cases the actual desires of the public for transportation are best served by the most economical practice. Thus the principal desire of patrons of public transportation probably is to save time. It is true that comfort and safety are also essential, but as the length of a ride in urban transportation is relatively short, comfort may be given second place, and as safety has become accepted as an axiom in public transportation, it may not be made a

Digitized by Google

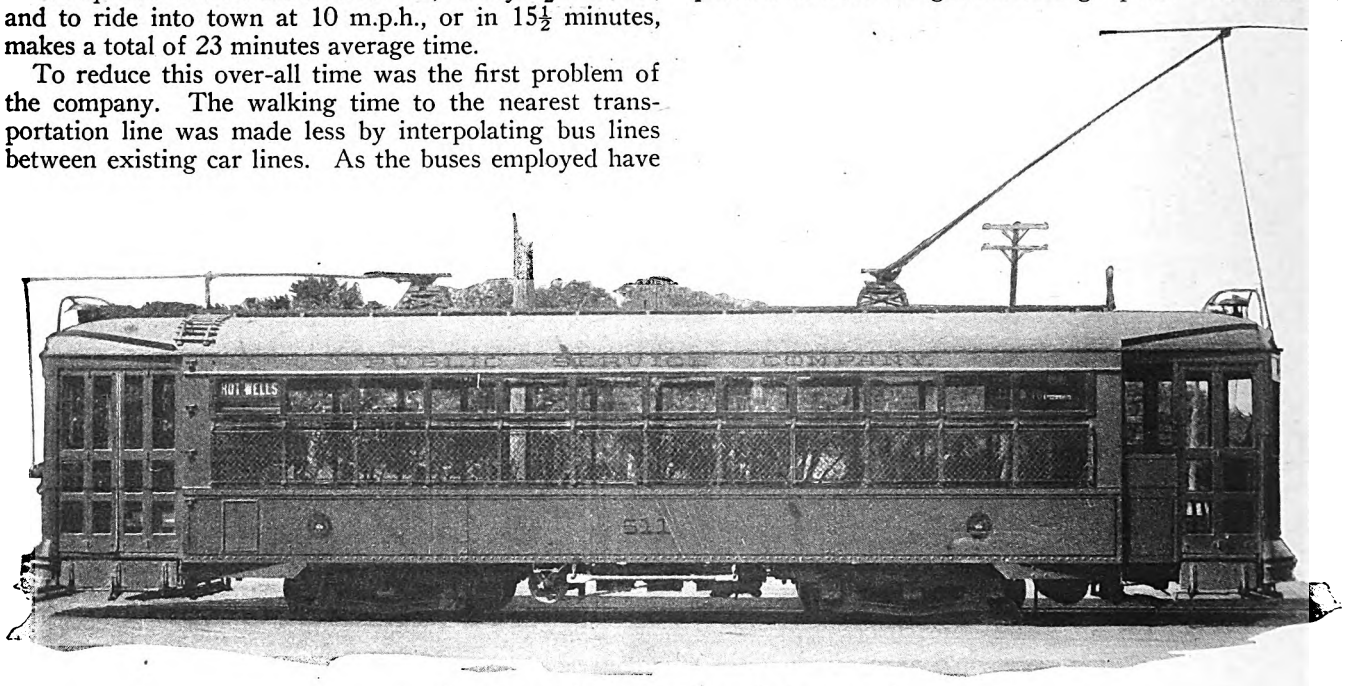
paramount thought because it may be taken for granted.

An analysis of the time required by a patron in his use of public transportation may be divided into three parts: that required in going to and from a transportation route, the time spent in waiting for a vehicle, and the time spent in transit. Each of these receive attention in San Antonio, with the object of making the total elapsed time for individuals between their homes and the downtown section on the average less than that which would be required if the same patrons used private automobiles between these points. For instance, the car lines in San Antonio, at a distance of $2\frac{3}{4}$ miles from the business center, average 0.88 mile apart, and the average walk to the nearest route from the residences in this section is approximately a quarter of a mile, requiring about four minutes. To this should be added the average time required to wait for a street car, or say $2\frac{1}{2}$ minutes, and to ride into town at 10 m.p.h., or in $15\frac{1}{2}$ minutes, makes a total of 23 minutes average time.

To reduce this over-all time was the first problem of the company. The walking time to the nearest transportation line was made less by interpolating bus lines between existing car lines. As the buses employed have less capacity than the cars, and consequently require fewer stops, a faster operating speed was possible.

The second item, that required in waiting for public transportation vehicles, is dependent upon the headways, the reliability with which the schedule is maintained, and the knowledge had of the schedule by those using the transportation provided. Headways in practice are dependent upon the volume of traffic and the size of the vehicle used. Where there is sufficient traffic, even large cars may be scheduled on such close headways that there will always be a car in sight, but where the business is relatively light it is desirable to use smaller units with more frequent headways. In either case the service given is unsatisfactory unless there is the most exact adherence to schedule. It is to this point that the San Antonio Public Service Company devoted a great deal of attention. In fact, to those who think that the "car in sight" basis of operation is necessary to compete successfully with private automobiles, it will be a revelation to learn the extent to which the public in San Antonio will use a service with relatively long headways where it knows the schedules and has found by experience that the schedules are maintained with clock-like precision.

The third item—time required in transit—is affected by several factors. They include the distance traveled, the conditions of the track, the equipment used, the number of people carried and stops made, the schedule speed and the ability of the crew to maintain the schedules. Each of these has its angle of approach. The route should be as direct as possible. Roundabout routings raise a greater psychological objection in the minds of passengers than the actual loss of time, because the time thus lost becomes exaggerated in their minds. Track well maintained not only adds to the comfort of the ride and is more economical in energy used and in cost of maintainence, but it permits faster schedule speed. New equipment should be selected and old equipment improved on the basis of its ability to accelerate rapidly and give rapid braking, because in city service with frequent stops, good acceleration and braking are most important factors of good running speed. In addition, good acceleration is needful in competition for street space, and good braking is essential in the matter of accident prevention.



Latest type of street car in use in San Antonio

The number of passengers carried on a given trip also usually has a close relation to the number of stops required. While it is possible to carry some standing passengers without seriously increasing the time of passenger interchange, when aisles become congested with standing passengers, the time taken for stops is out of proportion to the additional number of passengers carried.

Running time can often also be appreciably reduced by the establishment of an express service, supplementing a local service.

Comfort and Safety Also Considered

The factor in transportation above mentioned, coming next to speed, is comfort. There are many ways of contributing to this end, but the outstanding desire of the passenger is for a seat. This is especially true of off-peak passengers, and the desire for a seat increases with the length of the ride. Fortunately for transportation companies, however, this desire is not uppermost during peak hours, when it is economically impossible for an

Digitized by Google

TABLE I—FARE STATISTICS AND RUNNING TIME SAN ANTONIO

	Central Zone — Street Car	Central Zone — Bus	Second Zone Bus	Third Zone Bus	Fourth Zone Bus
Distance of outside limit of route from business center, miles	3	3	1½	1½	....
Running time, minutes	20	15	20	25	30
Fares, cents					
Cash	10	10	15	20	25
Tickets	3 for 25	3 for 25	5 for 50	5 for 75	5 for $1
With 25c. weekly pass	5	5	7	10	15
Average per seated passenger	6.5	6.5	9.3	12.7	17.9
Fares, cents per mile:					
Cash	3.33 2.67 w.t.	3.33 2.67 w.t.	3.33	3.33	3.33
Tickets	2.78 2.22 w.t.	2.78 2.22 w.t.	2.22	2.50	2.67
With 25c. weekly pass	2.33 1.87 w.t.	2.33 1.87 w.t.	2.00	2.00	2.27

Central zone bus fares, as listed above, apply also to rides within any zone; for each additional zone 5 cents extra is charged, *i.e.*, the fare from any zone to the next zone may be paid by 15 cents cash or by a three for 25-cent token, plus 5 cents, or by one five for 50-cent ticket. In the same way the fare through three zones, or say zone 2 to zone 4, may be paid by 20 cents cash or a three for 25-cent token plus 10 cents or by one five for 75-cent ticket.
w.t. = with transfer.

electric railway to give a seat to every passenger. However, the fact should not be overlooked that many automobile riders do not use public transportation at any time because of the usually crowded condition in cars at rush hours. Hence, a high standard of service in this respect during peak hours should be adopted, and of greater importance is the maintenance of schedules to provide an even distribution of loads in the cars that are operated.

Safety, the third item mentioned, is one of the chief sales points with the public in the use of public transportation. Any doubt on this subject will be dispelled when the reluctance with which most people consider the use of air transport is considered. Yet in competition with private automobiles, the acknowledged safety of public transport does not seem to count for so much because everyone feels competent of his own ability to drive an automobile with an equal degree of safety. Nevertheless, the safety of car riding is a sales point which should be continuously emphasized by railways.

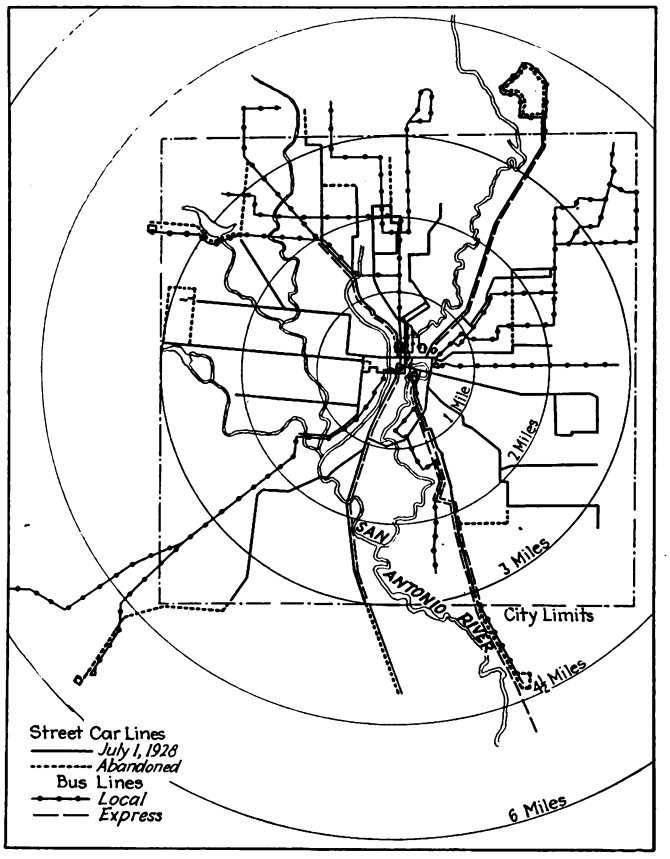
Need for Emphasizing Modernization

The general requirements of a good ride, just explained, are fundamental, just as the basis of sterling is with silver. But like that, they are not new or sensational, and some other means may be necessary to induce habitual automobile users to give public transportation a trial. This is the reason of many of the things which street railways are doing under the slogan of modernization. It does not matter a great deal whether it is bright paint, upholstered seats, white caps on the crews, or many of the things which are being tried, so long as some of them are done. All show the public that public transportation is abreast of the times and they give a reason to those who have not been using the service to try it. But unless the service is excellent in the fundamental principles enumerated, the trial will confirm the automobile rider more strongly in his habit of using his own transportation.

With this in view, a plan of service has been adopted in San Antonio by which the public is receiving what it wants in public transportation as nearly as it is possible to give it.

The next step was the establishment of a rate of fare which would be satisfactory to the public, and at the same time adequate to cover the cost of furnishing this transportation.

To meet the conditions in its territory the San Antonio Public Service Company adopted what may be called a zone service plan. The central zone is the area approximately 3 miles from the business center of the city. Additional zones are approximately 1½ miles each. Local service is furnished in the first zone, and it is planned to furnish express service to each of the succeeding zones. The advantages to the passenger are apparent. The time required for a street car to make the 3-mile local trip in densely settled sections is approximately twenty minutes, yet the same twenty minutes is sufficient for a bus to give express service to the beginning of the second zone and local service through it. Corresponding time savings are available for each succeeding zone. Another advantage to the passengers is that they



Electric railways serve the population within the 3-mile limit at a flat fare. Buses at a higher fare operate beyond these limits

are segregated into groups of neighbors with a considerable degree of personal and community interest. The value of this, while intangible, is very real.

From the economic standpoint, the value of the time saved in furnishing the service is also self-evident. In segregating the passengers into distinct groups, the complications of collecting different rates of fare for different distances is greatly reduced. Again, passengers are willing to pay an additional fare for the increased convenience of the more nearly personal express service. Finally, a schedule of fares has been worked out which allows a rate charge approximately proportional to the distance traveled. This permits future extensions to be made on an economical basis. A certain number of through local buses care for travel between the outside zones, such as between 2 and 3 or 2 and 4.

The lowest payment for fare, as shown in Table I, is a nickel, good only when used with a 25-cent weekly

Digitized by Google

pass. This form of pass has an especial flexibility in connection with varying zone charges, as shown in the table. For instance, for the central zone passenger, it may be considered as requiring 7 cents for each peak hour ride, and 5 cents for each additional ride during periods of light traffic. For the other zones a somewhat higher rate.

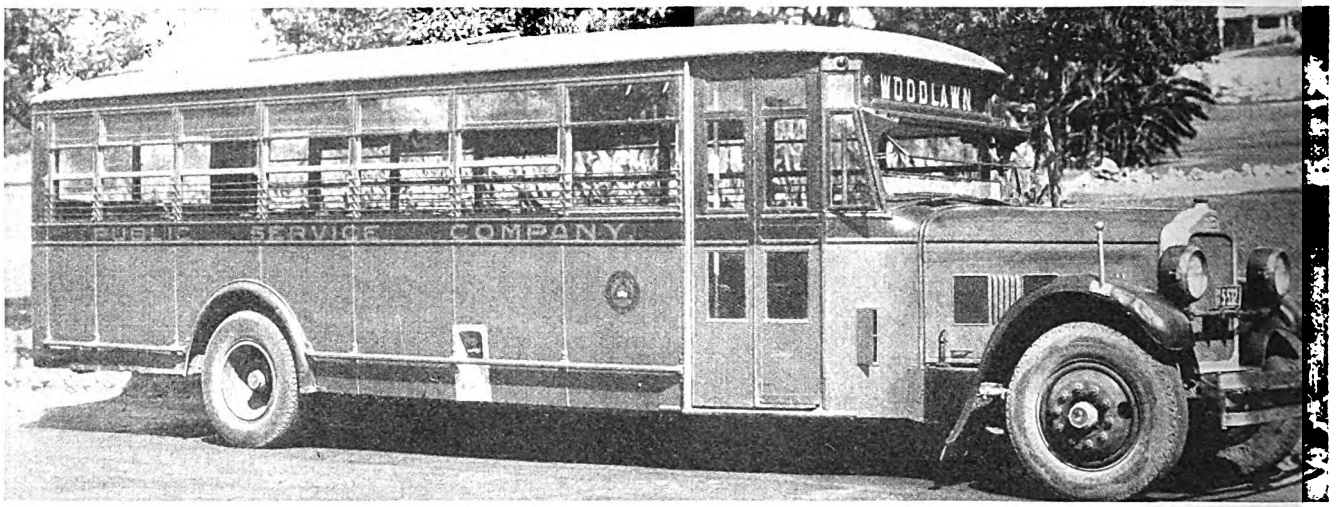
It will be noted from the table that all fares are on a sliding scale, not only as to the distance but also with respect to the frequency with which the passenger uses the service. It will also be noted that although there are twelve rates of fare, only one of the twelve requires the use of any odd cents. Finally, where passengers are segregated into vehicles where only one scale of rate is in effect, only three rates are applicable in that vehicle. A footnote to the table gives the fares between zones other than the central zone.

From the figures in the lower part of the table, it will be seen that all riders paying cash fares are charged $3\frac{1}{3}$ cents per mile. It will also be noted that both the ticket and cash rate in the central zone are somewhat higher when reduced to a mileage basis than in the other zones where transfers are not used, but that they are no higher, and sometimes less, when the passenger uses a transfer.

TABLE II—REQUIRED LOAD FACTOR IN DIFFERENT ZONES IN SAN ANTONIO

	Seat Trips per Hour Furnished	Pass. Required per Hour	Per Cent Required Load Factor
Central Zone			
48-passenger street car	144	65.5	45.5
32-passenger street car	96	46.2	48.2
33-passenger bus	132	50.0	38.0
21-passenger bus	84	36.0	43.0
Second Zone			
33-passenger bus	99	35	35.5
21-passenger bus	63	25	39.7
Third Zone			
33-passenger bus	79.2	25.7	32.6
21-passenger bus	50.4	18.4	36.6
Fourth Zone			
33-passenger bus	66	18.2	27.6
21-passenger bus	42	13	30.9

One bus line express for 2 miles in central zone and local for the rest in that zone and in the second zone.
Three bus lines express in central zone and local in second zone.
One bus line local in three zones.
One bus line local in four zones.
One bus line express in the central and second zones and local in third and fourth zones.



Latest type of bus used in San Antonio

Determination of Necessary Load Factor

With the figures given in Table I and the cost per hour of the various services, the company has determined the load factor necessary to keep the service financially self-sustaining. For this purpose, the cost per hour, including all investment charges, may be assumed as follows:

48 passenger street car with two men	$4.25 per hour
32 passenger street car with one man	3.00 per hour
33 passenger bus	3.25 per hour
21 passenger bus	2.33 per hour

From these figures the required load factors as given in Table II have been determined.

This table shows that the required load factor becomes less for the outer zone, where the need for seating passengers becomes greater. For this reason it is economically possible more nearly to approach the standard of a seat per passenger for the longer rides to the outer zones.

Division of Business Between Car and Bus

There are now in operation in San Antonio:

Eighteen street car lines in the central zone.
Six bus lines in the central zone.
Two bus lines local in both central and second zone.

From this it is seen that there are eighteen street car lines and ten bus lines serving the central zone. Of the total number of revenue passengers on the system, 82 per cent are carried on street cars in the central zone and 12 per cent of the total number are carried by buses in this zone. The nine bus lines going into the outer zone carry in the outer zone only 6 per cent of the total revenue passengers. From this, the averages shown in Table III may be obtained.

TABLE III—PASSENGERS CARRIED PER LINE

Lines	Percentage of Passengers Carried per Line
Eighteen street car lines in central zone	4.56
Ten bus lines in central zone	1.20
Nine bus lines in outer zones (four also local in central zone)	0.67

It is apparent from Table III that the street cars are being used on the lines where the volume of traffic is greatest. This is carrying into effect the established principle that street cars furnish the best and most economical transportation where great numbers of passengers are to be carried.

Some Track Abandoned

To rearrange the transportation lines in accordance with the zone service plan and to straighten out some of the indirect routing, it was necessary for the company to

Digitized by Google

abandon more than 15 miles of track on fourteen different lines. The completeness with which this policy has been carried out is shown by the fact that only five of the eighteen car lines now cross the 3-mile circle, and these lines average less than ½ mile outside this circle. This distance is so small that second zone fares are not collected on any of them. It is further expected that the overlapping will be eliminated on three of these lines.

It is naturally impossible to have all routes so direct that only 3 miles of route from the downtown district is necessary to reach the circumference of the 3-mile circle. But it is worthy of note that only one car line is longer than 4 miles, and this line is a combination of two light traffic lines.

The schedule speeds which have been obtained with this plan of operation have been relatively high. In connection with this fact it must be remembered that schedule speed is affected by three factors, the speed between stops, the number of stops and the average length of the stops. On a short line where the cars are filled, there are naturally more stops per mile and the stops are of longer duration, so that short lines cannot make as high schedule speed as longer ones.

Table IV shows the schedule speed of the various kinds of line, in elapsed time, which includes running time, stopping time and layover time.

TABLE IV—SCHEDULE SPEEDS IN MILES PER HOUR

	Minimum	Maximum	Average
Single-track lines	8.49	9.32	9.00
Double-track lines	9.44	11.55	10.00
Bus lines	9.57	14.62	12.38

TABLE V—PERCENTAGE OF VARIOUS FARES PAID BY REVENUE PASSENGERS

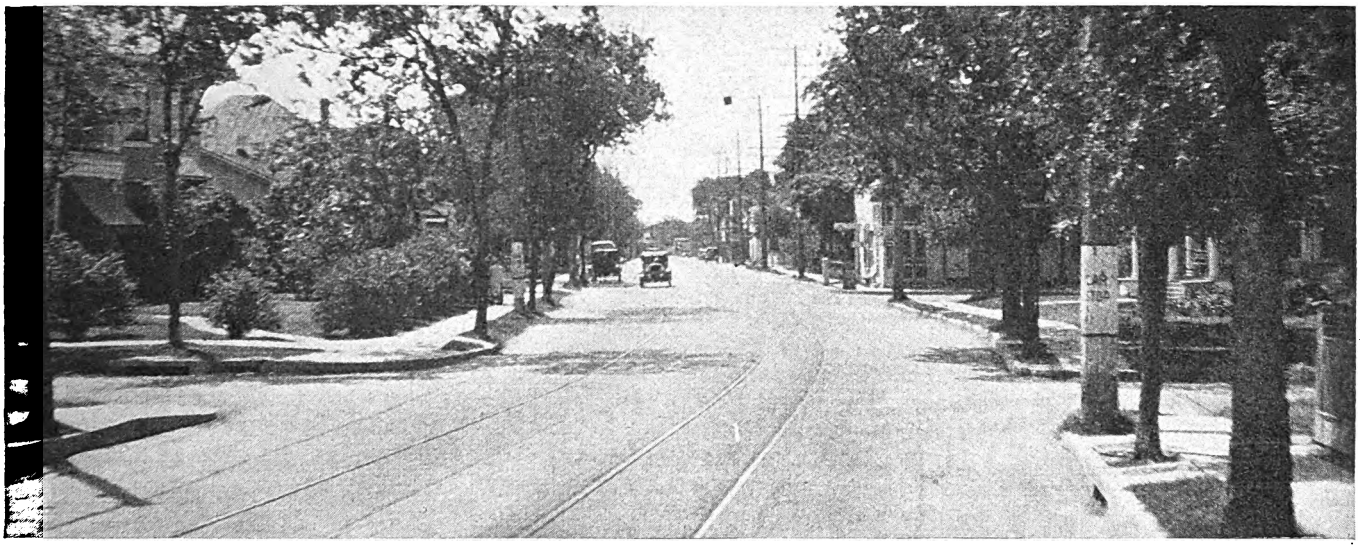
10-cent cash fare	33.0
Three for 25 cent token fare	23.8
Nickel fares on passes	39.4
School rates	3.8
Total revenue passengers	100.0

Percentages of Kinds of Fare Paid

The revenue passengers represent 80 per cent of the total passengers. The average rate of fare in the central zone for revenue passengers is slightly in excess of 8 cents, and for all pasesngers it is approximately 6.5 cents. Nickel passes are sold at an average rate of 12,250 each week, and they are being used for an average number of rides of fifteen per pass per week. For purpose of comparison with the other form of weekly pass, this is the equivalent of eighteen rides per week when transfers are taken into account. At fifteen rides per week the average income from nickel pass riders is $1 per week per pass.

Traffic Checked Constantly

Continuous checks are made of traffic to guide the schedule maker. Conductors' trip sheets give the maximum inbound and outbound riders. These figures are supplemented by street checks taken along the entire route. Three weekdays are selected in each month on which to make a street check for each line. The results are then charted so that characteristic curves for each month are obtained. The curves for the three months in each of the four seasons are then put on a single chart to show the general characteristics for that season.



Present condition of track laid in 1914

It has been found in San Antonio that this season division is very satisfactory, due in part to the fact that the schools are not in session during the greater part of the three summer months. From these charts the traffic demands for succeeding seasons are estimated.

Changes necessary in the basic schedules are made through "special service" cars or buses.

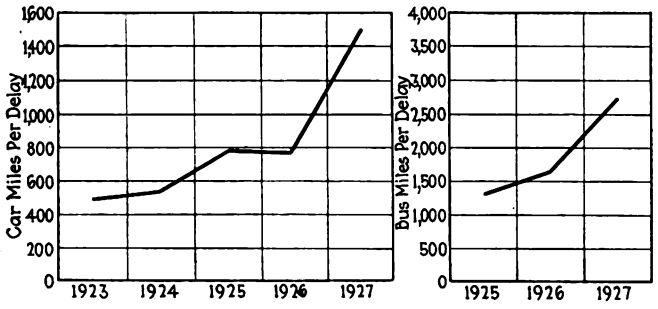
Cars and Car Equipment

The maximum number of cars required in basic service in San Antonio during 1927 was 120 cars. To have these cars available, 135 were kept in good operating condition. Of this number, 35, or 26 per cent, were purchased within the last five years. A number of the older cars are retained for circus days and other special events. They are kept well painted but are not of the same standard as the cars used in regular service.

The last ten cars received in 1925 were equipped with an air-operated register ringing device, electric signal between the conductor and the motorman, brass side sash, and center lighting fixture. Since they were put in service, brass side sash have been installed in eight additional cars, and brass vestibule sashes in one car for trial. Semi-flush center lights with oval shades have been installed in 74 cars, air-operated register equipment in 70, electric signals from conductor to motorman in 40, Feralun safety treads in 74 and Faraday burners on 70.

Digitized by Google

The company has now 62 buses in use, of which 30 were purchased between 1923 and 1928 and sixteen in the latter year. Before a new bus is accepted it is run over a test course on paved streets, making complete stops at alternate street intersections, to determine its ability to maintain fast schedules. All buses are also tested for riding comfort by a device developed in the shops and known, for want of a better name, as a bump



These graphs show the increase in miles run from better maintenance

meter. It is a spring-arm carrying small equalizing weights and a pen for making a graphical record on a strip of paper which is wound about a slowly revolving drum. It may be placed either on the floor or upon one of the seats.

Tests with this meter have shown very plainly that balloon tires afford so much easier riding that they are now specified on all new buses and have been installed on a number of the older buses. The former high pressure tires were 32x6 and cost in operation about 1 cent per bus-mile. The balloon tires are 34x7½ in. and their cost is approximately 50 per cent more.

The first buses purchased were equipped with rattan seats, but the later buses were furnished with leather-cushioned, double spring-edge double seats. Tests with the bump meter on both types of seats did not show as much difference in riding quality as was expected. However, the appearance of comfort and luxury gave so much satisfaction to passengers that all rattan seats in the 23 buses so equipped have been replaced with leather cushion type seats at a cost of more than $7,000. Not only are leather upholstered seats specified in purchases of all new buses, but they must have either two complete layers of springs, or an air cushion supplementing the springs.

Overhauling Practice in San Antonio

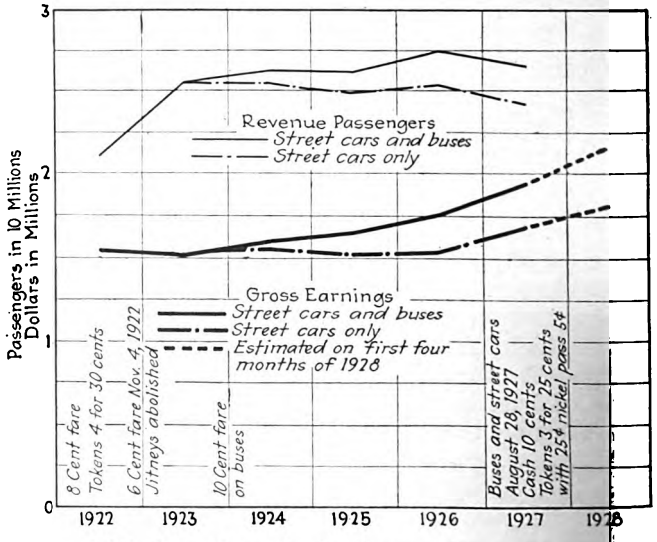
Several years ago cars were repainted at intervals of from four to five years, a period based on the ultimate life of paint. There was considerable fading, but as long as the paint was in good physical condition that was considered satisfactory. For many years the standard color scheme was orange below and lemon above the belt rail, with roof trim and lettering in Indian red. To improve the appearance of the cars it was decided to reduce the period of repainting to two years, and when this standard was attained, the period was reduced to one year, the present standard. All buses have been on this standard from the beginning.

The present standard of coloring for cars, after some experimentation, is lemon below and green above the belt rail with the company emblem on each side of all equipment. For the interior, natural wood finish and two shades of some harmonizing light colors are used to suggest roominess, cheerfulness and restfulness. Circuit breakers, meters, switches, piping, etc., are painted in the same shade as the rest of the interior to make them less conspicuous.

The one year interval for painting is also the standard of overhaul for both cars and buses.

The overhaul on buses is as follows: The engine, including clutch and transmission, is removed and left in the garage for overhaul. The body is left on the chassis and moved into the carpenter-paint shop bay where the body receives a complete overhauling and painting. While this is being done, the frame of the engine is either changed for a new one of standard bore or ground to over-size and new sleeves are installed, depending on the type of engine, and new pistons and rings are fitted. The crankshaft is either ground or replaced, according to conditions. The carburetor, generator, starter, clutch and other parts are thoroughly cleaned and inspected, the valves and seats are reconditioned and any necessary repairs or adjustments are made. After these operations are completed, the engine is reinstalled and the bus is returned to service.

The overhauling of the street cars follows the same general system used for buses. One of the outstanding operations done on the street cars is the building up by welding and reboring to standard size, or boring to oversize, of the axle and armature bearing housings of the motors, thus correcting the gear centers. All mechanical parts are thoroughly gone over, cleaned, inspected, adjusted, tested and repaired, and the electrical equipment is tested. The armatures and fields are dipped and baked and again tested. On the strength of the reports of the noise reduction committee of the A.E.R.E.A. helical gearing is being installed on the smaller types of motor.



This chart shows the development in earnings and passengers carried

While this shorter period for overhaul has temporarily increased the cost of maintenance, the management feels that when the first overhaul cycle is completed the costs will fall considerably below even those of 1923. Already there has been a noticeable decrease in run-ins.

Approximately half the street cars have been through the shop on the first cycle of overhauling. The miles per chargeable run-in averaged 25,508, in 1927, compared with 13,214 in 1926, and for buses 2,800 miles in 1927, compared with 2,200 in 1926.

With the higher bus and car maintenance mentioned, corresponding higher standards have been established in track maintenance. Perhaps the most important develop-

Digitized by Google

ment has been in the extension of the use of welded joints. Welded joints have always been used in track in concrete on paved streets, this form of construction constituting 77 per cent of all of the track. In 1924 an experiment was made of welding joints in gravel ballasted tracks. The experimental section was 1.43 miles in length, and it proved so satisfactory that additional gravel ballasted track has been improved by welding the joints. The method is now being extended to all track, so that at the present time 87 per cent of all the track has welded joints. This is not only effecting a great improvement in riding quality of the cars and in noise reduction, but it is also materially reducing the cost of track maintenance.

Financial Results

A very satisfactory measure of success in any kind of transportation is the result on the company's finances and the growth of its business. Both are shown approximately in an accompanying chart. The year 1923 was the first of operation after the elimination of jitneys and with a 6-cent fare. The gross earnings in that year were $1,528,946. These earnings increased in 1926, when they were $1,761,422. It is felt that this increase is largely due to the supply of local service to the public. The willingness with which the public granted the company a higher rate of fare in 1927 is considered a further tribute to the satisfaction which the service is giving. This increase became effective only during the latter part of 1927, but it enabled the gross earnings to be further increased to $1,953,696 in that year. Based on the first four months operation in 1928, it is estimated that the gross earnings will be in excess of $2,200,000 in 1928, corresponding to an increase of 44 per cent for four years. The accompanying curve shows graphically the history of the gross earnings during the past six years.

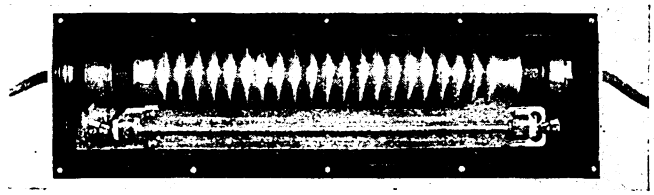
Telephone Dispatching

A feature of railway and bus operation in San Antonio is the method of dispatching by telephone, but an account of this will have to be reserved for a later issue.

Resistor Heaters Used in Cleveland Articulated Cars

Each duplex unit has 45 motor resistor heaters arranged to give the same resistance values on the different controller notches as regular resistors

RESISTANCE losses are converted into useful energy for heating the new duplex cars of the Cleveland Railway, through use of motor resistor heater equipment. The heating apparatus includes eighteen Consolidated Car Heating Company double unit panel heaters in the rear section of the car and 27 heaters in the front section. Of these 27 heaters 24 are duplex heaters, each having one motor resistor heater unit and one regular



The duplex heater has one motor resistor unit and one regular inclosed-type heater unit

inclosed type heater unit, and three having motor resistor heater units only. The motor resistor heater units are divided between the various resistance steps so that all units are subjected to approximately the same energy input. They are arranged to give the same resistance values on the different controller notches as the regular motor resistors under the car.

All heaters are of the panel type and are installed in a continuous duct along both sides of the car. In addition there is also a 1,200-watt, 600-volt vestibule heater for the motorman. The motor resistor heater unit is of extremely rugged construction. It was designed to

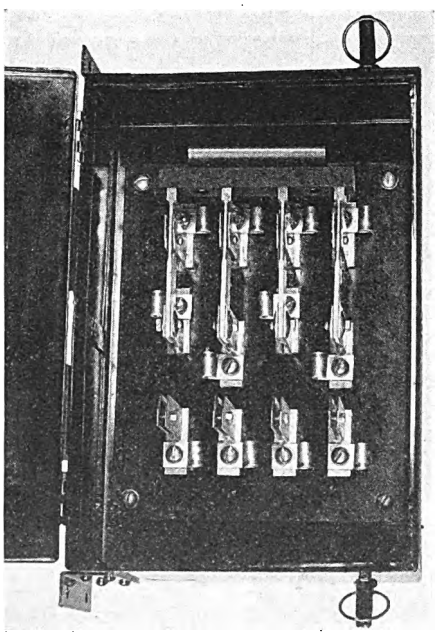
Two peak load relays are mounted side by side in a steel box with hinged cover

obtain the necessary mechanical and electrical strength and thermal capacity to insure the unit standing up under severe service conditions. The resistance element of the unit is a nichrome wire coiled in a helix. This resistance element, with terminals swaged on both ends, is placed in a steel tube, the terminals extending out through suitable insulating bushings placed in each end of the steel tube. After the resistance element is placed in the tube with ample clearance between the element and the wall, the tube is filled with a specially treated insulating powder and is then put through a swaging operation which reduces the diameter of the tube and compacts the insulating powder inside the tube. The result is that the resistance element, although self-supporting under normal conditions is held firmly in the center of the tube and cannot come in contact with the steel wall under any condition.

Lead wires of approximately 18 in. length are swaged into the terminals and to protect these connections a short length of steel tube of larger diameter than the main tube extends approximately 2½ in. beyond the end of the latter and is welded on each end of the tube. This forms a junction space which later is filled with a high temperature compound. In order to obtain thermal capacity and radiating surface an aluminum casting surrounds the steel tube. A four-pole double-throw changeover switch is used for connecting the motor resistor heaters in the motor control circuit or for using the regular resistors under the car.



A four-pole, double throw switch is used for changing over the circuit from the motor resistor heaters to the standard car resistors

Another feature of the heater equipment is the use of a peak load relay which cuts out the regular heaters while the car is using maximum power—that is, during the acceleration period. This relay is in circuit with the heaters in both sections of the car so that during the time the motors are taking the heavy accelerating current no current is taken by the regular heaters. The operating coil of the relay is of heavy bare copper wire and is connected in series in the motor circuit. The relay is provided with means for adjustment so that it can be set to operate at the desired current value. The contacts of the relays are in parallel with the thermostat of the regular heater equipment and therefore carry only a very small current.

The regular heating elements in both the front and rear sections of the car are under thermostatic control, each section having its own thermostat equipment. It is estimated that the accelerating resistance losses, which will be converted into heat in the car when the motor resistor heater units are being used for acceleration, will average approximately 6.6 kw. during the time the car is in service.

Noise Reduction Efforts in London

EFFORTS of the London Underground Electric Railways to reduce noise on its underground lines were pointed out recently by one of the company officials. The statement was inspired by a somewhat sweeping indictment on noise in the tube railways, contained in an article by Prof. Henry J. Spooner in *The Nineteenth Century and After* for September.

The statement in defense of the railways points out that the noise in underground lines is caused primarily by the contact of steel upon steel but is intensified by the limited space to which the noise is confined. The paramount need for minimizing any risk of fire necessitates the employment of metal in some instances where wood or other sound absorbing material would be utilized on an ordinary railway.

A number of steps, however, have been taken and have already been mentioned in ELECTRIC RAILWAY JOURNAL for Oct. 1, 1927, page 567.

The statement goes on to point out that noise can be kept out of the cars to a large extent if the windows are kept closed, but this makes the cars uncomfortable to ride in. Noises arising from the wheels and other parts of the truck can be kept from entering the car by a skirt surrounding the truck and wheels, but this cannot be very low, because it would then hinder free access to the brake gear, and other mechanism. Various forms of gears are now being tested to reduce noise but as improvement in this direction is made there is a call for higher speeds, and higher speeds cause increased noise.

Efforts to reduce the noise by changes in the track have been confined largely to keeping the rails smooth and using resilient material under the rails. Rail grinding, particularly of rails on curves, has helped, but the rubber and composition pads inserted between the rails and the ties do not seem to have had any effect in reducing noise. The ties are of jarrah, an exceedingly hard fire-resisting wood. Part of the Piccadilly tube has been provided with ballast between the ties. This seems to have had an alleviating effect on noise reduction.

Future Rolling Stock

From Viewpoints of Operator and Manufacturer

Growing demand by the American public for greater comfort and increased speed in transportation is leading to improved car designs. Low first cost and maintenance are nevertheless important factors in dictating types of future rolling stock

AN ANALYSIS of the factors which affect the development of future rolling stock was made in an article in last week's issue of ELECTRIC RAILWAY JOURNAL by Charles Gordon, editor. The following three articles present a further discussion of this subject, one by an operating executive who has had a leading part in the present movement toward the improvement of electric railway rolling stock, and two by representatives of leading car building companies. This material was prepared originally for presentation before the equipment division of the American Electric Railway Engineering Association at the Cleveland convention. Because of the great interest throughout the industry in the car situation this discussion of Mr. Gordon's article is printed here as a symposium.

Car Purchases Should Not Wait for Final Verdict on New Equipment

BY L. J. DE LAMARTER
Vice-President and General Manager
Grand Rapids Railroad

AS I ANALYZE Mr. Gordon's article, it is in the nature of a plea for co-operation and co-ordination of efforts to produce a proper design for future rolling stock. I agree that it should be within the province of the manufacturers to initiate the design and to build the cars, but in doing this they must consider the problems of the transportation industry and not merely the manufacturers' problems. In addition to the need of improved appearance, easy riding, quietness, fast acceleration and light weight for future equipment, other general requirements from the transportation department's viewpoint are covered by the report of the committee on service betterment which should be considered carefully in connection with this subject.

One point which I believe needs to be supplemented is the statement that "during the past eighteen months there has been a sudden further drop in new car orders which is now generally attributed to the fact that many properties are holding off needed purchases, while awaiting the outcome of recent experiments in design and construction."

As I see it, there are other governing factors which are also responsible for the reduction in cars sold during the past eighteen months. Some of these are as follows: (a) The volume of business during that period did not warrant the increase in investment which would be occasioned by the purchase of new cars; (b) Uncertainty during the past eighteen months as to when the gradual and continuing decrease in passengers carried throughout the country will stop, and (c) Uncertainty as to when the much-discussed privately-owned automobile saturation point will have been reached.

I feel that it is the combination of these factors with the one mentioned by Mr. Gordon that has caused the transportation executives to postpone the purchase of new equipment until the public riding habit becomes more stabilized. It is my belief, however, that if the car builders had undertaken the development cost and had been prepared to offer to the transportation industry fully developed, standardized cars which would meet present-day requirements, together with a satisfactory financial purchase plan, the sale of cars during this eighteen months period might have been greater.

A favorable sign that we are getting somewhere was indicated to me in an editorial I read recently in a Cleveland newspaper, which, in covering the convention, mentioned the fine exhibit of cars and buses, saying the street car designers were making their cars look like buses and the bus designers were building some of their buses to look like street cars. There is at least evidence here of an open mind on the part of some of the car builders, which promises ultimate success of the effort to develop cars that will actually attract passengers.

Regarding future rolling stock, I do not believe that we need to hold up car purchases now for further drastic change in design over the cars in the Cleveland exhibit. Refinements, pleasing color combinations and attractive lines will continue to be the aim of the car builders, which is in keeping with the order of the day, and improved trucks and other essentials to a modern car may be expected to come along gradually as experience increases with some of the new designs that are being tried.

Low First Cost and Maintenance Must Be Combined With Attractiveness

BY JAMES A. BROOKS
Chief Engineer The J. G. Brill Company

VERY strenuous efforts are being made to solve the rolling stock problem and produce more modern and attractive cars, but of the many innovations that are being tried, only those that measure up to the requirements of actual service, over a reasonable length of time, may be considered practical.

There has grown with the industry many variations

Digitized by Google

in fundamental forms and dimensions for cars. It was thought a few years ago that the time had arrived when common fundamentals could be adopted to suit most of the conditions and thereby enable the car builder more nearly to approach mass production, with an ultimate saving to the purchaser.

A committee was appointed by the association to study the matter and determine upon these fundamentals, and immediately upon the completion of this work the demand arose for something radical and different. For this reason the co-ordination work failed of its purpose.

Previous to this, at the most critical period in the history of the industry, the Birney car, thousands of which were built and thousands of which are still in satisfactory operation, was manufactured in mass production due to standardization of fundamentals; and this car was the most outstanding car of all time, for it accomplished most of the things to be desired in rolling stock, which were: Economy in first cost and in maintenance, low operating cost due to exceptionally light weight, rapid acceleration, and one-man operation. As soon as this type of equipment had met the immediate crisis with which the industry had been faced, the desire for larger equipment became prevalent, and for the past several years modern double-truck light-weight cars have been used—almost to the exclusion of the four-wheel car.

The newly-developed types of motor buses, which appealed both in appearance and comfort, unquestionably placed the electric rail car at a disadvantage in the minds of the traveling public, particularly on lines operating cars that were very old, or on which maintenance had been deferred; and comparisons were made between the improved type of motor bus and antiquated car equipment. This brought about a trend in design of the electric rail car toward the motor bus and with it the introduction of comfortable seats and other improvements, and these alone, in many cases, have been responsible for improved service and increased riding. It is a fact that what the electric railways need most are new cars which will be inexpensive both to purchase and maintain.

The design and arrangement of the bodies of recent cars have been materially improved, and various types of propulsion are being experimented with. These, at the present time, can be considered only as experimental and will, most likely, remain in this state for some time to come.

It is unfortunate that in these new methods, which embody a combination of automotive and electric railway practice, the cost in many instances is greatly increased, without showing any particular advantage of the newer type. It may be, however, that from these will develop something that will accomplish many of the improvements for which the industry is seeking. In such an event, however, a simplification will undoubtedly have to be made, for the various equipments being experimented with have added complications and increased cost.

The car of the future must be of adequate size to meet the requirements of mass transportation and yet not be too large or too heavy to operate during the dull periods. In the matter of light-weight equipment care must be exercised that strength is not sacrificed beyond the point where there is a reasonable assurance that excessive maintenance will not offset the savings.

It appears that there may be two classes of rolling stock; one, where the passenger traffic is necessarily heavy and in which the quick movement of passengers is of more importance than luxury, and the other on lines where bus and automobile competition are more prevalent and where luxurious refinements must be provided to invite car riding.

Future rolling stock must be attractive in appearance, probably of the streamline sedan type, with particular attention devoted to exterior and interior decoration. It must be economical to purchase and maintain, including only those advanced ideas in design which offer definite and practical value. Designers are seeking simplification of control and braking, with sufficient power to develop an acceleration of approximately 5 m.p.h.p.s. and with brakes that will accomplish equally as fast retardation.

Co-operation Between Manufacturers and Operators Essential

By A. L. Kasemeier

Vice-President in Charge of Sales
Cincinnati Car Company

BEFORE we consider the type of future rolling stock, the reasons for advocacy of the replacement of existing equipment at this time should be determined. Both operators and car builders were on solid ground when the so-called obsolete equipment of yesterday was built and put in operation, for the universal 5-cent fare seemed unchangeable and the durability of rolling stock was of greater importance from the standpoint of operating costs than was that of luxury for the purpose of attracting additional patronage. There are today, however, two distinct reasons why a change in the type of rolling stock is desirable, if not absolutely necessary, if we are to maintain our position in the field of urban and interurban transportation. The first is the growing demand on the part of the American people for a greater display of luxury in transportation vehicles than for even the comforts of home. The second reason is that the electric railway car now has a real and formidable competitor in the cheap automobile.

I do not regard the bus or the expensive automobile as menaces to existing electric railway lines if we look with care to the future development of these properties. First thought should be given to the adoption of a car which will effect an increase in the net earnings of our properties, and, naturally, operating costs and passenger appeal are considerations of major importance. The passenger of today is in a position to change his means of transportation unless we offer a type of service that will attract and satisfy him.

I do not agree with Mr. Gordon that car builders have been trailing, rather than leading, in developing improved rolling stock, although I will admit that if we were consulted more freely and frequently before specifications are prepared by the equipment and operating officials, greater economy would result in original costs, and cars would be built more nearly to a standard which would be accepted and, in fact, welcomed by the bankers to whom we look for assistance in the marketing of securities. Electric railway credit and, consequently, operating costs would be vastly improved if we could get the investment banker to regard electric railway car trust securities as equal in security to those of steam roads; and this is possible of accomplishment if we would so standardize rolling stock that the banker could think of the value and mobility of the security (the car) rather than of the credit of the particular lines to which cars are leased.

There should be no rivalry between the builders of railway equipment and operating officials for leadership

Digitized by Google

in designing cars, but rather the closest kind of co-operation. The car builder, by reason of his constant contact with market conditions and equipment and with operating officials of railways, is often in position to advise against the adoption of certain sizes of structural material, plates and even screws and bolts, because many of the old sizes of these things are not now standard with mills and jobbers and are, consequently, both difficult and expensive to obtain; and while he may be unwilling to criticize other features of railway specifications, he is in excellent position to do so for he hears complaints and often is blamed for appearance and unsatisfactory service of parts of the finished car for which he is in no wise responsible.

This question of closer co-operation between the operator and car builder is one of great importance to the industry, and the observations made and pointed out by Mr. Gordon of the growing tendency on the part of railway officials to vie with each other in an effort to become not only car designers but builders also should be considered with alarm. I do not question the ability of the equipment and operating officials to design and build electric cars, but two things will result if the practice continues. The first is that maintenance of the property now intrusted to their care will surely be neglected, and the second is that talent and capital now devoted to car manufacturing purposes will seek other fields of activity, and in either case the interests of the industry will suffer.

As modestly intimated in his address, Mr. Gordon has been most active in urging manufacturers to get busy in the development of cars to meet today's demands, but at the same time he very wisely has stated that: "Right now the manufacturers need active suggestions and co-operation." We have, naturally, always depended upon equipment men and operating officials for advice, and to them in a large measure is due credit for what has been accomplished in the present development. Much thought is being given by us to further improvements, and we will welcome any suggestions.

Mr. Gordon calls attention to the desirability of developing a distinctive car which could be sold as other manufactured products are sold. Our company has what might be termed a ready-made car, designed more than eight years ago, but flexible as to size, which we consider suitable for a wide range of operating conditions. This car embraces what we term the four features of balanced design, namely: Speed with safety, capacity with comfort, light weight with strength and beauty with low cost. The same construction and general design is used for both city and interurban service. The unit is built for speeds up to 60 m.p.h. and can be operated safely at the higher speeds by the installation of Duplex air-magnetic braking equipment. By the use of alloy steels and aluminum, and by careful balancing of all the elements of the structure, the weight has been reduced to a safe minimum.

I do not wish to be understood as saying there will be no further developments in car design, but I feel safe in asserting that future rolling stock will not depart radically in design from that which was exhibited at the Cleveland convention, and that further developments will be gradual and along lines to be determined by both operator and car builder. In the meantime, however, if a railway's equipment needs replacing because of excessive weight, low speed or lack of attractiveness, it should not wait for the seer to tell what the characteristics will be of cars five years hence.

Company and Department Awards in New Contest

ELECTRIC RAILWAY JOURNAL'S New Maintenance Contest includes several important features:

An attractive trophy will be awarded to the company making the greatest contribution to the improvement of maintenance practices through participation in the contest.

Special certificates of merit will be presented to each department making the best individual showing.

An individual cash prize of $200 will go to the person submitting the best maintenance idea during the contest.

A series of twelve individual prizes of $25 each will be divided equally between the following four maintenance divisions: (1) Rolling stock and shops; (2) way and structures; (3) electrical and line; (4) buses and garage, including shop equipment for bus maintenance.

A cash payment of $5 will be made for each item published.

Start at once and help your department and company to win the recognition they deserve for improved maintenance work. In addition you can win one or more of the valuable individual prizes.

See ELECTRIC RAILWAY JOURNAL for Oct. 20, pages 724-725, for complete details. An attractive folder giving full instructions and suggestions for preparing entries in the contest is available and will be mailed to those interested upon request.

Pennsylvania Railroad To B

from New Yor

$100,000,000 project will cover 1,300 miles of track and will require 365 new electric locomotives. Said to be largest electrification in world

Principal Facts

about Pennsylvania Railroad Electrification from New York to Wilmington, Del., and from Philadelphia to Columbia and Atglen, Pa.

Miles of railroad to be electrified	325
Miles of track to be electrified	1,300
Electric locomotives required for new operation:	
Passenger	165
Freight	200
Total new electric locomotives required	365
Electric locomotives now in operation	84
Number of passenger trains:	
To be operated by electric locomotives	318
To be operated as multiple-unit trains	218
Estimated cost to complete program	$100,000,000
Estimated time to complete program	6 to 7 years
Saving in number of freight trains operated	Approximately 50 per cent
Size of freight trains to be operated	125 cars
Speed of freight trains under electrified operation	25 m.p.h.
Miles of railroad already electrified (includes 140 miles Long Island Railroad)	333
Miles of track already electrified (includes 418 miles Long Island Railroad)	960
Total P.R.R. line mileage which will be operated electrically on completion of new program	658
Total P.R.R. track mileage to be operated on completion of new program	2,260

ELECTRIFICATION of the entire Pennsylvania Railroad between New York and Wilmington, Del., including both passenger and freight service, has been authorized by the board of directors of the Pennsylvania Railroad, according to an announcement by General W. W. Atterbury, president.

This project will require an estimated expenditure of $100,000,000 to be spread over a period of the next seven or eight years, at the rate of about $15,000,000 per year. Approximately 60 per cent of the total amount will be spent for catenary, transmission lines and substation construction and 40 per cent for rolling stock. This will be a normal percentage of Pennsylvania Railroad's improvement expenditures which have been averaging $70,000,000 a year. The proposed capital expenditures for electrification will make unnecessary certain other capital expenditures on this section of the railroad which would have to be made if electrification plans were not carried out.

The new project covers 325 miles of line and 1,300 miles of track. This authorization is part of a plan which includes also the electrification of the grades between the Susquehanna, Schuylkill and Delaware River valleys and Eastern terminals. According to present plans the first section to be electrified will be between North Philadelphia and Trenton, the next step between Newark and New Brunswick and the final section between New Brunswick and Trenton. At present the system is electrified between Long Island City and Newark and from Philadelphia to Wilmington. The latter section has just been completed.

Overhead construction and not third rail power supply will be used on this installation. Alternating current at 11,000 volts, single phase, similar to that now in use in the Philadelphia suburban service, will be adopted. Decision to use this type of system was made after a study of the systems now used extensively in Germany, Switzerland and Sweden and in this country on the New York, New Haven & Hartford, Norfolk & Western and the Virginian Railways.

In view of the fact that the suburban sections of the railroad will be electrified first, the purchase of cars will probably precede that of the locomotives. In the suburban service multiple-unit cars similar to those now in use on the Paoli division at Philadelphia will be used.

The through freight and passenger service will be handled by electric locomotives of a type recently developed by the electric railway manufacturers. Three types of these locomotives have been developed, one for high-speed passenger service, one for high-speed freight service and one for switching. When used singly or in multiple, as required, these locomotives will provide any power demanded by the weight or speed of a train. They will be so designed as to permit the maximum interchangeability of parts, the minimum cost of maintenance and the simplest and most direct method of manufacture. By the method of operation proposed it is expected eventually to reduce the number of freight trains 50 per cent for a given car movement and to increase the speed to any reasonable extent required. This of itself provides for a 100 per cent increase in capacity in so far as freight movement is concerned. In the case of passenger trains it is expected to eliminate all double-heading and most if not all of the second sections of trains, and to avoid the possibility of rough handling due to limited

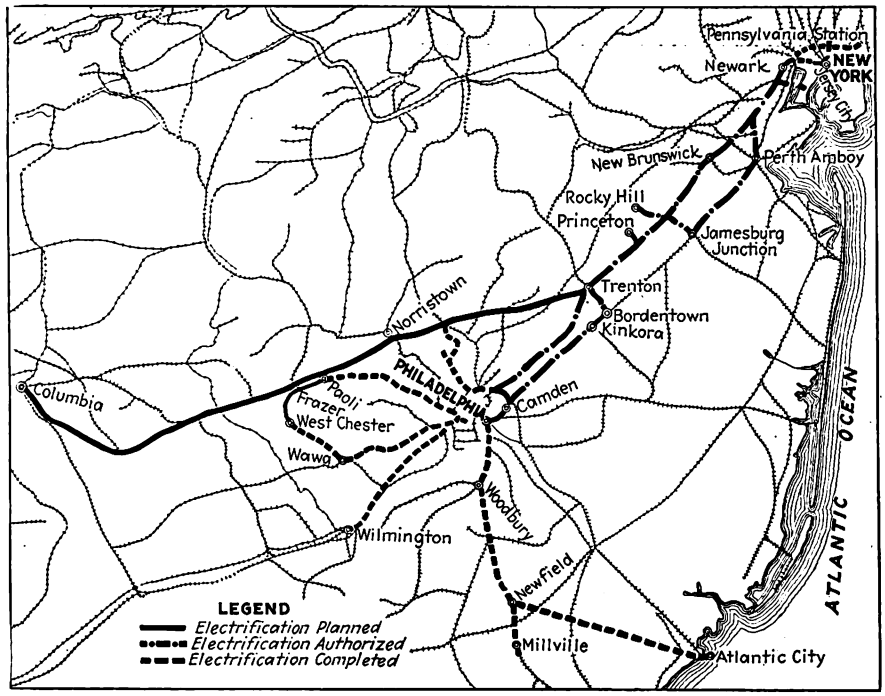
Electrified

to Wilmington

starting capacity, all of which makes for greater comfort, better service and increased capacity of lines.

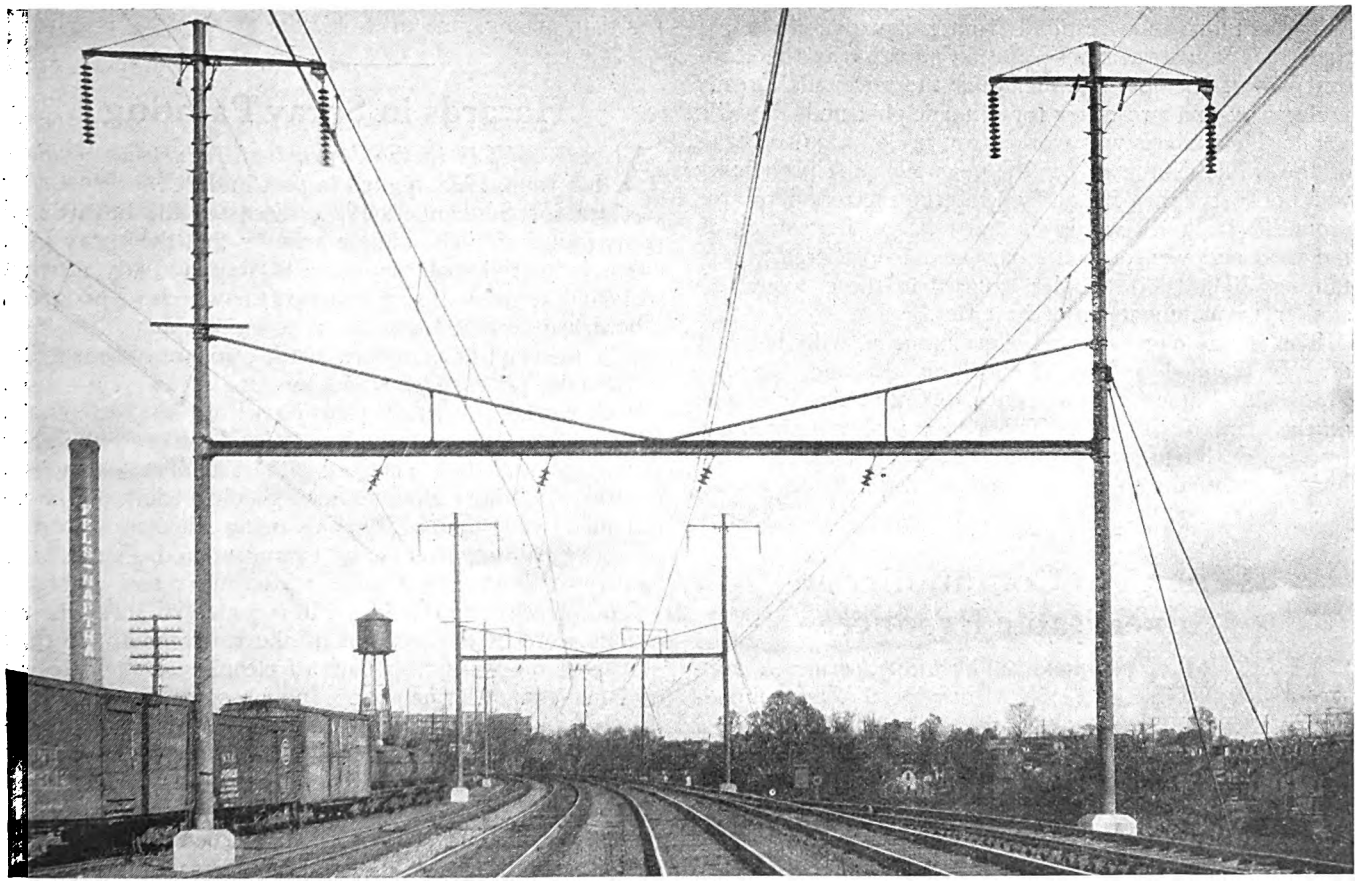
Immediate Factors Which Influenced the Decision

The immediate factors which influenced the decision to proceed with electrification at this time were as follows: greater economy of electric operation as compared with steam operation in dense traffic territories; the growth of the southern passenger business; the increasing density of both freight and passenger business on the Eastern lines of the railroad and the probability that in the future more rapid movement will be required; the desirability of utilizing the advantages of electric operation in connection with the construction of the new passenger terminals at Philadelphia and Newark; the desirability of providing motive power that would meet the growing requirements from the standpoint of weight of trains, speed and reliability. The probability that the project, if started now, would be completed with a less total expenditure, all matters considered, than if started at a later date, was another factor in the present move.



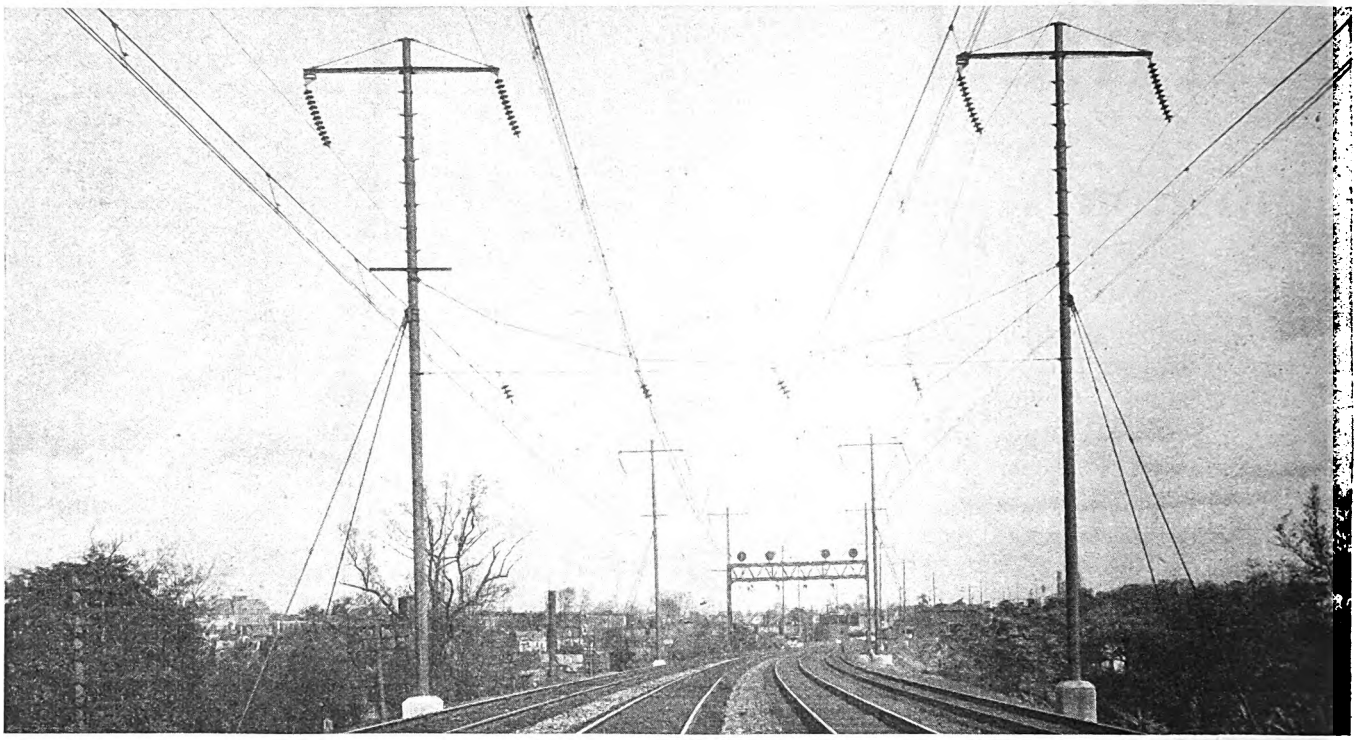
Map of proposed, authorized and completed electrification of Pennsylvania Railroad. This does not include the Long Island Railroad

Of the 365 electric locomotives required eventually for this electrification, from 250 to 300 will be purchased within the next five years. Arrangements have been made for the Pennsylvania Railroad to purchase power from the Public Service Corporation of New Jersey and the Philadelphia Electric Company.



Catenary bridge spanning five tracks on the Wilmington section

Digitized by Google



View along the Wilmington line, electrification of which was completed recently

This electrification is claimed by the railroad officials to be far greater in magnitude and importance than that of any other railroad in the world in miles of track to be electrified, in volume and density of passenger and freight business handled, in size and amount of equipment required, in the number of trains affected, and in terminal operations involved.

The authorization resulted from exhaustive studies of the whole industrial transportation situation in the Eastern part of the country, including the terminals already under way and projected for Philadelphia and Newark. While this analysis was worked out in detail on the basis of the traffic estimated for the year 1935 the probability was not lost sight of that by 1950 the metropolitan area around New York would extend to New Brunswick on the west and well out on Long Island on the east, containing 30,000,000 people; and that there would be similar developments in other cities.

The next electrification development will be that already planned on the Philadelphia division, Trenton branch, to Pomeroy, and thence to Columbia, as shown on the map on page 807. This will probably be followed by electrical equipment of lines in and around Pittsburgh, eventually to be connected with the Eastern lines.

When is a Community an Advertisable Product?

"WITHOUT adequate public utility service a community is not a successful advertisable commodity, in the same sense that food without flavor is not a successful advertisable commodity. As a community's public utility service is good or bad, so in like degree is that community a comfortable, convenient and satisfactory (or the contrary) place in which to live and do business." In these words A. H. Herrmann, publicity director of the Virginia Electric & Power Company, Richmond, Va., addressed the Richmond Advertising Club at a weekly meeting held recently. He stressed the newspaper as the most effective medium for public utility advertising.

After giving a résumé of the advertising budget of the electric railway industry, Mr. Herrmann stated that his company was spending more money today for advertising than at any time in its history.

Hazards in Spray Painting

AN ARTICLE in the *Journal of Industrial Hygiene* for June, 1928, quoted in part in the *Monthly Labor Review* for September, 1928, discusses the hazards of spray painting. The author believes that the spray gun, as an industrial tool, has come to stay, and any attempt to forbid its use will simply arrest the wheels of progress. There are certain hazards in its employment, but they can be lessened or eliminated with comparative ease.

Periodic physical examinations are regarded essential for all workers in spray painting within inclosed places. Where the compound used contains lead or benzol, the person should be examined at least once every six months, and these examinations should include the various blood cell counts. Persons using siliceous materials in spray painting should be examined and should have X-rays of their chests made at least every two years.

The principal faults found in commercial spray installations were in the location of the spray booth, method of use of the equipment, lack of cleanliness, poor design and inadequate air supply. Indoor spraying should be done in a properly constructed booth with exhaust ventilation. The face area of the booth should be from four to eight times the area of the object being sprayed, and wide booths should have multiple fan installations or a large exhaust fan. The booth should be cleaned periodically, and walls and ceilings should be greased or papered, or both. Fans should be located in the rear or sides of

Digitized by Google

the booth and preferably low, as most of the harmful substances in the paint give off heavy vapors or heavy solids. The air to supply the fan should be fresh, and preferably from the outside.

Transportation Prominent at West Virginia Meeting

In a stirring address, J. P. Barnes, president of the American Electric Railway Association, bespoke a new trend of thought for the industry. A. C. Spurr new president

SEVERAL subjects of interest to electric railway representatives were included in the program of the eleventh annual convention of the Public Utilities Association of West Virginia, held at Huntington, W. Va., Oct. 24-25, 1928. Among these were "The Utility's Responsibility to the Public," "The Trend of Transportation," "Public Utility Safety," "Improving Foremanship" and "Structural Rate Making."

The keynote for electric railway men was struck by J. P. Barnes, president of the A.E.R.A., who urged that all agencies of local transportation be considered a part of one system, serving one public, but giving the various classes of service demanded by the public of today. He made an appeal for more fundamental thinking and a broadened conception of the important problems of community transportation and traffic congestion, to conform to changed conditions in modern cities.

"The world has stepped on the gas and is going somewhere. Are we going too?" With these words, Mr. Barnes issued a bold challenge to the industry. The paper is published, in full, elsewhere in this issue.

"The Utility's Responsibility To the Public," was the subject of an address by G. M. Alexander, president Monongahela-West Penn Public Service Company. Because the public has granted franchises to operate and in many instances is a part owner of the business, Mr. Alexander asserted, it has the right to expect that the utility officials be men of good conduct in private life. Speaking of return he said, "I don't believe the public is so seriously concerned with rates and fares as we think, if we satisfy the demands of service. The rates must be just to the public and to ourselves in order to give the public the service expected."

"Honesty, absolute and scrupulous, not merely legal honesty," was listed by the speaker with other requirements for successful utility operation. Another was the caution against making any promises that cannot be fulfilled within the expected time.

Man Power Important Weapon

C. I. Weaver, vice-president of the Ohio Edison Company, Springfield, Ohio, speaking on "Man Power," said that this is by far the most important available tool or weapon of the utilities. Courage, intelligence and ambition are among the qualities to be sought in new employees. "If we are to guard our man power we must watch the office boy."

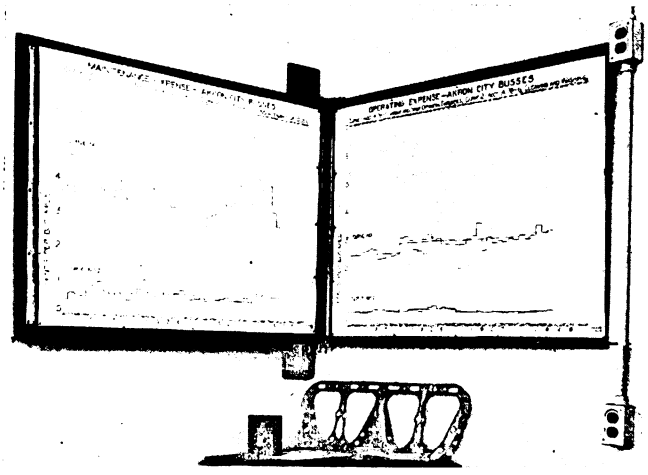
An address on "Public Utility Safety" by Fred A. Lange, Ohio Department of Safety, dealt principally with the light and power industry. He said that the iron and steel industry is inherently more hazardous than the light and power industry yet by personal effort on the part of high officials one concern, the Lorain Steel Company, has completed 3,000,000 man-hours without an accident, as compared with an average of 48 accidents per 1,000,000 man-hours in the light and power industry. To officials he addressed this final remark, "You men who are the managers—it is not sufficient to put someone in charge of safety, you must take a personal interest."

N. M. Argabrite, vice-president American Gas & Electric Company, dealt with fundamentals of "Structural Rate Making." He showed that because readiness-to-serve and per-customer costs may total to ten times or more the actual manufacturing cost, energy may be sold to one customer for 1 cent at a profit and to another for 10 cents but at a loss.

Arthur M. Hill, president of the association, presided at the meetings. He is vice-president of the Charleston Interurban Railway and president of the Blue & Gray Transit Company. Officers for the ensuing year are: president, A. C. Spurr, general manager Wheeling Traction Company; vice-presidents, W. F. Ficklen, manager Appalachian Power Company; C. H. Hardesty, assistant to president Monongahela-West Penn Public Service Company; Fred M. Hawley, treasurer Bluefield Telephone Company; executive secretary, A. Bliss Crum, Charleston; treasurer, G. B. Moir of the Appalachian Power Company, Charleston; and assistant treasurer, J. W. Cummins, assistant treasurer Charleston Interurban Company.

Hinged Wall Charts An Aid To Meetings

LARGE wall charts that are clearly visible from any point in the conference room are being found invaluable for reference purposes during foremen's meetings of the Northern Ohio Power & Light Company in Akron, Ohio. These charts have been made 30 in. high and 40 in. long, and have been mounted on sheets of veneer boarding which are hinged to a wall holder by means of rods running through metal loops at top and bottom of the frame.



The charts on this rack can be removed readily for current additions

Charts showing pertinent information such as mileage maintenance or operating expenses can be plainly displayed. By removing the thumb tacks the sheets can be removed for replacement or changes.

PRACTICAL IDEAS

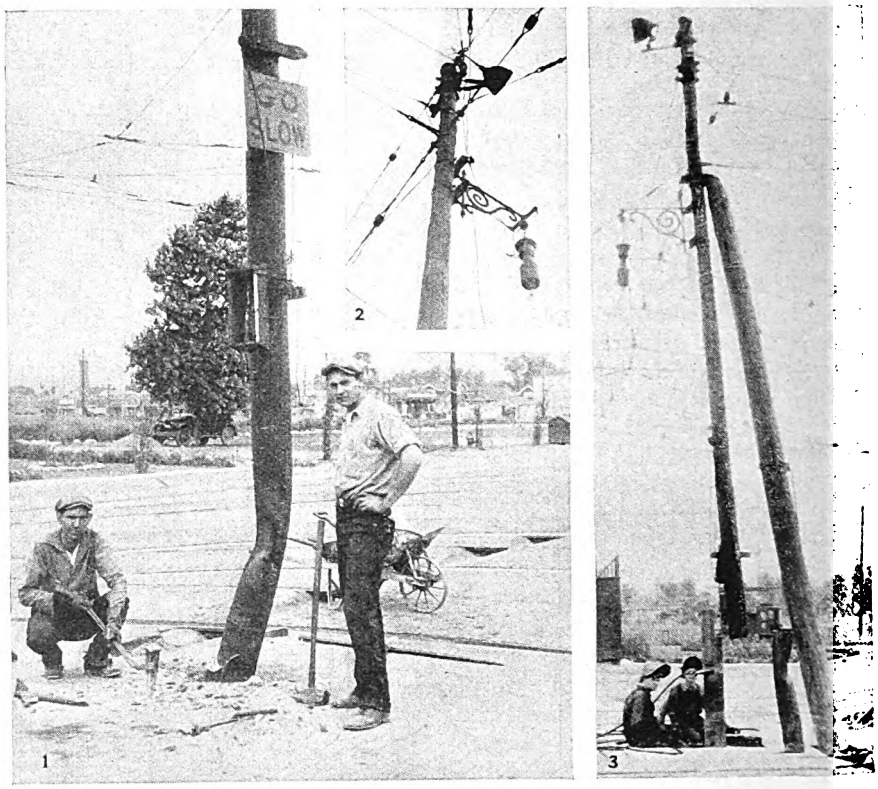
for Use by the Mainte

Reclaiming a Badly Bent Steel Trolley Pole

By E. M. Miley
Estimating Engineer
Chicago Surface Lines, Chicago, Ill.

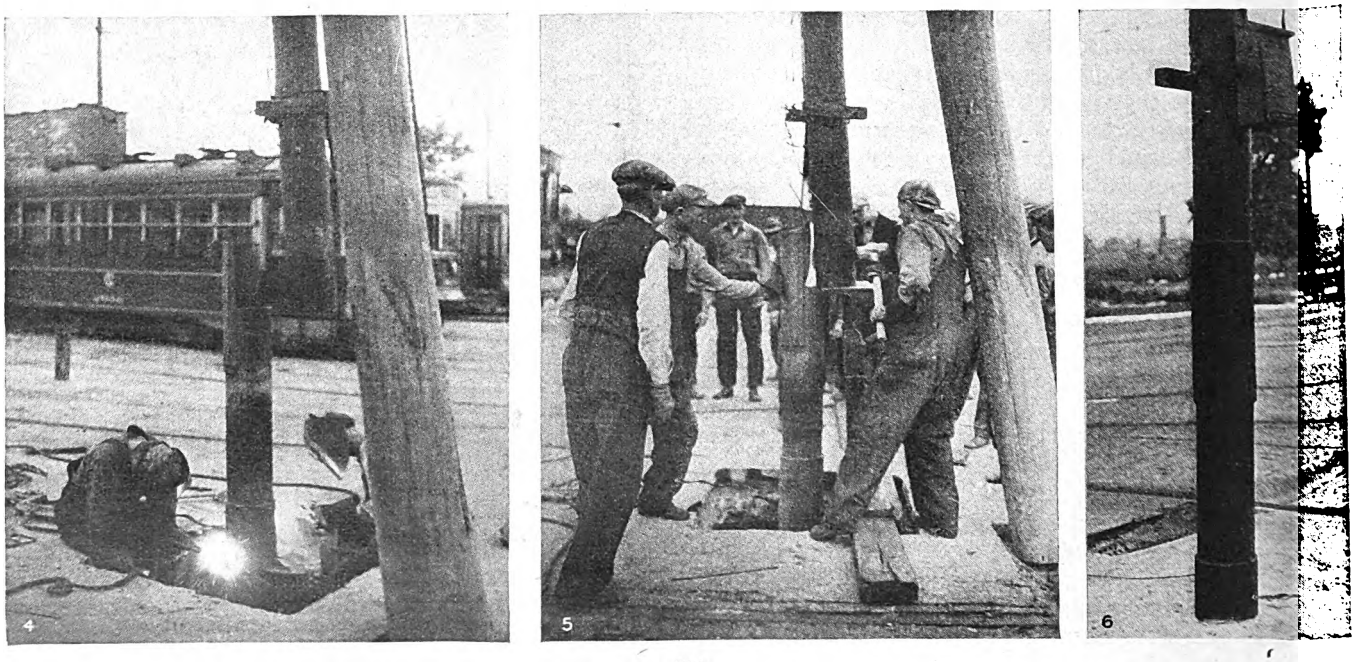
RECENTLY a car, while entering one of the tracks of the Cicero and North Avenues car station, was derailed and hit a steel trolley pole, bending it badly about 4 ft. above the ground line. The pole was one of the main messenger poles holding up the trolley special work in the rear of the car station and also carried a floodlight lamp, bracket and switchbox. The pole was bent so badly that one of the tracks could not be used for operation.

The problem confronting the railway was how to renew the pole in its same location and keep it in line with present poles so as not to interfere with car operation or with the overhead work. If the old pole was to be removed and a new one installed, all the overhead wires would have to be removed, which would cause a slacking off of the trolley special work and fixtures. This would entail an expense amounting possibly to $250.



Various Steps in Method Used to Reclaim Steel Pole

1. Condition of steel pole before repair work was started.
2. In addition to carrying overhead messenger wires the pole carried a floodlight, lamp and bracket.
3. A temporary wooden pole was lashed to the steel pole as a support.
4. A new piece of tubing 5 ft. long was welded in place.
5. Placing the upper part of the pole in position.
6. View of the pole after reclamation.



Digitized by Google

The idea of cutting out the bent section of the pole and welding in a new piece of tubing seemed to be the logical way of performing the job.

hance Man

The strain on the pole was in three directions, the main messenger running north and south, and a span wire and pull-off wire to the west. To distribute the strain evenly all around the pole, a temporary strain guy was installed to the east. Then, of course, the strain was only a down thrust.

First one of the company's standard crossarm brackets was put around the pole so that the load, when the bent section was cut out, would rest on top of a temporary wooden pole lashed to the steel pole. The bent section was then cut out and a new piece of tubing 5 ft. long was welded in place. The accompanying illustrations show various stages of the work. The sleeves used are the same as the standard sleeve used in pole reclamation by the railway. The total cost of labor and material for the job was $67.87.

Cleaning and Painting Underside of Railway Bridge*

By Thomas O. Smith
Superintendent of Overhead Charleston Interurban Railroad, Charleston, W. Va.

CLEANING and painting the understructure of a bridge on a line of the Charleston Interurban Railroad, Charleston, W. Va., was done successfully by constructing a movable platform and attaching it to two messenger wires running the length of the bridge underneath. The platform was moved from one position to the next by sliding the snatch blocks, to which ropes fastened to the scaffolding were attached, along the messenger wire. When located, the platform was pulled up to working position and safety slings were attached to the bridge beams as found most convenient.

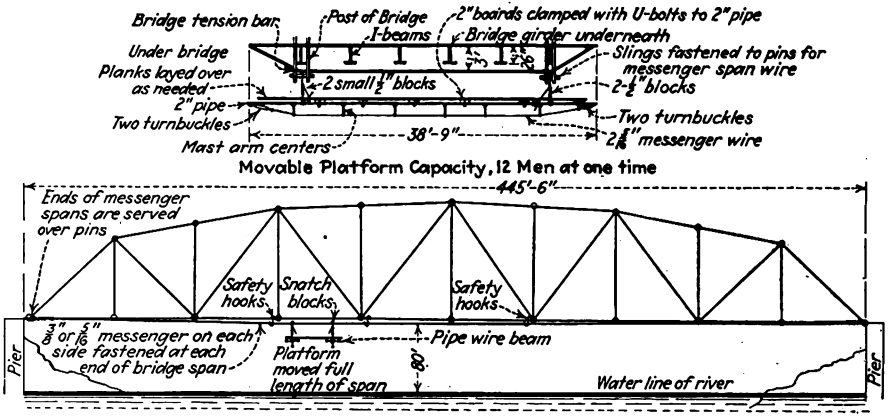
The side members of the platform were constructed of 2-in. wrought-iron pipe with mast arms hanging down. A $\frac{5}{16}$-in. wire attached to either end of the wrought-iron pipe passed through the ends of the mast arms and was tightened by turnbuckles. There were two of these structures, one on either side. The mast arms were spaced 5 ft. apart and 2-in. boards were used for the flooring of the platform and were fastened to the 2-in. pipes by U-bolts. The size of the platform was 38 ft. 9 in. x 42 ft. 9 in. and had a capacity of twelve men.

The messenger wire that supported the platform was run underneath the bridge from end to end and was tied to bridge pins. Other safety slings were tied to the bridge arms as found most convenient and safety hooks were fastened to the messenger wires at either side of the platform. By use of this construction the labor cost for the job was reduced approximately 30 per cent.

*Submitted in Electric Railway Journal Prize Contest.

Dolly Truck for Broken Axle

FOR bringing in crippled cars of the single-truck type when an axle is broken, the Virginia Electric & Power Company has developed the so-called "dolly truck," shown in the accompanying illustrations. It consists of nothing more than two side bars and an axle fitted with a pair of small wheels, and can very easily be attached to the end of the truck frame. The two side bars fit underneath the journal box pedestals, being bolted at one end to the side frame of the truck. The other ends rest on a pair of bearings on the outside ends of the dolly axle. The two pictures tell the story.



Above, crosswise view of the platform and attachment. Below, longitudinal view showing how messenger wire was attached to provide easy movement of the platform

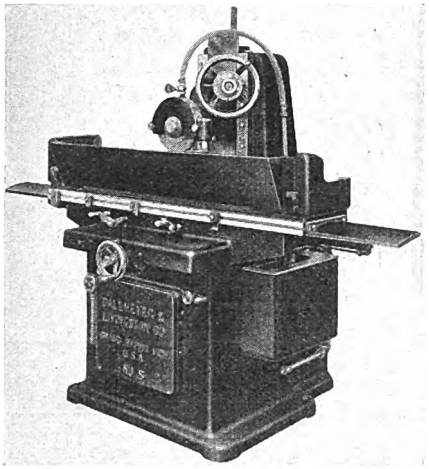
Improved Equipment Suggestions

Hydraulic Feed Surface Grinders

DESIGNED for more rapid grinding and higher capacity are two hydraulic feed surface grinders, equipped with oil gear, products of the Gallmeyer & Livingston Company, Grand Rapids, Mich. The oil gear mechanism makes possible any longitudinal table speed up to 55 ft. per minute. The feeds may be set slow enough to require nine



No. 5 hydraulic feed surface grinder

hours to cover the working surface of the table or they may be set to enable the operator to cover the entire working surface of the table in 3½ minutes. The oil gear hydraulic feed reciprocates the table at a variable rate of travel and is connected to a cross-feed engine mounted under the saddle, arranged so that at each reversal of the reciprocating table it actuates the cross-feed mechanism.

For raising and lowering the wheel head a large hand wheel is used. This gives a direct action through a worm gear to the elevating screw. The wheel is graduated in one-quarter thousandths with a movable pointer which can be set for convenient readings. By turning the smaller hand wheel or knurled hand knob in the center of the large wheel, a back-geared action to the elevating mechanism is provided. The disk in the center of the hand wheel has a graduated dial ring which can be set at zero in relation to the pointer mounted on the spoke of the large hand wheel. Both inner and outer wheels turn but the graduations on the inner wheel are arranged to read on this moving pointer, giving a Vernier effect. By this it is easy to get readings of adjustments in ten-thousandths. With this sort of graduation and an accuracy in the machine that makes this available in service it is possible to increase greatly the accuracy of work turned out by surface grinding.

Operating Conditions Affect Spark Plugs

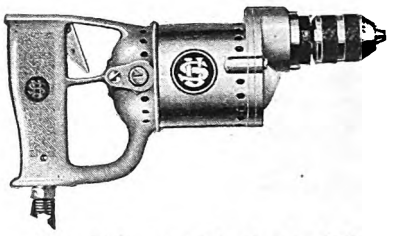
SOME reasons why one bus or truck can operate a greater mileage without spark plug trouble than another are explained in a service bulletin recently issued by the A. C. Spark Plug Company. It states that some buses operate at low speeds in towns, stopping frequently and with the engine idling for long intervals, while others are used for intercity highway transportation and carry heavy loads and operate at high speed.

The compression in an engine varies with the opening of the throttle and the speed attained. So in the case of a bus or truck driven in town, there will be little chance to open the throttle wide for any length of time, to get the full benefit of the high compression of the engine. If the same vehicle is run in the open country at a sustained high speed, the explosive temperature will be far higher than in the previous case and the revolutions of the engine will double or treble. For such service spark plugs have to withstand a higher combustion gas temperature and dissipate several times more calories, due to the increased number of explosions per minute resulting from the higher speed.

If a bus or a truck operating on long runs at fast speed is equipped with the same type spark plug as a bus or truck in city service, it will be difficult for the plugs to stay cold enough to prevent pre-ignition. A cooler constructed type of plug which will withstand more heat should be used in such a case. Weather temperatures have an important bearing on spark plug service. Spark plug recommendations as shown on specification charts are based on average operating conditions but to get maximum service from abnormal driving conditions, a spark plug must be obtained that is suitable for the particular condition involved.

High-Speed Portable Electric Drill

TO MEET a growing demand for a higher speed light-weight ¼-in. portable electric drill the United States Electrical Tool Company, Cincinnati, Ohio, has two in regular production. One of these, known as the ¼-in. special direct drive drill, operates directly on the armature shaft at a speed of 10,000 r.p.m. and weighs only 4 lb. The other, known as the ¼-in. special gear reduction drill, operates at 2,000 r.p.m. and is only ⅛-lb. heavier.



New ¼-in. portable electric drill

New features on these drills include keyless chucks and easy accessibility to close places. Both have universal motors that operate on either alternating or direct current.

Light-Weight Headlining

A NEW headlining with an aluminum face is announced by the Haskelite Manufacturing Corporation, Grand Rapids, Mich. The new product is made of Haskelite plywood faced with aluminum and results in a much stronger headlining with less weight than the usual materials employed.

The new lining consists of No. 27 gage aluminum sheet glued to a three-ply back of Haskelite plywood. The plywood recently developed has two faces of $\frac{1}{32}$-in. spruce and a $\frac{1}{32}$-in. poplar core, but walnut and mahogany can also be used for backs. The total thickness of the aluminum-Plymetl, including the aluminum, is 0.108 in. and the weight factor is 0.510 as compared with 0.715 for No. 16 gage aluminum which is ordinarily used. The stiffness of the new headlining is also much greater.

With No. 16 gage aluminum, the stiffness factor is 109.6 while that of the aluminum-Plymetl is 375 longitudinally and 145 transversely.

Engineering Standing Committees Complete

STANDING committees of the power, purchases and stores, rolling stock and the way and structures divisions of the Engineering Association have been completed. These are the continuing groups which have charge of the committee work of the four principal divisions of the association. The personnel follows:

Power

W. E. Bryan, superintendent of power St. Louis Public Service Company, St. Louis, Mo., chairman.
W. H. Bassett, Waterbury, Conn.
L. W. Birch, Mansfield, Ohio.
C. A. Butcher, East Pittsburgh, Pa.
H. A. Kidder, New York, N. Y.
John Leisenring, Springfield, Ill.
J. F. Neild, Toronto, Ont., Canada.
F. W. Peters, Schenectady, N. Y.
W. J. Quinn, New York, N. Y.
J. L. Ross, Pittsburgh, Pa.
Dwight L. Smith, Chicago, Ill.
L. J. Turley, Los Angeles, Cal.

Purchases and Stores

A. A. Ordway, Boston Elevated Railway, Boston, Mass., chairman.
John Y. Bayliss, Richmond, Va.
A. S. Duncan, East Pittsburgh, Pa.
A. L. Fischer, Cincinnati, Ohio.
J. Fleming, Washington, D. C.
B. W. Forkner, Mansfield, Ohio.
A. E. Hatton, Pittsburgh, Pa.
F. A. Jordan, Atlanta, Ga.
E. A. Murphy, Indianapolis, Ind.
W. E. Scott, Philadelphia, Pa.
C. Thorburn, Los Angeles, Cal.
W. J. Walker, Schenectady, N. Y.

Rolling Stock

A. T. Clark, superintendent of rolling stock and shops United Railways & Electric Company of Baltimore, Baltimore, Md., chairman.
R. S. Bull, Pittsburgh, Pa.
V. W. Berry, Richmond, Va.
C. Bethel, East Pittsburgh, Pa.
W. C. Bolt, Chelsea, Mass.
J. M. Bosenbury, Springfield, Ill.
James A. Brooks, Philadelphia, Pa.
M. R. Hanna, Erie, Pa.
J. S. McWhirter, New York, N. Y.
A. D. McWhorter, Memphis, Tenn.
T. H. Nicholl, Anderson, Ind.
R. B. Smyth, Boston, Mass.

Way and Structures

E. M. T. Ryder, way engineer Third Avenue Railway, New York, N. Y., chairman.
C. A. Alden, Steelton, Pa.
C. H. Clark, Cleveland, Ohio.
E. B. Entwisle, Johnstown, Pa.
C. L. Hawkins, St. Louis, Mo.
William G. Hulbert, Easton, Pa.
John R. McKay, Fort Wayne, Ind.
C. A. Smith, Atlanta, Ga.
A. T. Spencer, Montreal, Que., Canada.
J. H. Sundmaker, Cincinnati, Ohio.
F. B. Walker, Boston, Mass.
Oscar Williams, Pittsburgh, Pa.

Aluminum and Its Alloys in Car Construction

Material saving in weight and no indication of corrosion have been shown in 368 cars built for steam railroads and 108 for electric railways, largely of aluminum or its alloys

ONE of the features of the meeting of the metropolitan section of the American Electric Railway Association, held in the Engineering Societies Building in New York, on Oct. 5, was an address on "Aluminum and Its Use in the Transportation Industry." The speaker was Dr. Paul V. Faragher of the Aluminum Company of America. After giving an account of the methods of producing aluminum and its alloys, particularly duralumin, he gave a list of the cars for steam and electric railroads in which these materials had been used extensively. The list follows:

Illinois Central Railroad has 25 cars that were built in 1923 for its Chicago Terminal. The outside roof sheets, doors, interior finish sheets, conduit and junction boxes are of aluminum. The total weight of each car is 87,500 lb. and the weight saved, 4,700 lb. The service given has been suburban, three years with steam and two years with electricity. The condition of the aluminum is satisfactory, with no indication of corrosion. In addition, the same company has 215 cars that were built in 1926, the same parts as before being of aluminum. The total weight of the motor cars is 140,000 lb. and the weight saved, 10,150 lb. The total weight of the trailer cars is 88,700 lb. and weight saved, 7,763 lb. These cars have been in electric suburban service for two years. Here also the condition of the aluminum is satisfactory.

Pennsylvania Railroad has eight cars built in 1926 for its Paoli suburban branch. Here the entire superstructure except the belt rail is of aluminum. The total weight of each car is 111,270 lb., and the weight saved, 16,100 lb. These cars have been in electric suburban service for two years. Here the condition of the aluminum is satisfactory, the only corrosion being due to the welding flux left on after the roof sheets were welded. There is no indication of atmospheric corrosion.

Chicago & Northwestern Railroad had 120 cars built in 1927 for its Chicago suburban service. The exterior roof sheets, side girder and letterboard sheets, interior finish, bulkheads, doors and all miscellaneous sheets are of aluminum. The total weight of each car is 98,300 lb. and the weight that was saved 7,000 lb. These cars have been one year in steam suburban service. The condition of the aluminum is satisfactory, and there is no corrosion.

Cleveland Railway had one car built in 1926. All metal in the car with the exception of the side sills, wheels, axles, springs, bolts, rivets and similar material is of aluminum. The total weight of the car is 30,300 lb. and the weight saved is 12,901 lb. This car has been in city service for two years, covering during that time approximately 80,000 miles. Part of the time it has drawn a trailer. The condition of the aluminum is satisfactory.

Chicago & Joliet Electric Railway has one car, built in 1927. All metal in the car body and equipment is of aluminum with the exception of the bolts, rivets and similar parts. No aluminum was used in the trucks. The total weight of the car is 23,722 lb. and the weight saved, 11,500 lb. This car has been one year in city service, covering approximately 40,000 miles. The condition of the aluminum is satisfactory, with no corrosion.

United Railways of St. Louis has one car, built in 1927. Aluminum is substituted in the underframe and car body for steel, with the exception of the bolsters and miscellaneous minor parts such as bolts, rivets, etc. The weight of the car is 32,000 lb. and the weight saved, 5,332 lb. This car has been in service for one year, covering approximately 30,000 miles. The condition of the aluminum is satisfactory with no corrosion of any kind.

Montreal Tramways has ten cars, built in 1927, using aluminum in place of steel for all underframe members and metal work in the car with the exception of bolts and rivets. There is no aluminum in the trucks. The weight of the car is 37,100 lb. and the weight saved, 3,700 lb. This car has been in normal street car service in Montreal for one year. The condition of the aluminum is satisfactory, with no corrosion. The company also had 40 cars built at the same time as the one mentioned, in which aluminum replaced sheet steel in the body only. The total weight of each of these cars is 35,900 lb. and the weight saved was 1,200 lb. Here the condition of the aluminum is satisfactory. The same company had 30 cars built in 1928 with the same aluminum as in the above 40 cars.

Twin City Rapid Transit Company, Minneapolis, Minn., had 25 cars built in 1927 in which aluminum was used for all metal work except the underframes. The total weight of the car is 27,670 lb. and the weight saved was 2,618 lb. These cars have been in city operation for one year in Minneapolis and St. Paul. The condition of the aluminum is satisfactory with no indication of corrosion.

Pittsburgh Railways has two trucks, built in 1927, with aluminum used for all parts except the arch bars. The total weight of each truck is 1,100 lb. and the weight saved was 856 lb. These trucks have been in service for one year under street cars in Pittsburgh. The condition of the aluminum is satisfactory with no indication of corrosion.

Commenting on the future possibilities of light metals, the speaker said that the only means of producing structural sections in aluminum and its alloys up to the present time has been by the exclusion process, by which only small sections have been available. It is expected, however, that in a mill now under construction it will be possible to produce large structural plates by rolling, and in the not too distant future to be able to roll a channel 85 ft. long.

News of the Industry

Buffalo Fares Before Court

Federal Judge John R. Hazel in United States District Court at Buffalo has reserved decision on the application of the International Railway, Buffalo, for permission to amend its bill of complaint filed in 1926 to increase its fares in Buffalo, Niagara Falls and Lancaster. The court also reserved decision on the counter motion of the city of Buffalo to dismiss the original complaint on the grounds that it is not within the jurisdiction of the federal courts and should be referred to the New York State Public Service Commission.

Henry W. Killeen, appearing as counsel for the railway, told the court that the action was brought into the Federal District Court mainly because the Public Service Commission had previously refused to make a valuation of the company's property. He charged that the utilities board had done this in face of adverse decisions of the Supreme Court. The company also contended that the present rates of fare are confiscatory and under the constitution it has a right to bring its case before the federal court rather than before a regulatory body like the Public Service Commission.

The International Railway seeks to charge a 10-cent fare on local lines within the city of Buffalo instead of the present fare of three tokens for 25 cents, and to increase local fares in Niagara Falls and Lancaster from the present rate of 5 to 8 cents, with two tokens for 15 cents.

Russell B. Burnsides, representing the Public Service Commission, opposed the efforts of the railway to bring the fare case into the Federal District Court. He pointed out that since the original complaint was filed with the utilities board, fare increases have been granted in Tonawanda, North Tonawanda and Lockport. He said that as far as Buffalo is concerned the commission has granted the company an increase and this higher fare has been acceptable to the company and that no application has been filed by the company with the commission to review the need for another fare increase.

Hearings on Electrification in Atlanta Expected

One hearing has been held in Atlanta, Ga., on the proposed electrification of main trunk line railroads now operating into that city and others are to be held in the near future by the bridge committee of the Atlanta City Council. Representatives of railroads and interested citizens are to be permitted to present their views on the ordinance intended to eliminate the smoke nuisance in the downtown section. Electrification of the roads in the downtown section has been under consideration for some time. It is hoped that some tentative plan will result from the present conferences.

Rochester Line Reduces Price of Books

The Rochester & Eastern Lines of the New York State Railways, Rochester, N. Y., has announced reductions on the suburban line. The reductions concern both the 54-trip commutation books, which are good for 32 days, and the 46-trip school ticket books, which are good until used except during the months of July and August. The proposed reduction will effect a saving of from $1 to $20 per book. The change in commuters' rates is an experiment and the volume of traffic under the reduced fare will be checked to see if commuters actually take advantage of the cheaper rates.

Without Jurisdiction to Approve Purchases

The item was in error which was published in ELECTRIC RAILWAY JOURNAL for Oct. 27, page 778, to the effect that the Ohio Public Utilities Commission had ruled that no contracts involving the lines of the Youngstown Municipal Railway may be entered into without the approval of the local city street railway commissioner. As a matter of fact, the issue did not come before the commission, and it has no jurisdiction over such matters, which under the home rule situation in Ohio come under the jurisdiction of the City Council. Neither was such decision made by any court, commission or official of competent jurisdiction.

The issue was raised by the local street railway commissioner at Youngstown before the City Council and was referred by that body to the City Law Director and the Council's railway committee. The Law Director at the meeting of the Council on Oct. 29 rendered a written opinion in which he ruled that the city street railway commissioner did not have authority to approve purchases.

The Youngstown Municipal Railway franchise in Youngstown does not give the commissioner any such right to approve purchases and the commissioner has never exercised any such prerogative. To do so would, of course, place the commissioner, a political appointee, in the position of purchasing agent of the company without any responsibility to the management or to the owners.

Final Plea for Approval of Omaha Franchise

The proposed franchise for the Omaha & Council Bluffs Street Railway, Omaha, Neb., will be voted upon at the general election on Nov. 6. The terms of the franchise were agreed upon after long study by the city commissioners and the city's corporation counsel. The franchise in full is being published as a paid advertisement in the newspapers so that every phrase and every clause and every sentence can be studied at leisure. In a final word on the matter the company says:

In every way, the people of Omaha have been safeguarded and their rights preserved. The company is content with the terms, provided the franchise is approved, for approval is needed if the railway of Omaha is to be permitted to extend its financing and develop its property.

We have been told by many people that our efforts to make the service suit the needs of the city, our efforts to give courteous, efficient, regular tramway service, are appreciated. We believe that an efficient railway system is one of the biggest assets a city can have.

We know that traffic and transportation engineers agree that trolleys cars propelled on fixed routes over steel rails must ever be the backbone of any city's transportation system. We know nothing comes so near the daily routine of the worker and the shopper as the street car.

We ask Omaha to approve the proposed franchise. We pledge Omaha, at all times, the very best street car system it is possible to give; the best, the safest, the most courteous, the most efficient.

Reference is made elsewhere in this issue to the free bridge proposal before the voters.

Riding Holds Up in Hamilton

Three months' experience with a higher fare in Hamilton, Ontario, has shown no decrease in patronage, according to the Canadian *Financial Post*, which recently described the fare and jitney situation in the city. The railway, operated by a subsidiary of the Dominion Power & Transmission Company, was authorized in a recent finding of the Ontario Railway & Municipal Board to provide for a cash fare of 7 cents, four tickets for 25 cents and children's fares at ten tickets for 25 cents and to provide a new wage scale. Reference was made in these pages at that time to another live topic, the jitney. A lower court had declared that the jitneys were operating illegally and that pending the findings of this court on an appeal they continued to operate. The Dominion Power is contending that it has an exclusive franchise for carrying passengers, other than in taxicabs, within the city limits. Meanwhile the jitneys continue to operate.

New Fare Schedules on Schenectady Line

A new joint passenger tariff for the Schenectady Railway in connection with United Traction Company and Capitol District Transportation Company, Inc., provides for sale and use of a twenty-coupon school ticket good between Schenectady and Albany, N. Y., and between Schenectady and Troy for $5. It also provides joint ticket fares of 50 cents one way and 84 cents round trip, between Schenectady and Albany and between Schenectady and Troy.

At the same time the Schenectady Railway has had cancelled its joint 50-trip commutation ticket fare in connection with the United Traction Company and Capitol District Transportation Company, Inc., between Albany and Schenectady, Stanford and Van Heusen and between Troy and Schenectady, Morgan Avenue and Niskayuna. These changes are effective Nov. 18, 1928.

Provision has also been made on the Schenectady Railway line for sale and use of a twenty-coupon school ticket book, good between Schenectady and Ballston Spa for $5, and a like book between Schenectady and Saratoga for $7. New ticket fares effecting reductions from cash fares are in force between Schenectady and Ballston Spa, and between Schenectady and Saratoga. The time limit on commutation tickets (50-rides) has been changed from 30 to 60 days from and including date of sale.

San Francisco Protests Trade Commission's Act

The Federal Trade Commission, through its local representatives in San Francisco, Cal., has requested the Citizens' Transportation Committee to open its campaign receipts and expenditures to their inspection. This request has been denied. Furthermore, President Coolidge has been requested by the San Francisco Chamber of Commerce to direct the Federal Trade Commission to confine itself to matters over which it has jurisdiction and not to interfere with the local political battles. The president of the chamber declared that the commission's action in directing its local agents to inquire into the activities of the Citizens' Transportation Committee and the various organizations sponsoring charter amendment No. 24 is "strongly and widely resented." The president, Mr. Fay, said:

This demand of the Federal Trade Commission has been given wide newspaper publicity here for purely propaganda purposes. We wish to protest to you this interference by an agency of the federal government in a matter of a local election on a question of purely local concern to San Francisco. The attempted interference by the Federal Trade Commission in a matter that does not concern the federal government in any way is strongly and widely resented. We accordingly request that appropriate action be taken to direct the representatives of the Federal Trade Commission to confine themselves to matters over which the Federal Trade Commission has jurisdiction.

Vice-President Burt Hamerstrom of the Market Street Railway, in answer to Supervisor Havenner's statement that the company's expenditures for advertising and publicity had jumped from approximately $5,000 in 1925 to $70,000 in the last year, freely admitted the figures. He said:

When the present régime took over the direction of the Market Street Railway, it was agreed that the receipts must be increased. Two ways naturally suggested themselves. The first, to raise fares, was rejected as it might have resulted in a decrease because of public resentment. The other method was adopted. This plan is simply to sell our service. We realized that to get satisfied patrons we must give good service, so considerable money was expended on improvements, elimination of rough crossings, new easy riding cars and other things. Then we used the newspapers to tell the people about it. We also advertised in our cars. The results have proved that we adopted the right method to sell our service to the public. Not one word of politics has been printed in our advertisements.

Popular Selling Appeal in San Francisco

Approximately 11,000 persons are now using the Sunday pass

Commission Receives Demands of Indianapolis Men

Union employees of the Indianapolis Street Railway, Indianapolis, Ind., carried their demands for increased pay and changed working conditions to the Indiana Public Service Commission on Oct. 24, through their attorney Frank P. Baker. The employees, members of the Amalgamated Association, ask for a basic wage of 56 cents an hour, instead of the present 40 cents an hour. Under the present agreement the carmen receive the base pay for the first year and and increase of 1 cent an hour each year for five years, when the maximum pay of 45 cents is attained. The demands are for 56 cents for the first six months, 58 cents an hour the next six months and 60 cents an hour for all periods over one year of service.

The demands were presented first to James P. Tretton, superintendent of the company, and then to Joseph A. McGowan, acting president, both of whom rejected them. Mr. McGowan informed the representatives that the company's earnings did not justify a salary increase at this time.

Taxi War in Muskegon

Muskegon has been added to Cleveland, Columbus, Louisville, Washington and other cities in which taxi companies have warred among themselves or cut prices and sometimes done both. Three weeks ago a local company appeared on the field to contest with the Yellow cab, formerly the only servce in the city. The new company announced a unit price of 25 cents anywhere in Muskegon, 50 cents to Mukegon Heights or North Muskegon, and 75 cents to Lake Michigan Park. The Yellow cab was forced to meet the competition, coming down to 20 cents for Muskegon and cutting to the competitor's scale to other points. On Oct. 25 the Checker Cab Company entered the fray at 20 cents for Muskegon and 5 cents lower to the other cities than the scale above. There is no charge for extra passengers, so workmen band together, call a cab and are driven to work for about 5 cents each. Mothers send children to school via cab, and one company is using the cabs for errand service.

Indiana Commission Starts Its Stand on Mergers

The Indiana Public Service Commission issued a statement recently seeking to justify its stand against the merger of certain utility properties during the last few months. The statement said:

The commission has no hesitancy in saying that if the public is to be protected against undue and unreasonable rates, greater scrutiny must be given in the future to purchase and sales and consolidations. The commission believes that the present tendency toward consolidation of purely local utilities into larger corporations in many instances is adverse to public interest. The commission believes that close local contact with the controlling authorities of utilities is more conducive to good service and reasonable rates.

The commission is of the opinion that utility rates generally are too high. It is determined to remedy this situation. The commission insists on its lawful right to approve or disapprove matters that come before it for sanction in the light of all evidence which it has, bearing on such matters.

Speculation in utility properties within this state has been very pronounced in the last few years. It is very clear to the commission that the tendency to inflate purchase and sales prices of utilities is a result of undue speculative activity. Purchase and sale price is used as a basis of security issues and becomes a factor in establishing fair value, which in turn determines rates. The commission cannot hope successfully to control rate making or the issue of securities if the present speculative activity among utilities is not more effectively controlled.

Digitized by Google

Oftentimes unreasonable prices are paid for utilities. So long as valuations, security issues and rates keep pace with advancing purchase and sale prices, this practice will continue. A process of this kind is clearly adverse to public interest. The control of such matters is delegated by law to this commission. This commission feels it to be its duty to curb undue speculation in utilities within this state.

Committee on Unification in New York

The first concrete action on the transit unification plans proposed by Samuel Untermyer, special counsel for the New York Transit Commission, and Comptroller Charles W. Berry was taken on Oct. 23 by the Board of Estimate when Mayor Walker announced the appointment of a committee to study the projects and report to the board in four weeks. The committee consists of the Mayor, Joseph V. McKee, president of the Board of Aldermen, and Mr. Berry.

The Untermyer plan was submitted to the Board of Estimate last July. The Berry plan was made known in January.

Following are the main features of the Untermyer proposal:

Municipal ownership, with 5 cents as the "basic" fare.

Operation of the unified lines by a public corporation to be organized and owned by the city.

Existing lines to be acquired and new lines to be built with the bonds of this corporation, to be tax exempt and to be secured by a requirement that the fare must be raised if no other way of earning carrying charges can be found.

Existing lines to be acquired either by purchase or recapture, but probably by purchase of the B.-M.T. and recapture of the I. R. T.

No surface lines or buses included.

The directors of the corporation to be four city officials ex-officio and fifteen members appointed for ten-year terms, to escape political influence.

By use of corporation bonds instead of city bonds, the debt limit would be freed of the subway burden and the city left free to use its credit for building schools, etc.

The feature of the Berry plan which aroused greatest interest at the time of its proposal is the provision for a three-year trial of the 5-cent fare, with a referendum on the question after that period, if necessary. The plan would abolish the present Transit Commission and would set up a new transit authority similar to the Port of New York Authority to take over the unified system and lease it to an operator.

The plan provides that the transit authority shall consist of five or six commissioners to be appointed by the Mayor with the approval of the Board of Estimate. The new Authortiy would be expected to bring about the unification within a year. The plan provides also for limitation of the profits of the operating company and for ultimate ownership of the transit lines by the city when the securities listed in payment of the properties of the B.-M.T. and the Interborough, in case they shall have been purchased, have been retired.

Division of McGraw-Hill Executive Leadership

James H. McGraw continues as chairman of the board. Malcolm Muir elected president. Changes, in line with current expansion, take effect at once

RECENT growth and expansion of the McGraw-Hill Publishing Company have led to action by the board of directors, it was announced on Nov. 1, separating the offices of chairman of the board and president of the company, both of which have hitherto been held by James H. McGraw. Under the new plan of organization Mr. McGraw will continue as chairman of the board. Malcolm Muir, formerly vice-president, has been elected president of the company and chairman of its executive committee. James H. McGraw, Jr., vice-president and treasurer, has been elected vice-chairman of the board and chairman of the company's newly-created publishing committee.

©Bachrach

Malcolm Muir

Through merger and purchase in recent months the McGraw-Hill Publishing Company now comprises nine subsidiary and associated companies publishing business and industrial magazines, engineering books, catalogs and directories. Twenty-four magazines serving ten fundamental industries and covering business broadly are published at such widely distant points as New York City, Chicago, San Francisco and London. The direct effect of this coordination of related publishing interests will be to enhance publishing facilities for the group as a whole beyond those which any single paper or lesser group might enjoy. At the same time, the official announcement of the board of directors points out, these developments have greatly multiplied executive responsibilities and have necessitated a readjustment of the administrative duties of the company's principal officers.

Mr. Muir will be the chief executive of the McGraw-Hill Publishing Company, with full authority and responsibility for the operation of the company's business. He has been with the organization for the past 23 years and has been identified with many phases of its activities. During the past ten years particularly he has taken an active part in each step of the company's growth. He has been a leader in the work of the Associated Business Papers, serving as president in 1925-1926, and has been an important factor in raising the publishing standards of the business papers.

$1,200,000 Duboce Tunnel Opened in San Francisco

A celebration marked the official opening of the Duboce Tunnel on Oct. 22 and the inauguration through it of street car service over the new "N" line of the San Francisco Municipal Railway. Construction on the project had been under way since June, 1926.

To Mayor James Rolph fell the honor of piloting the first car. The motorman's cap he wore was more than a decoration. It was a badge of performance, for he actually piloted the car without assistance for 1½ hours—down Market Street from Duboce Avenue to the ferry, back through the tunnel and down to the ocean. His conductor, also garbed in regulation carman's attire, was Mrs. Minnie White.

The tunnel is approximately 4,200 ft. long, is double tracked and has a width of 25 ft. It was built at a cost of $1,200,000, while the car line cost an additional $600,000.

Eight Cents Authorized in Shreveport

In a decision handed down on Oct. 19 the Louisiana Public Service Commission denied the 10-cent fare rate requested by the Shreveport Railways, Shreveport, La., but authorized an 8-cent rate which is an increase of 1 cent over the present rate. The new ruling requires the company to sell books at the rate of eight for 60 cents, or 7½ cents each. Fares for children are retained at 3½ cents instead of the 4-cent rate requested.

The order terminates an issue which dates back to February, 1928, when the company applied to the commission for a 10-cent cash fare with a weekly permit card, three tickets for 25 cents and 4 cents for school children. After

Digitized by Google

several months characterized by inaction, injunction hearing, adjournment and continuation the attorneys requested the United States Court to grant a further extension until Sept. 17 to give the commission sufficient time to consider the petition.

Capt. H. B. Hearn, president of the company, announced some time ago that the company's net earnings last year were $69,634 "on a property investment valued by eminent utilities engineers to be $2,804,884 at a minimum." After noting deductions of $51,037 for interest on borrowed money, the statement continues, the company had $18,597 left for improvements or to apply to dividends.

The various steps in this situation have been covered previously in these pages.

Jitneys Driven Off Detroit Streets

Jitney operation on streets in Detroit, conducted for the past six years under the protection of a series of injunctions, has been terminated by the police department acting under a decision of the Michigan Supreme Court. The jitney ordinance was signed by Mayor Couzens on May 29, 1922. It became effective the following October. On Oct. 24 the Michigan Supreme Court, in a majority opinion, upheld the validity of the ordinance and indicated that further legislation aimed to delay enforcement would not be tolerated. The ordinance in question prohibits the operation of jitneys on Fort Street East and West, Michigan Avenue, Grand River, Woodward Avenue, Jefferson Avenue, Cass Avenue, John R. Street and the parks and boulevards.

In order to provide transportation for passengers who formerly used the jitneys all available street cars and buses belonging to the municipal system have been thrown into service and buses and cars have been rented from the Eastern Michigan Railways, formerly the Detroit United Railway. Moreover, 30 street cars and trailers have been rented from the Cleveland Railway. They were run to Detroit over the connecting interurban lines.

The Supreme Court's opinion was handed down on the city's motion to dismiss the bill of complaint of the Red Star and the Blue Ribbon Jitney Drivers' associations. The court also took up the city's appeal asking for a writ of mandamus to compel Circuit Judge Clyde Webster to dismiss his injunction under the protection of which the jitneys were operating. The court opinion stated that with the dismissal of the bill, the injunction based upon the bill goes down with it. The order dismissing the writ was signed by Judge Webster when presented by the Corporation Counsel, leaving the city free to enforce the ordinance.

Edward N. Barnard, counsel for the jitney drivers throughout the long fight against the city, stated that the members of the jitney associations were willing to submit to any reasonable regulation. to operate under the direction and control of city authorities, to furnish any bond or surety and to comply with all requests of the city.

Del A. Smith, general manager of the municipal system, said there may be places in the city where supplemental service will be necessary. It is expected that within a week or so surveys will be completed indicating just where help is needed.

The first of the 50 new street car type buses which are being purchased from the American Car & Foundry Company, Detroit, will be delivered within a week and will be put into service immediately.

A de luxe bus service is being planned for Grand River and Woodward Avenues by the Street Railway Commission. It is expected that the first of a fleet of 30 16-passenger Graham-Paige buses, will soon appear on these lines. These buses were ordered by the commission after the jitneys were driven off the streets. No standing passengers will be permitted. The rate of fare to be charged on these buses has not been determined.

More Moves in Chicago Negotiations

City and company engineers disagree over financial set-up in proposed ordinance. Another suggestion made by Lisman group

REPRESENTATIVES of the Chicago Surface Lines and the Chicago Rapid Transit Company, meeting during the week ended Nov. 3 with the City Council's local transportation sub-committee, agreed to revise the financial estimates recently submitted by company engineers in the negotiations for a new unified transit ordinance. The estimates of the engineers were interpreted by the Aldermen as making necessary a fare of 11½ cents on surface and elevated lines by 1948 in order to yield the companies the return which they are asking.

As estimated by Major R. F. Kelker, Jr., the subcommittee's engineer, in the tentative draft submitted to the companies a few weeks ago, the fare in 1948 would be 7 cents on both surface and elevated lines, under the operation of the proposed ordinance.

New Financial Estimate Promised

When, after hearing the results of Major Kelker's conference with the traction engineers regarding a financial basis for the new ordinance, several Aldermen moved that the city break off all further negotiations with the companies and call in outside capital. Officials of the two systems contended that their engineers had no authority to decide the provisions desired by the companies and promised to furnish a new financial estimate.

The fares which the company engineers held to be essential to meet the desired return and the fares as incorporated in the committee's tentative ordinance, compare as follows:

RATES OF FARE

	Company Plan		City Plan	
	Surface Cents	Elevated Cents	Surface Cents	Elevated Cents
1929	7½	10	7	8½
1935	9½	10	7	8½
1937	10	10	7	8½
1944-48...	11½	11½	7	7

While it is now believed that the companies will accept virtually all of the financial arrangements upon which the committee's franchise plan is based, they will insist, however, in their demand that the return on the capital values of the present companies and on new capital, shall not fall below 6½ per cent, plus one mill for every revenue passenger carried. This stand, Major Kelker pointed out, accounts for the wide difference between the financial plan evolved by the committee and that of the companies. In the committee's set-up the return allowed to the company is 5½ per cent and only upon the initial capital value of the company. A camparison of the two estimates follows:

	Company Plan	City Plan
GROSS RECEIPTS		
20th year	$194,700,000	$119,100,000
40th year .....not estimated		155,850,000
COST PER PASS CARRIED		
20th year	9.15 Cents	5.45 Cents
40th year .....not estimated		5.45 Cents
RENEWALS		
Contemplated Expenditure (20 years) $331,129,000		$129,742,000
Per Cent of present value of property ($258,000,000)	128 per cent	50 per cent
COMPANY'S RETURN		
Total $566,299,000		$336,946,000
Average per year.	28,314,950	16,847,300
CITY'S RETURN		
Total	$48,266,000	$196,675,000
Average per year.	2,411,300	9,833,750
Portion of city's share used for reduction of fares	4,137,000	27,754,000
CAPITAL INVESTMENT		
Initial capital value $258,000,000		$258,000,000
Extensions	235,000,000	235,000,000
Renewals	98,600,000	.....
Totals $591,600,000		$493,000,000

John M. Harlan, attorney for the Lisman group of New York bankers which submitted a plan for a 20-year franchise nearly two years ago, suggested to the local transit sub-committee during the discussion of the respective financial plans that both his clients and the present traction systems be asked to submit in detail the best ordinance that they can on the same day, pointing out that if the Aldermen made it clear that no other plan would be considered after that date each bidder would make every effort to submit a better ordinance than the other. Both of these plans then could be passed on to the City Council and submitted to the voters.

Bridge Line Bought by City

New York to substitute buses for present Manhattan Bridge service. Through service on Williamsburg span

ACQUISITION of the Manhattan Bridge Three-Cent Line by the city of New York was approved by the Board of Estimate on Oct. 25. The price to be paid is $206,760. This is $21,340 more than the franchise and the equipment of the company could have been bought for two months ago, when the outfit was offered to the city at $184,420.

While the board was thinking about the proposition, prompt acceptance of which was urged by Borough President Byrne of Brooklyn, the transit commission ordered improvements to be made on the 3-cent line. The cost of these improvements must now be borne by the city, but they will be removed along with the rest of the equipment to make room for additional vehicular traffic lanes on the bridge.

Representatives of the Brooklyn Chamber of Commerce and the East Side Chamber of Commerce in Manhattan, appeared to oppose discontinuance of the 3-cent line unless buses were to be substituted as soon as trolley operation ceased. The 3-cent line is operated between the Flatbush Avenue Extension in Brooklyn and lower Manhattan over the Manhattan Bridge. It has been indicated that the bridge runway now occupied exclusively by tracks of the railway will be converted to a roadway for motor vehicles thus increasing the vehicular capacity of the bridge, long since exceeded at certain hours of the day.

Mayor Walker promised that buses would succeed the cars, but no action in the matter was taken by the board. The bridge commissioner said he could put on emergency buses until a franchise can be granted for the permanent right-of-way to replace the railway.

Another development of considerable interest was the indication by Bridge Commissioner Goldman that he would soon be in a position to recommend to the Board of Estimate abolition of the local line on the Williamsburg Bridge and the restoration of through service by the Brooklyn-Manhattan Transit Corporation. This through service over the Williamsburg Bridge was discontinued on the day early in Mayor Hylan's administration when the city took over the local bridge line for municipal operation.

Mr. Goldman explained that the Brooklyn-Manhattan Transit Corporation wanted the city to advance $180,000 to meet the expense of a rearrangement of the tracks which would be necessary before through service could be restored, but that thus far he had not been able to agree with President Menden of the railway on that point. Mr. Goldman indicated that he expected some sort of compromise would be effected. For more than five years the East Side Chamber of Commerce has kept up its fight for the restoration of through service over the Williamsburg Bridge. Bankers, merchants and manufacturers were in the group that appeared before the Board of Estimate to urge the Mayor and his associates not to delay the installation of through service.

Mr. Young's Speech Distributed in Baltimore

Copies of the address made by Owen D. Young before the American Electric Railway Association in Cleveland on Sept. 25 have been printed in pamphlet form by the United Railways & Electric Company, Baltimore, and are being distributed by that company. The pamphlets are accompanied by a letter signed by C. D. Emmons, president of the company, who states that in Baltimore the street cars carry 75 per cent. of the people going to and from business. Mr. Emmons says:

Charging the company with the cost of repairing and repaving streets, relics of days when horse cars destroyed pavements, the 9 per cent tax designed to support the parks, once most frequently used by our car riders now used principally by motorists, who pay no park tax—these and other items now charged to the company are of the character of "special charges" which Mr. Young protests should be abolished. They simply increase carfare and prejudice the people against the company, which must collect it.

Mr. Young's general conclusion was that without a proper carfare, cities will have to raise money for transportation indirectly but more expensively—namely, through taxation under public ownership.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Jan. 23-25, 1929*—Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.**

Bridge Controversy in Omaha

The Omaha & Council Bluffs Street Railway appears to be menaced by the action of the courts in Council Bluffs requiring the county board to submit a $400,000 bond proposition to join with Omaha in building a no-toll bridge across the Missouri River connecting both cities. Previously the board had refused. The county board in Omaha had already voted to submit an $800,000 bond issue as its contribution to the cost of the bridge.

In a full-page advertisement in the Omaha newspapers President Shannahan of the Omaha & Council Bluffs Street Railway has offered to sell the company's bridge to the public. He explains what will happen to street car service if the people of the two communities vote bonds to build a free toll bridge. He points out that the Council Bluffs line is merely under lease to the Omaha company. For thirteen years the bridge company was supported by revenues from the Omaha company, and during the last year the deficit in operation of the Council Bluffs company, counting taxes and bond interest, was $111,623. A similar situation now exists with reference to the Omaha company. The net revenues from the bridge alone the first nine months of this year were $231,539, while the deficit from the operation of the lines in Omaha was $100,650, that much less than enough to pay bond interest, without any dividends. The Omaha company pays $60,000 a year rental, and there is a $2,000,000 mortgage on the Bluffs property and bridge.

Mr. Shannahan says that the company recognizes the existence of a strong sentiment in favor of a free bridge, and that it will sell the bridge at its just and fair value. It suggests that the proposition can be handled in one of two ways, mortgaging the bridge tolls and allowing these tolls to pay for the structure until it is made a free bridge. The other would be to have the cities or counties issue bonds. This is objectionable because this would increase taxes on the railway.

He also makes it plain that the Omaha company is merely a tenant and that any sale made must be by the Council Bluffs company, which cannot pass a clear title without the consent of the Omaha corporation. He thinks that if the bridge is bought on a fair price basis bankruptcy can be avoided, but that this contingency is inescapable if a competing non-toll bridge is built. The money from the sale will be divided and used to reduce the interest charges of each company.

Objects to New Service in Ohio

The Lake Shore Electric Railway, Sandusky, Ohio, has protested to the Ohio State Utilities Commission against application of the Moor Trucking Company for permission to operate trucks across Ohio from Detroit to Pittsburg. The railway says it is giving adequate service and that a motor line is unnecessary.

Recent Bus Developments

Ohio Bus Company Restrained by Court

Inter-terminal bus service between Alliance and Sebring, Ohio, a distance of 4 miles, served by the Sebring-Alliance Bus Company, has been terminated since the United States Supreme Court at Washington, D. C., has dismissed a plea from the bus company in its fight for an unrestricted certificate of operation. In this ruling the court sustained the Ohio Supreme Court. The Ohio court has issued its order to the Ohio Public Utilities Commission to revoke the old bus certificate and order operation under the new restricted permit.

Action of the courts and the utilities board is the result of charges made by the Stark Electric Railroad, Alliance, which operates between Alliance and Sebring. The electric railway contended the bus line was operating under an illegal certificate. Investigation resulted in the old certificate being revoked, but immediately the Ohio Public Utilities Commission issued a new certificate without restrictions. The case was carried by the Stark Electric to the Ohio Supreme Court, which ordered the Ohio utilities commission to grant a new certificate which would prohibit inter-terminal service.

The new permit allows the bus company to take on passengers at either the Alliance or Sebring terminals, but they must be discharged before the bus crosses the corporation limits of the other city. Passengers who board buses between the two places can ride to either terminal.

This restriction was opposed by the owners of the bus line. The plea for an unrestricted certificate was carried to the United States Supreme Court, but that request has been dismissed and the state court ordered to enforce its ruling.

Fifteen-Year Franchise for Tulsa Operation

The City Commission of Tulsa, Okla., has adopted an ordinance making effective a fifteen-year franchise voted by the citizens Oct. 17, to the Union Transportation Company and the Berry Bus Line Company. The Union Transportation Company is under the same ownership and management as the Oklahoma Union Railway and these companies and the Tulsa Street Railway furnish street car and bus service in Tulsa. The Berry Bus Line Company supplies bus transportation to sections of the city that are tenanted largely by colored people.

The Union Transportation Company has a total investment of $500,000 in bus equipment. The company operates 80 buses wholly for city service, of which 55 are continually in use. An average of 22,000 persons ride the buses every day.

Buses Will Not Solve Seattle Problem, Says Mr. Avery

Arrangement by the City Council of Seattle, Wash., of another loan of approximately $700,000 from the city light or city water department for the Seattle Municipal Street Railway system has been suggested by Councilman E. L. Blaine, chairman of the finance committee, as virtually the only means of enabling the railway department to meet bond interest and redemption payments due next March. Even this, it is declared, will afford only a temporary solution of the railway system's financial problem, leaving the city confronted by the necessity of working out, within the next few months, a complete refinancing and rehabilitation program for the entire car system.

George B. Avery, superintendent of public utilities, at the invitation of the Council, is now working upon detailed suggestions and proposals for the major program, which members of the Council estimate may entail the expenditure of approximately $5,000,000, and which may involve an extensive reorganization within the railway department as well as in operation of the service.

Mr. Avery said that buses would not and could not solve Seattle's transportation problem. Bus operation in Seattle had proved a poor but very expensive substitute for extended street car lines. The buses already operating in Laurelhurst were paying half the cost of their operation. Not one of the city's bus routes is paying. He saw the problem solved by various extensions to the railway lines, replacement of old rolling stock with new equipment, and general improvement of tracks.

Councilman Blaine said that of a loan of $650,000 made to the street railway department by the city light department about a year ago, all but about $100,000 will have been repaid before March 1, at which time the railway system must be prepared to pay $1,125,025 on bonds and interest. It is figured that current revenues of the system, averaging about $475,000 a month, together with a small reserve now on hand, will take care of operating expenses and provide the amount of money needed in addition to the $700,000 loan which is being contemplated.

Meantime, the City Council utilities committee has denied the petition of Beacon Hill residents for an extension of car service into their district. The Council will hold another hearing in about three weeks on the proposal, but before the time for that meeting it hopes to figure out a way to improve the service.

Indiana Cities May Regulate Buses

Right of the city of Muncie, Ind., to control bus operation within its corporate limits has been upheld by the Indiana Supreme Court in a recent decision. The case was sponsored by Sumner B. Denny and a group of independent bus operators, with Arthur W. Brady, president and receiver for the Union Traction Company of Indiana, as defendant. The decision ends a protracted controversy between the railway and the independent bus operators and city officials of Muncie. The railway operates a bus line in the city under a certificate of convenience and necessity issued by the Indiana Public Service Commission.

The railway contended that it had the sole right to operate buses in Muncie, but the independent operators asserted that Muncie came within the purview of section 5 of the 1925 bus regulation law, which provides that cities already having bus service at the time the law went into effect retained control of the buses. Muncie regulatory laws were passed by the City Council there in 1926.

The Union Traction Company obtained an injunction at Muncie to prevent the independents from operating. The Supreme Court decision reversed the lower court's rulings in the matter, which had been decidedly in favor of the railway.

Buys Stock of Pacific Coast Motor Coach

The Pacific Electric Railway, Los Angeles, Cal., has been authorized by the Railroad Commission to purchase all of the outstanding stock of the Pacific Coast Motor Coach Company, amounting to $45,000, and to take over the operation of that company.

Express Car and Local Bus Working Out in Louisville

G. B. Powell, head of the bus department of the Louisville Railway, Louisville, Ky., in commenting on the combination bus and railway service on the Broadway line, by which the street cars became express cars, with local stops made by the buses, stated that the plan had worked out smoothly and was proving successful.

Prior to the recent installation of the bus service 28 motors and 14 trailers were used in handling the peak loads. Today the peak load is handled with 24 motors and 12 trailers, and normal day loads with 14 cars and no trailers. Fourteen buses carrying 29 passengers each are used on the line in making the local stops. The street cars seat 42 passengers.

Fare on buses or street cars is 7 cents, with single or double transfers made, as usual, plus the transfers to and from the buses, and the street cars of the same line.

Financial and Corporate

Broad Street Operation Results in Loss of $304,431

Analysis of the revenue statistics by the city, Philadelphia Rapid Transit Company, and commission experts comprising the Broad Street Subway Conference Board disclosed that the net income of the P. R. T. system had decreased $304,431 during September because of the subway operation. Of that total $200,000 represents the sum paid monthly by the P. R. T. to the city for operating privileges. Added passenger revenue brought into the P. R. T. system through the tube operation amounted to $24,000 plus $1,000 revenue from other sources. Also about $7,500 was saved in operating expenses on the surface system because of riding traffic diverted to the subway. Against the total gross revenue of $136,556 for the line during September, paid by 2,519,356 riders, there stands the $400,000 which the city and P. R. T. meet on an equal basis for fixed charges on the city bonds sold for construction of the line.

The report given out on Oct. 29 states in part:

It is obvious that the brief term of a 90-day lease makes impractical the expenditure necessary and the disturbance to the car-riding public attendant on such a general rerouting as would develop the maximum possible use of the subway, since such rerouting might be entirely reversed if the lease were not extended.

Broad Street subway carried during September 2,519,359 passengers. It operated 361,510 car miles and 27,569 car-hours. The normal week-day service provides a headway of five minutes during the middle of the day and four minutes during the peak hours, morning and evening. During the middle of the day three-car trains are operated, and during peak hours six-car trains are operated. During the present operation when City Hall station is used to somewhat greater proportional extent than will be the case when the subway is extended to South Street, one track has been planked over to supply additional platform space, and operation into and out of the station must be by single track.

Since this condition exists it may not be possible materially to reduce the intervals between trains below that stated. Present timetables call for the operation of 78 of the 150 cars supplied by the city. The reserve is obviously adequate for some time to come. Of the northbound passengers 769,727, or 61.2 per cent of passengers originated at the City Hall station, and 411,414 passengers, or 32.6 per cent, of the southbound passengers originated at the Olney Avenue station, indicating the large preponderance of long riders and through traffic.

The Engineering Committee of the Board was assigned the task of determining the passenger revenues which were brought into the P. R. T. system by reason of the operation of the Broad Street subway. Excerpts from this committee's report have been accepted by the board as expressing with substantial accuracy the passenger revenues which have been brought into the P. R. T. system by reason of the operation of the Broad Street subway.

Mayor Mackey said that the program he has in mind is to continue for two years the experimental operation of the Broad Street subway under lease to the Philadelphia Rapid Transit Company. The present lease dates from Sept. 1, is for three months, at a rental to be paid the city by the P. R. T. of $200,000 per month, plus the operating cost. Provision is made in this temporary lease for its extension beyond Nov. 30 from month to month. Some time in December, it is expected, a new lease for two years will be drafted, based upon the revenue received by the system during the three-months' experimental operation.

Before the expiration of the two-year agreement the South Broad Street section of the subway will have been in operation for almost a year, so that such data as to fares, operating cost and other expenditures will have been more definitely determined for the completed system in Broad Street. The Mayor has fixed Jan. 1, 1930, as the date for opening and operation of the tube south of City Hall to South Street.

Roger Babson Buys Into Boston & Worcester

Roger W. Babson and associates are understood to have acquired control of the Boston, Worcester & New York Street Railway, the successor following foreclosure to the Boston & Worcester Street Railway. At the first meeting of the new board, which was held recently, it was voted to pay the 2½ per cent interest coupon on the 5 per cent reorganization mortgage bonds, which was deferred last May. The company is doing a little better than breaking even and is understood to be earning the interest charges on the funded debt. The outlook for the company's coach line is regarded as favorable.

Loss on San Francisco Municipal $290,326

Total passengers carried 85,281,171. Profit of $44,558 shown before allowing charter comparison charges that put system on a basis similar to private enterprise

FOR the fiscal year ended June 30, 1928, the Municipal Railway of San Francisco, San Francisco, Cal., reports a loss of $290,326 compared with a loss for the year ended June 30, 1927, of $240,228. As in a comparison of 1927 with 1926, most items of expense in 1928 increased over those of the previous year, the total being $3,012,641 against $2,897,905 for 1927. These facts were disclosed in the financial report prepared for and approved by the finance committee of the Board of Supervisors.

STATEMENT OF BUS LINE OPERATIONS OF THE MUNICIPAL RAILWAY OF SAN FRANCISCO

	1928 Total
Revenues:	
Passenger revenue	$109,938
Miscellaneous revenue	29,424
Total revenues	$139,363
Expenses of operation:	
Repairs and painting	$24,857
Tires, including repairs	16,876
Gasoline and oils	21,012
Cleaning, washing and servicing	17,572
Conductors' and chauffeurs' salaries and wages	67,762
Depreciation of buses	27,502
Proportion of general expenses—	
Insurance	17,907
Administrative salaries	8,400
Pension fund payments	4,200
Equipment rental	3,294
Garage rental	3,000
Store room expense	4,787
Stationery and printing	300
Total expenses	$217,472
Loss from operations	$78,109
Add:	
Interest on investment	5,794
Loss on buses retired	12,491
Net loss for period	$96,395

An analysis of the item of $8,894,122 in road and equipment shows a net increase over the previous year of $257,282. Provision for depreciation in the amount of $259,105 has been made during the period under review applicable to those assets acquired prior to July 1, 1927. This provision was calculated at the rate of 3 per cent per annum. At stated intervals during the year there were transferred from the Municipal Railway (operating) fund to the depreciation reserve fund amounts aggregating the sum of $250,921 on account of depreciation provision. Construction work in progress totalled $174,654.

Under the heading "Due from General Fund of City and County of San Francisco" is the sum of $82,123, including $32,152 from the account of the Twin Peaks Tunnel and $48,971 on account of Stockton Street Tunnel. Under miscellaneous accounts payable, amounting to $28,902 are amounts of various invoices received from the Market Street Railway representing charges for a portion of the cost of work done on crossings over the Municipal Railway tracks. These charges have accrued over a period of years during which they have been the subject matter of litigation. It appears that legal opinions indicate these to be proper charges.

The reserve for accidents was $80,296 for the year ended June 30, 1928. This reserve fund was established by ordinance No. 7060 N.S. passed by the Board of Supervisors in April, 1926. According to the terms of the ordinance 2½ per cent of the gross traffic revenue

ANALYSIS OF ANNUAL PROVISION FOR DEPRECIATION AND PERCENTAGES BASED ON COST, MUNICIPAL RAILWAY OF SAN FRANCISCO

Fiscal Year Ended June 30	Provision Gross	For Redemption of Bonded Debt	For Depreciation	Cost of Road and Equipment Amount	Percentage
1913	$24,291	.....	$24,291	$1,660,492	1.463
1914	149,672	.....	149,672	4,307,115	3.475
1915	294,959	$101,000	193,959	5,042,331	3.847
1916	352,075	101,000	251,075	5,396,706	4.652
1917	264,727	101,000	163,727	5,838,791	2.804
1918	425,271	200,000	225,271	6,174,607	3.648
1919	430,543	196,000	234,543	6,578,885	3.565
1920	486,551	196,000	290,551	6,658,817	4.363
1921	516,414	197,000	319,414	6,674,682	4.785
1922	519,266	197,000	322,266	6,802,637	4.737
1923	538,889	200,000	338,889	7,267,837	4.663
1924	571,172	201,000	370,172	7,570,225	4.890
1925	588,308	201,000	387,308	7,992,410	4.846
1926	549,955	151,166	398,789	8,245,407	4.836
1927	247,362	.....	247,362	8,245,407	3.000
1928	259,105	.....	259,105	8,636,839	3.000
	$6,218,568	$2,042,166	$4,176,401		

The difference between the balance in this account and the net provision, as disclosed by the above table, is accounted for as follows:

Net provision as disclosed by table	$4,176,401
Less provision applicable to assets retired:	
Fiscal year ended June 30—	
1921	$2,063
1923	30,650
1924	1,082
1925	4,960
1927	43,649
1928	33,066
Total	$115,472
Balance per books, June 30, 1928	$4,060,929

STATISTICAL DATA MUNICIPAL RAILWAY OF SAN FRANCISCO FOR THE FISCAL YEAR ENDED JUNE 30, 1928

	Total	Per Car-Mile	Per Car-Hour
Passenger revenue	$3,461,859.03	0.3584	3.4645

Total single track mileage June 30, 1928 ..... 74.12

must be set aside in the above fund for the purpose of paying claims for accidents and damages resulting from the operation of the Municipal Railway (other than accidents to employees) and expenses incidental thereto.

Ordinance No. 7060 N. S. provides that 3 per cent of the cost of road and equipment shall be set aside each year to meet all charges arising on account of depreciation of road and equipment.

Since the Municipal Railway is owned by the city and county of San Francisco and has no capital stock, the excess of assets over liabilities represents surplus. In the preparation of this report the surplus account has been subdivided into three groups: (1) that which has been contributed; (2) that which has been deducted from operating revenues for comparative charges for which no liability exists; (3) that arising from operation of the railway. A comparative statement of earnings and other data are shown in the accompanying tables.

Suspension in Ohio Will Affect Many Towns

Residents of more than a score of towns along the line of the Southern Ohio Public Service Company, from Columbus to Zanesville, will be without railway service if that company secures the consent of the Ohio Utilities Commission to abandon its line. Suspension will also mean that the Columbus East Mound Street line, operated by the Columbus Railway, Power & Light Company, will be abandoned. This line has been operated by the latter company through an agreement with the Southern Ohio Public Service Company to furnish the local service required.

The Southern Ohio Public Service Company has been in the hands of a receiver for the past five years. The growing number of autos and buses has greatly reduced its patronage, according to officials, who also point out that the company faces a demand for improvements that would cost nearly $650,000 in Columbus, along the National Highway, and in Newark, Zanesville and at other points.

Further Simplification of Georgia Power Company Structure

Stockholders of the Georgia Power Company have approved an agreement for consolidation of the Central Georgia Power Company, the Central Georgia Transmission Company, the Macon Railway & Light Company and the Georgia Public Service Corporation with the Georgia Power Company. The consolidation agreement, which previously had been unanimously approved by the boards of directors of the companies, will be submitted to the stockholders of the Macon company at a meeting in Macon shortly. The consolidation, if approved, is expected to become effective in about 30 days after it has received the necessary indorsement of the secretary of state.

Net Below Allowed Return in St. Louis

The St. Louis Public Service Company, St. Louis, Mo., had a return of only $757,662 on its investment during the quarterly period ended Sept. 30 according to advertisements inserted by the company in the St. Louis newspapers on Oct. 24. The return is $405,999 less than the amount authorized by the Missouri Public Service Commission on the valuation fixed by the state board. It is approximately 4.5 per cent annually, although the commission found that the company was entitled to 7.14 per cent. Under the commission's return basis the net should have been $1,163,661 on its valuation of $63,500,000 during the quarter.

The advertisements are headed "The Facts About Street Fares and Where They Go" and are in keeping with the company's policy of dealing openly with the people on all questions affecting fares and service. Similar statements are to be published at regular intervals so as to keep the public informed on company revenues and expenditures.

Concerning the fares the company's advertisements state:

Various items have appeared recently in the public press referring to the rates of fare. Representatives of the company have not recently proposed any change in fare. They have stated that a 10-cent cash fare, four tokens for 30 cents, for adults, would probably yield approximately the same amount as the present fare.

The company is not now in a position to state whether there will be any change in car fares, because the required revenue cannot be estimated until the Public Service Commission of Missouri has determined the amount of operating revenue required for wages as a result of the hearings just concluded before it.

The company bases its claim to a quarterly return of $1,163,661 on the valuation as of Jan. 1, 1927, fixed by the state commission plus $1,669,974 for addition and betterments since that date.

Abandonment of Rochester & Sodus Bay Line Approved

The Public Service Commission approved on Oct. 24 a declaration of abandonment by the New York State Railways of the Rochester & Sodus Bay line in the towns of Irondequoit, Penfield, Webster, Williamson, Ontario and Sodus, a distance of about 34 miles. It was found that further operation was not necessary or convenient for the public.

According to the evidence submitted to the commission the number of passengers on the Rochester & Sodus Bay line decreased from 1,708,008 in 1912 to 363,017 in 1927 and 142,179 for the first six months in 1928. Evidence also showed that in 1922 the revenue from passengers was $160,973, while in 1927 it was $92,735. The operating loss for 1927 was $47,486. The company further claimed that if the line were to continue, renewals and replacement to its roadbed and overhead system would require an expenditure of approximately $166,410. Evidence was submitted to show that the earnings of the New York State Railways system were not sufficient to absorb the loss on the Rochester and Sodus Bay line.

Twin City Issue Approved

The Minneapolis & St. Paul Suburban Railway has been authorized to issue $500,000 in stock, all to be taken by the Twin City Rapid Transit Company, in payment of the act of the Twin City in assuming $500,000 in bonds issued by the suburban company in 1899. After a brief hearing the Minnesota Commission approved the plan on Oct. 25.

Denver Net Increased

The directors of the Denver Tramway, Denver, Colo., met on Oct. 25, but nothing was done about a change in the fare. The present rate is 8 cents or two tickets for 15 cents if tokens are purchased. The statement of earnings from January to September shows net of $377,511 after deduction of interest. The total operating revenue for the period decreased $67,843 below the similar 1927 period, but net operating income showed an increase of $22,521 accounted for by economies. Total operating revenue was $3,204,651. Return on the investment of the company fixed by the courts is about 4 per cent against a 7½ per cent return deemed to be necessary under court rulings.

Legal Notes

FEDERAL DISTRICT COURT—*Powers of State Commission Over Fares.*

The Pennsylvania Public Service Act, which empowers a state commission to prescribe fares of street railway companies, does not impair the obligation of contracts even when the original contract with the railway contains a clause limited its fares to a certain amount. [Sambor et al vs. P. R. T. Co., 27F (2d) 406. Also City of Philadelphia ex rel Furey vs. P. R. T. Co. et al. 27F (2d) 439.]

ILLINOIS — *Financial Responsibility for Shift of Track on Viaduct.*

A steam railroad was responsible for keeping in repair a viaduct which was built over its tracks. During extensive repairs to this viaduct, some street railway tracks which were on it had to be transferred from one side of the viaduct to the other and then back again. The expense of this transfer was held to be a part of the general repair of the bridge for which the steam railroad was responsible. [Chicago City Railway vs. Chicago and W.I.R. Co., 162 N.E., 852.]

MASSACHUSETTS—*Railway Not at Fault When Passengers Crowd to Leave or Enter Its Cars.*

A passenger after having left an elevated train was injured on the platform by being jostled by other passengers. The railway was held not at fault in failing to prevent passengers from crowding when they leave or enter its cars in the customary way. Where there is evidence of boisterous or disorderly conduct which should have been foreseen, a jury may find the carrier to have been negligent in failing to prevent it. Testimony that other passengers had been injured at other stations in a similar manner was immaterial, as the only question in the case in point was whether the company had shown negligence to this particular defendant. [Boyd vs. Boston E.R. Co., 162 N.E., 735.]

MISSOURI—*Duties of Guest in Automobile at Railroad Crossing.*

A passenger guest in an automobile about to cross a railroad track is not required to use the same vigilance as is required of the driver, but he is required to use that degree of care that an ordinarily prudent person would use under similar circumstances. In this case the court held that the track, the warning sign, the whistle and the noise of the approaching train were indications that a train would soon be at the crossing, and a word of warning to the driver might have avoided the casualty. Hence, the guest was negligent in not giving this warning. [Cox et al. vs. St. L. and San F. Ry. 9 S.W. (2nd) 96.]

NEW YORK—*Liability of Subway Contractors for Damages to Surface Property.*

A street railway operating over streets under which a subway was being built brought suit against the city for damages caused by interference with its track structure and the operation of its cars. A motion by the defendant to include various subway contractors, because of their responsibility for the conditions complained about was granted on the ground that their contracts with the city covered conditions of this kind. [Eighth & Ninth Avenues R. Co. et al. vs. City of New York et al., 228 N. Y. S., 201.]

OHIO—*Charge on Contributory Negligence Must Be Complete.*

A charge of the court on contributory negligence must be complete, showing both what the duty of the plaintiff is respecting the burden of proof, and what the duty of the defendant is in respect to its burden as to contributory negligence. If the error in such a charge is one of commission, a general exception to it is adequate. If it is one of omission the objecting attorney should suggest what further statement he wants the instructions to include. [Cleveland Ry. vs. McCoy, 162 N.E., 699.]

Personal Items

JOHN A. REICH, formerly chief engineer of the Ponce Electric Company, Ponce, Porto Rico, has been transferred to the Virginia Electric & Power Company. Eldon Tyler has been selected to succeed Mr. Reich. Both these companies are controlled by Stone & Webster, Inc.

GEORGE E. HAGGAS, for the past ten years chief engineer of the Cumberland County Power & Light Company, Portland, Me., has been appointed assistant general manager of that property. Mr. Haggas was engaged in valuation engineering in Michigan prior to joining the Portland company, and for three years before being made chief engineer was occupied in that branch of technical activity on the Cumberland County system.

OWEN KRAFT has resigned as assistant to the president of the Philadelphia Company, Pittsburgh, Pa., to become associated with the recently opened Pittsburgh office of H. M. Byllesby & Company, investment securities. He commenced his activities in his new field on Oct. 1.

ALBERT M. BOYD has been appointed manager of personnel, claims and safety departments of the Philadelphia Electric Company and the Philadelphia Suburban Counties Gas & Electric Company. Mr. Boyd has been in the employ of the United Gas Improvement Company since June, 1901.

J. L. CAMPBELL is appointed acting chief engineer of the Northwestern Pacific Railroad, San Francisco, Cal. This appointment is effective Oct. 26.

OBITUARY

David W. Henderson

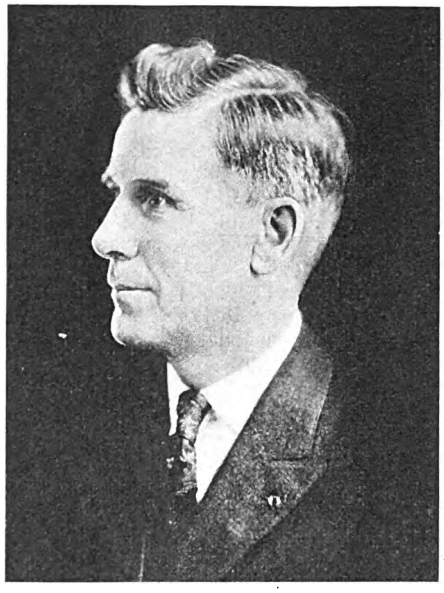
Superintendent of Seattle Municipal dead. Kept road on an even operating keel through storms of public criticism

DAVID W. HENDERSON, superintendent of the Seattle Municipal Railway from the time of its purchase in April, 1919, by the city of Seattle, Wash., from the Stone & Webster interests, died in Seattle on Oct. 27. He had suffered from pernicious anaemia for many months. Not many weeks ago resort was made to transfusions, scores of volunteers from the railway department offering their blood for their stricken chief. He had revived beyond all expectations, and for some time had been thought on the road to recovery. He had been on leave of absence from his duties with the railway since early in June of the present year.

BORN IN SCOTLAND

Mr. Henderson was born in Scotland on Feb. 24, 1873. His parents migrated to Randolph, Wis., when he was eight years of age. Educated in the public schools of that state, he began teaching in the country schools at the age of 18 and followed this occupation in Wisconsin until 1902, when he moved to Seattle.

On April 8, 1902, he entered the service of the city railway lines of the Seattle Electric Company as a motorman and continued in that capacity until early in 1905, when he was promoted to the position of inspector. Other advancements followed until at the time the system was taken over by the city Mr. Henderson was holding the position of superintendent of transportation, under G. A. Richardson, general superintendent of the property who is now general manager of the Chicago Surface Lines.



D. W. Henderson

Mr. Henderson was appointed to the position of superintendent of the municipal lines by Ole Hanson, Mayor of Seattle, who had negotiated the purchase of the street railway lines from Stone & Webster, and he continued in this position under subsequent administrations. Distinguished by his rugged honesty, his poise under trying situations and his keen sense of proportion, Mr. Henderson was credited with having kept Seattle's municipal railway on an even operating keel through the storms of public criticism that have assailed it from time to time since its accession from its former owners.

Mr. Henderson is survived by a wife and three sons, the oldest of whom, David Jr., has just completed high school.

James A. Smith

James A. Smith, superintendent of the Schenectady plant of the General Electric Company for the last fifteen years, died on Oct. 25 at his home in Schenectady. Mr. Smith was endowed with mechanical genius of the highest order and his knowledge of machine tool design and application was unsurpassed. His skill and experience made him a most useful and valuable counselor for any who sought his advice. He possessed unusual executive ability and his acquaintanceship with the employees was of such a kindly and intimate character that he was genuinely loved and admired by them.

His first General Electric position was at the Schenectady plant as assistant to the mechanical superintendent. In a few months' time he was made superintendent of one of the shops. He became general superintendent of the plant in July, 1913.

From 1901 to 1903 Mr. Smith was associated with the Niles-Bement Pond Company, and in 1905 was made superintendent of the Dutchess Tool Works at Fishkill Landing, N. Y., which position he held until he entered the employ of the General Electric Company in 1910.

Mr. Smith was born in Hartford, Conn., on May 25, 1873, and in his youth worked on a farm. In 1888 he entered the employ of Pratt & Whitney in Hartford, Conn., about a year later entering the apprentice shop of that company. He was sent to Chicago to install the Pratt & Whitney exhibit at the World's Fair and, in 1900, was selected to install and demonstrate the company's exhibit at the Paris exposition.

Owen D. Young, chairman of the board of the company, said:

> The death of James A. Smith brings to me and to every one who was associated with him a feeling of great personal loss which is accentuated by the suddenness of the blow. We feel first that we have lost a friend and next that we have lost a competent and highly efficient associate. He was so very human that even his discipline was a delight and, from an organization standpoint, his frankness and directness disciplined those above as well as below, but always with kindliness and charm and, basicly underneath it all, good humor and friendship. How much we shall miss him I need not say, because every person who has come in contact with him knows. I share with his family and with his friends their sorrow at his death.

O. C. Chesney, vice-president and chairman of the manufacturing committee of the General Electric Company, said:

> Mr. Smith was a mechanic by nature and training—a mechanic of the very highest type. His knowledge of machine tools and of their capabilities was unsurpassed by that of any other employee, and it made him for many years a most useful counselor of the manufacturing committee on all questions relating to equipment. He also possessed executive ability of a high order; his activities as an executive being of the direct, human kind.
>
> His premature death is a great loss to the company and a keen personal loss to thousands of individuals.

Volume of Material Purchases Constant

Line market active. Hamilton, Ont., orders twelve cars. One car contemplated by Beech Grove Traction

THE apparent decline in the purchase of track materials continues this week. However, according to reports received from a number of electric railways, there has been an offsetting increase in the purchases of line material and equipment. Louisville Railway, Louisville, Ky., has placed orders for 15 miles of 00 round hard-drawn copper trolley wire, 1 mile of 12-gage insulated iron telephone wire, 215 30-ft. class B Western red cedar ½-in. penetration poles, and 75 30-ft. class B creosoted pine poles. Other line equipment ordered by this company includes two electric switch ground boxes, one right-turn signal for use with electric switch and electric circuit changer, 2,500 ½x4½-in. galvanized lag screws, 500 porcelain strain insulators, 500 galvanized guy clamps, 50 bronze frogs, 500 clinch ears, 300 splicing ears, 500 flexible approaches, 50 center castings and 100 end castings for insulated hinges.

Two carloads of bare wire, 1,800 poles, one carload of insulators, overhead frogs and crossovers have been ordered by the Union Traction Company of Indiana, Anderson, Ind. Berlin Street Railway, Berlin, N. H., has placed orders for 25 iron pole brackets and 100 trolley ears. Poles, wire and line material for a double-end siding have been ordered by the Beech Grove Traction Corporation, Indianapolis, Ind. The Brantford Municipal Railway, Brantford, Ont., has ordered 30 trolley ears.

Track Materials

One hundred tons of 122-lb. girder rail, 120 pairs of 30-in. rail joints and 2,400 1x4¼-in. track bolts have been ordered by the Louisville Railway. The Beech Grove Traction Corporation has ordered 500 ties and special work for a double-end siding. Rail ordered for 1928 by the Union Traction Company of Indiana amounted to 400 gross tons of 70-lb. re-laying type and 100 gross tons A.R.A. 100-lb. rail. Materials ordered by this company include one carload of track bolts, one-quarter carload of tie plates, two cars of spikes, one-half carload of bonds, approximately 50,000 white cedar ties and 25,000 creosoted ties. Brantford Municipal Railway has ordered four kegs of ⅞x4½-in. track bolts.

Five cars of ties for 1929 delivery have been ordered by the Berlin Street Railway. Other equipment ordered by this company includes ten kegs of bolts, ten kegs of track spikes and 1,000 lock washers. The Memphis Street Railway, Memphis, Tenn., is working on an extension of the Jackson Avenue car line from Watkins Street to the L. & N. Railroad. Approximately 1,000 ft. of single track remain to be laid.

Construction Projects

The first major track job to be done by the Dallas Railway & Terminal Company, Dallas, Tex., under the Everman plan will be that on Cole Avenue at a cost of approximately $125,000. It is doubtful if this rebuilding job can be started until about Jan. 1. In view of the repaving of Commerce Street, city officials are of the opinion that the tracks on this street should be rebuilt and repaved at the same time. This construction will cost approximately $138,500.

The Springfield Street Railway, Springfield, Mass., has completed its major trackwork for this year with the finish of its Benton Lawn job. Worcester Consolidated Street Railway, Worcester, Mass., has just completed the reconstruction of 2,300 ft. of track on Lincoln Street and installed a new switch and mate at a total cost of $12,000. Work has been started by this company on the underground conduit line from Chandler Street between Main and Wellington and the track construction is now under way. International steel ties are being used for the first time in Worcester. A new crossover has been installed near Irving Street, and special curves are to be installed at Posner Square and Penn Avenue. Lynchburg Traction & Light Company is repairing tracks in connection with the repaving of Rivermont Avenue. The city of Miami, Fla., has laid 260 ft. of new track on First Street and has graded 150 ft. for a track installation in the extension of Southwest and Third Avenue.

Cars and Equipment

Twelve new cars have been ordered by the Hamilton Street Railway, Hamilton, Ont., from the National Steel Car Company. Beech Grove Traction Corporation, Indianapolis, Ind., contemplates the purchase of one double-truck car and trucks for remodeling another car. This company also contemplates electrical equipment necessary for this new car and has ordered one International 15-passenger parlor coach. The Berlin Street Railway has remodeled one car and has ordered door brackets, step brackets, scraper brackets, posts and panels at a cost of approximately $200.

Brantford Municipal Railway has ordered 2 tons of brakeshoes, and two cases of 36-watt lamps. Louisville Railway has ordered 22 treadle door-operating devices and 22 illuminated signs for the remodeling of 22 Birney safety cars. This company has just received nine Studebaker street car type 21-passenger buses and has on order five Studebaker street car type 21-passenger buses and two Studebaker parlor car type 14-passenger buses. It has also received two Mack 29-passenger buses. The Connecticut Company, New Haven, Conn., has ordered seventeen treadle step equipments.

Midland Utilities Company, Chicago, Ill., is planning a power substation and extensions in line and other improvements at Gary, Ind. Berlin Street Railway has ordered one Westinghouse rotary converter at a cost of approximately $3,000. The Connecticut Company has ordered one compression riveter. Preparations are being made by the Indianapolis & Southeastern Railroad, Indianapolis, Ind., to move its general offices in Rushville, Ind., to the remodeled freight office.

$800,000 Viaduct for Dallas

Construction of levees along the Trinity River between Dallas proper and that part of the city known as Oak Cliff will require the building of a new viaduct by the Northern Texas Traction Company, Fort Worth, Tex., to replace the one which now connects these two parts of the city. The proposed viaduct will cost approximately $800,000. Plans are under consideration by the city commission for joining with the Northern Texas Traction Company in this project so that the viaduct may be for the use of vehicular as well as street car traffic. Although the viaduct will be used by the Dallas Railway & Terminal Company, the cost of its construction will be paid by the Northern Texas Traction Company.

Interborough May Order More Tokens

The first supply of 7-cent tokens has been delivered to the Interborough Rapid Transit Company, New York, N. Y. Six millions of these tokens, which are made of German silver, have been ordered from at least three companies. It is known that the Johnson Fare Box Company of Chicago has delivered the bigger part of its order for 2,000,000 tokens. The other companies, said to have similar contracts, are the Meyers & Wentz Company, Chicago, and the Scovill Company, Waterbury, Conn.

The Interborough Company expects to increase its order to 16,000,000 tokens if the United States Supreme Court upholds its claim to an increase in fare. The tokens are slightly larger than the nickel.

Springfield Track Relocation Approved

The Public Utilities Commission has approved the new location of tracks petitioned by the Springfield Street Railway, Springfield, Mass., in connection with the new road on the Chicopee line, and relocation on State Street, Springfield, from the Commercial High School to Saint James Avenue. The track location on Chicopee line will involve laying rails in the center of the new road with double track from the Bosch magneto plant to the Springfield Rendering plant, and single track beyond.

Buyers and Sellers Adopt Code

That full confidence between both buyer and seller is the greatest need of American business today, was the unity of feeling expressed at a meeting of eminent business executives held recently at the Commodore Hotel, New York City. It was the nucleus of a committee appointed at a conference held last May of representative manufacturers, sales executives, purchasing agents, and business paper editors which had been called by the National Association of Purchasing Agents to consider the subject of "Profitless Prosperity," the responsibilities of the purchasing agent for the lack of profits by many manufacturers, and, if possible, to arrive at a practical and workable solution.

A code, previously prepared by a group of the N.A.P.A. and endorsed by a number of very large organizations to whom it had been submitted, was unanimously adopted. This code or platform of sales and purchasing co-operation is as follows:

Unnecessary sales and purchasing expense is an economic waste, a tax on legitimate industry. Its elimination will assure satisfactory profits to the producer, economy to the consumer, and greater efficiency in commercial relations.

We recognize that the concern which buys must also sell, that buying and selling are companionate functions, that sound commercial transactions must be mutually profitable, and that co-operation between buyer and seller will reduce the cost of purchasing, sales and distribution with consequent benefits to industry as a whole.

In furtherance of these principles, we subscribe to the following standards in our buying and selling.

1. To buy and sell on the basis of *value*, recognizing that value represents that combination of quality, service and price which assures greatest ultimate economy to the user.

2. To respect our obligations and neither expressly nor impliedly to promise a performance which we cannot reasonably expect to fulfill.

3. To avoid misrepresentation and sharp practice in our purchases and sales, recognizing that permanent business relations can be maintained only on a structure of honesty and fair dealing.

4. To be courteous and considerate to those with whom we deal, to be prompt and businesslike in our appointments, and to carry on negotiations with all reasonable expedition so as to avoid trespassing on the rights of others to the time of buyers and salesmen.

5. To avoid statements tending to injure or discredit a legitimate competitor, and to divulge no information acquired in confidence with the intent of giving or receiving an unfair advantage in a competitive business transaction.

6. To strive for simplification and standardization within the bounds of utility and industrial economy, and to further the development of products and methods which will improve industrial efficiency.

7. To recognize that character is the greatest asset in commerce, and to give it major consideration in the selection of customers and sources of supply.

8. To adjust claims and settle disputes on the basis of facts and fairness, to submit the facts to arbitration if a mutual agreement cannot be reached, to abide by the decision of the arbiters, and to resort to legal measures in commercial disputes only when the preceding courses prove ineffective.

9. To provide or accept no gifts or entertainment in the guise of sales expense, where the intent or effect is to unduly prejudice the recipient in favor of the donor as against legitimate competitors.

10. To give or receive no bribes, in the form of money or otherwise, in any commercial transaction, and to expose commercial bribery wherever encountered for the purpose of maintaining the highest standard of ethics in American industry.

Simplified Practice Gains Supporters

Simplified Practice, or the elimination of waste in industry through simplification, gained 1,705 supporters during the third quarter of 1928, according to Ray M. Hudson, assistant director of the Bureau of Standards, in charge of the commercial standards group.

At the end of the second quarter of this year there were 9,754 individual firms and 883 trade associations supporting simplified practice recommendations. At the end of the third quarter there were 11,319 individuals and 1,023 trade associations.

Commenting on this gain in acceptors, Mr. Hudson said, it was "apparent that the consumers were becoming better acquainted with the benefits that result from buying the simplified or standard lines. The simplified line not only gives purchasers better value in the form of improved quality of product, and cheaper prices, but it makes delivery and replacement a simple problem, since the manufacturers can produce for stock, thus insuring a sufficient supply of the commodity will be on hand with the merchants and jobbers."

Weekly Business Conditions

Measured by the value of check payments, the volume of business during the week ended Oct. 27 was somewhat smaller than in the previous week, but showed a substantial gain over the same period of last year, according to the weekly statement of the Department of Commerce. Operations in steel plants showed a slight decline in activity from the preceding week but were on a higher plane than at this time a year ago. Prices for iron and steel continued to show further slight recovery, exceeding for the first time this year the level which prevailed a year earlier. Prices for copper were stronger than in either the previous week or the same period of last year.

The value of new building awards during the week showed a higher daily average than in either the previous week or the same period of last year. Bond prices showed no change from the preceding week but were lower than a year ago. Interest rates for both time and call funds averaged higher than in either the preceding week or the same week of 1927. Stock prices reached a new high level during the week.

The output of bituminous coal during the week ended Oct. 20 showed a decline from the previous week but was greater than in the same week of last year. Petroleum output, though showing a fractional decline from the preceding week, was greater than in the same period a year earlier. Freight car loadings for the latest available week were larger than in the corresponding period a year ago.

WEEKLY BUSINESS INDICATORS
(WEEKS ENDED SATURDAY. AVERAGE 1923-25 = 100)

	1928				1927			
	Oct. 27	Oct. 20	Oct. 13	Oct. 6	Oct. 29	Oct. 22	Oct. 15	Oct. 8

Manufacturing Activity Highest

Manufacturing plants of the nation closed the third-quarter of the year with operations at the highest rate ever recorded by American manufacturing industry in general. Reports received by *Electrical World* on the monthly consumption of electrical energy by some 3,600 manufacturing plants scattered throughout the nation and in various industries indicate that the operations of these plants during September, after corrections are made for the number of working days, were 11.4 per cent over August, 13.5 per cent over September of last year, and 5.4 per cent above the previous high rate of productivity recorded last February. The average rate of operations in the manufacturing plants.

Digitized by Google

during the first nine months of the year was 5.3 per cent above that during the same period last year. This is about 2 per cent higher than the generally accepted normal rate of annual growth in American productive activities.

U. S. Buses Abroad

According to the United States *Commerce Reports,* American buses are scattered all over the civilized world to a great extent. In Aden, the British port of the Arabian Gulf, there are no less than 80 American buses running, which is only five less than are being used in Australia and Tasmania. In the little Azores Islands, 95 American buses are used; 75 are in use in British West Africa; the Canary Islands have 60; and Ceylon 97. Korea has 99 American buses in operation; and China has 92. The Rock of Gibraltar uses 60 American buses; British Guiana, 96; while Guam, and the Philippines each has an even 100. The little British Island of Hong Kong has 78; Iraq uses 50; Mocalla uses an even 100; and so does Tonga; while Palestine uses 93.

Altogether, *Commerce Reports* shows there are 6,084 American buses in use in 119 foreign countries.

New Screw Thread Report

In the interval which has elapsed since the publication of the National Screw Thread Commission's 1924 report several screw thread standards, which were then in the early stages of development, have been completed. Progress and change in industrial methods also have necessitated some revision of the standards promulgated. The second revision of the report of the commission, which is to be known as the 1928 report, has now been prepared and approved for publication. Those desiring to be notified when the report is available may send their names to the commission, at the Bureau of Standards, Washington, D. C.

Coal Conference to be Held

More than a hundred speakers representing twelve countries are tentatively listed to present papers at the Second International Conference on Bituminous Coal to be held under the auspices of the Carnegie Institute of Technology in Pittsburgh, Nov. 19 to 24, 1928, according to a preliminary program announced by President Thomas S. Baker. Major subjects to be discussed, it is expected, will include "Pulverized Fuel," "Gas Production," "Liquefaction and Hydrogenation," "Fertilizers," "Origin, Composition and Classification of Coal," "High Temperature Carbonization," "Combustion in Furnaces," "Purification and Cleaning," "Tars and Oils," and "Low Temperature Processes."

The chief purpose of the coming conference will be to present the results of recent studies of coal that have to do with improved methods of utilization and combustion. The list of speakers includes the world's leading authorities on the latest developments in improved utilization of coal as a source of energy and power.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

	Oct. 30, 1928
Metals—New York	
Copper electrolytic, cents per lb.	15.775
Copper wire, cents per lb.	17.875
Lead, cents per lb.	6.5
Zinc, cents per lb.	6 60
Tin, Straits, cents per lb.	49.25
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.40
Somerset mine run, f.o.b. mines, net tons	1.90

Central, Ill., screenings, Chicago, net tons	0 675
Kansas screenings, Kansas City, net tons	1 875
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.3
Weatherproof wire base, N.Y., cents per lb.	18.625
Cement, Chicago net prices, without bags	2 50
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10 5
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal	$0.5925

Detroit May Build Cars

Mayor John Lodge of Detroit has instructed the Street Railway Commission to proceed at once with the preparations for the manufacture of its own street cars in the municipal shops in Highland Park. According to the president of the commission the department will be prepared to manufacture cars within 90 days, and although it is believed that the first 50 cars will cost in excess of the purchase price, the department will then be in a position to build its cars as cheaply as they can be built any place else. Trailers have been built in the Highland Park shops for several years.

G. Ogden Ellis, president of the commission, cited that the D.S.R. now owns 1,690 cars, 450 of which are now fifteen years old and 125 of which are twenty years old. There are 213 one-man cars.

TRADE NOTES

COPPER-WELD STEEL COMPANY, Glassport, Pa., announces that Lowell S. Monroe, former advertising manager for the Electric Controller & Manufacturing Company, is now a member of the Copperweld engineering staff. Mr. Monroe will be engineer in charge of service data.

ROLLER-SMITH COMPANY, New York, announces the appointment of Wise & Braisted, General Motors Building, Detroit, Mich., as its district sales agent in the state of Michigan.

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., announces the addition of R. W. Piper to its transformer sales division. Mr. Piper will travel the southeast district, including a section of West Virginia and the state of Virginia, North Carolina, South Carolina, Alabama and Florida. This company also announces the transfer of H. D. Epting from its Philadelphia sales office to the Atlanta sales office.

NATIONAL PAVING BRICK MANUFACTURERS ASSOCIATION has moved its offices from Chicago to 1245 National Press Building, Washington, D. C.

E. C. BROWN, who has been connected with the Ohio Brass Company, Mansfield, Ohio, for 21 years, is retiring from active duty and moving to California, which has been his plan for some time.

ADVERTISING LITERATURE

CURTIN-HOWE CORPORATION, 11 Park Place, New York, N. Y., has issued a booklet entitled, "A Technical Discussion on Zinc Meta Arsenite." Zinc meta arsenite is the wood preservative developed by the Western Union Telegraph Company. The booklet is made up of three sections. Part 1 is entitled "Chemical Reaction of Wood Destroying Fungi." This was an address before the American Wood Preservers' Association at Montreal last January by Dr. L. P. Curtin, chemist of the Western Union Telegraph Company. Part 2, entitled "Chemistry and Toxicity Data" was prepared by Dr. Curtin as a supplement to part 1. Part 3, "Weathering and Field Tests," is a paper presented before the American Wood Preservers' Association at Montreal last January by Paul J. Howe, construction engineer, Western Union Telegraph Company.

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., has issued a fourth volume of its book on "Cars and Car Equipment." This issue, known as special publication 1816, includes photographs, floor plans and complete information on equipment, dimensions and service capacity of nineteen modern types of cars purchased during the past year. Copies of this publication may be obtained by writing either to the nearest Westinghouse district office or to the advertising department at East Pittsburgh.

LINCOLN ELECTRIC COMPANY, Cleveland, Ohio, has recently published a supplement to its 160-page textbook, "Arc Welding—The New Age in Iron and Steel." This 32-page supplement is entitled "How to Begin the Application of Arc Welding in Production Manufacturing." The bulk of the text is devoted to the re-design of machinery. In developing the theory of arc welded design many line drawings have been used which show how standard steel shapes are utilized to build up structures which formerly would be cast. Along with these theoretical designs, are shown photographs of similar designs which are in actual use. The Lincoln Electric Company plans to distribute the supplement without charge to all present owners of the parent textbook. Individual copies of the supplement can be obtained at a small charge from the company.

The Nation Shows Good Business Judgment

ONCE again the American public has proved its ability calmly to weigh principles, even in the face of strong appeals to the heart and the emotions. This it has done by overwhelmingly expressing its choice of Herbert Hoover for President of the United States. It admired Governor Smith's qualities of personal magnetism, integrity and courage, but it chose Hoover for President. In that it showed good business judgment.

True, it is probable that tradition, emotion and prejudice played a part in the vote on both sides, but the public had the facts as never before. Never were the issues in a Presidential campaign carried to so wide an audience. For this the radio is largely responsible. It is quite apparent that the new medium of communication permitted the great mass of the American public to judge at first hand between candidates and issues. The result indicates that America's future rests secure upon the ability of its people to sift out of the many phases of a national contest, those issues which are of really vital importance to the country's welfare and continued development.

For the first time since the industrial revolution began to change the character of industry and business, "big business" as such was not an issue. True, one or two big businesses were verbally tarred and feathered for the entertainment of the mob, but it seems quite evident that the voters gave more attention to principles than to fire-works.

In choosing Herbert Hoover as President, the people of the United States have shown that they understand the warning he sounded against the extension of government into business, under whatever guise it may be attempted. They have recognized that social and even moral well-being are founded upon economic health. And they have expressed their determination to continue to build America's future upon the foundation of individual intiative. But they have done more than all of this in that they have chosen to put the affairs of the nation into the hands of an executive who by training, experience and temperament is probably better qualified than any other living man to understand and to deal wisely with the complexities of our delicately adjusted modern economic structure.

Seen Through Bankers' Eyes

CARDINAL NEWMAN, the English stylist, says that the great author is not one who merely has a *copia verborum* and can turn out at his will any number of splendid phrases and swelling sentences, but he is one who has something to say and knows how to say it. This is the test that the report of the public service securities committee of the Investment Bankers' Association meets. It is a lucid presentation. In the space of about 750 words the committee has reviewed the situation of the electric railways from the dark days of 1920 to the present. This discussion of the status of the local transportation industry by a committee of financiers, is of particular interest and significance.

The statement is made that the industry's survival in the face of the difficulties with which it has been beset is proof of the basic necessity of the service which the railways are rendering. The bankers also recognize that the tension between the railways and the public which they serve has lessened materially and they see in this evidence of an improvement in public understanding of the problems of the railways. The bankers see in recent violent public discussions of the fare problem a factor that is bringing many companies out into the light for public inspection, and they express the opinion that the industry has profited by this. The committee takes cognizance of the speech of Owen D. Young at the recent convention in Cleveland. It calls attention to the fact that the remarks of Mr. Young, an international figure, secured national publicity for the idea that the electric railway is an essential industry, that private ownership is preferable to public ownership, that traffic congestion must not be permitted to fetter public transportation, and that fares must be commensurate with the cost of giving service. The bankers say that not even the most optimistic electric railway men believe the industry is out of the woods yet, or anywhere near it, but they are now certain that the fear of extinction was merely a nightmare; that the bottom has been touched and the way is now upward. All this is doubly significant, since these remarks are made by men against whom no charge of special pleading can be sustained—men not prone to exaggeration of statement.

Raising the Entrance Requirements

REALIZATION is growing among electric railway executives of the value of specialized employee selection and training. As the results achieved by scientific selection of new employees become available on those properties that are pioneering in this important phase of management, there is every indication that the employment office may be expected to receive increased attention as a laboratory for raising the standards of public transportation service. There is further evidence that the investment which is being made by some properties in personnel and facilities for specialized training of employees is producing an attractive return in the form of men better qualified for their work. If scientific selection is justified, it must reduce the percentage of misfits on car platforms. Similarly, specialized educational and training activities must have as a definite objective the development of a better-informed, more alert and more courteous personnel.

It was with these general thoughts in mind that the training work of the transportation department of the Milwaukee Electric Railway & Light Company, as outlined elsewhere in this issue, was reorganized early in 1926. The training division was made an operating unit of the transportation department with a supervisor re-

Digitized by Google

sponsible to the educational department for his methods, and to the transportation department for their application. This indicates that the management was well convinced of the value of the instruction work previously carried on in Milwaukee. The present improved and amplified methods of selecting trainmen have shown their worth in the bettered records of new men, as compared with the performance of former recruits. As the caliber of the new employees has been raised, the training division has had increased opportunity for intensive education. No system of training can surmount the barrier established by the intelligence limits of the men available. Therefore, in raising its "entrance requirements" through scientific selection, the company is multiplying the possibilities of its training courses.

That this intensive work of employee selection and training is decreasing the number of chargeable accidents, increasing the equipment-miles operated per pull-in, bettering the record of labor turnover and raising the standards of intelligence and salesmanship displayed by employees, is indicated by the statistics cited in the article this week. The experience of the Milwaukee company parallels that of European electric railways, most of which now conduct extended psycho-technical tests of candidates for employment as trainmen.

Taxi Mortality Attributable to Lack of Regulation

RECENT price wars among taxicab operators in Louisville, Muskegon, Seattle, Columbus, Cleveland, Providence and other cities emphasize again a fundamental weakness of the taxicab business both from the standpoint of the investor and the public. Inadequate financial return to the operator, and inferior service to the public are the inevitable results of unbridled competition in a business which by its very nature should be considered as a public utility. But in most cities the operation of taxicabs falls far below the level of a responsible and well-organized utility service. True, there are well-managed taxi services in some cities, meeting a real need, but by and large, neither the performance nor the history of the business is auspicious. If the financial manuals are to be relied upon, the records of even the larger companies do not show that their earnings have been commensurate with the opportunity that exists for making a fair profit and building a stable industry.

Many elements tend to give the taxi business a high mortality rate. The most important of these is uncontrolled competition, and the conclusion appears inescapable that the recent rate wars are a reflection of financial desperation on the part of the owners. It is this contingency that stands in the way of organization of the taxicab business on a sounder basis, and prevents its co-ordination with other forms of public transportation service. The benefits that would accrue to the public from such co-ordination, in the form of improved organization, better and more reliable service and responsibility of the operator, are illustrated in Philadelphia and Minneapolis, where the railways have gone into taxicab operation. The advantage of co-ordination from the standpoint of eliminating needless duplication, and consequently reducing traffic congestion is apparent.

In the cities where rate wars have been waged among the taxis, the effect upon the railways has not been serious. If they have done one thing more than another, these rate wars have emphasized the need for regulation. Eventually, this must come, and when it does, the taxicab business itself as well as the public will be the gainer. The question of regulation is of primary importance to no other interest. It is probable, however, that the elimination of cut-throat competition in this field would open the way for more widespread co-ordination of this form of service with other public transportation agencies. It is somewhat surprising that responsible operators and manufacturers of taxicabs have not taken the initiative in sponsoring regulation. If they cannot be brought to subscribe to this need, there is little occasion for shedding tears over the spectacle of the increased mortality among the operators.

Analyzing the Cause to Prescribe a Cure

ELIMINATION of street traffic delays is only part of the problem confronting electric railways in providing better service. Study of the countless other causes of delay reveals many ways of increasing schedule speeds and effecting other improvements. Often it is desirable to conduct extensive surveys to discover these causes. Some few companies have staffs which continually are making analyses of conditions with the thought of improving the service.

As evidence of what can be done with such surveys, several important railways have steadily increased their schedule speed without any change in equipment. One company employs as traffic engineers technical graduates who have been thoroughly trained for the work by a development course of several years' duration. These men make thorough analyses from time to time of different lines at critical locations in the city. Their reports include recommendations for improvements, and time-tables which will take advantage of these improvements.

On the theory that delays do not merely happen but rather are the result of definite causes, the traffic engineer will find ways of eliminating, wherever possible, the causes of delay. Many other elements can be investigated, some of which are charged to conducting transportation, while others are due to the physical equipment. Such an investigation may well include handling of passengers at concentrated loading points, supervisory attention given the line, attitude of the trainmen and petty difficulties militating against service betterments. In addition, many phases pertaining to traffic movement may be investigated, as the enforcement of regulations directly or indirectly affecting the movement of cars, the need for special traffic or parking regulations and the efficiency of signal lights or officers at important intersections.

Study of the physical equipment of a line may include the checking of switching facilities, adequacy of energy supply, installation of loading zones, wherever possible, lighting of stopping places, and terminal facilities. Different types of equipment may be found best suited for particular lines, and route changes may make the service more effective.

Many discoveries are made by one on the alert. Changing of methods and equipment require more time and greater perspective than the transportation man can give. They are important to the progressive electric railway. To get the best results specially-trained men are needed to conduct surveys at regular intervals.

"Light Equipment" Move Backed By Our Sister Industry

THE possibilities of securing lighter rolling stock and all the advantages and economies which that means were emphasized at the talk on aluminum and its alloys at the meeting of the Metropolitan Section, A.E.R.A., on Oct. 5. The facts given by the speaker, Dr. Paul W. Faragher of the Aluminum Company, on the extent to which this metal has already been used in steam and electric railway car construction in this country, must have been quite a revelation to many who have not followed recent developments along this line. During the past six years the trunk line railroads have put in operation more than 350 passenger cars in whose construction aluminum alloys are extensively employed for the sake of lightness. Electric roads have built more than 100 cars in which aluminum played a large part.

Significantly, all of the group of 350 cars are in use on lines which are now, or soon will be, electrically equipped. This indicates that the saving in energy required for propulsion was the chief aim sought. Obviously, similar savings would follow the use of lighter equipment in steam service, but it is more evident and more easily measured when electric power is used.

It is also a well-known fact that aluminum alloys have been used in the construction of some of the reciprocating parts on steam locomotives, such as connecting rods, where there are marked advantages in the way of maintenance following the use of light material, in addition to the energy saving. European electric railway and bus companies have also used aluminum alloys extensively in the body construction of their vehicles, though in this case it has been more for side and end sheathing with a wooden frame, than for the framework itself.

That the steam railroads are behind the lighter equipment campaign is highly significant. Operating a heavier class of rolling stock than that used in our industry makes it imperative that the material from which the equipment is constructed should be both highly durable and safe beyond question of a doubt. The field is a fruitful one for study in the direction of reducing car and track maintenance as well as energy costs.

Science and Knowledge No Respecters of Persons

PROF. H. A. OVERSTREET has written a book "About Ourselves." The obvious thing to say, and the true thing, is that professors are always writing books. But in this instance the professor's work compels interest. He differentiates between two types of individuals, the expansives and the contractives. He says that the mind that is predominantly inquiring is expansive. It does not hold itself fixed in dogma or in absolute value. It presses out to the still unknown, "aiming to extend the area of its intelligent comprehension." That, of course, is a little pedantic. But the professor elucidates by saying that "the inevitably distrustful person is a contractive. He holds off others at arms length, refuses them admittance to his councils, and his confidence. He is widely distrustful—of persons, ideas, movements, motives, of the age in which he lives. He is unable to join in with anything or anybody."

The professor had the individual in mind, but the qualities—or the lack of qualities which he enumerates—are not necessarily limited in their applicaton to individuals. An industry or a part of an industry may be predominantly contractive. That industry or that part of it to which this quality applies surely is on its way to obscurity. By and large, the electric railway industry is an expansive industry. It has widened the field for the use of its products. It is adapting itself to changing conditions. It is striving to improve the living conditions of its workers.

Contractive elements within the industry have been and still are in evidence. But there is every indication that those who have acted at times with an eye only to the present are conspicuous by the difficulty in locating them. In other words, the number of contractives has been on the wane for several years. The advice of a diagnostician is not necessary for the individual to determine in which of the classes he belongs—whether he is a contractive or an expansive. If he cannot decide for himself, there is little hope for him in a world in which science and economics, like time, are no respecter of persons.

Dogmatic Standardization Decreases Vitality

STANDARDIZATION has been accepted as essential to the reduction of costs and the elimination of waste in industry. The Department of Commerce, through widespread co-operative effort, has brought about considerable progress in standardization and in the simplification of products and practices. From the design of large power apparatus, down to the selection of types and sizes of screw threads, the possibilities of economy through this process play an important part.

But there is another and even more vital force in modern industry. That is research and the development which results from its application. In a measure the forces of research and standardization are opposed. The former tends to overcome the latter and the latter tends to check the former. In a sense research is dynamic; standardization, static. Research overcomes difficulties, improves the product and extends the horizon of an industry. Standardization conserves resources, eliminates waste and reduces costs. Thus there must be constant compromise between these two forces. Otherwise there is danger of waste on the one hand or stagnation on the other.

When standardization becomes an end in itself rather than merely a means to an end there is grave danger to an industry. When it is permitted to stand in the way of adoption and use of needed new developments, then standardization defeats its own purpose. A recent illustration of this condition comes to mind in the electric railway industry. On a particular property almost the entire organization was sold on the merits of a new device. The engineers of the organization had conducted a sufficient number of tests to feel confident that it would reduce their costs. However, because the chief executive of this property had made almost a fetish of standardization, his subordinates dared not recommend the use of this new product, even though they were convinced that the present part should be replaced with a better one.

Research men claim that the relative vitality of industries may be measured by their attention to research and particularly by the time lag required between the conception and application of a new idea. Dogmatic administration of standardization materially increases this time lag, and thus decreases an industry's vitality.

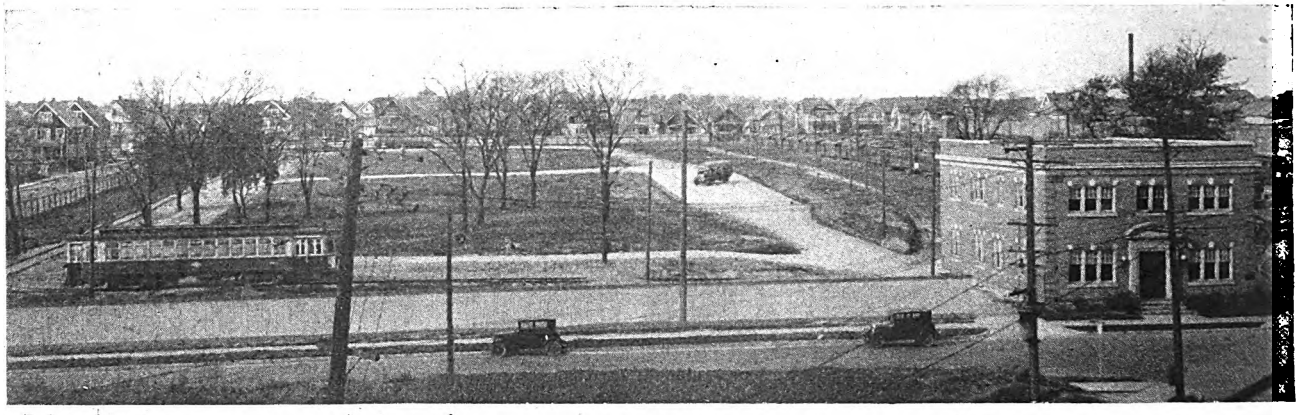
Specialized Employee Training Pays

in Milwaukee

Analysis of car and bus operation records for past five years in Milwaukee show results that amply justify the unusual methods of employee selection and training used



View of the two-story employee training building and the large plot with the oval practice track for motormen and the macadam road for bus drivers

WILL specialized training pay? This question was asked by the Milwaukee Electric Railway & Light Company when it reorganized its training division in 1926. So that definite results from a training program could be checked readily and the question answered satisfactorily, the training department was established as a separate division of the transportation department, and a supervisor of training appointed. This supervisor was made responsible to the educational department for methods of training and to the transportation department for their application. Training work was, in this way, accepted as an integral part of the operation of the company.

Studies were made of the jobs for which training methods needed to be devised. The work ahead was outlined, and the following definite objectives were established:

1. *Reduction of Labor Turnover*—Employing and training new men is always a costly matter. While there are many factors which effect labor turnover, it was felt that if the proper men were first selected for the job and then trained to do it well there would be fewer failures and certainly less dissatisfaction.

2. *Reduction in the Consumption of Power*—With a given piece of equipment, power can be saved only by the operator on the car, and he can reduce the energy consumption only if he understands how to handle the car properly. It was felt that if the operator could be made familiar in a practical sense with the conditions existing in his equipment under various phases of operation, he would be able to judge for himself the methods to employ in conserving power. Rules of "don't do this" and "don't do that" were considered to be ineffective.

3. *Improvement of Public Relations*—With only three written complaints from the public per million passengers carried, it seemed that little need be done to improve the public contacts of the trainmen and bus operators. There was, however, a slightly upward trend in the number of these complaints as the extension of one-man cars was in prospect, with evidences of decided opposition from many sources. It was felt that not only must the men who operated these cars be most efficient, but also that their public contacts must be of the best. Accordingly, definite training plans were organized for this purpose.

4. *Reduction of Accidents*—Accidents are always a problem, especially so in the transportation field. In studying this problem, it was felt that a competent and efficient man is synonymous with a safe one. Definite training, therefore, was planned for the prevention of accidents.

5. *Reduction of Delays Due to Uninformed Trainmen*—A study of road delays and interruptions in service indicated a lack of knowledge of the equipment on the part of the trainman operating it. It was hoped that by means of specific training, information could be supplied to all trainmen to correct this condition.

6. *Reduction of Equipment Failures Through Improvement of Operator*—To reduce equipment failures plans were made to perfect a training corps which would follow up every operator on the system periodically to check his method of operation.

Work could not be commenced on all of these objectives immediately, but a start was made on some, and as facilities for more effective training have been added, organization has been perfected to handle all of these.

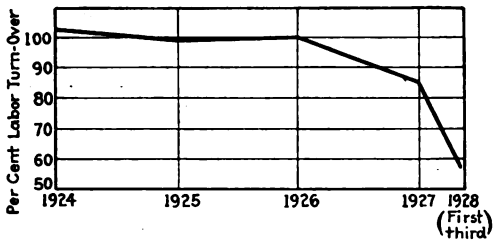

Fig. 1—Labor turnover in percentage of annual turnover during 1924, 1925 and 1926

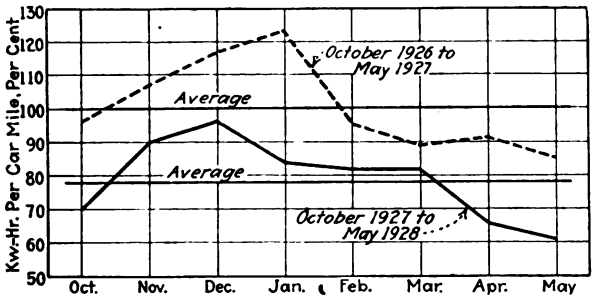

Fig. 2—Reduction in power consumption per car-mile. Instruction in power circuits commenced in October, 1927; hence the restriction of these curves to October-May periods of the last two years

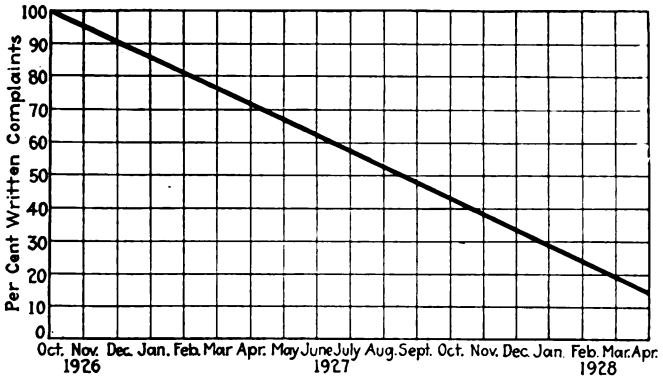

Fig. 3—Monthly average of written complaints per 1,000,000 passengers

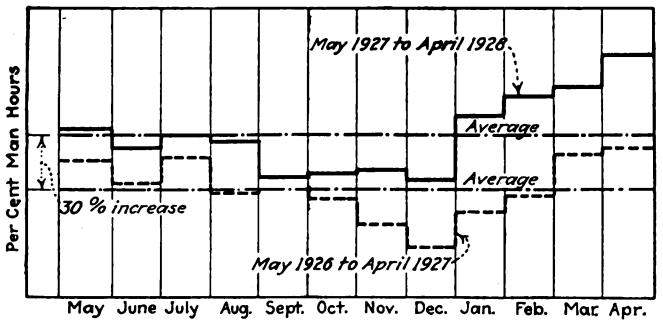

Fig. 4—Increase in man-hours worked per chargeable accident

Statistics relating to each of the foregoing objectives are compiled monthly, and the results are discussed with all those responsible for the training work. The accompanying group of graphs depicts the extent of changed conditions since the inception of the training courses. There is no intention of crediting all the improvement shown to the work of the training division of the company; unquestionably, all departments played a part in the general betterment of service, the improvement of employee morale and the reduction of accidents. Careful analysis of the results with respect to the six objectives outlined by the company shows the actual extent of the progress made:

1. Reduced Labor Turnover—The labor turnover of 1924, 1925 and 1926 was almost constant. As this was the condition at the time of the reorganization of the training work, it is taken as the base, at 100 per cent, in Fig. 1. The turnover has since been reduced to 58 per cent of what it was at that time.

2. Reduced Power Consumption—A course of instruction on the power circuits of the cars was offered in October of last year. This consisted of thirteen one-hour lessons, using equipment described in an article which appeared in the JOURNAL of June 30. Everyone in supervisory positions as well as many trainmen took the course. Systematic follow-up has been an important factor in securing results. The follow-up instructors have been giving particular attention to motormen running too long on resistance points of the controller. The data shown on the graph are for one type of car and are based on an average of 650,000 car-miles per month. The power consumption does not include that consumed by auxiliaries such as heaters and air compressor motors. The average power consumption for the year 1927-1928 has been reduced to about 76 per cent of the average for 1926-1927.

3. Improved Public Relations—It was thought that to reduce the number of written complaints on the railway service to a point below three per 1,000,000 passengers carried would be an impossible task. However, the number of complaints are now less than two per 1,000,000 passengers, with the trend definitely downward. Since 1926, about 60 per cent of the men have been trained as one-man operators. In this training public relations had a very prominent place. Training was given in calling streets, making useful announcements, using standard expressions, and in the handling of unusual situations. All other men on the system were given the same instructions through demonstrations by follow-up instructors.

4. Man-Hours per Chargeable Accident Increased—There has been a marked increase in the man-hours per chargeable accident, or a marked reduction in the number of accidents per car-mile operated. The continued divergence of the curves indicates that the improvement in this respect may well be expected to continue even in the face of increased operating speeds and a more stringent definition of what constitutes a chargeable accident.

5. More Car-Miles per Pull-In Charged to Uninformed Motormen—Schedule delays due to uninformed trainmen have been much reduced. From 1920 to 1926, the car-miles per pull-in remained practically constant. From 1926 to the present, the car-miles for this type of pull-in have been almost tripled. This improvement unquestionably has been made possible by the better facilities for training now available and the improved methods of instruction devised.

6. Reduced Number of Equipment Failures Due to Improper Operation—The reduction in the number of delays due to improper operation of the cars has been very marked. Here again, the car-miles per pull-in for this type of trouble remained about the same until 1926. From 1926 to the present, the car-miles per pull-in of this nature have been tripled. The re-instruction of men for one-man operation, coupled with close follow-up of their performance in service, plus a thorough and systematic course of instruction for repairmen, has influenced this trend for the better.

Experiments in scientific selection were conducted from 1921 through 1923. The use of these selection

Digitized by Google

tests in the routine employment of trainmen was begun in 1925. Proper and thorough training is impossible unless trainable material is available. By furnishing this kind of material, the selection tests have had their influence on the results. Individual analyses also have been made in studying particular trainmen.

It is rather difficult to make a comparison of the selected and unselected railway operators on the basis of discharge records, since in the last year and a half a new policy has been put into effect in the transportation department, which has increased the dismissals for repeated chargeable accidents.

TABLE I—STATUS OF 168 MEN SELECTED DURING 1927

	Number	Per Cent of Total
Discharged (not including accidents)	14	8.3
Discharged because of accidents	9	5.4
Resigned	16	9.4
Failed in training or did not complete practice period	5	3.
Still in service as motormen or one-man operators	124	73.9
Total	168	100.0

TABLE II—RATING BY SELECTION TESTS OF 23 OPERATORS DISCHARGED FOR ACCIDENTS IN 1927

	Number	Per Cent of Total
Ranked above average on selection	8	34.8
Ranked below average on selection	15	65.2
Total discharged	23	100.0
Failed on motorman selection test	6	

TABLE III—REASONS FOR REJECTING MOTORMAN APPLICANTS IN 1927

Reason	Number of Cases	Per Cent of Total
Motorman selection test	45	46.8
Interview only	9	9.4
Conductor tests	7	7.3
Employment department (references, etc.)	18	18.8
Interview and test	17	17.7
Total rejected	96	100.0

TABLE IV—RE-EMPLOYMENT OF TRAINMEN AS MOTORMEN IN 1927

	Number	Per Cent of Tota
Re-employed trainmen who are still in service	30	83.4
Re-employed trainmen who left service*	6	16.6
Total re-employed	36	100.0

*Three resigned and three were discharged.

TABLE V—MAJOR OCCUPATIONS OF MOTORMEN BEFORE ENTERING SERVICE

(Including those who entered service since 1925 and those transferred to one-man operation)

Major Work	Total Employed	Number In Service	Per Cent In Service	Number Out of Service	Per Cent Discharged	Per Cent Resigned
Farmers	161	84	52.1	77	8.7	32.4
Mechanics	157	102	65.	55	8.9	24.2
Garage men	87	49	56.4	38	17.2	21.8
Laborers	48	35	72.9	13	4.2	8.3
Salesmen	27	19	70.4	8	11.1	18.5
Clerks	25	21	84.	4	0.0	16.
Miscellaneous	72	40	55.6	32	5.6	29.6

As shown in Table I the number of new men discharged because of accidents in 1927 amounted to 5.4 per cent. This figure compares favorably with the 2.9 per cent in 1926 and the 0.6 per cent in 1925. Even this figure, which may be charged to the more stringent discipline, is still a little better than one-third of the percentage of unselected trainmen who were discharged for having accidents in 1924 (14.1 per cent).

In 1926 10 per cent of the motormen selected failed in training or otherwise did not complete the practice work. In 1927 only 3 per cent similarly failed, which would seem to indicate increased success in the selection of the men, together with the employment of improved training methods.

Table II gives an analysis of the total number of men discharged with respect to their rating on the motormen selection test.

Table III shows the percentage of rejections for various reasons. Of these rejections, 18.8 per cent were made by the employment department, the remaining 81.2 per cent being made because of failure on the selection tests, the interview, or both.

Likewise, the question of re-employing men who have previously been in the company's service as motormen or conductors was investigated, as shown in Table IV.

A good many of the men desiring to re-enter the railway service had made unsuccessful ventures into businesses of their own; hence it was not surprising to find

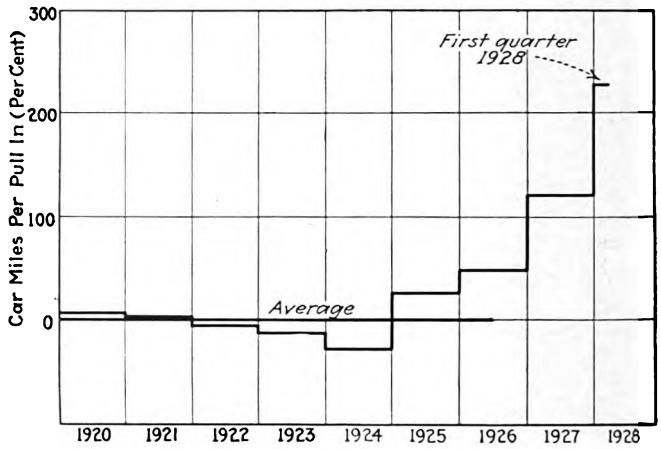

Fig. 5—Increase in car-miles per pull-in due to any cause

that when reinstated, these men were more permanent as a group than new men.

No great difficulty has been experienced in preparing regular trainmen for one-man operation. Of 111 men considered for transfer, five were rejected and 106 were given the test. One failed to pass the test and another

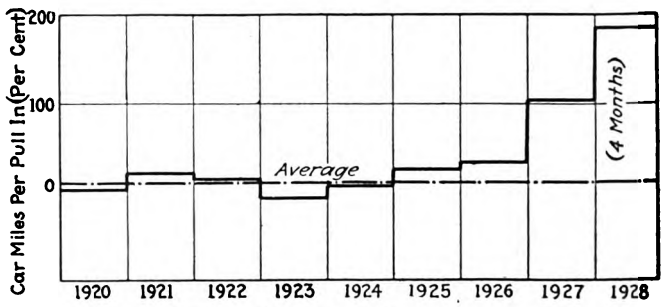

Fig. 6—Increase in car-miles per pull-in due to controller trouble

was recommended as a borderline case, so that of the 106, a total of 104 passed.

Another study concerned the major occupations of motormen before entering railway service, including those transferred to one-man operation. The results of the study are given in Table V.

Apparently the largest number of men are those who have had farm, mechanical, or automotive experience; a smaller number are those who have had sales or clerical experience. If the mechanics and automotive men are grouped together, they constitute the source from which 42.2 per cent of all Milwaukee motormen are drawn. This is contrary to the general opinion that the chief source of supply is from the farm. Of those discharged

Digitized by Google

because of accidents, the farm group is the highest, outside of those classified as miscellaneous, whereas the sales and clerical groups are lower. From the disciplinary point of view, the garage and sales groups show the highest per cent discharged for reasons other than accidents, whereas the clerical is the lowest.

A study was made of car collisions from November, 1926, to June, 1927, inclusive. Fifty-four cases were studied, all being instances where it was definitely known that the car operator had been at fault. Of the 54 men who were observed, 46 had been given the motorman selection test. Sixteen of the tested men had been in service more than a year, and 50 per cent of these had failed on the motorman selection test. Of the 30 tested men in service less than a year, 20 per cent had likewise failed.

All these results show progress toward the accomplishment of every training objective. Were the results to be translated into terms of their monetary value to the company, there is little question but that they would constitute an attractive dividend on the investment in training work and equipment.

Accident Prevention Contest Is Close

AT THE end of eight months, no "probable winner" of the accident prevention contest of the Chicago Surface Lines could be named. Ten of the twelve participating divisions were staging a "neck-to-neck" race for premier honors, and the two lowest divisions were not far behind.

Points are awarded for the lowest number of fatal accidents to passengers and public, the lowest number of fatal accidents to trainmen and other employees, and for the elimination of all types of mishaps. Percentage values have been fixed for the purposes of the competition as follows:

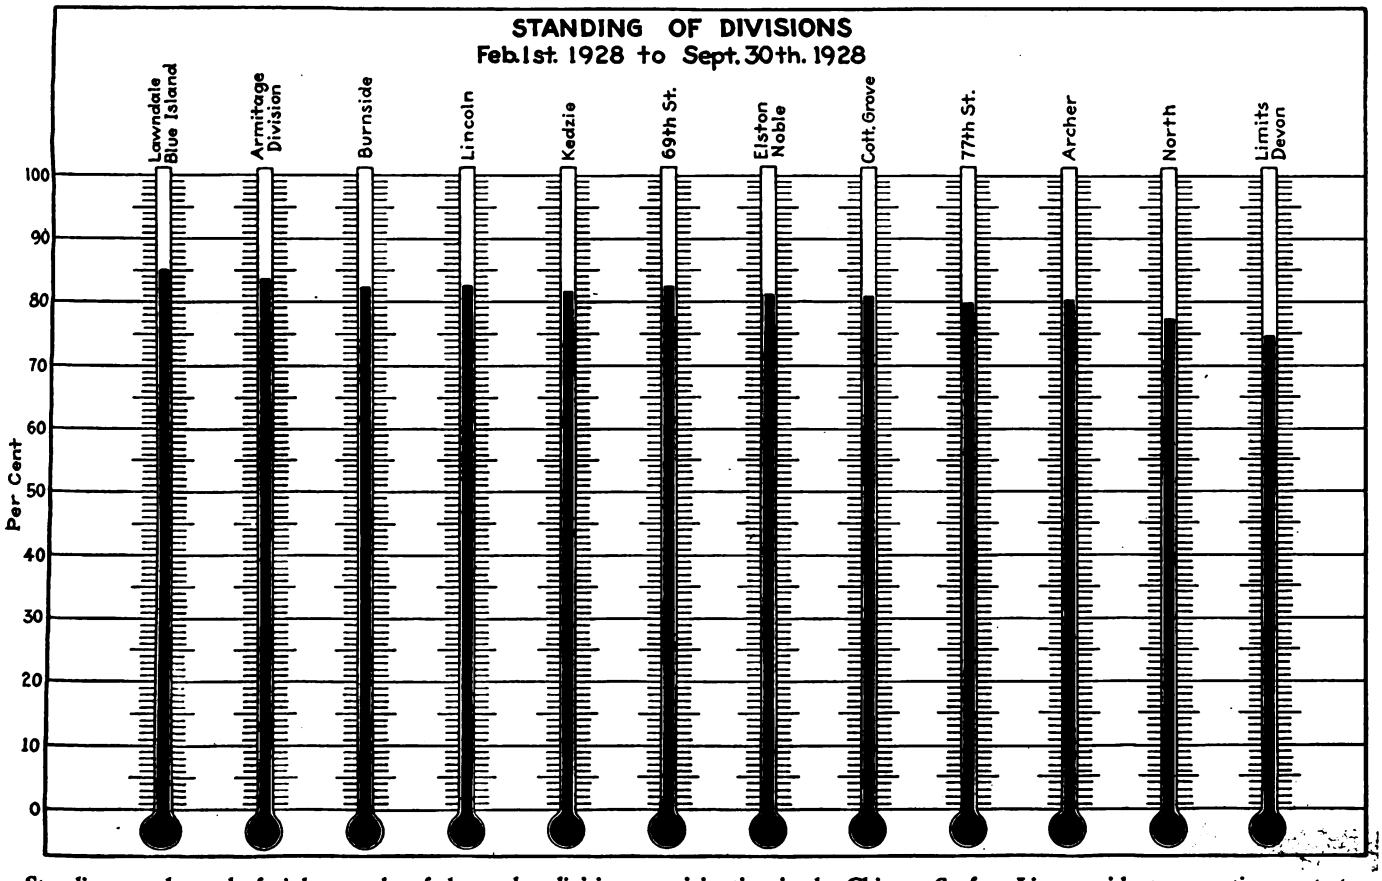
		Points
1.	Lowest number of fatal accidents and injuries to passengers and public	10
2.	Lowest number of fatal accidents and injuries to trainmen or other employees	5
3.	Alighting or boarding mishaps	20
4.	Collisions with vehicles	20
5.	Persons struck by car	5
6.	Collisions of cars	15
7.	Brushed off step (car in motion)	5
8.	Thrown in car by sudden start or stop	5
9.	Employee injured under duty	5
10.	Blind cases	10
	Total points	100

San Antonio Holds Treasure Hunt

THOUGH the San Antonio Public Service Company is a regular patron of the usual methods of advertising its gas, electric and street railway services, it occasionally adds special drives with definite objectives to its program. A most unusual drive to familiarize the public with the routing and general convenience and dependability of its street railway and bus service was carried on during 1927 by the company in conjunction with a local newspaper and a number of merchants. Particulars are given in the company's 1928 Coffin brief.

The drive took the form of a treasure hunt. It appealed to the imagination of all classes, and for many weeks created interest and enthusiasm. The participation of the newspaper brought many columns of first page news items of the progress of the contest, all of which were good publicity for the railway.

During the treasure hunt a full-page display advertisement was used daily, carrying the headline "Follow the



Standing at the end of eight months of the twelve divisions participating in the Chicago Surface Lines accident prevention contest

Digitized by Google

Trolley to Treasure Land." Part of this page was devoted to detailed diagrams of some particular car line, showing the streets, cross streets and the scheduled time of cars at various points at one-minute intervals. The short time required to travel from the business district to various points in the residential district was emphasized in these diagrams.

Clues and general information were furnished in the daily page advertisements and were supplemented by a generous amount of reading matter. Following the clues, treasure hunters made a journey through the company's office and various street cars and found it necessary to visit the stores of merchants participating in the plan. Some made the hunt in automobiles, some walked, and others found it desirable to ride in street cars, but all were forced to familiarize themselves with the conveniences in the transportation system. As a typical example, one of the rules read as follows:

"Count the number of advertisements in a street car, multiply this by the number of turns made by the Army Post bus on its regular routing, add a certain number, and the total will give you the number of a street car that is now in operation on the North Flores line, carrying the treasure."

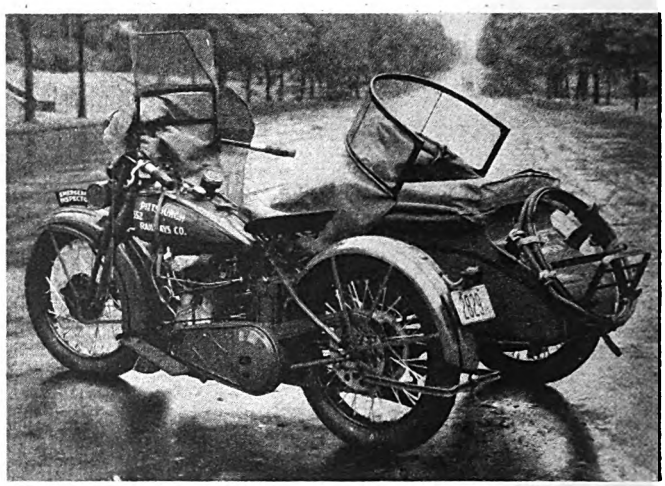
It is very interesting to note that in this instance, more than 50 people solved the problem, stopped the proper car, and searched it from roof to truck.

The weekly prize was $50 in cash, together with merchandise orders of equal value. It was necessary to solve each daily problem to locate the weekly prize. In turn it was necessary to solve and keep the solution to each weekly problem in order to compete for the grand prize given by the company, which was $500. In addition to this, merchandise orders amounting to $350 were included in the final prize.

Motorcycle Emergency Service Proves Effective

By R. C. Rearick
Chief Traffic Dispatcher Pittsburgh Railways, Pittsburgh, Pa.

STUDY of the delays to their system convinced the Pittsburgh Railways that the length of delay could, in a great many cases, be lessened materially if a means, more rapid than the regular emergency trucks, was used. Accordingly, on July 1, 1928, the company purchased six Harley-Davidson commercial type motorcycles with side cars to be used for street inspectors. These machines



Commercial type motorcycles with heavy-duty motors were selected. Note the wire tow cable on the tire carrier

have a special heavy-duty motor with a maximum speed of 45 m.p.h., and are stationed at strategic points about the system. The regular passenger type of side car was selected instead of the commercial body, so that, if necessary or desirable, the inspector can take someone to help in caring for the emergency.

The side cars are arranged for the carrying of all necessary tools and supplies, such as wrenches, hammers, trolley wheels, fuses, coupler links and pins, tape, trolley rope, etc., for the making of emergency repairs to equipment. They also are equipped with a fire extinguisher, trolley wire pick-up, rubber gloves and first-aid kit. The tire carrier on the rear of the side car is utilized for carrying instead of a spare tire, 25 ft. of $\frac{5}{8}$-in. rope center wire cable with detachable hooks on each end, by means of which derailed cars can be pulled back on the rails or disabled vehicles removed from the track.

The motorcycles are in service eighteen hours per day, two men, working separate shifts, being assigned to each machine. The vehicles, when not in use, are kept in company garages convenient to the places at which they are stationed.

During the three months these machines have been in service, they have proven very satisfactory, providing a light, fast, inexpensive, auxiliary emergency service without the loss of the inspector to the street supervisory force. With these machines, it is possible to quickly dispatch an inspector to any part of the system in contrast to the older method under which the inspector was generally forced to use the street car and often arrived after the emergency had been cleared.

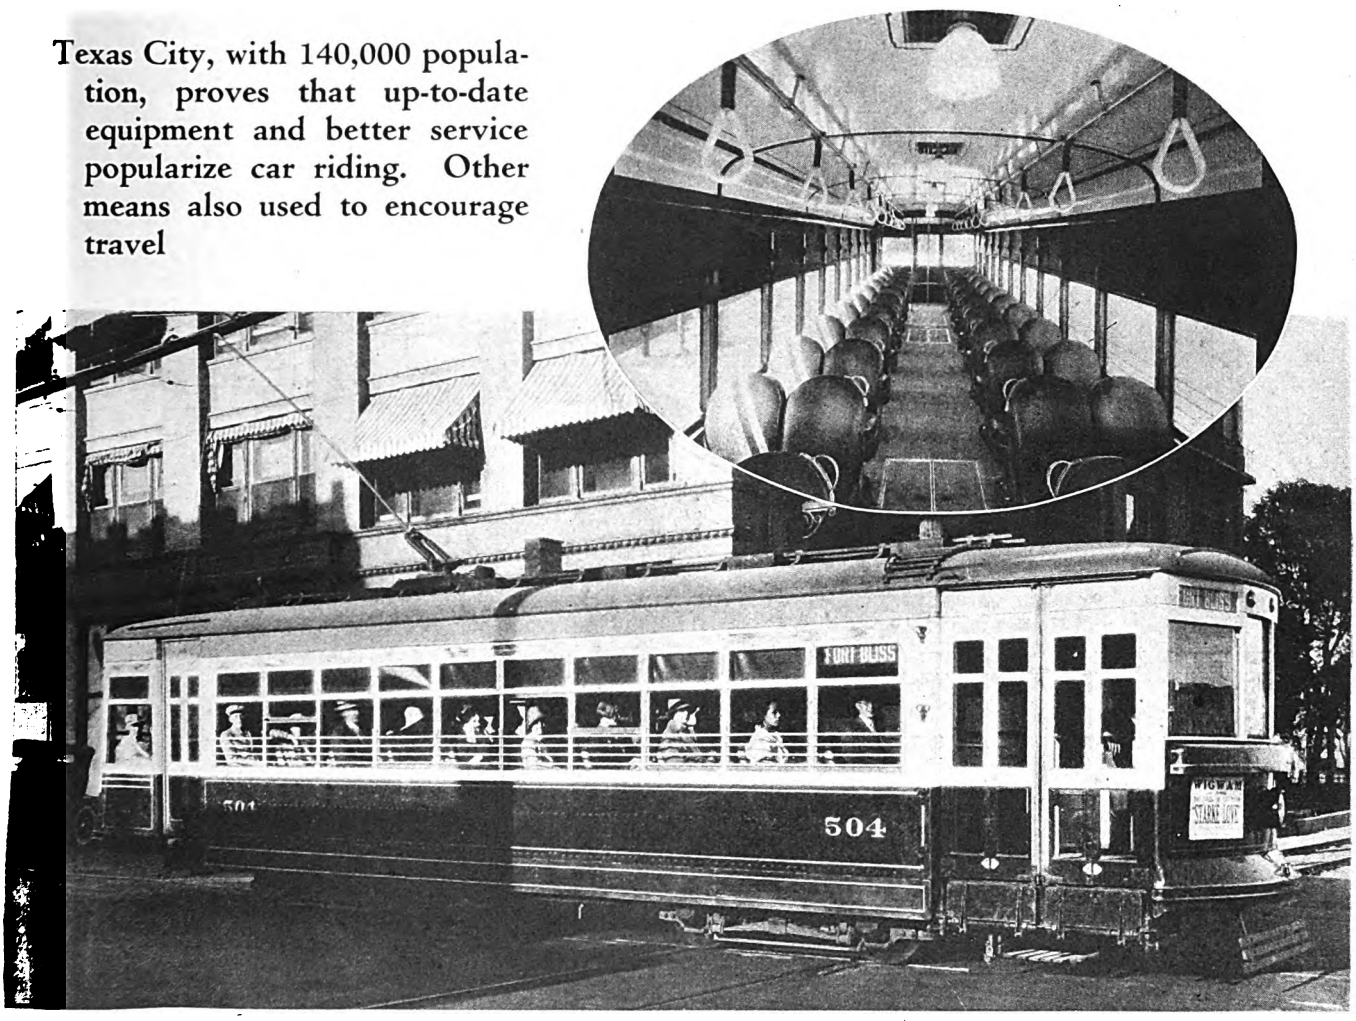
Modern Cars Build Traffic
in El Paso

Texas City, with 140,000 population, proves that up-to-date equipment and better service popularize car riding. Other means also used to encourage travel



These attractive cars are helping to increase car riding in El Paso

EL PASO ELECTRIC COMPANY, under the executive management of Stone & Webster, Inc., serves a combined population in El Paso, Tex., and Juarez, Mexico, of approximately 140,000, with a rolling stock equipment consisting of 80 passenger cars, four work cars and eleven buses. Last year the company added seven new street cars and rebuilt seven of its older cars and installed modern equipment. The higher acceleration and improved loading and unloading facilities of these cars have permitted an increase in the speed on the lines where they are being operated from 10.3 to 11.9 m.p.h. This has made possible the handling of as many passengers on a line with five cars as formerly were hauled with seven cars. The length of time the cars have been in operation has been so short that figures are not available as to the exact extent to which they have developed additional traffic, but it is obvious that the public is using them to a greater extent than formerly. The accompanying data relating to these cars are taken from the company's brief for the 1928 Coffin prize.

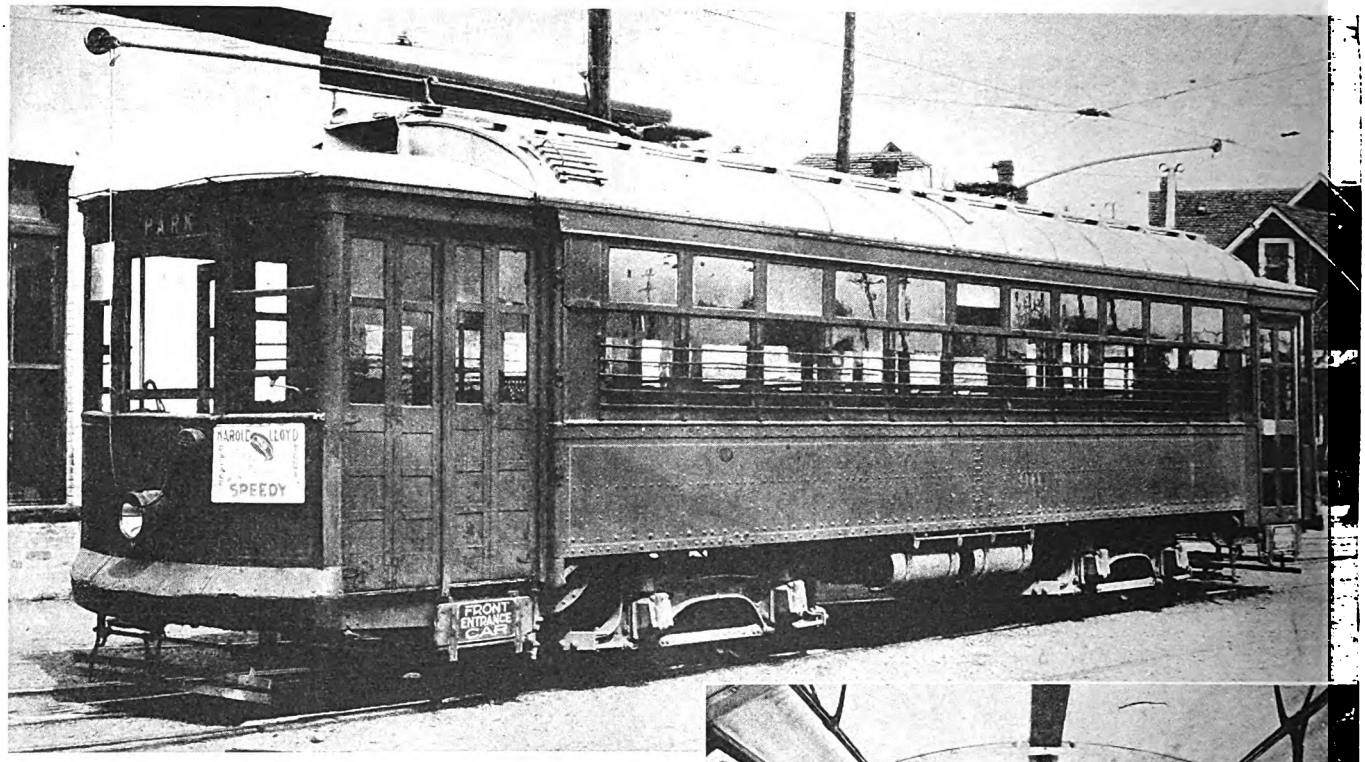
The new cars are of the double-truck, single-end, one-man, Birney safety type, with automatic treadle-operated rear-exit doors and double front-end doors for entrance and exit. Low floors with ramps to the doors speed up the loading and unloading of passengers. The doors and steps are of the folding type and of positive action. The door edges of the posts are equipped with folded strips of extra flexible leather in place of the customary rubber.

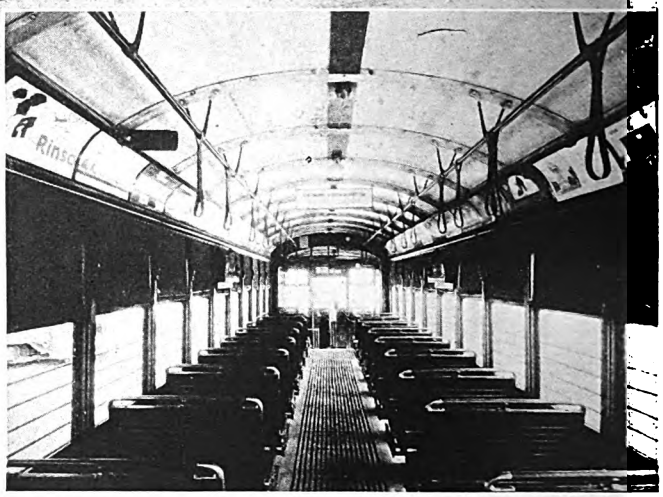
The new cars were equipped with individual type seats, spring cushions and upholstered in genuine brown leather. Each car can accommodate a seated load of 49 passengers. The floors are covered with rubber tiling, which makes an unusually neat and attractive appearance and presents a surface that is easily cleaned. It also deadens the noise in the car from the trucks. The window posts are narrow, and metal sash is employed to give the riders unhampered vision.

The interior of the cars is finished in mahogany with all metal fixtures nickel plated and all pipes in the front vestibule neatly boxed. The fare box is driven by an air motor and is nickel plated. The cars are equipped with sanitary hand straps.

The lighting units are shaded by glass bowls, mounted as an integral unit with the ventilators. They extend the

Digitized by Google





These views show the original condition of the rebuilt cars

length of the car in the center of the ceiling, which is of Haskelite finished in white enamel.

The exterior appearance of the car is enhanced by a hinged skirt, suspended from the sides of the car body, so that the noise of operation is deflected. A row of lights shielded by a cowl extending across the top of the front and rear dashboards greatly adds to the appearance of the cars at night.

The painting is carried out with a streamline effect, the colors extending in an unbroken line through the doors and around the ends of the car. The body is done in Cordovan red, the window posts and panels in white, and the panels just below the roof in blue. These color shades have been carefully blended and harmonized. As the cars operate on a line to the largest cavalry post on the Mexican border, the coloring is very much in keeping with the service rendered. The new cars were built by the American Car Company of St. Louis.

Novel Method of Introducing New Cars

The company adopted a novel method of introducing the new cars to the public. Following their arrival, all inspectors spent a full day at the carhouse familiarizing themselves with all operating details. Then two cars were taken out on the line. One, in charge of a regular operator and an inspector, was stationed on a siding across from the main office of the company, and suitable signs invited the public to make a thorough inspection. The second car was run on one of the principal lines in the downtown section, a short belt line, and the public was invited to take free rides. Both the car on the siding and that operated on the belt line were on display from 9 a.m. to 9 p.m. for three days. The plan was given wide publicity in the local newspapers, both in news columns and by regular use of advertising space.

Approximately 13,000 people took advantage of the opportunity to visit the car on the siding and ride on the one operated on the belt line during the three-day period. The result was that the new equipment became the talk of the town.

Besides adding these new cars, the company rebuilt seven of its older cars during 1927, as explained. Those selected were of the double-truck, double-end, four-motor type. Automatic treadle-operated rear-exit doors were installed with double front doors for entrance and exit. These doors are of the folding type with wireglass in the lower panels and clear plate in the upper panels. The doors were entirely new, and the door engines were placed overhead in the vestibule, inclosed in attractive cabinets.

The controller box was turned with its back to the side wall of the vestibule, so that the treadle door valve and the selector valve could be cared for without crowding. Another advantage of the change was that it placed the controller handle in a more natural position for use by the operator. The fare-box post, which formerly extended from the floor to the ceiling, was cut off even with the sill of the front vestibule window and moved forward. This allowed more room in the vestibule and removed an obstruction to the operator's vision. A dividing rail was placed in the vestibule between the entrance and exit doors, and another rail separates the passage to the treadle door. Hand brake wheels were discarded in favor of drop brake handles, which were considered to take up less space and to be more sightly.

The way the cars looked after modernization

Each car roof was completely recovered with canvas and a new Haskelite ceiling was installed. The hand straps used and the lighting system are the same as in the new cars. The wooden slat seats, including the backs, in the old cars were upholstered with curled hair and covered with brown Spanish grain leather. The old flooring was replaced with new wooden floors overlaid with Celotex and covered by battleship linoleum. The steps from the vestibule into the car and the folding steps were equipped with Kass safety treads. The red, white and blue color scheme used in the new cars was followed in the rebuilt cars. The cost of remodeling these cars was approximately $2,500 each, exclusive of overhauling and replacement of old materials.

Better Service Slips

While these cars proved efficacious traffic builders, they have not been the only means followed for encouraging car riding. All employees are supplied pads of 50 slips, known as "Better Service Slips." Every time that a significant remark is heard about the company or about ways in which it could improve its service the employee records it on one of these slips. The slips are then sent to the manager and by him to the customers' service department. These slips help in three ways. Some good suggestions are received; they offer an index of the company's standing in the community, and they stimulate employees to render the best service of which they are capable.

Regular complaints received by mail are handled by the customers' service department, and in almost every case the reply is made by a personal call. This method has been found to be productive of the best results. If the matter will require some time to investigate, the complaint is acknowledged by mail with the explanation that the company appreciates the interest prompting it and that a report will be made later. Where the complaint is received by mail from a person well known to some official of the company, the reply sometimes takes the form of a telephone conversation instead of a call.

A unique practice was begun in 1925 and has since been continued of trainmen handing greeting cards to all customers on Christmas Day. Last Christmas a total of 20,000 such cards were distributed in this way. The public reaction was distinctly favorable. This practice was helped by the fact that every car carries the name of the operator in a conspicuous place on the fare box. Hence the operators are individually known to many patrons.

The company arranges to have various magazines treating public utility questions sent to the public library, Chamber of Commerce and elsewhere where they will be read, so that utility problems can better be understood.

An Information Booth

In San Jacinto Plaza, in the heart of the downtown district, an information booth has been erected for the benefit of those who want to be informed about the company's railway and bus service. Maps showing the routing of all cars and buses, as well as the block numbers on various streets, are distributed free. The attendants in charge also are prepared to supply information on steam railroad schedules, sport events, amusements, fire alarm calls, and other information of general public interest.

The buses, both in city and interurban service carry unique courtesy signs lettered across the rear end: "Toot Your Horn and This Bus Will Gladly Move Over."

When the company decided some time ago to paint its cars a different color the choice of color was taken up with the City Planning Commission. This act received the unqualified indorsement of the commission, which made suggestions as to the color schemes.

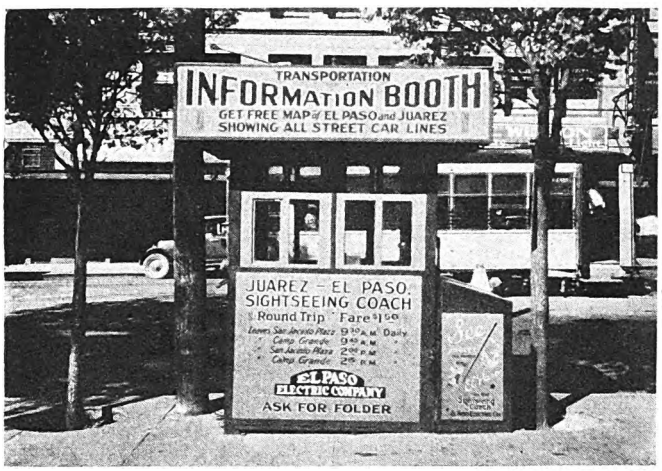
Campaign Against the "Pick-Up" Evil

El Paso is one of the best paved cities in Texas and contains a private automobile for every seven inhabitants. At one time it was customary for many automobile owners, on their trip to town or return, to invite friends and even strangers to ride with them in their cars. The result was a loss of patronage by the railway. The latter published advertisements discouraging the practice, but it continued. Finally, the company decided upon a personal campaign.

Now, when a car operator notices that a private auto-

Digitized by Google

mobile owner is habitually picking up his passengers, he takes the license number of the car and turns it over to the superintendent. The automobile owner is then interviewed by some company official, supervisor or operator who knows him. The general line of argument in all such cases is that a local business man has no more right to take away prospective railway passengers than a company would have deliberately to set out to injure the business of a local merchant. The point is also made that this practice makes it much more difficult for the company to maintain its service and pay dividends to its stockholders and wages to its employees, and that a good street railway service is an asset to every city.



This booth is maintained in downtown El Paso for the dissemination of information on car and bus schedules and other data desired by the public

The company had very little difficulty in making those to whom this argument was presented see its logic. In practically all cases promises were secured from them to refrain in the future from offering free rides to prospective railway patrons, waiting on the streets for a car.

Holyoke Street Railway Develops New Headlight

IMPRESSED with the necessity for the frequent need for dimmers with the more powerful headlights now in use, G. E. Pellissier, assistant general manager Holyoke Street Railway, Holyoke, Mass., has developed a lamp which, while illuminating the track and highway ahead, also floodlights the outlines of the front end of the car to which it is attached and does not have to be dimmed under any circumstances. Mr. Pellissier found in his experience that in a number of instances where accidents occurred after nightfall complaints were made that the glare of the headlights was responsible, and that even where dimmers were used the sudden transition from very bright light to comparative dimness was confusing alike to motorman and automobile drivers.

The new headlight has a non-glaring pick-up of from 300 to 500 ft., and illuminates not only the space out ahead of the car but the front of the car itself and from 25 to 30 ft. each side of it. With the front end of an approaching car floodlighted in this maner there is little chance for an autoist or pedestrian to confuse it with any other kind of vehicle. The headlight is simple in design, involves no expensive apparatus and requires no dimming arrangement of any kind. Experiments are now being made with lamp bulbs which, if satisfactory, will eliminate the headlight resistances.

While the new headlight is not in production as yet, it is in the hands of the Crouse-Hinds Company and the Ohio Brass Company for further development.

Besides installing the new headlights the Holyoke Street Railway is equipping all of its cars with Person's 5-in. amber reflectors, for use as markers. It has been found that these reflectors indicate very clearly the outline of the car when the newly-designed headlight is used and that where the power is off the reflectors are equally effective in catching the reflections from the headlights of approaching automobiles.

Transportation in Japanese Cities

By S. Kanaya
Chief, Section of General Affairs Electric Bureau of Tokyo,
Tokyo, Japan

The Tokyo railroad station, served by both buses and street cars

JUST as in the cities in America or Europe, a horse car line appeared as the first means of mass transportation in the communities of Japan. This line, however, was destined to be superseded within a comparatively short time by an electric surface car line.

The first regular electric road was built and operated by a private company in Kyoto in 1896, and within the next ten years the principal cities, such as Tokyo, Osaka, Nagoya, Kobé, and Yokohama, had successively installed their own systems. With the exception of the Osaka Railway, which always has been under municipal control, all these systems were built and operated by private companies. It was not until 1911 that these private electric roads began to be purchased by the municipalities concerned.

Owing to the increase in traffic from year to year, it was apparent that some kind of subsidiary service would have to be provided in some of the larger cities, in conjunction with the street railways. Tokyo was first driven to this need and the Tokyo Motorbus Company was incorporated in 1917, and began its regular service on the main streets of the capital city.

The disastrous earthquake and great fire of 1923 had destroyed the street railway system of Tokyo. To meet the deficiency of transportation caused by the calamity, the city of Tokyo installed a motorbus service in 1924, which, having been improved and extended, is still in use.

Recently bus service under private or municipal control was inaugurated in most of the larger cities, such as Osaka, Kobé, Nagoya, and Yokohama. However, the extension of this service in these cities, except Osaka, is still limited and conservative.

The cities of Tokyo and Osaka have been authorized to construct municipal rapid transit systems and are now engaged in the preliminary construction work. There is also the Tokyo Underground Railway, which acquired a franchise for an independent line about 10 miles long. A part of this line has been constructed and was opened to the public in December, 1927.

Transit Conditions in Tokyo

In 1882 the first horse car line was established by a private company in Tokyo. Before that time, there had not existed any means of public conveyance. Consequently, the success of this undertaking was great despite the poor condition of service.

In 1891 the National Industrial Exhibition was held in Tokyo, where the first experimental electric car was operated with success, and in 1904 the last horse car lines then existing were electrified. Two other street railways were installed a few years later and eventually were amalgamated with the original tramway, thus forming the Tokyo Tramway Company.

In 1911 the city purchased from the Tokyo Tramway Company all the existing lines of electric surface cars in the city and began operation under management of the Electric Bureau. At that time there was about 119.5 miles of track operated, with 1,514 cars owned; the average number of daily passengers carried amounting to about 534,400, with a revenue of 18,500 yen a day.

After having purchased the company's lines the Bureau extended several of them and constructed new lines, thus improving the equipment and service. There are now 197 miles of track operated with 1,598 cars owned. The average number of daily passengers carried is 1,200,000, with a passenger-revenue of 80,000 yen a day.

The total passengers in 1924 amounted to about 490,000,000, being the largest number of passengers ever carried by the electric tramways of the city. A marked decline in passenger traffic began to manifest itself in the subsequent years, which was due principally to the

Digitized by Google

rapid development of the suburban districts. Probably more than 500,000 persons then residing in the city area moved out into the suburbs, thus decreasing the patronage of street cars, the service being generally limited within the city proper. The total passengers carried by each type of conveyances in Greater Tokyo are as indicated by an accompanying table.

There are two independent bus systems in Tokyo City; the municipal service, with 60 route-miles and owning 379 buses; and the Tokyo Motorbus Company, with 25 route-miles and 284 buses.

There is also an electric railway line of the Imperial Government Railway, which runs around the city limits and partly through the downtown district on the elevated structures and is practically a rapid transit railway. This comprises 59.7 route-miles, with 300 motor cars and 403 trailers. In 1927 the total passengers carried by this railway line amounted to about 290,000,000.

As was said in a preceding paragraph, a part of the Tokyo Underground Railways line (about 1.5 miles) was opened to the public at the end of 1927. The average number of passengers carried daily is about 25,000.

The municipal rapid transit railway comprises four authorized routes of about 42 miles, and will cost approximately 187,000,000 yen. The preliminary work for construction is now being carried on by the Electric Bureau of Tokyo City. It is probable that a part of this municipal rapid transit railway will be constructed in the near future.

Traffic Situation in Other Cities

Considering population within the city limits only, Osaka is larger than Tokyo. However, from the point of view of transit, Osaka is inferior to Tokyo.

Modern cars serve the business section of Tokyo around the Yusen and Marunouchi Building

As indicated by the accompanying table, the number of passengers carried by the Osaka municipal electric tramway has shown only a slight increase in the last few years. This was due to the rapid development of buses and taxis in the city. There are at present two motor bus systems. One is the municipal motor bus service, which operates about 80 buses. The other is a private company, with 270 buses owned. There are also about 2,500 taxis in service.

In other cities, namely, Kyoto, Nagoya, Kobé and Yokohama the urban transportation is still under complete control of electric tramways operated by the municipalities. The transit conditions in these cities are as indicated by the tables on page 841. Tokyo is omitted from these tables because the principal data are given on this page.

TRAFFIC FIGURES IN GREATER TOKYO

Year Ending March 31	Population, 1,000	Rides per Inhabitant	Number of Passengers Carried, Millions—Total	*Tramways	Electric Railway Line, I.G.R.	‡Motor Bus	†Suburban Electric Railway

1927	3,837	244	935	433	275	47	180

*Excluding passengers carried by a special line of Tokyo Municipal Tramway which serves the suburban district.
‡Passengers carried by the municipal and private motor buses.
†Including passengers carried by the Tokyo Municipal Tramway Suburban line.

While Kyoto operated approximately the same number of route-miles in 1927 as in 1919, the number of car-miles operated has increased during that period from less than 7,000,000 to almost 10,000,000. Passenger traffic has almost doubled in the nine-year period and the revenue in 1927 showed an increase of more than $3,000,000 since 1919.

Nagoya, Kobé and Yokohama have extended their route mileage from year to year, Kobé having almost trebled the 1919 mileage. Passenger traffic and revenue have also substantially increased from year to year, as shown by the accompanying tables.

With the rapid development of motor buses in Tokyo and Osaka, the control by the electric tramways of the urban transportation in these cities seems to be coming to an end. But it is incredible that the electric tramways in these cities will be superseded eventually by buses. On the contrary, it is quite certain that the time will

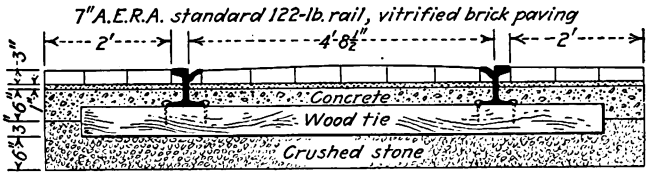
never come when the electric tramways will be deprived of the important rôle which they are now playing on the stage of urban transportation.

Needless to say, the provision of a municipal rapid transit railway in Tokyo and Osaka, having a population of more than 200,000, is a pressing affair. The municipalities concerned realize this condition and are now planning to build a municipal rapid transit system at the earliest date possible.

Extensive Track Renewal Program in Richmond

PROCEEDING through the heaviest part of a major track renewal program on some of the most congested traffic streets in the capital city of Virginia, the Virginia Electric & Power Company, Richmond, Va., holds the enviable record of never having delayed a single car or having a single accident. Although compelled to wait on a delayed city street program, the track crews have already completed three major jobs.

At present work is being rushed on a 24-hour basis on Seventh Street, from Canal to Marshall Streets. This

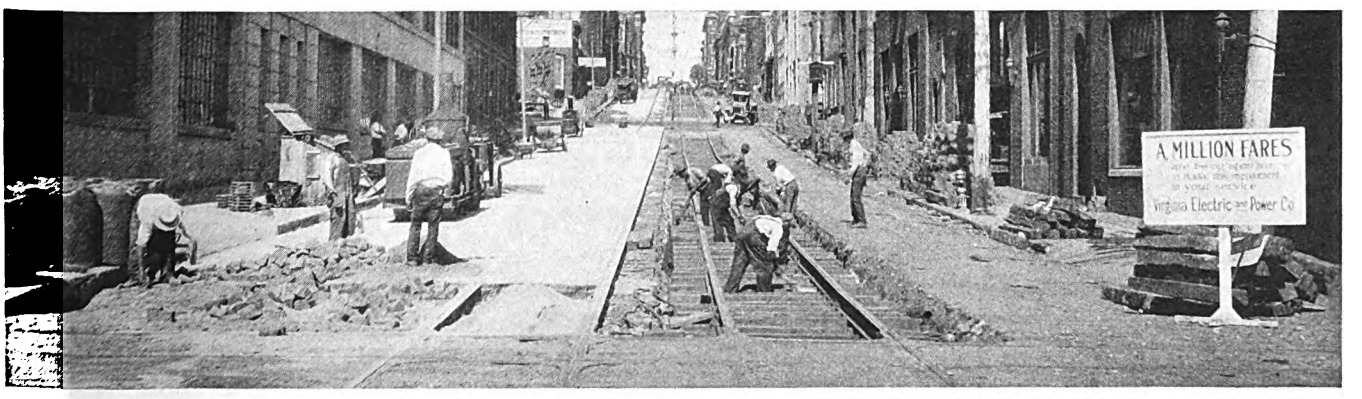


Standard type of track construction for paved streets, being used in the extensive program of the Virginia Electric & Power Company

project involves 3,000 ft. of double track on a maximum grade of 5.5 per cent, with the construction crossing five main arteries of traffic. Standard 122-lb., 7-in. girder rail is being used on 7-in. x 8-in. x 8-ft. white oak ties. These are being laid on 6 in. of 1-in. crushed granite. The ties are covered and partially surrounded with a 6-in. layer of concrete. The job is completed with 3-in., vertical fiber, wire-cut brick paving on a 1-in. plain sand cushion.

Another feature of this work, which got under way Aug. 20, and which is set for completion about Nov. 20, is the use of approximately $6,000 worth of new pneumatic machinery. To insure adequate working conditions for a 24-hour day, the entire job is brilliantly lighted. The next major job to be undertaken is that of reconstructing 4,000 ft. of double track on Main Street from Fifth to Laurel Streets. The same type of construction will be used with the exception that Cary-Elastic rail filler will be used to reduce noise, as this portion of Main Street is semi-residential.

The total expenditure on these jobs will be approximately $140,000. There have been no serious car delays on this project, and according to F. C. Womack, engineer of maintenance-of-way, this record has been maintained during the past five years.



Track construction in progress in Richmond. Note the sign at the right, reminding the public that a million fares are being spent to improve the service

Railway Electrical Engineers Convene

COMMITTEE reports and ensuing discussion at the Nineteenth Annual Convention of the Association of Railway Electrical Engineers, held at Chicago from Oct. 23 to 26, revealed a steadily increasing number of applications of electrical energy to steam railroad requirements. Of the nine reports presented at the convention five were especially conspicuous for the scope and importance of their contents, among them being reports on train lighting, power plants, motors and control, illumination, and locomotive electrical equipment.

The report of the committee on train lighting received much discussion, particularly the section devoted to electric refrigeration for dining cars. Other subjects touched upon in this report included the lighting of parked Pullman cars, fabric faced pulleys, locomotive lighting and the standardization of illumination for rail motor cars. The committee on power included in its report the subjects of combustion and furnace design, stokers, piping, prime movers, purchased power and power contracts. With regard to purchased power and power contracts the committee furnished information concerning methods of keeping cost records and recommended a special form for power records. The subject of motors and control was divided into three parts, each being handled by a sub-committee. One covered the application of motors to various types of machines; another prepared instructions for the maintenance and test of motors, and the third presented specifications for the purchase of electric motors and a form to be used in ordering motors.

The work of the committee on locomotive electrical equipment was prepared by two sub-committees, one furnishing a tentative specification for locomotive wire, and the other treating the subject of cost accounting related to inspection and maintenance of automatic train control equipment. The committee on illumination devoted its report to the development of lamps for train and locomotive service, lamps for special purposes and floodlighting for railroads. The lamp demand tables were brought up to date. The remaining four reports, those on the manual of recommended practices, radio application, electric heating and welding, and self-propelled vehicles, while much shorter than the others, were productive of valuable discussion.

An interesting and important part of the convention was the display of electrical equipment by 67 member companies of the Railway Electrical Supply Manufacturers' Association. The registration of engineers who attended the convention and exhibit exceeded the 360 mark for the four days.

American Standards Association Now a Reality

UNANIMOUS approval by the 37 member bodies now provides for the establishment of the American Standards Association to succeed the American Engineering Standards Committee. It is felt that a more widespread participation by trade associations towards national industrial standardization will result from the abandonment of the committee form of organization previously used.

One of the first acts of the new association will be the organization of a board of directors composed of twelve industrial executives. This newly created board will control the general administration and policies of the association. The old committee made up of representatives of all the member bodies now becomes the standards counsel and in its hands will rest matters connected with the adoption and approval of national standards.

The officers of the association are: W. J. Serrill, president; Cloyd Chapman, vice-president; P. G. Agnew, secretary; F. J. Schlink, assistant secretary.

Spring Switches Used on South Shore Line

HIGH-SPEED spring switches of the No. 20 type were installed for the new siding of the Chicago, South Shore & South Bend Railroad at Tamarack, Ind., recently opened to traffic. Many railway engineers have contended that spring switches were not suitable for high-speed operation, but the South Shore engineers have worked on the theory that the switch points can be protected satisfactorily by automatic signals.

In 1926 the South Shore engineers installed turnouts of the spring type at some of the least traveled portions of the line. No. 16 switches were used. Operation of these switches has been satisfactory. The signals are set to show red if there is as much as $\frac{1}{8}$-in. opening in the switch point. When the new Tamarack siding was tested out experimental trains were run through the switches at a speed of 60 m.p.h. Tests of the signal protection at the points also showed that the slightest separation of the points caused an immediate danger signal to show on the target. At present the motormen are limited to 45 m.p.h. through turnouts.

Electric Railway Joins France and Spain

DIRECT railroad connections between France and Spain across the Pyrenees Mountains, which separate these two countries, has been an active subject of discussion for many years. Now one line has been completed and two others are under way. Up to this time rail transportation between the two countries was limited to lines along the coast, either on the Mediterranean or the Atlantic Ocean side. The new line considerably reduces the distance and running time between many important cities in France and Spain.

The longest tunnel on the route is 7,822 m., or about 4.9 miles in length. It is at an altitude of 4,000 ft. above the sea, and about 2,500 ft. below the peak of the highest mountain above it. One end of the tunnel is in France and the other in Spain.

Railway operation on the French side to the International Railway station on the south side of the tunnel is conducted by the Midi Railway, which already has equipped a number of sections of its line with electric power. The same system used by it has been adopted for this international line, namely, 1,500-volt direct current with catenary construction. The locomotives used on the line are of the BB type with all four axles motor driven. The locomotives have a continuous power output of 1,000 hp. and a one-hour output of 1,400 hp. The maximum speed of the passenger locomotives is 75 km. (47 miles) per hour. On sections with the steepest grades, two locomotives are required to haul the trains. Hydro-electric power is used and is transmitted three phase. The particulars given were obtained from *Le Génie Civil.*

The Readers' Forum

Service Is a Vital Factor

To the Editor: Nov. 3, 1928.

While it is admitted that our equipment must have a civic attractiveness, we must not lose sight of the fact that: "Pretty is as pretty does," and without good service the latest models and the smoothest running cars will not avail.

It has been stated that the man in the front and the man who collects the fares can either help or hinder a street car system, and we know the truth of the statement. After reading that statement, which emanated from the Cleveland convention, one of the first things that flitted through my mind was the necessity of the motorman and the conductor being on the alert at the safety zones.

There are many times when the vehicular traffic is heavy and passengers cannot get from the sidewalk to the safety zone while a green light is showing. Coming with the heavy traffic is the street car and with no one in the loading space and no one to alight, the car lumbers away with many passengers trying to hail the attendants. The men swear and the women wring their hands, and right there we lose friends, and we lose many during a day with this kind of work. Also, we advertise the "supposed fact" that if we want to get anywhere we must ride the automobile.

The green or other lights only remain lighted for about half a minute and the car attendants should remain in stop position until the traffic light turns red. This would permit the waiting car passengers to wedge through and gain their objective, to get home on the street car. This practice would make friends for the company and, incidentally, increase the number of fares. Service is a vital factor and the greatest of attention must be paid to details like these if the service is to be made salable.

Co-operative Educational Plan Successful

The Milwaukee
Electric Railway & Light Company
Milwaukee, Wis., Oct. 31, 1928.

To the Editor:

Readers of your paper who read the editorial entitled "Educating Employees a Good Investment," published in your issue of Oct. 20, 1928, page 709, may be interested in a co-operative educational plan developed in Milwaukee, in which we are dealing with the problem discussed in that article in another way.

More than five years ago a group of people from some of the larger corporations joined in planning a course given at night to men who had completed high school or who had partly finished college work in engineering. The course was adopted and put into operation by the Milwaukee Vocational School. Its first graduates finished last June. The subject matter in the senior year is precisely the same as that found in senior work in a good college course. The enrollments are growing year by year. Five men from the rolling stock department of this company started in on this plan this present year.

The course is a heavy one, but we have gone far enough with it to know by graduates that it is a good one and leads to better results than could easily be anticipated, considering the time spent in the classroom.

Arthur J. Rowland,
Educational Director

Could You Use

$5?
$25?
$200?

SEND in your items for Electric Railway Journal's Maintenance Contest. You are sure of $5, as that amount is paid for each item published regardless of whether it wins a prize or not.

There are twelve $25 departmental prizes to be awarded to individuals sending in winning maintenance ideas. These will be divided equally between the following four maintenance divisions: (1) Rolling stock and shops; (2) way and structures; (3) electrical and line; (4) buses and garage, including shop equipment for bus maintenance.

The most sought after prize of all will be the $200 individual prize to be awarded at next year's annual convention to the person submitting the best maintenance idea during the contest.

An attractive trophy will go to the company making the greatest contribution to improve maintenance through participation in the contest, and special certificates of merit will be awarded each department making the best individual showing.

The first thing to do is to read over the instructions and conditions of the contest as published in the Oct. 20 issue of Electric Railway Journal, pages 724-725. An attractive folder has been prepared, giving full information and suggestions for preparing items for the contest. This will be mailed upon request. Copies of the folder for posting on bulletin boards or distribution among maintenance men are available.

Don't delay in getting started! There is no limit on the number of items that may be sent in by one person. The more you submit the better chance you have of winning one or more of the big prizes. Some companies are organizing all maintenance departments to go after these awards. Look up the announcement in the Oct. 20 issue of the Journal, or send for copies of the instruction folder!

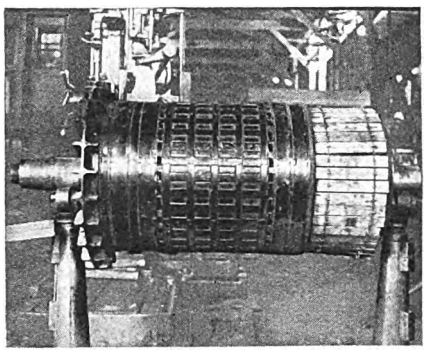
Time and Labor



Wood strip blanket used to protect commutators on Staten Island Rapid Transit Railway

Wood Strip Blanket Protects Commutators

WHEN commutators are unprotected in the shop, after being turned and slotted they are very often damaged when being transported or handled. To decrease this possibility, the Staten Island Rapid Transit Railway, Staten Island, N. Y., uses a wooden strip protective blanket around the commutator.

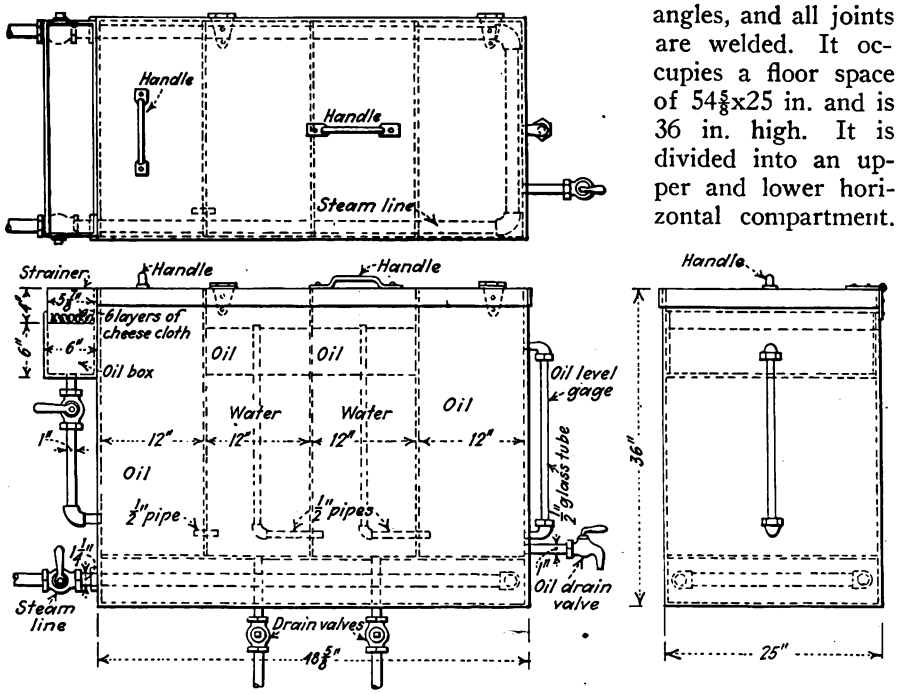
This blanket is made from a number of $1\frac{3}{4} \times \frac{3}{4}$-in. wood strips 8 in. long, spaced so that radial flexibility can be obtained. They are fastened together by two pieces of $\frac{1}{8}$-in. soft drawn wire, held to the strips by $\frac{1}{2}$-in. staples. One of these blankets, installed on a commutator, is shown in the accompanying illustration. This blanket eliminated the danger of mechanical injury to the commutator during handling and shipment and while the armature is being installed in its frame.

The protective features of this strip blanket have decreased materially the commutator maintenance costs on this property.

Oil Filter Reduces Compressor Maintenance Costs

BOTH the quality and quantity of compressor oil used must receive careful consideration if the maximum life and uninterrupted service of the compressor bearing surfaces is expected. This fact is appreciated on the Staten Island Rapid Transit Railway, Staten Island, N. Y. Not only is the oil selected carefully by this company, but it is changed periodically and especially at certain seasons of the year. At one time the old oil was thrown away, but it represented a large sum of money.

After extensive experimenting a purifying or filtering tank was designed and constructed in the shop. This is made from $\frac{1}{8}$-in. plates, $\frac{3}{8} \times 1\frac{1}{2}$-in. channel and angles, and all joints are welded. It occupies a floor space of $54\frac{5}{8} \times 25$ in. and is 36 in. high. It is divided into an upper and lower horizontal compartment. The lower compartment is equipped with a circular steam coil made from $1\frac{1}{4}$-in. pipe. The upper compartment is divided into four vertical compartments 12 in. wide. A strainer 4 in. deep and $5\frac{7}{8}$ in. wide is installed on the upper left-hand corner of the tank. This strainer extends across the entire width of the tank and fits into an oil reservoir 6 in. high, 6 in. wide and 25 in. long. The bottom of the strainer is provided with six layers of cheese cloth which can be renewed readily. The oil reservoir is connected to the first vertical compartment by a 1-in. pipe.



Oil filter used by Staten Island Rapid Transit Railway

The old oil is poured into the strainer and flows to the first compartment through the 1-in. pipe. The second and third vertical compartments are partially filled with water. A $\frac{1}{2}$-in. pipe nipple installed in the partition between the first and second compartments permits the old oil to flow from one compartment to the other and to float through the water to its surface. A $\frac{1}{2}$-in. stand pipe is erected in the center of the second and third compartments and extends through the base of the partition, between the second and third and the third and fourth partitions. This permits the oil which has filtered through the water to overflow into those pipes and pass from the second compartment to the third and from the third compartment to the fourth. The fourth compartment contains the purified oil. Oil and water temperature is controlled by the steam supply in the steam coil installed in the lower compartment. A glass gage connected to the fourth compartment shows the height of the purified oil. A 1-in. pipe connection installed near the base of the fourth compartment provides for withdrawal.

COMPARISON OF OLD, NEW AND FILTERED OIL

Sample	No. 1	No. 2	No. 3
Gravity	20.8 deg. B.	23.0 deg. B.	22.2 deg. B.
Flash point	375 deg. F.	400 deg. F.	395 deg. F.
Fire point	415 deg. F.	440 deg. F.	435 deg. F.
Viscosity at			
100 deg. F.	317 seconds	310 seconds	326 seconds
130 deg. F.	140 seconds	136 seconds	144 seconds
210 deg. F.	48 seconds	50 seconds	50 seconds
Color	Reddish brown	Reddish brown	Brown

Sample No. 1—Represents new oil.
Sample No. 2—Represents oil removed from the compressors and filtered.
Sample No. 3—Represents oil removed from the compressor, but not filtered.
Sample No. 3—Contained dirt and moisture.

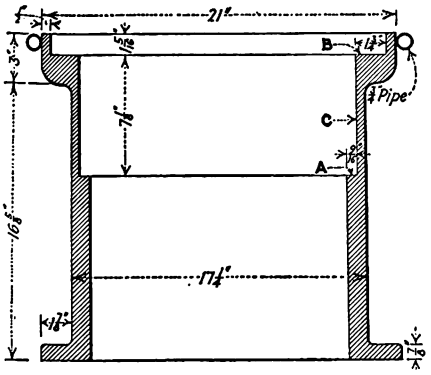
Saving Ideas
from Staten Island

This equipment has been found very satisfactory, not only because of simplicity of its design but from an oil purification standpoint. The same oil can be used over and over. The characteristics of the purified oil compared with new and unfiltered oil can be seen in the accompanying tabulation. Oil for seasonal changes consists of 75 per cent filtered oil and 25 per cent new oil.

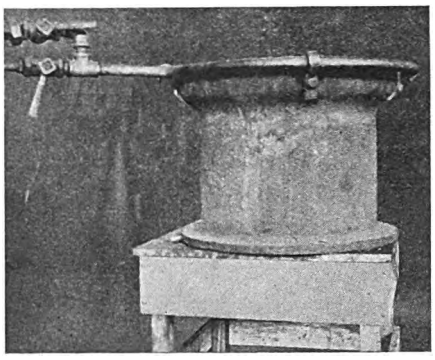
Commutator Soldering Cylinder

SOLDERING of armature leads in the commutator ears of the G-E 282A armatures was always a slow and tedious job in the Clifton shop of the Staten Island Rapid Transit Railway, Staten Island, N. Y., until Machinist Joseph A. Collins designed and installed the soldering cylinder



Section of soldering cylinder

shown in the accompanying illustrations. This cylinder is an iron casting and has an outside top and bottom diameter of 21 in. It is designed with three bores, a top, middle and bottom. The top bore is of 20-in. diameter, the middle 16.5 in. and the bottom 15⅜ in. A ¾-in. iron gas pipe is fitted neatly around the outer surface near the top and is held in place by substantial clamps. This pipe is drilled with 1/32-in. holes on 4-in. centers, so that the gas flame will strike the surface of the cylinder at the proper angle. The end of this pipe is fitted with suitable valves and unions as well as an air connection for controlling the character of the flame.



Exterior of soldering cylinder

The commutator to be soldered is placed vertically in the cylinder so that the end of the commutator bars adjacent to the string band rests upon the surface *A* shown in the sketch. The entire surface of the commutator as well as that of *C* in the cylinder is chalked so that any overflow of solder will not adhere. If the commutator is undersize so that an air space exists between the bars and *C*, the space is filled with powdered chalk. The flame plays upon the cylinder and gradually transmits heat to the commutator bars and raises the temperature to that proper for soldering. Solder is applied to the ears and floated in from the surface *B*.

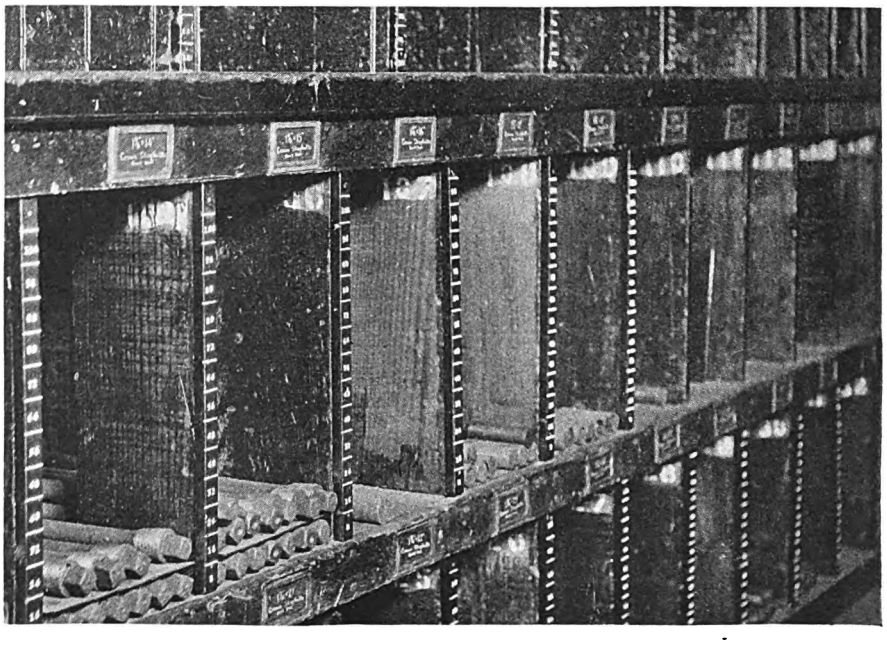
It is claimed that since this commutator soldering method has been in use all trouble caused by the improper soldering of the ears has disappeared. It is further claimed that a greater number of commutators can be soldered in a given time compared with the discarded method and as a result maintenance costs have been decreased.

Storage System Eliminates Delay

TO FILL orders rapidly, determine the amount of stock on hand and simplify the annual inventory, the Staten Island Rapid Transit Railway, Staten Island, N. Y., stores all shop material in metallic or wooden bins when possible and places the name, size and other characteristics of the material on a tag appearing above the center of each bin.

Bins are stacked in tiers and each tier is separated by a 1/16-in. sheet iron plate. The quantity of material in the lower tier is painted on the front of each partition and, directly over this, the amount of material in the first and second tiers. Above this, the sum of the first, second, and third tiers appears, and this idea is carried on through to the top tier.

This storage arrangement makes it easy to tell, at a glance, the exact amount of the total stock in each bin and practically eliminates the need for counting. The accompanying illustration shows the construction and arrangement of the bins as well as their contents, the tags, and the numbering on the partitions.



Bin arrangement for storing railway supplies

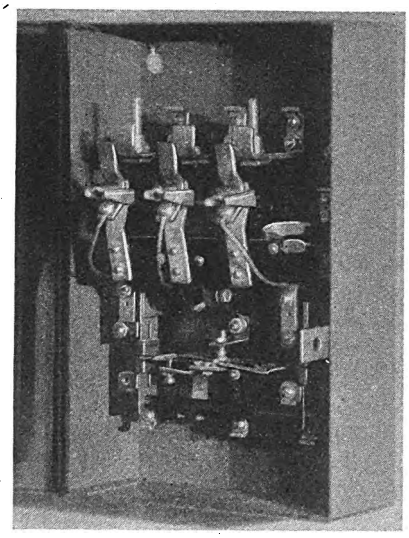
New Equipment for Better Maintenance

Line Starter for Shop Motors

FOR starting and protecting small induction motors used for driving machine tools, woodworking machines, pumps, fans, and many other machines where remote control with complete protection to operator, motor and machine is desired, the Westinghouse Electric & Manufacturing Company has developed a new line starter. It provides an unusually desirable feature in its adaptability to either hand or automatic reset after an overload, which is unique for this class of starter. It comes equipped



New line starter for shop motors

with hand reset of the thermal overload relay, but if automatic reset is desired the hand reset lever can be removed and automatic reset obtained. The automatic reset is convenient where the small starters are housed within the base of the machine they control.

The cabinet housing the mechanism of the line starter was proportioned from the standpoint of the man who does the installation and maintenance work, ample space being provided at both top and bottom for drawing in wires and making connections without the necessity of removing the mechanism from the cabinet.

Thermal overload protection is provided. The thermal operating elements consist of high temperature metal strips which are deflected due to heat from heater elements when the motor is overloaded.

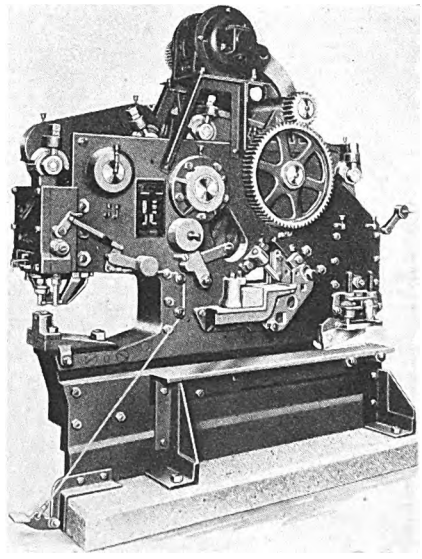
All operating parts are attractively finished to prevent corrosion and maintain good contact between parts. The copper and brass parts are tinned, while the iron and steel parts are cadmium plated. The approximate dimensions of the dust proof enclosing cabinet are $8\frac{1}{2}$ in. wide by $12\frac{1}{2}$ in. high by $5\frac{3}{4}$ in. deep, and the approximate shipping weight is 15 lb.

Improvement in Universal Iron Workers

TWO new Universal iron workers have been brought out by the Buffalo Forge Company, Buffalo, N. Y., to meet the need of shops and blacksmith departments. The most recent machine is a combination slitting shear, punch and bar cutter, and has several new features. The throat is lower than in previous designs, which permits a compact, powerful design with less bulk.

One eccentric runs all three tools, consisting of the punch, shear and bar cutter. That is, all three tools are actuated during the course of one revolution of the eccentric, but not at the same instant. This prevents overloading the machine and yet permits using the three separately controlled parts of the machine at the same time.

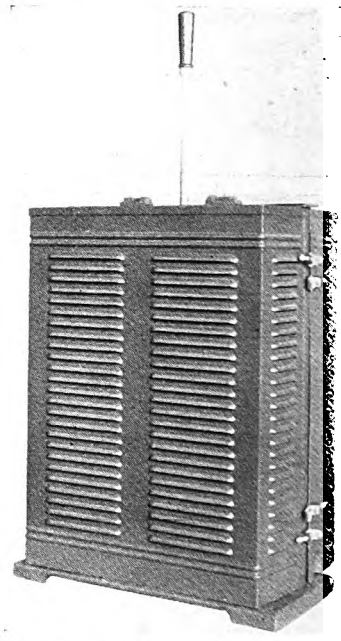
Interchangeable high and low die blocks on the punch end take care of beams, channels, girders, and H sections, although not in so great a range of sizes as in the larger machines. The stripper swings out of the way when changing tools. Shear blades are exceptionally long and are reversible. Angles can be cut on a miter without inclining the stock.



New Universal iron worker

Improvements in "Dinkey" Controller

SEVERAL improved features incorporated in the "Dinkey" type controller, are announced by the Electric Controller & Manufacturing Company, Cleveland, Ohio. Among these are the use of ebony asbestos in place of slate, ventilated contacts raised $\frac{9}{16}$ in. from the dial face, and



Exterior view of improved controller

contact supporting lugs attached to the front of the dial, which are removable from the front. The contact lug has a single square head set screw to clamp the lead wire tightly. A welded steel frame is used and the main arm is carried on ball bearings. A smooth center top of the roller type is provided. The bearing spider casting supports the dial as well as the arm and quadrant bearings. This insures correct alignment and even contact pressure. Nickel alloy resistors are incorporated.

Better Service and Maintenance Make Transportation More Salable*

By John H. Walsh
Superintendent of Rolling Stock and Shops Middlesex & Boston Street Railway, Newtonville, Mass.

WE ARE in this business of ours primarily because we like it, and secondly to sell our goods, whether it be merchandise or transportation, to the best possible advantage. To make our transportation salable we must be everlastingly on the alert to take advantage of each and every opportunity to improve our service and better our product.

Only after making our service reliable, fast and comfortable, can we hope to educate our patrons who own automobiles to use our service more frequently. Next to courtesy and speedy service, a passenger's comfort should be considered. Due to the efforts of the automotive industry, the people have become more and more accustomed to a luxury in travel which was unheard of a few years ago. So, nowadays, railways are equipping their cars and buses to the end that a ride of such luxury and comfort may be given that patrons will become regular riders by choice rather than occasional riders of necessity.

The bus of today is built with low, pleasing lines, lacquer finish, special-designed chassis with long wheelbase, balloon tires, air brakes, more powerful motors, plate glass windows and special bus seats, designed to permit more knee room and constructed with combination deep coil springs and air bag cushions. Lighting fixtures are attractive and provide ample light, floors are covered with linoleum, aisles are wider and headroom is increased. All of these improvements were made to add to passenger comfort and while most of these changes meant an increase in the initial cost of the bus, in the light of our experience the end certainly justified the means.

Good service to the passenger depends in a large measure on good maintenance, coupled of course, with a courteous and efficient operator driving a clean, attractive and comfortable bus. A passenger rarely sees the officials of a street railway and seldom, if ever, realizes the extent of the repair shops, stock rooms, etc., which a street railway maintains to insure the passenger uninterrupted service. Therefore, it is imperative that the bus in which a passenger rides be kept in its highest state of efficiency and comfort; that the operator be trained so that he may reflect the courtesy and service which any progressive management wishes shown the passenger. The operator must have the necessary knowledge to detect readily any unusual behavior of his bus, and sufficient knowledge to make any necessary repairs of a minor nature.

Eternal vigilance must be exercised in the maintenance of buses to obtain lower repair costs, while improving the mechanical condition of the equipment. Buses having damaged body panels as a result of collision must be repaired and refinished as soon as possible following the accident, so the appearance of the fleet may not be marred. This practice also proves an aid in the follow-up of unreported collisions. All of our 82 buses in service, with the exception of 7 units, are finished in pyroxylin. This finish has been found an invaluable aid in keeping buses clean and in reducing frequency of refinishing periods, both of which aid materially in lowering maintenance costs. In the every-day cleaning of bus exteriors finished in lacquer, it has been found that the surface can be readily cleaned solely by the use of hand power and soft cloth rags, and that dirt and grit seldom, if ever, scratch or mar the finish. Another important reason for using lacquer is the closeness with which it is possible to match new colors of the same shade against the old lacquer. It is true that the cost of refinishing a bus with lacquer is somewhat higher than paint or enamel, and I appreciate that in its application to wooden surfaces the results are not satisfactory, but on aluminum-covered exteriors the psychology of the passenger who notes the approach of a bus that always seems to be clean and attractive, is sure to justify its use.

The Middlesex & Boston has instituted a number of preventative inspection methods in its endeavor to furnish a fast, reliable and comfortable service with as few interruptions as possible. Our operators at the completion of their run turn in defect blanks on which are recorded mechanical, electrical and body defects, and any other comments they may care to make concerning the operation of the bus, and these defects are then cared for by the night mechanic.

Buses are inspected daily for gas, oil, water and tires, as well as all body and running lights. Every 1,500 miles the bus is brought in the shop for an oil change and general inspection. The time of our general overhaul is determined not so much on a mileage basis as on the operating conditions of the bus as reported by our inspection department. At the present time buses are making an average of some 55,000 miles before being overhauled.

Believing that results are only as good as the men, methods, and machines at work, we have secured as mechanics, men who are specialists in the art of building and servicing of bus units. To enable these mechanics to perform their work with accuracy and dispatch, we have equipped our shop with a number of tools and machines, specially adapted for this work. "No Deferred Maintenance" should be the guiding watchwords of any progressive street railway, and should the opposite course be taken, unsatisfactory service is bound to result. Any method, tool or machine, which will increase accuracy, lower costs, and finally and most important of all, lessen the probability of the failure of any mechanical unit or part, should be put in use.

*Abstract of a paper presented at the meeting of the New England Street Railway Club, at Portland, Me., Oct. 18, 1928.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Nov. 13-16—National Association of Railroad and Utilities Commissioners, New Orleans, La.

Nov. 13-15 — Ohio State Safety Congress, Columbus, Ohio.

Nov. 14—Association of Electric Railway Equipment Men, Middle Atlantic States, semi-annual meeting, Hampton, Va.

Nov. 21-22—Public Utilities Association of Virginia, Hotel Roanoke, Roanoke, Va.

Nov. 21-22—Central Electric Traffic Association meeting, Auditorium Hotel, Cleveland, Ohio.

Dec. 10—National Highway Traffic Association, annual meeting, Automobile Club of America, New York, N. Y.

Jan. 22—New York Electric Railway Association, mid-winter meeting and dinner, Hotel Commodore, New York, N. Y.

Jan. 23-25—Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.

Win Back the Public With Modern Cars*

By R. T. Foster

Superintendent Wason Manufacturing Company, Springfield, Mass.

MANY of us have returned very recently from the A.E.R.A. convention at Cleveland, where we saw large cars, small cars, four-wheel, six-wheel and eight-wheel cars, some with rubber-tired wheels, some with steel wheels, and some with steel and rubber wheels. Let us pay the highest tribute to every designer and builder who exhibited there for they are all trying to help solve the problem of how to sell more rides to the public. Let us not fail to mention the bus manufacturers, for they too are offering new models and new designs for the same reason, namely, to help the railways sell more rides.

Street cars are still needed as part of our transportation system. In fact, you will all agree that should we discontinue the use of cars we would have much more difficulty than we now have from street congestion and it is of paramount importance that congestion be relieved rather than increased. Our car riding has fallen off. Why? The answer is competition. Cars have not been brought up-to-date, to correspond with American progress, and something more attractive, the private automobile, has taken away our rides. What are the advantages of the private automobile? The two most important are undoubtedly speed and comfort. The automobile of 28 years ago certainly was not as speedy, was not as comfortable and did not have the same general appearance as the automobile of today; neither does our electric car of 28 years ago resemble the present-day models. Yet many companies are wondering why the 28-year old car, or any of the early 1900 models, will not compete with the 1928 model automobile.

The car builders have designed lighter weight cars, more attractive cars and easier riding cars, with faster starting and stopping. The manufacturers of electrical and air brake equipment, the treadle door manufacturers and all others can give something better than they could many years ago. I agree that the railways cannot afford to buy all the newly designed vehicles of today any more than the manufacturer can afford to buy everything that is offered in the way of new machines. Some of the new machines are rather freakish and we do not buy them all, but on the other hand we always have and always will buy practical modern machinery.

The public does not want and will not use the same things they did years ago. Imagine the musical instrument manufacturers offering the public the old-fashioned organ, the stocking manufacturers offering anything but silk stockings, the automobile people offering our earlier touring cars without even wind shields. Would the public buy the old dusters and ride in them? No, they would not, yet some railway managers wonder why the public does not enthuse over the old model street car.

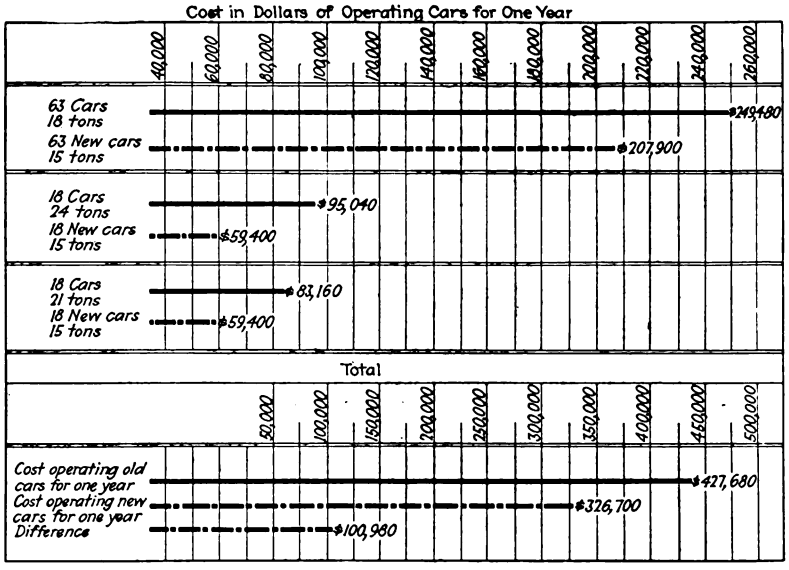
The public will help the street railways and will boost for them, if the street railways win back the public through modernization. A railway man recently told me that the new cars he put into service in his city changed the entire outlook of his company. The city government worked for them in stopping competitive bus operation and relieved them of a great deal of their snow removal cost; the operators seemed to have a new interest in their jobs, everyone feeling that he was working for a modern company instead of just an old-fashioned street railway; and most important of all, the public's feeling was even reflected in the law suits.

Figures for corresponding nine-month periods of an electric railway in Massachusetts, before and after the purchase of new rolling stock, show a net difference of $92,013. For the period preceding the purchase, the figures showed $50,820 in red; for the following nine months the records showed $41,193 in black. Before the purchase of new cars, the cost per car-mile was 0.479 cent, and the receipts, 0.434 cent. After the road was equipped with new cars the cost per car-mile was 0.352 cent and the receipts, 0.487 cent.

A railway in an eastern New York city, which operates 90 cars, found that the cost of operating old cars for one year was $517,066, while the cost for modern cars was $344,160, a saving of $172,906. The totals were arrived at by assuming the operating cost to be 11 cents per pound per year. Whether the 11 cent figure is right or half that amount is right, there is a saving you cannot afford to overlook. Do not forget that in addition to this saving you may win back public spirit. If you had the proper co-operation of the public and the city government could you not better survey and educate the public to the unfairness of some of their local ordinances? Could you not educate them that practically as many people travel in private automobiles over the paved surface of their city streets which you paid for and which you kept free of snow in winter, as did car riders who paid all the expense of this paving and this snow removal? Could you not win the support of the city fathers and get better results in the enforcement of parking regulations? Could you not get the public to work with you in the study of jump stops in your rush hours? Could you not do hundreds of little things that you now find difficult of attainment, if you could win back the public's good will?

Do not overlook the trackless trolleys, or in other words the straight electric buses. Think of the economy of electric power, the dependability of it, the smoothness and quietness of starting and stopping, the possibilities of working with the city government to combine modern cluster or decorative electric street lighting with trackless trolley suspension arms on the same poles.

Another development in car and truck construction demands attention — the aluminum car and truck. If you can duplicate your present 32,000-lb. light-weight steel cars with 22,000 or 23,000-lb. aluminum cars, you can use four 25-hp. motors in the place of four of 35 hp. If you haven't even tried modern light-weight steel cars, compare 22 or 23,000 lb. against 42 to 68,000 lb. cars, which carry the same number of passengers. Think of the difference. Think of the life of your roadbed, rails, frogs and switches, the noise, the wear and tear caused by the heavy pound on every part of the car body and trucks, to say nothing about the cost of hauling it around and keeping it in repair.



Comparative operating costs of corresponding numbers of old cars and new, light-weight cars

*Abstract of a paper presented at the meeting of the New England Street Railway Club, at Portland, Me., Oct. 18, 1928.

$66,000,000 Terminal Plan

Pennsylvania president stresses part elimination of P.R.T. underliers plays in his company's program

"UNLESS the city of Philadelphia moves to get the P.R.T. underlying companies out of the way we shall be unable to complete the building of our new passenger terminal on the west bank of the Schuylkill."

That declaration was made according to the Philadelphia *Public Ledger* by W. W. Atterbury, president of the Pennsylvania Railroad, during a discussion of the railroad's plans to expend $100,000,000 for electrification.

In that same period the railroad will have spent upward of $66,000,000 additionally in the development of its terminal plans and allied improvements. Electrification of the road at Philadelphia will be co-ordinated with terminal construction, General Atterbury said, so that upon completion only electric trains will be operated in the new structure and in the underground suburban service, which will terminate in a new station south of the Parkway between Fifteenth and Sixteenth Streets. Mr. Atterbury was quoted as saying:

We were convinced before authorizing this great outlay that the city would carry out its agreement to have the Market Street elevated structure relocated under ground between the east river bank and a point west of Thirtieth Street and we are still satisfied that the city will proceed with the acquisition of the P.R.T. underliers so that improvement can be accomplished.

The job itself will be particularly difficult, because of the necessity of maintaining traffic while the underriver tube is being constructed. The project will require several years to complete and until it is started all our plans for the development of the terminal and the west bank area of the river must be held in abeyance.

The Union Traction Company, principal underlying company of the P.R.T. system, is the franchise holder for the Market Street elevated. Virtually all the underliers have signified their acceptance of the $139,000,000 total valuation placed on their holdings by the Public Service Commission. The Mackey Administration, as indicated elsewhere in this issue, plans to hold a special election in about three months to submit the proposed municipal acquisition of the underliers at that price to the voters.

General Atterbury pointed out that the act of Assembly authorizing the condemnation provided for the acquisition of all the underliers, thus making it impossible for the city to proceed for the taking over of the Union Traction Company franchise solely. He said:

If the city's program for condemnation fails we shall be left in a mighty difficult position. We will be faced with the necessity of completing a greatly needed public improvement, with the anticipation of seeing an unsightly elevated structure directly in front of the Market Street portals of the terminal.

Better Maintenance Aim of Iowa Operators

Papers and discussions dealing with possible methods of reducing maintenance costs of railway and bus equipment without impairing service occupied the attention of the Operators' Section of the Iowa Electric Railway Association at the eleventh annual convention, held at Cedar Rapids, on Nov. 8 and 9. Discussion of both railway and bus problems was entered into heartily by the hundred or more delegates, presided over by E. J. Anderson, general superintendent of the Tri-City Railway, Davenport, Iowa. Of greatest interest were the papers dealing specifically with the care of equipment and property.

A full report of the meeting of the association at Cedar Rapids, with an account of the discussion, will be published in next week's issue.

Franchise at Omaha Approved

New grant sanctioned by voters at election on Nov. 6 will make it possible for company to carry out improvement program. Terms digested

VOTERS of Omaha, Neb., at the election on Tuesday approved the new 30-year franchise for the Omaha & Council Bluffs Street Railway. Ten ballots in all were handed to each voter, but the only other matter on them of interest to the utilities was the county bridge proposal, referred to editorially in the ELECTRIC RAILWAY JOURNAL for Nov. 3. The bond measure was lost.

The vote on the franchise is interpreted as reflecting recognition by the electors of the fact that the railway has been doing its best to give the city efficient and courteous service and acceptance by the public at face value of the promise of the company to continue to render efficient service.

The street raiway franchise expired last May. The City Council authorized the railway to continue to use the streets until Nov. 6. The terms of the franchise were agreed upon after long study by the City Commissioners and the corporation counsel of the city. The franchise in full was published previous to the election as a paid advertisement in the newspapers, so that every phrase and every clause and every sentence could be studied at leisure. The contention of the company was that approval of the grant was needed if the railway was to be permitted to extend its financing and develop its property. At one stage of the discussion of the matter the company said:

We believe that an efficient railway system is one of the biggest assets a city can have. We know that traffic and transportation engineers agree that trolley cars propelled on fixed routes over steel rails must ever be the backbone of any city's transportation system. We know nothing comes so near the daily routine of the worker and the shopper, as the street car.

In its advocacy of the franchise the company among other things, said:

1. The proposed franchise contains every provision that the city asked for. The franchise ordinance was passed unanimously by the City Commission after long and diligent study by the commissioners and the city corporation counsel, Dana Van Dusen.

2. The franchise will enable the company to live and to do business in Omaha and to grow with Omaha as any other business wants to grow and develop. The franchise will enable the company to refinance and to make such improvements and extensions as may be needed. Failure to get a franchise would mean receivership because without a franchise it would be impossible to refinance the company, the bonds of which are now past due. All progress would then stop.

3. The street railway asks the franchise also because of its loyal staff of 1,100 employees. These men, heads of families, home owners many of them, worthy, law abiding, splendid citizens, deserve the vote of confidence of their efforts to give Omaha efficient tramway service.

TERMS OF GRANT

The new franchise is for 30 years. It dates back to May 22, 1928. Since there was some question about the real date of the expiration of the franchise under which the company has been operating, it was agreed that should the grant which has now been approved be passed by the voters, the issue would not subsequently be raised about any inherent rights under the old grant. In other words the new grant is in the nature of a replacement ordinance. The principal provisions of the ordinance, abbreviated in their terminology follow:

Consent is granted to the railway and to its successors to construct, reconstruct, maintain and operate a street railway, motor bus and street transportation system, upon, along and across the streets and public ways, in Omaha, within the present and future boundaries thereof; but the right in all alleys, pleasure boulevards, park grounds, and all spaces between the estab-

Digitized by Google

lished curb line and the outer street boundaries not already occupied by tracks shall not be exercised unless special authority hereafter is granted or order made with appropriate conditions, at the option of the governing body of the city, acting by ordinance.

This consent shall fully terminate in 30 years from and after May 22, 1928, and on such termination, or at any time thereafter upon the order of the governing body of the city, the grantee, shall immediately discontinue all operation and remove all property from public streets and ways and restore same to good condition; neither the failure to order such discontinuance or removal nor the failure of the grantee, to discontinue operation and remove the property, nor the acceptance by the city of public service, the making of additional investment, the construction of extensions, the payment of taxes, fees and charges nor the regulation of rates and service, nor any act or failure to act of the governing body or the officials of the city shall confer any right whatever upon the grantee.

The rights, licenses, privileges and consent hereby granted cannot be renewed, extended, enlarged or amplified by user, occupation, investment, acquiescence, implication or estoppel, nor by the issuance or granting of any permits or by any act or failure to act by the governing body of the city nor in any manner except by the direct and new vote of the electors of said city.

This grant is not exclusive, and the city reserves the right to grant to other corporations or persons similar or other rights and consents upon the same or other terms and conditions, over the same or other streets and public ways; and also nothing herein contained shall deprive the governing body of the city of the right and power to grant licenses or permits to other auto or buses, taxicabs or vehicles to use the streets of the city in carrying passengers for hire.

The properties owned, shall, during the period hereof, be constructed, operated and maintained solely under the authority of and subject to this consent and no other claim or right, but shall be subject to assignment, transfer, lease, sub-lease, consolidation or merger under the laws of the state of Nebraska, but only when and if any and all interested parties are bound by and subject to all the terms and limitations contained in this ordinance, and then only to or with a corporation resident in Omaha and created by and existing under the laws of the state of Nebraska, a majority of whose directors shall be residents and citizens of the state of Nebraska.

All increases or changes in the railway and all additions and all supplementing or supplanting by bus or otherwise, shall become at once subject to all of the conditions and restrictions of this consent, including the time limitation. All property and operation outside of the city limits shall at once become subject solely to the conditions of this consent, including the time limitation, upon the extension of the boundaries of the city by annexation or otherwise, regardless of any grant under which same may have been acquired, constructed or operated.

The consent is limited to the operation of street cars such as are now in common use, propelled by electric power upon two parallel rails and not more than two parallel tracks or lines, upon the surface of the streets and by over-head trolleys, and to the supplementing and supplanting of such street cars by the operation of gasoline or electric motor propelled buses, over definite and regular routes along and upon the streets and public ways.

The consent extends to all parts of streets and public ways of the city along and upon which electric street railway tracks now owned and used by the grantee are located; and also extends to all other streets and public ways and all other parts of streets and public ways, subject to the limitation that such additional occupation and use shall in such instance be first authorized by the governing body of the city.

Providing for the Future

THE governing body of the city, from time to time, by ordinance, may order and require such extensions of car lines or new lines, or supplemental or supplanting bus service, or transportation facilities as may be necessary for efficient and convenient transportation facilities throughout the city, consideration being given to the initial cost thereof, the resulting increased expense of operation, the usefulness of the proposed extension in connection with the system of transportation as a unit, and the length of the unexpired period of this consent. Such ordinance shall determine whether the extensions or new lines shall be by street car or by bus or otherwise, and shall be adopted by a vote of five-sevenths of the governing body of the city.—*Omaha Franchise.*

The consent given by this ordinance is limited to intra-city transportation exclusively, except that grantee is authorized to operate suburban, interurban or interstate electric or motor bus passenger transportation lines, by connecting same with its city lines or entering the city over the tracks or along the routes of grantee, for interurban transportation exclusively, and to be operated subject to all of the provisions of this ordinance and the legal requirements of Nebraska statutes. No local business shall be conducted on or by such lines, and grantee shall accurately segregate all investments, inventories, valuations, accounts and operation thereof. All such arrangements and relations for the operation of such suburban, interurban and interstate lines, shall be terminable at the option of the city in the event of purchase of the local lines of grantee by the city.

The grantee shall have the right to use viaducts and bridges constructed or maintained by the city only upon such terms, conditions and compensation as shall be provided, from time to time, by the present and future requirements of the city charter and city ordinances, and the right to use other viaducts and bridges upon such terms as may be agreed upon with the persons constructing, owning, or maintaining same, with and subject to approval by the City Council and in conformity to the city charter. Subject to such conditions grantee may be required to extend over or construct upon viaduct and bridges.

Grantee shall engage in no business other than the operation of transportation properties and shall acquire no properties other than such as are useful and used in such operation.

The grantee will obey the orders of the governing body of the city, with reference to the stopping points of cars, buses and vehicles for the purpose of receiving and discharging passengers.

Street car lines shall not be supplemented or supplanted, in whole or in part, by bus service, unless upon the city consents by ordinance.

The grantee agrees that it will pay such occupation taxes as may be levied by the governing body of the city.

The grantee shall be subject to and shall comply with all present and future statutory, charter or ordinance requirements, burdens and powers embraced within provisions as to the cost and expense of street maintenance and repair, paving and repaving, surfacing and resurfacing, and improving, and no exemption from any of these requirements, burdens and powers will be, directly or indirectly, granted by or derived from this consent, and the city expressly reserves all present and future requirements, burdens and powers with reference to the things enumerated herein.

The grantee agrees to carry without charge all members of the police force and all members of the fire department of the city while engaged in their official duties, and bearing official passes or recognition cards which shall be supplied by grantee.

The grantee shall, at its own expense, raise or lower all tracks to conform to grade or change of grade and to conform to the paved surface of any street or public way when paved, repaved, surfaced, resurfaced, or improved, and always so maintain them.

There shall be filed with the city clerk promptly when made certified copies of all financial statements prepared by the company for any purpose, all literature or reports used to promote the sale of stock or bonds or to inform the public or purchasers with regard thereto, copies of contracts relating to the sale or exchange of stocks, bonds and debentures, all appraisals or valuations and the annual report of the officers and the board of directors to the stockholders. The city shall have ten days notice of all applications to the State Railway Commission to issue securities, adjust fares, or otherwise to invoke the jurisdiction of said commission. The city corporation counsel, city attorney and city comptroller, together with any expert assistance, shall at all times have access to all the files, records, books, documents, accounts, reports and minutes of the grantee, except those pertaining to personal injury or property damage claims or litigation or to employment of employees, and shall be supplied with certified copies upon request. The city shall have the power to require an audit of the books and accounts of grantee at the expense of the city at any time.

Grantee shall annually file with the city an inventory and description of all additions and betterments and state the actual cost thereof and shall also present a detailed statement of depreciation and obsolescence during the previous year. Within 30 days after acceptance of this consent, grantee shall file a similar statement for the years 1920 to 1928, both inclusive. The city and the grantee agree that either of them shall be entitled to demand a revaluation of the properties of grantee used in local transportation, at any time or times when a period of five years shall have elapsed since the last preceding valuation or revaluation.

It is agreed that the city shall have the right to intervene in and be made a party to any suit or proceeding before the Nebraska State Railway Commission or any court involving in any way the construction or performance of the terms of any part of this consent or any suit to foreclose or enforce any lien, mortgage or trust against the street railway and transportation system, or any part thereof.

If the grantee shall wilfully refuse or neglect to comply with the provisions of this consent the governing body of the city upon the affirmative vote of 5/7 of the members shall have the power to revoke

Digitized by Google

and terminate all of the authority and rights granted by this consent, subject to judicial review in the courts of the state of Nebraska; provided, however, that no such revocation and termination shall be declared until after the grantee shall have been given a full hearing before the governing body of the city, to which hearing the grantee shall have 30 days notice.

If now or at any time within the life of this consent, the state of Nebraska or its Railway Commission does not have, or shall be held by a court of final jurisdiction to not have, or shall relinquish, in whole or in part, jurisdiction over and control of rates of fare and conditions of service, either or both, in whole or in part, then, to that extent and immediately thereupon, the governing of rates, fares and conditions of service with full power to fix rates and to establish and enforce service requirements shall be vested in and exercised by the governing body of Omaha, and its orders shall be complied with by grantee.

The city reserves the right at any time to acquire the property needed exclusively for local transportation purposes but there is to be no allowance for franchise value. All mortgages shall specifically recite this condition. In the event of purchase by it, the city shall have the option to terminate or cancel all leases, trackage agreements and other contracts.

By vote of the majority of the electors at an election called for that purpose, this franchise-consent shall be subject to direct amendment to remedy, alter or supply any provision hereof which may have failed, in whole or in part, due to its illegality; but no such amendment shall change the duration of this consent nor the royalty therein required to be paid.

This consent shall be void if not approved by the electors and if approved and adopted by the electors this consent shall be void unless within 30 days from the date of the election, the consent thus adopted and granted shall be unconditionally accepted in writing by the grantee duly authorized by the board of directors and stockholders and by the duly authorized trustee for the bondholders of grantee, and any bondholders and stockholders protective committees, for themselves, their successors and assigns, which instrument of acceptance shall, together with certified copy showing proper corporate and other action authorizing such acceptance, be filed in the office of the city clerk of the city of Omaha. Such acceptance shall constitute an abandonment, assignment, surrender and waiver of all rights, privileges, franchises, consents and authority previously acquired or claimed by the grantee hereof, it being the intention of this agreement to divest the grantee of every right of such nature existing or claimed to exist at the time of the acceptance of this consent.

Power Show in Early December

MOTION pictures will feature the program of the seventh National Exposition of Power and Mechanical Engineering, to be held at the Grand Central Palace, New York City, during the week of Dec. 3-8. The films, which cover a wide field, include "The Age of Speed," "The Manufacture of Timken Steel Roller Bearings," "Freezing Out Fires," "Electrical Measuring Instruments," "Power" and "From Coal to Electricity." More than 465 exhibitors had registered at an early date and indications point to a higher attendance than last year.

More Subway Talk in Cleveland

Pennsylvania said to be behind Cuyahoga proposal about which facts are slowly coming out

DETAILS of the organization and purposes of the Cuyahoga Subway Company, Cleveland, Ohio, are gradually seeping out, but the company still remains as great a mystery as it was when it was incorporated. Attorneys for the company, however, permitted it to be known that M. F. Bramley, president of the Cleveland Trinidad Paving Company, and owner of Luna Park, Cleveland amusement resort, was connected with the subway company. It was also said that Thomas E. Monks, vice-president of the Guardian Trust Company, Cleveland, was associated with Mr. Bramley. Mr. Monks, denied that he had anything to do with the subway company. Mr. Bramley at first said he was acting as "sort of a trustee for some other folks," but later it became known that he is president.

On Nov. 2 Cleveland newspapers received maps labelled "proposed Bramley tubes of the Cuyahoga Subway Company." The maps showed a layout of approximately 50 miles of subways, radiating in every direction from the Public Square, with a number of proposed crosstown and connecting routes.

What was regarded as a significant circumstance was the name "Pennsylvania" applied to a route projected in Superior Avenue N. E., to East 40th Street. The Pennsylvania Railroad crosses Superior at East 40th Street and apparently the only reason for designating this route as the "Pennsylvania route" would be to create the impression that it would have some connection with the Pennsylvania Railroad.

Since the Pennsylvania Railroad has declined to enter the Van Sweringens Union Terminal there has been a vast amount of speculation as to where the Pennsylvania will locate a terminal in Cleveland. There have been all sorts of stories about a rival terminal or rapid transit project backed by the Pennsylvania in competition with the Van Sweringens. One story is that the Cuyahoga Subway Company is fostered by the Pennsylvania Railroad.

Mr. Bramley declared that the subway maps had been sent out without his knowledge or consent. He declined to make any comment on the use of the name "Pennsylvania" in the description of the Superior Avenue subway. No announcement was made as to whether the company would build all the projected subways. Based on previous subway studies, however, it was roughly estimated that it would cost $500,000,000 to build the subways on the maps.

Petitions in circulation for several months which called merely for blanket authority under an initiated ordinance to construct and operate subways are to be scrapped, and new petitions are to be circulated which will indicate proposed routes, method of operation, rate of fare and the means by which the city will have some control or supervision over service. It was indicated that the proposed fare would not be a fluctuating one fashioned on the Tayler grant of the Cleveland Railway.

The company will propose to build and operate a subway system as a complete unit, entirely independent of the Cleveland Railway, it was learned.

All previous subway studies in Cleveland, particularly the proposal made by Raymond Cragin, which is up for consideration of the Cleveland Railway, have been based on the theory that transportation services in Greater Cleveland should be operated by one company. Backers of the Cuyahoga Subway Company are said to believe that the city is large enough for two systems, one above and one below ground.

San Francisco Rejects Three Utility Measures

Three charter amendments of interest to private utilities and one of particular concern to the Market Street Railway, were all voted down by the electors of San Francisco at the general election on Nov. 6. Charter amendment No. 24, provided for the surrender of the expiring franchises of the Market Street Railway and the issuance by the city of revocable permits containing all the provisions of the existing franchises, including the 5-cent fare.

This amendment, it was urged, would tend to alleviate the complicated situation growing out of the fact that a number of franchises held by the company expire at different dates. A bitter controversy developed over the amendment.

Amendment No. 22 would have provided a local public utilities commission of three to be appointed by the Mayor of San Francisco with jurisdiction over all publicly owned and operated utilities. San Francisco now operates an extensive railway system in competition with the private company; has a municipal hydro-electric plant of approximately 100,000 hp. with a transmission line but no distribution system in the city, and has recently voted $40,000,000 in bonds for acquisition of the Spring Valley water system.

Charter amendment No. 23, was characterized by its opponents as the most dangerous proposal of the three. It would have set up a scheme for financing the acquisition or extension of public utilities by bonds authorized by a majority vote and payable as to both principal and interest out of revenue only. The amendment was intended to replace the present charter provision requiring a two-thirds vote on bond issues and limiting bonded indebtedness of the city to 12 per cent of the real and personal property in the city.

Unofficial returns for San Francisco showed the vote on the three charter amendments to be 67,771 in favor and 93,849 against amendment No. 24; 47,838 in favor and 74,092 against amendment No. 22; 34,852 in favor and 95,348 against amendment No. 23.

Taxi War in Providence Makes Cabs Practically Jitneys

An effort to end the Providence, R. I., taxicab rate war will be made soon. Several taxicab companies now have a rate of 35 cents from the center of the city to any point within the city line, or from any point in the city to the center. Thousands of persons, especially school teachers and pupils, who ordinarily ride on the street cars are now using the taxicabs, it is reported.

Meanwhile Alonzo R. Williams, president of the United Electric Railways, intends to file a formal complaint with the Board of Police Commissioners, charging that the cut-rate taxis are guilty not only of "cruising" but of creating a serious traffic problem in Providence, already badly congested because of its narrow streets.

Officials of the cab companies deny their cabs are allowed to cruise and declare the low rate has brought them so much business over the telephone that they have their facilities taxed without seeking additional passengers by cruising. One company intends to add about 25 cabs to the 50 now in operation.

Mr. Williams charges that the taxis are so operated as to make the cabs almost jitneys, against which there is a law.

Sunday Pass on Gary & Southern

Extension of the privileges of the Sunday pass plan to patrons of the Gary & Southern Traction Company was announced recently by the Gary Railways, Gary, Ind., under which management the Gary & Southern, recently purchased by the Midland Utilities Company, Chicago, is now being operated. The 25-cent Sunday pass, established last spring by the Gary Railways for the purpose of stimulating Sunday riding permits the holder to ride anywhere on the system as many times as he wishes on the date of issue. Passes are sold by all car operators and agents. Passengers travelling between Gary and Crown Point on the Gary & Southern line, however, will be required to pay a 10-cent cash fare per trip in addition to presenting the 25-cent pass. The regular single trip fare is 45 cents.

Sale of the Sunday pass has resulted in a marked gain in traffic and revenue on practically all divisions since the device was adopted, according to C. W. Gifford, general superintendent of the Gary Railways.

New Order on Grade Crossings in Pennsylvania

Permission has been granted to the Reading Transit Company by the Pennsylvania Public Service Commission to operate one-man cars over grade crossings in Bridgeport and Norristown, Pa. The company asked the commission for a waiver of the general order which covers the operation of trolleys over grade crossings. The commission has directed the railway to place watchmen at three of the five crossings named in the petition for the waiver. The trolley tracks cross the right-of-way of the Pennsylvania and Reading Railroads in these two towns.

Seattle Improvement Program

With the Seattle Municipal Railway, Seattle, Wash., needing approximately $700,000 in excess of anticipated revenues between now and next March, according to present estimates, to permit the railway system to meet its bond obligations, Mayor Frank Edwards and members of the City Council have under consideration an extensive reorganization and general improvement program for the lines. At an early meeting Mayor Edwards will lay before the members of the City Council utilities committee the salient features of the proposed reorganization plan.

Pending this meeting and the proposed full discussion of the railway problems, Councilman E. L. Blaine, chairman of the finance committee, states the Council will hold in abeyance preparations it has under way for another huge loan to assist the railway system in meeting its bond interest and redemption payments. Although the railway department still owes approximately $200,000 to the light department on a previous loan, which debt will be reduced to $100,000 before next March, it is planned to effect a loan either with this department or with the city water department, both of which are on a good paying basis.

City Councilmen are agreed that the municipal railway system must undergo some course of financial rehabilitation at once. A plan suggested by Councilman Otto A. Case is the rebonding of the system for approximately $25,000,000 to pay off its present debt and completely rehabilitate the physical property. The Case plan would entail passage at the next Legislature of a measure authorizing Seattle to refund its railway debt, and another granting the city a more liberal apportionment of the license and gasoline tax money from the state, together with authority to use it for the railway if necessary. It would provide for the replacement of the present heavy, cumbersome street cars with lighter, speedier, more comfortable ones. Councilman Case declares he is opposed to refunding the Seattle railway debt with a new issue of bonds which will be a general obligation upon the community, instead of being purely against the railway.

Councilman Oliver T. Erickson, long an exponent of municipal ownership, believes it will require between $5,000,000 and $10,000,000 to rebuild and re-equip the railway system to make it sufficiently attractive to win back patronage and convert the road into a financial success.

In the meantime, a committee of leading men and bankers of the city is completing a report, based upon an investigation, of the entire problem, which will be presented to the city within 60 days. When ready for submission, the program will represent the fruits of two years' intensive work by a small and anonymous committee of civic leaders, who have contributed their own time and have also retained expert engineers.

It is declared that one of the principal aims of the committee will be a rapid transit system which would lure citizens away from the use of automobiles in going to and returning from work. Another important phase is that of unification of the city's entire transportation system.

Shoppers Limited on Excelsior Springs Run

The Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo., put on the Excelsior Springs run on Nov. 1 the new Clay County shopper, a de luxe crimson limited coach, which will make four trips daily. The new service is designed particularly for shoppers living on the Excelsior Springs line, and the schedule will be arranged to serve these women. The new coach has been completely remodeled and newly equipped. It is an all-steel coach, with high-backed chairs finished in mohair and leather. The exterior is crimson with a cream top and black trimming. It is like the cars put into service on the ten limited runs to St. Joseph 60 days ago.

According to Robert P. Woods, president of the Kansas City, Clay County & St. Joseph Railway, patronage on the interurban cars has increased while patronage on the company's bus lines has decreased.

Service Reduced on Iowa Line

The Fort Dodge, Des Moines & Southern Railroad has reduced its service between Fort Dodge and Des Moines, Iowa, from six to four cars each way daily, due to lack of patronage. Schedules have been arranged to give patrons a full day in either city.

Would Remove St. Louis Utilities from Commission Rule

Mayor Victor J. Miller of St. Louis has stated that he is having a bill prepared for introduction before the next Missouri General Assembly removing St. Louis public utilities from control of the Missouri Public Service Commission.

Poems on Car Service in Kansas City

The Kansas City Public Service Company, Kansas City, Mo., is offering $5 for each four-line poem accepted on the subject of the railway service. The contest has been going on for several weeks, and each week a different jingle is posted on a card in the rear of all cars. Largely humorous, the poems have attracted considerable attention.

Recent Bus Developments

Chicago Feeder Bus Hearings Concluded

Concluding testimony in the contest between the Chicago Surface Lines and Chicago Motor Coach Company as to which system shall operate motor coach extensions on the northwest side of Chicago was heard on Nov. 1 by the Illinois Commerce Commission. As a result of a ruling in which the commission reversed its original order authorizing the Surface Lines to operate feeder buses in this territory at a 7-cent fare with free transfers to street cars, the Chicago Motor Coach Company started a 10-cent service on approximately 70 miles of new bus routes on the same streets on Oct. 3.

Since that time representatives of numerous civic organizations from this section of the city have appeared before the commission asking that the decision favoring the Chicago Motor Coach Company buses be rescinded and the right to operate over these streets be restored by the state body to the Surface Lines' feeder buses.

An appeal from the commission's order authorizing service by the motor coach company at a flat 10-cent fare, has also been filed by the Chicago Surface Lines and city attorneys in the Circuit Court. The appeal is based on the allegation that the Commerce Commission had acted without hearing the side of the railway lines and the city. Ordinances approving feeder bus operations by the Surface Lines throughout the disputed area had previously been passed by the City Council over Mayor Thompson's veto.

In the final testimony presented before the commission, E. J. McIlraith, staff engineer for the Surface Lines, introduced evidence showing that patrons of the 7-cent joint feeder bus-railway service would save from 16 to 18 per cent of their time compared with the 10-cent service on the motor coaches in traveling between the northwest side and the downtown Loop district.

Ten-Cent Bus Fare in Binghamton

Members of the Common Council of Binghamton, N. Y., have registered their approval on a projected ordinance providing for an increase of fare on the Riverside Drive and Seminary Avenue bus line, through adoption of an ordinance introduced by Alderman Earl B. Chubbuck. The increase is from 7 to 10 cents, with the privilege of purchasing four tickets for 30 cents. It establishes a uniform rate for bus and railway transportation in the city of Binghamton.

The action was taken upon recommendation of the joint committee on law and health-motor bus lines, to which the ordinance was referred at a previous session and in accord with the wishes of some 300 residents of the city who recently petitioned the Council to take such action.

The project finds a parallel in the franchise granted in 1927 by the Common Council to the Binghamton Railway Bus Lines, Inc., controlling the Riverside line, to operate the Rockbottom and Spring Forest Line.

Favors Bus Service on Outlying Lines in Providence

Alonzo R. Williams, of the United Electric Railways, Providence, R. I., told the Public Utilities Commission, at a recent public hearing at the State House on a petition to abandon trolley service on the Washington-Providence and Crompton-Hope lines and substitute bus service, that authorization of the change would enable the company to give "more comfortable, faster and more frequent service" on all its lines in the Pawtucket Valley and between Providence and the Pawtucket Valley villages.

Charge Made Against Stark Electric Dismissed

PETITION of the Salisbury Transportation Company, protesting fifteen-minute service between Canton, Ohio, and Louisville, a distance of 5 miles, and requesting that certain tickets and passes authorized by the Stark Electric Railroad be ordered discontinued, has been dismissed by the Ohio Public Utilities Commission at Columbus. The bus company contended that the Stark Electric Railroad is trying to destroy bus competition by the "unreasonable sale of tickets and passes and extra service." Officials of the bus company declared that service was being sold at less than cost and that revenue was not sufficient to meet depreciation costs. Officials of the electric road declared that the service at present rates is showing a profit.

In dismissing the petition, the Ohio board in its journal entry held that "there is no showing in the record which would warrant the commission in finding that the defendant is actually furnishing service for less than the actual cost, for the purpose of destroying competition or that defendant's rates are illegal, discriminatory, unjust or unduly preferential."

Seeks to Abandon Service in San Leandro

Officials of the Key System Transit Company have applied to the California Railroad Commission for authority to abandon bus service in the city of San Leandro, Alameda County, which has been operated experimentally since May 3, 1928. Applicants state that the patronage of said line has not been sufficient to warrant its further maintenance.

Problem of Interurban Bus Traffic

Regulation of interurban bus traffic is being considered in Kansas City, Mo., by the traffic committee of the Kansas City Safety Council. A set of recommendations has been prepared by the committee and at a meeting on Oct. 30, the report was referred to the board of governors of the Safety Council, which was scheduled to meet on Nov. 12.

It is agreed that the ultimate solution of the problem, which has grown out of the loading and unloading of interurban buses in the congested districts of the city, is the establishment of a common terminal, but the recommendations of the committee dealt with the immediate problem, regulating the number of discharges of passengers in the congested district, the number of pick-ups, and the bus route through the city. It has been found by survey that more than 200 buses are scheduled to leave Kansas City daily, and many of these lines have their terminals on the street.

The Safety Council has had the advice of owners and operators of interurban buses in their preliminary conferences on the subject. A proposed ordinance which would have prohibited the buses from entering the congested downtown district was opposed by the merchants, who believe that the downtown terminals help their business.

Geneva-Waterloo Purlieu of Controversy

Competing bus lines figured in a spirited public hearing on Oct. 22, before the village board of Waterloo, N. Y. Applications were made by the Geneva Railway Bus Lines, Inc., subsidiary of the Geneva, Seneca Falls & Auburn Railroad, for a franchise to operate buses to Waterloo, and by the Finger Lakes Rapid Transit Company for a new franchise to carry passengers between Seneca Falls and Waterloo and eventually to extend to Geneva.

Attorney Lansing G. Haskins, president of the Geneva bus corporation, which now has a franchise to operate buses in the city of Geneva, represented the company. The company asked for a franchise which would enable it to abandon trolley service now carried on to Waterloo and replace this with buses. Mr. Haskins said that the company would give ade-

Digitized by Google

quate service with rates comparable with the present trolley fare.

Claude R. Mann, representing the Finger Lakes company, now operating buses between Waterloo and Auburn, applied for a franchise which would take away the present restriction preventing the company from carrying local passengers between Waterloo and Seneca Falls. Officers of the Finger Lakes company objected to the franchise to the Geneva Lines. They said that with four new buses they could extend the lines through to Geneva.

Plans in East St. Louis

The Illinois Commerce Commission dismissed the application of the East St. Louis & Suburban Railway for a certificate of convenience and necessity for the operation of buses between Belleville and East St. Louis. Buses will be substituted for electric service on Dec. 1 between St. Louis, Mo., and East St. Louis, Ill., to Lebanon and O'Fallon, Ill., according to W. W. Welsh, vice-president of the company.

Three 40-passenger buses will be put into the service, operating from the Eads Bridge station in St. Louis over the Eads Bridge to East St. Louis to French Village, O'Fallon and thence to Lebanon.

The East St. Louis *Daily Journal* regrets that such substantial agencies of transportation as electric railways should reach that point where earnings do not justify continuance. It stated:

It is our opinion that the bus line to Lebanon is to have its own difficulties, although they may be far in the future. The cry of railroad lines is partially justified that for many years they have been under an injustice in being compelled to pay a tax to help support a system of roads that provided competition for them to such an extent that dividends have been cut to a minimum and many railroads have been forced to go out of business. By the building of state highways at public expense, there has been created an adversary for electric lines of communication as well, caused principally by the public's use of highways thus depriving these connecting lines of their only source of revenue.

The *Daily Journal* must not be understood as opposing bus lines. There are certain phases of the transportation scheme that nothing can occupy so efficiently or so economically, but we have never seen a modern city or a growing community discard its railway lines without noticing at the same time a certain decadence that is unpleasant to consider. There are twice as many people now in and near O'Fallon as were there when the rail line was laid that connected it. Yet, the changing times has routed the stable and dependable cars for speedier buses. It is a natural development of the age—but it is not one upon which any person who considers investment and the losses which accompany a change of the kind can contemplate with pleasure.

It is said that other suburban connections are to be replaced by bus service unless the revenue increases. From this experiment in this section, we may be enabled to gain some idea as to whether it is better or worse, from a community standpoint. Very much indeed will depend upon the results of this initial attempt to replace the steel rails with buses.

Safety Survey in Indiana

A state-wide survey of motor coach operations in Indiana is being made under the direction of the Indiana Public Service Commission to determine how fully the bus companies are observing the commission's recently adopted code of safety regulations. Through cooperation with state motorcycle police, watchers are being stationed at various grade crossings to ascertain the proportion of bus drivers who obey the new rule requiring them to bring their vehicles to a full stop before crossing the tracks of steam railroads and interurban lines.

According to Ross A. Greenwalt, motor coach inspector for the commission, motor coach companies of the state generally have shown a willingness to abide by the new ruling. In cases where state inspectors are riding in buses which fail to observe the regulation, personal warning is served on the driver. In other cases, the warnings are communicated to the company managements.

The campaign for enforcement of the new rule has been in progress for the last 60 days and will continue until satisfactory results have been obtained.

In addition to the crossing regulation, the commission now has in effect an order requiring that bus companies notify the commission immediately by telephone or telegraph, when mishaps occur that involve personal injury. Although the new regulations do not have the force of laws, it is pointed out that companies ignoring the rules are subject to the penalty of having their operators' certificates revoked.

Petitions Filed in New York

Two petitions relating to transportation service in the city of Rome, N. Y., were filed with the Public Service Commission on Nov. 7. The Utica Railway Co-Ordinated Bus Co., Inc., asked for a certificate for the operation of a bus line over a new route to which the city consented on Oct. 29.

The New York State Railways also filed a petition asking the commission to permit it to stop operation on its trolley line in Madison Street for a period of at least one year, promising that if the petition is granted bus service will be provided in that territory under the application of the Utica Co-Ordinated Bus Line.

Canton-Youngstown Service Improved

Joint bus and railway service between Canton and Youngstown, Ohio, a distance of about 50 miles, was started on Nov. 1 after the Ohio Public Utilities Commission approved plans for discontinuing the bus route between these two cities. This service is being offered by the Stark Electric Railroad and the Youngstown & Suburban Transportation Company, the latter controlled by the Youngstown & Suburban Railway.

Formerly, the Youngstown & Suburban operated buses every two hours out of Canton. Under the new schedule, Stark Electric cars leaving Canton on the hour connect with Y. & S. buses at Salem, 33 miles distant. In this way, service between Youngstown and Canton has been increased to hourly service instead of every two hours. Running time between the two cities under the joint plan is practically the same as under the previous bus system.

The Y. & S. now sells through tickets to points along the Stark Electric system while the Stark Electric sells through tickets on the Y. & S. to Youngstown.

Privilege Granted St. Louis Public Service

The Missouri Public Service Commission revoked, effective Nov. 12, the certificate of convenience and necessity issued to the De Luxe Motor Company for the operation of buses between Maplewood, Webster Groves, Kirkwood and Brentwood in St. Louis County for its alleged failure to provide adequate and safe equipment and for other violations of the commission's rules. A certificate to operate buses between Maplewood and Kirkwood over virtually the same route used by the De Luxe company was granted the St. Louis Public Service Company.

Would Discontinue a Los Angeles Line

The Pacific Electric Railway has applied to the California Railroad Commission for permission to discontinue operation on its Hyperion Avenue-Silver Lake-Glendale Boulevard motor coach line in the city of Los Angeles. Despite the payment of a subsidy by certain real estate interests the route continued to be run at a loss. This subsidy recently was withdrawn.

Injunction Prevents Invasion at Crown Point

Through the issuance of an injunction recently by Judge F. M. Ridgely of the Gary Superior Court, the Midwest Motor Coach Company of Gary, Ind., was prevented from operating buses from Chicago, Whiting and Gary to the Lake County fair grounds at Crown Point, Ind., and entering into competition with the Gary & Southern Traction Company, which holds an exclusive franchise for passenger carriage between the cities of Gary and Crown Point. The temporary injunction was obtained by the company after several buses had been operated into Crown Point, where the 1928 county fair was at that time in progress. It was the intention of the coach company, which operates regular service between Gary and Chicago, to run buses to Crown Point only during the four days of the fair, but the restraining order placed the hearing date several weeks after the close of the fair.

Financial and Corporate

Affirmation Sought of Condemnation Figure Fixed for Fonda Road

Affirmance of the value placed on the line and right-of-way of the Fonda, Johnstown & Gloversville Railway, Fonda, N. Y., by the Appellate Division, third department, was asked of the Court of Appeals on Oct. 25 by former Governor Nathan L. Miller, appearing as special counsel for the Hudson River Regulating Commission, which seeks to take over the property by right of eminent domain.

The Appellate Division accepted the value placed by a board of appraisal at $1,442,139 as against the claim of $4,193,678 plus interest to be paid on the judgment, asked by the company. The property of the railway will be flooded in creating the regulating reservoir in the upper Hudson and Sacandaga Valleys by which it is sought to regulate the flow of the Hudson River, eliminating spring freshets and summer drouths.

The judgments from which appeal was taken determined the right of the board to take, in the name of the state, certain land of the railroad under the power of eminent domain. The proceeding was under both the conservation law and the condemnation law. Justice Crapser overruled all of the appellants' contentions and directed the final entry of the judgment confirming the report of the commissioners. Justice G. D. B. Hasbrouck wrote the prevailing opinion in the appellate division in which a majority of the court joined. Justice Hill wrote a separate concurring opinion in which Justice Davis joined.

The appeal involves various questions concerning the validity and regularity of the proceedings. The railroad did not contend that all of the conservation law was unconstitutional nor that any of the formal requirements were not duly taken up to the time negotiations were begun to take the appellants' property. The objections in the highest court are as to subsequent proceedings based on the failure of the board to comply with the provisions of the conservation law authorizing the taking of property for the purposes specified and on alleged errors of law of the commissioners in condemnation in receiving and rejecting certain items of evidence offered before them for the purpose of determining the amount of compensation to be paid the railroad company by reason of such taking.

The plans for the Conklingville Dam called for the relocation of several miles of track of the railroad. In its claim for damages the company estimated the work would cost $1,439,119; railroad damages $1,350,000; damage to Sacandaga Park $1,304,356 and administrative, legal and engineering expenses $100,000. The commissioners subsequently offered $1,442,130.

In January, 1925, the board made an offer of $550,000 to the railroad. Negotiations were broken off when the representative of the railroad insisted on recognition of the principle that consequential damages should be allowed. The attitude of the railroad, former Governor Miller told the court, was precisely the same it took in its original written summary of claims. He argued that no formal offer is necessary where the owner has demanded a sum which is far beyond the amount which, in the opinion of the plaintiff, the owner is entitled to receive.

Edward C. Bailey, one of the attorneys for the railroad, insisted that the final order should be vacated by the highest court, the report of the commissioners set aside and that judgment should be reversed and the petition dismissed.

Traffic Fare and Wage Figures

The number of revenue passengers, including bus passengers, reported by 209 companies to the American Electric Railway Association for the month of September, 1928, compared with September, 1927, is as follows:

September, 1928	776,274,742
September, 1927	788,261,619
Decrease, per cent	1.53

The decrease in traffic is somewhat larger than has been recorded in the previous months of the year, which is probably due first to the fact that there were five Saturdays and Sundays in September, 1928, compared with only four in 1927, and second, to the fact that weather conditions in 1928 were exceptionally good throughout the month, thus promoting greater use of private automobiles and a lesser use of street cars.

Average cash fare in cities of 25,000 population and over were:

	Cents
October 1, 1928	8.2155
September 1, 1928	8.2155
October 1, 1927	8.0449

The average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track were:

	Average Hourly Rate, Cents	Index Number 1913 = 100, Per Cent
October 1, 1928	57.52	211.08
September 1, 1928	57.52	211.08
October 1, 1927	57.28	210.20

The correction in the average hourly rate for September, 1928, from that shown in last month's service letter is due to a wage increase occurring since that time which has been made retroactive.

Missouri Interurban to Be Sold at Foreclosure on Dec. 1

Announcement that all properties of the Joplin & Pittsburg Railway, Pittsburg, Kan., will be offered for sale to the highest bidder at an auction on Dec. 1, was made on Oct. 28 by John F. Layng, general manager for M. H. McLean, receiver. The sale will be made on orders from the federal court for the western district of Missouri.

Reorganization of Schuylkill Property Asked

The Pennsylvania Public Service Commission at Harrisburg has been asked to approve petitions for the reorganization of the Schuylkill Railway, Girardville, Pa., which has been inactive for the last year. Since the company ceased operations the business has been handled by the Schuylkill Transportation Company. Receivers for the railway have secured court permission to sell their perishable property and this probably will be conveyed to the Schuylkill County Company, which formerly leased part of its property to the bankrupt utility.

A long strike, poor physical condition and declining revenues were causes which contributed to the receivership of the railway.

Depreciation Hearings Scheduled in Baltimore

Hearing before the Maryland Public Service Commission of the depreciation issue in the case of the United Railways & Electric Company, Baltimore, is expected to begin in Baltimore on Nov. 15 or a few days later. The commission set this date tentatively several weeks ago when it also ordered a complete survey of the company's property. H. Carl Wolf, chief engineer of the commission, under whose direction the survey was made, has announced that all the field work has been completed and that only the work of compilation remains to be concluded. The survey was made necessary when the Court of Appeals ruled that the commission place the annual allowance for depreciation on present value of property instead of on original costs.

Hearing Held on Union Electric Light Purchase

The Missouri Public Service Commission on Oct. 29 held a hearing on the application of the Union Electric Light & Power Company to purchase from the North American Company a number of electric power and light, gas and railway companies in East St. Louis, Ill., and vicinity. For the properties the Union Electric woud pay $18,111,000, part stock and part cash. It would give 420,000 shares of common stock on the basis of $25 a share and $7,611,000 in cash. Companies to be taken

Digitized by Google

over are the Union Electric Light & Power Company of Illinois; East St. Louis Power & Light Company; East St. Louis & Suburban Railway; East St. Louis Railway; St. Louis & Alton Railway; Alton Railway and Alton Gas Company.

The application has been taken under advisement.

Detroit Earnings Decline

The income and statistical statement of the Department of Street Railways at Detroit for the year ended Sept. 30, 1928, compared with the previous year and for the month of September, 1928, compared with the similar month of 1927, follows:

INCOME AND STATISTICAL STATEMENT OF THE DEPARTMENT OF STREET RAILWAYS CITY OF DETROIT

INCOME	Month of Sept., 1928	Month of Sept., 1927	Year Ended Sept. 30, 1928	Year Ended Sept. 30, 1927
Operating Revenues				
Railway operating revenues	$1,735,220	$1,563,526	$20,680,724	$20,774,345

Ratio of coach operating expenses to coach operating revenue, per cent	99.66	97.99	98.94	90.54

Revised Financial Plan in Chicago Expected

Members of the local transportation sub-committee which is engaged in working out a new program for settlement of the Chicago railway situation, were expecting this week a revised estimate from representatives of the surface and elevated lines covering the financial plan under which the proposed unified transit ordinance would operate. Preliminary estimates submitted last month by company engineers were summarily rejected by the Aldermen.

Pending the arrival of a new set of figures, Alderman Joseph McDonough, chairman of the local transportation committee, presented on Oct. 31 to the City Council a resolution calling upon the receivers of the Chicago Railways to refund $220,000 to the city which he claimed has been paid the receivers and officers of the railway as double salaries. These double payments, he charged in the resolution, are made as salaries under the corporate organization and under the federal receivership.

If the money is not paid promptly, the resolution asks the board of supervising engineers to determine whether the salaries are excessive and whether the Surface Lines can charge 55 per cent of them to the city. It points out that under the 1907 ordinances, the provisions of which are still in force under the extended franchise arrangement, the Surface Lines are required to pay to the city 55 per cent of their net receipts.

Service in Alameda Curtailed

Discontinuance of all street railway and bus service in Alameda, except the new Webster Street-Central Avenue line and a small portion of the No. 9 rail route, has been announced by the Key System Transit Company, Oakland, Cal.

The routes to be abandoned include the so-called "dinkey" street car service over High Street from Santa Clara Avenue and High Street to Park Street and San Jose Avenue, the Santa Clara Avenue street car line from Park Street to High Street, the San Jose Avenue rail line from Park Street and San Jose Avenue to Ninth Street and Santa Clara Avenue, the Haight Avenue bus service from Webster Street and Santa Clara Avenue to Fourth Street and Haight Avenue and the temporary street car service over Santa Clara Avenue into Metropolitan Oakland during the peak hours of travel.

This leaves two lines serving Alameda, it was pointed out. The bus service over Central Avenue from Fernside to Webster and over Webster Street through the estuary tube, which replaces the Santa Clara No. 1 line under authority from the State Railroad Commission, is one service. The other is the No. 9 line. This crosses the Park Street bridge into Alameda. It will turn back now at Park Street and San Jose Avenue.

The abandonments of these services by the Key System was authorized in a recent decision by the State Railroad Commission. The Key pleaded its case for their abandonment upon the contention that the lines were a source of loss to the company and also constituted a duplication of service.

Hearings in Case of St. Louis Holding Company Continued

The Missouri Public Service Commission has fixed Dec. 4 as the date for reopening the hearing on the application of the City Utilities Company, a Delaware corporation, for permission to increase its stock holdings in the St. Louis Public Service Company, St. Louis, Mo., to more than 10 per cent. Attorneys for the Delaware company informed the commission they required additional time to

Digitized by Google

prepare their case and to comply with the subpoenas issued by the commission for its books and records and a transcript of all of its corporate transactions since organization.

J. K. Newman, president of the holding company, and Col. Albert T. Perkins, vice-president, have been called as witnesses by the commission.

The application has been pending since early in this year following the reorganization of the United Railways.

L. A. Busby on Chicago Surface Lines Prospects

Speaking before the Bondsmen's Club of Chicago, Leonard A. Busby, president of the Chicago City Railway, declared on Oct. 23 that the properties of the Chicago Surface Lines are in first-class condition and that the operation of them is conceded to be the best in the country. He said:

Holders of Surface Lines' securities may rest assured that they have a valuable property with large potential earnings. During 1928 the increase in revenue riders on the Surface Lines exceeds that of any other similar property in the United States. On the first twenty days of October revenue passengers increased 2,082,213 over the similar twenty days of last year, an increase of more than 100,000 revenue-passengers a day.

No other form of transportation in the world compares with ours. Motor bus cost of operation is 9 cents a passenger; street car cost of operation is 5.8 cents.

There are $165,000,000 of Surface Lines' securities to be refunded in the settlement of the railway problem, he pointed out. Of this, $95,000,000 is represented by first mortgage bonds and $70,000,000 in junior bonds and stocks. Mr. Busby continued:

Other than this provision will have to be made for $325,000,000 in additional securities in the next 40 years under the financing plan proposed by the City Council transportation sub-committee. Of this, $135,000,000 of new money will have to be furnished in the first ten years.

The Surface Lines securities have a sound basis back of them. There is a steady and large growth of population. Gross receipts of the Surface Lines in 1907, the first year of the ordinance under which we are now operating, were $18,823,094. In 1927 and 1928 these gross receipts were $61,624,752, an increase of 227 per cent. The residue receipts increased in that same period 137 per cent.

The capital account of the Surface Lines, $165,000,000, is extremely conservative. In 1925 the State Commission placed the minimum valuation at more than $200,000,000. The ratio of capital account to gross receipts in 1907 was 3.3 to 1; at the present time it is 2.7 to 1.

The companies have a renewal fund of more than $17,000,000 and in addition have spent more than $8,000,000 for the purchase of new cars and laying of new track, none of which has been added to the capital account. No other company in the country has a renewal fund equal to that.

Every dollar of outstanding securities is sound. We are at present negotiating an ordinance, which, if both sides agree, will be submitted to the next Legislature for approval and enabling legislation. I am still optimistic about the outcome.

Net of New York State Railways Holds Up Well

The New York State Railways operating in Syracuse and other cities in Central New York reports for nine months ended Sept. 30, 1928, profit of $457,941 after taxes, interest, sinking fund, etc., but before depreciation, comparing with $618,025 in first nine months of 1927. For the quarter ended Sept. 30 profit was $102,913 before depreciation, against $139,269 in the preceding quarter and $149,981 in third quarter of previous year.

EARNINGS OF NEW YORK STATE RAILWAYS

	1928	1927
Sept. Quarter		
Gross	$2,232,658	$2,331,158
Balance after tax	486,210	538,131
*Net after changes	102,913	149,981
Nine Months		
Gross	7,302,335	7,535,008
Balance after tax	1,612,999	1,773,727
*Net after changes	457,941	618,025

*After sinking fund but before depreciation.

Stock in St. Louis Sold

A block of 400 shares of preferred stock of the St. Louis Public Service Company, St. Louis, Mo., has been sold for $83 a share by the city of St. Louis, which received 16,000 shares of the stock in settlement of its mill tax claims against the defunct United Railways. The city advertised the stock for sale in blocks of 400 shares or more and received only three bids, each for a block of 400 shares. The highest bid was accepted. The city will offer more of its stock later.

Situation in Twin Cities Reviewed

Figures furnished by Twin City Rapid Transit Company, Minneapolis, Minn., following the passing of the quarterly dividend on common stock because "earnings for past nine months did not warrant payment," show a decline of $61,000 in gross revenues for nine months of 1928 as compared with the corresponding period of 1927. Total revenue for nine months of 1928 (September estimated) is $8,853,820 compared with total revenues for the corresponding period of 1927 of $8,914,703.

REVENUE AND PASSENGER COMPANIES OF TWIN CITY SYSTEM

	Number of Passengers	Total Revenue
First quarter, 1928	49,785,148	$3,380,745
First quarter, 1927	48,953,261	3,323,116
First quarter, 1923	59,730,329	3,585,269
Six months, 1928	91,883,928	6,248,092
Six months, 1927	91,584,438	6,224,924
Six months, 1923	115,352,395	6,926,642
Nine months, 1928*	130,091,887	8,853,820
Nine months, 1927	131,013,541	8,914,703
Nine months, 1923	166,929,596	10,026,559
ST. PAUL CITY RAILWAY		
Nine months, 1928*	45,461,370	3,104,098
Nine months, 1927	46,762,565	3,192,644
Nine months, 1923	60,082,918	3,604,975
MINNEAPOLIS STREET RAILWAY		
Nine months, 1928*	80,224,270	5,485,187
Nine months, 1927	79,862,766	5,457,061
Nine months, 1923	99,879,445	5,992,766

*September estimated.

There has been a steady and consistent falling off in number of passengers carried and in earnings for the past nine years. The decline for the nine months of this year is attributable to operations in St. Paul. Minneapolis operations showed a slight gain. Early in 1928 the company proposed to raise the fare in St. Paul, although the fares have always been the same in St. Paul and Minneapolis. This plan now has been abandoned and it is understood that an effort will be made to increase the fare for both cities.

On Jan. 1, 1926, the fare was raised from 6 cents cash to 8 cents cash or 6⅔ cents for tokens purchased in lots of six or more. Under this method of increase the fare has averaged 6.8 cents. Despite this increase, total revenues for 1926 were smaller than for 1925 and the decline continued through 1927. Gross operating revenue for 1927 was $13,425,643, against $13,945,266 for 1926, and net income transferred to profit and loss for 1927 was $1,272,600, against $1,436,805 for 1926.

"Fair value" of Twin City Rapid Transit Company property has been set by the State Railroad Commission at $42,983,318. This does not include the bus-operating subsidiary, which is valued on company books at $1,264,992. "Fair return" on this valuation is set by the commission at 7½ per cent.

The commission's valuation of the company's property in St. Paul is $16,452,073. For the eight years (1920-1927) the amount required to give the "fair return" on the "fair value" was $9,598,331. The actual amount available was $4,683,391—a return of 3.66 per cent.

Number of passengers carried in St. Paul operation declined from 89,020,734 in 1920 to 63,810,891 in 1927. The decline was steady throughout the eight-year period.

Income Larger in Springfield

The Springfield Street Railway, Springfield, Mass., shows a net income of $31,536 for the quarter ended Sept. 30, 1928, against $14,362 for the corresponding quarter of 1927. For the first three quarters of 1928 it shows net income of $180,915, against $163,476 for the first three quarters of 1927.

Denver Doing Better

Net earnings of the Denver Tramway, Denver, Col., continued to show a gradual increase in the third quarter, although total operating revenue declined, the earnings statement for the first nine months reveals. H. S. Robertson, president, said:

Total operating revenue during the nine months period ended Sept. 30, 1928, decreased $67,843 in comparison with the same period in 1927.

Operating expenses for the period, as a result of strict economy and the fact that maintenance was subordinated to a reconstruction program and in some instances deferred, resulted in a reduction in

Digitized by Google

these expenses of $90,365. This accounts for the increase of $22,521 in net operating revenue for the period ending Sept. 30, 1928.

STATEMENT OF THE DENVER TRAMWAY AND THE DENVER & INTERMOUNTAIN RAILROAD WITH INTERCOMPANY TRANSACTIONS ELIMINATED

Total operating revenue	$3,204,651
Less operating expenses and taxes:	
Operating expenses (including depreciation)	2,104,581
Taxes	379,845
Total operating expenses and taxes	$2,484,426
Net operating income	$720,224
Total miscellaneous income	26,816
Gross income less operating expenses and taxes	$747,041
Deductions from income:	
Interest on underlying bonds	141,575
Balance	$605,466
Interest on general and refunding bonds	240,366
Balance	$365,100
Net profit and loss credit less amortization of discount on funded debt	12,411
Balance available for dividend requirements on 104,412 shares of preferred stock	$377,511

Balance available for dividend requirements on 104,412 shares of preferred stock for the third quarter totaled $135,302, compared with $125,192 in the second quarter and $117,017 in the first quarter of 1928. Balance available for dividend requirements for the first nine months totaled $377,511.

Earnings on the preferred stock in the third quarter were at the rate of $1.30 per share as compared with $1.20 in the second quarter and $1.12 in the first quarter of 1928. Earnings on the preferred for the first nine months were $3.62 per share. This compares with earnings of $4.61 per share in the full year 1927, which is at the rate of $1.15 per quarter.

Total operating revenue for the first nine months was $3,204,851. Total operating expenses and taxes were $2,484,426, leaving net operating income of $720,224.

The dividend on the preferred stock was $1.25 quarterly until the last quarter of 1927 when the rate was reduced to 75 cents quarterly. At this time the company issued a statement saying that it was impossible to maintain the former dividend rate and keep the same high standard of service.

Omaha Reduces Expenses

An improvement in the financial condition of the Omaha & Council Bluffs Street Railway, Omaha, Neb., is shown in the report for the month of September. While revenues decreased from $218,583 to $216,433 operating expenses were cut from $159,552 to $148,532. Net income from operation was $67,901, compared with $59,031 in September, 1927. After deducting taxes and other expenses there was a gross income of $40,303, compared with $31,638, leaving the company $5,171 short of meeting bond and other interest charges.

Cortland Company Would Suspend Homer Line

Abandonment of the Homer-Preble line, near Homer, N. Y., which has been in operation for twenty years, is being sought by the Cortland County Traction Company on the ground that buses and private automobiles have made the line unprofitable. Proceedings have been started by the company through a resolution of the board of directors authorizing the officers of the company to petition the Public Service Commission for the right to suspend operations on the line. It is stated that the Delaware, Lackawanna & Western Railroad and bus lines provide adequate service.

Agitation Over Underliers Revived

Mayor Mackey of Philadelphia revealed on Nov. 2 that he is going to engage in a vigorous "campaign of education" to win public support for the plan to have the city buy up the franchises of the Philadelphia Rapid Transit Company's underliers for $149,000,000. Protest prevented the plan being placed on the ballot on Nov. 6. The issue is to be re-submitted later.

Book Reviews

Gutachten über die Elektrifizierung der Strecke Wien-Salzberg

Julius Springer, Wien, 1928. 163 pages.

Some time ago the Austrian government appointed a committee of experts to study the desirability of equipping an important section of one of its main line railways, or that from Vienna to Salzburg, for operation by electricity. This report has been completed, and is now published in pamphlet form.

A list of questions was submitted to the committee covering various points on which earlier reports of the railroad administration and the electrical industry had differed materially. These included, for instance, the cost of electrically connecting the various power circuits, placed at about $2,350,000, or almost 12 per cent of the entire initial cost. The investment required for the whole project is estimated at $29,280,000, but the steam locomotives released for other service provide a credit of about $4,270,000. It is expected that power will be bought from existing power companies. The present capacity of the hydro plants in the Alps can be increased without excessive cost. Either a small hydro plant or an existing steam plant near the load center, operated by a power company, could take care of the basic load of about 10,000 kw. Two estimates, computed on different bases, give the annual energy required as 100,000,000 kw.-hr.

The opinion of the committee was not unanimous. The minority proposes the use of more modern steam locomotives instead of electric power. This would greatly increase the economy of steam operation and requires much less investment. The minority points out that no other country which has to pay as high interest rates as Austria and can be supplied from nearby coal mines (in Czecho-Slovakia), has undertaken to electrify its railroads.

The majority favors electrification, although for the first years of operation it is estimated that a small loss will result. This will change into a profit with the gradual amortization of the capital. Any increase in the price of coal, wages or volume of traffic would tend to usher in the period of profitable operation just that much sooner. Further, electrical equipment possesses certain factors which favorably influence the economic life of the country to a value that cannot readily be expressed in figures. Among these is the effect of decreased coal imports on the trade balance. Moreover, since adjoining lines in neighboring countries are electrified, or soon will be, it is advisable to complete the missing link promptly so that passenger and freight trains may be hauled by electric locomotives on a continuous line of 900 miles through the heart of Europe. It is recommended that the work be distributed over a period of five years so as to facilitate the change to electric operation and permit the gradual reduction of operating labor expected with electrification.

American Society for Testing Materials

Headquarters of the society, 1315 Spruce Street, Philadelphia, Pa. 320 pages. Price, $1 to non-members; 50 cents to members for extra copies.

This yearbook, dated August, 1928, contains names of officers and members of the executive committee, society representatives, past officers, and general information relating to history, membership, meetings, publications, and other activities of the society.

American Railway Signaling Principles and Practices—Chapters VII, VIII and XXIII

Published by Signal Section, A.R.A., New York. Price: first two, 15 cents per copy to railroad employees, 25 cents per copy to non-railroad employees; third, 10 cents and 20 cents respectively.

Very wisely the signal section of the American Railway Association is publishing its handbook on signaling principles and practices in installments. Altogether there will be 26 chapters, of which three were issued some time ago and three have just been published. These latter relate to direct current circuits, transformers, and highway crossing protection. The other chapters will be issued at the rate of about three a year.

Personal Items

George B. Avery to Run Seattle Road

Complete charge of the Seattle Municipal Railway, Seattle, Wash., is to be placed in the hands of George B. Avery, superintendent of public utilities, until the proposed reorganization program for the department can be perfected. Announcement of this effect was made by Mayor Frank Edwards, following the death on Oct. 27 of David W. Henderson, for years general superintendent of the system. The plan is understood to contemplate the immediate curtailment of expenses of the railway department, starting with a saving of $500 a month in salary for a separate superintendent of the department. It has the backing of the City Council at large, although there is some opposition.

As superintendent of the city's utilities Mr. Avery has supervision over the light, the water and the railway departments, as well as over the service of privately-owned utilities operating under franchise in the city. The appointment of a successor to Mr. Henderson is not contemplated at present, but divisional heads in the department will be directly under Mr. Avery. This plan was evolved during the time Mr. Henderson was ill, and appears to have grown into an accepted policy when it became evident that he would not return to the department.

J. N. Shannahan Heads Advisory Council

Former president of American Association and official of Omaha & Council Bluffs Street Railway chosen to succeed B. C. Cobb as chairman of body that guides policy of industry

NO MORE fitting appointment could have been made than that of John N. Shannahan, president of the Omaha & Council Bluffs Street Railway, Omaha, Neb., to the post of chairman of the Advisory Council of the American Electric Railway Association to succeed B. C. Cobb, for it was during Mr. Shannahan's administration as president of the association that the Advisory Council came into being as the successor to the committee of 100, formed during the war time.

It is at his own expressed desire that Mr. Cobb is retiring as head of the council. As was made plain at the time of the formation last spring of the Allied Power & Light Company to bring together the Hodenpyl-Hardy and the Stevens & Wood interests, Mr. Cobb has been gradually relinquishing the more arduous of his affiliations and when he expressed the wish to be relieved of the responsibility which he had carried since the formation of the Advisory Council, a committee was appointed consisting of R. P. Stevens, former president of the American Association and head of the Allied Power & Light Corporation; C. E. Grossbeck of the Electric Bond & Share Company, and J. J. O'Brien, president of H. M. Byllesby & Company, to co-operate with President Barnes in choosing a successor to Mr. Cobb. The members selected Mr. Shannahan, and secured his consent to serve.

Entirely aside from the element of recognition by the industry of the part that Mr. Shannahan has played in the past as a member of important committees of the American Association, as an officer of that association and finally in 1924 as its president in helping to shape the destiny of the local transportation industry, Mr. Shannahan's appointment

J. N. Shannahan

puts into the post of chairman an executive who helped not only to formulate the fundamental principles proclaimed by the Advisory Council some time ago, but a man who has made a fetish of every pronouncement set down by the committee as an obligation of companies engaged in furnishing local transportation. He has been in Omaha just about a year, yet in that short time he has installed no end of innovations and has just seen his work substantially recognized by a vote of confidence at the polls which carries with it a new franchise to his company for a period of 30 years. His work there may be said only to have just begun.

True, Mr. Shannahan has won over the public of Omaha to his company by a series of well-timed service and other changes in their interest, but work on the bigger program which he has in mind necessarily had to wait on the settlement of the franchise matter. As the vote just recorded in Omaha indicates, it pleased more than three persons out of four when Mr. Shannahan said some time ago about the new grant that "when I accept the franchise, I marry it; I accept it for better or for worse." People knew that he meant what he said, for his record was there to prove it, the record of a year of most strenuous work, some of the high spots of which were only hinted in the review in the JOURNAL of Oct. 13, page 695.

Mr. Shannahan's is a career around which a notable biography could well be written for popular consumption, but the record of his previous accomplishments has been covered before in the pages of the JOURNAL, notably in the issue of the daily published during the sessions of the American Association at Atlantic City in October, 1924, at which he was elected president of the association, and in the JOURNAL at the time of his accession to the post at Omaha which he now fills. It suffices to reiterate the statement that the avowed purpose of the Advisory Council is to interest owners of large properties more directly in the welfare of the industry generally, and to get the benefit of their advice and counsel at meetings held regularly, and then have the suggestions so evolved carried out through L. S. Storrs, the managing director. Probably no other man in the industry is better qualified than is Mr. Shannahan for this work and for the task of aiding the members of the council as their directing head in formulating plans for meeting such problems of the industry as the restoration of the credit of the railways, securing co-ordination of railway and bus service, effecting the modernization of properties and carrying through other outstanding tasks.

As indicated before, both at Omaha and in his other official capacities, Mr. Shannahan has applied all the principles that the Advisory Council has laid down as essential to successful local transportation because he has first secured from the public that measure of recognition of the rights of the railway upon which all accomplishments of a permanent character necessarily are presaged. In short, the record of his work is Mr. Shannahan's own best eulogy.

OBITUARY

David S. Carll, vice-president of the Capital Traction Company, Washington, D. C., and the engineer who was in charge of the installation in 1897 and 1898 of electric lines of that company practically as they stand today, died at his home in that city Nov. 5. Mr. Carll went to Washington from Kansas City in 1890 at the time the lines of the old Washington & Georgetown Railway were being converted from horse to cable. He was chief engineer and superintendent, and held that position when the Capital Traction Company was organized in 1895 and took over the properties of the Washington & Georgetown. He had been an officer of the company since that time and a vice-president for about twenty years. Mr. Carll was born in 1855.

Large Orders Ahead for Heavy Electric Equipment

New York to ask bids on 300 subway cars. Pennsylvania Railroad asks bids on electrification. South Shore orders ten cars. Track projects in Washington, D. C.

NEW YORK City Board of Transportation announced today that it will soon advertise for bids for the construction of 300 steel cars for service on the Eighth Avenue-Central Park West-Washington Heights line of the new subway system. Initial operation will probably be started early in 1930 from the Harlem River terminal at 207th Street as far south as Chambers Street, which will be a temporary terminal pending the completion of the East River tubes under Fulton Street to Brooklyn.

For nearly a year, the members of the board and its engineers have been consulting and conducting research on the design of a steel car. As a result it is expected that the cars of the city's new subway system will afford greater capacity and facility, will be faster in operation and have less crowding for the amount of traffic anticipated than other cars now in use in the city.

The new cars, as designed, will be 60 ft. 6 in. long, 10 ft. wide and 12 ft. high. The length will be 9 ft. and 2 in. longer than the Interborough Rapid Transit Company cars and about 7 ft. shorter than the single steel cars now used by the Brooklyn-Manhattan Transit company. They will permit easy movement of passengers through the end doors between cars, while the train is in motion.

The width and height of the new cars will be the same as the width and height of the Brooklyn-Manhattan Transit company cars. The new cars will have four double doors on each side, each doorway being 3 ft. 10 in. wide.

For initial operation, local trains will terminate temporarily at 168th Street and Broadway, while the expresses will go to 207th Street. The speed of the local service will be about the same as the present I. R. T. service, but the express trains between 207th Street and 42nd Street will be about three minutes faster than the I. R. T. expresses under the present schedule of service.

In order to determine structural clearances and demonstrate the arrangement of car body parts, the Board of Transportation for some time past has been working on a model section of a typical car in the office of the board's bureau of equipment and operation at No. 49 Lafayette Street, as shown in the accompanying photographs.

The arrangement of the seats is somewhat similar to the arrangement now in existence in the B.-M. T. cars, but in the city's new subway cars there is to be 2 in. more knee room between cross-seats than in the B.-M. T. cars. Each car will seat 60 passengers, and when filled with a standing load, each car will have a capacity of 282 passengers. The station platforms are 660 ft. in length, enough to accommodate a train of eleven cars, nearly 30 per cent more than the longest B.-M. T. train and 55 per cent more than the present Interborough trains of ten cars each.

The cars will be provided with white-enameled hand straps in front of the seats and vertical stanchions near the doors. The seats will be of heavy, natural-colored rattan.

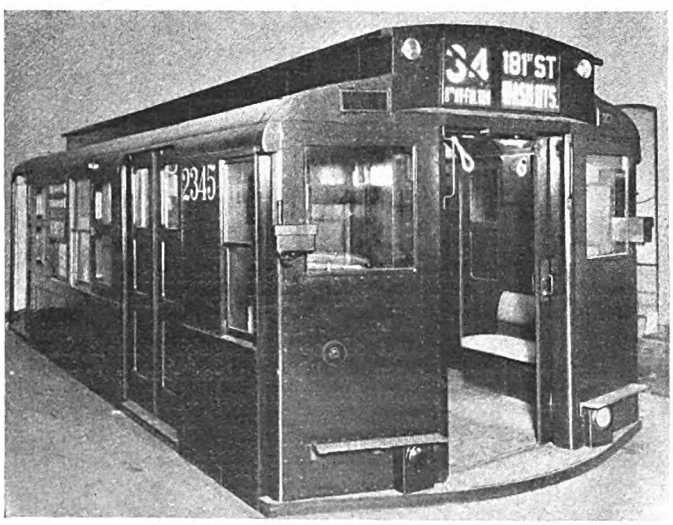
Illuminated route or destination signs will be installed on the sides and at both ends of cars. These signs will carry a designated route number indicating the particular line the train is operating over—similar to route numbers now in use on some of the bus lines.

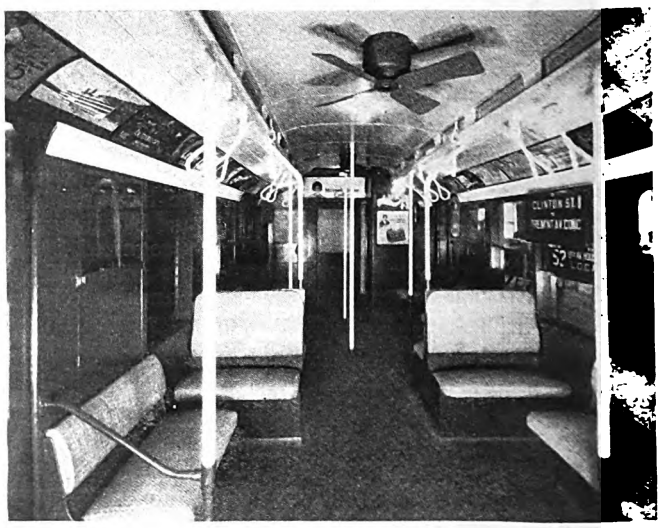
Each car will be equipped with five ceiling fans. The equipment of each car such as doors, fans, lights, etc., will be connected to permit operation from one or more positions between cars on the train.

Pennsylvania Railroad Asks Bids for Electrification

Bids have been asked by the Pennsylvania Railroad, Philadelphia, Pa., for the electrification of its lines between Philadelphia and Trenton as the first section to be electrified under the $100,000,000 electrification program. Money has already been appropriated by directors to cover cost of electrification between Philadelphia and Trenton.

The second step will be electrification of the line from New York to New Brunswick. This line is already electrified from Newark to New York, although some modifications may be necessary in connection with the whole electrification program. The third step will be the tying together of New Brunswick and Trenton, which will permit of





At right—New York Board of Transportation has constructed a model of typical section of cars for new subway. At left—Interior view of section of new subway cars for New York

Digitized by Google

operation of through electric trains from New York to Philadelphia. Many details remain to be developed, and it is yet to be determined whether electrification of the whole road, freight as well as passenger, will be next pushed to Wilmington or whether electrification of the main line to Atglen will be taken up after the Philadelphia to New York stretch is completed.

The line between Philadelphia and Wilmington is at present electrified for local passenger service only. Electrification of the road between Philadelphia and West Chester has almost been completed for local passenger business and will be opened for service shortly.

South Shore Orders Ten Cars

An order for ten more steel passenger cars, five motors and five trailers, has been placed by the Chicago, South Shore & South Bend Railroad, Michigan City, Ind., with the Standard Steel Car Company, Hammond, Ind.

Ten motor cars are under construction by the same concern now, to be delivered toward the end of the year. The new order brings the total of cars to be put in service during the next half year to twenty.

Specifications of both orders call for little change in the latest model of South Shore Line car. Individual easy seats of the bucket type, Pullman smoking compartments, wide aisles, large windows, "turtle-back" roof with raised ventilators, and spacious vestibules with low, descending steps are the important features.

Installation of the twenty new cars will give the railroad 50 steel motor cars and fifteen steel trailers.

Extensive Track Projects in Washington, D. C.

It is estimated that the pending project for the extension of the Capitol Plaza Parkway in Washington, D. C., will cost the electric railways $500,000 in relaying their tracks. Under this plan it is proposed to take the tracks in the vicinity of the Union Station and the Capitol underneath the parkway in a subway. Stations will be built for the Senate and House office buildings. The federal government will pay for the construction of the subway but the grading and the cost of track relocation is left to the railways to pay.

This park extension plan has already passed the House and no opposition is expected to develop to it in the Senate next December. The car companies have no desire to take their cars off the streets in the Capitol area because much tourist business at present originates there.

A provision made in the Capitol Park extension measure provides for construction of subterranean garages of 400 car capacity to be used by Congressmen and employees of the Capitol. The lighting of the subway will be left to the street car lines. Besides the improvement projected for the Capitol area, the federal government has already approved a $500,000,000 park and building development in the triangle section between the Capitol, the Monument and Pennsylvania Avenue. This last plan not only calls for several subways but also requires extensive surface track reconstruction.

Equipment Market Continues Good

During the past few weeks a number of railways have announced the completion of their track program for this year. Although the average volume of orders has decreased, a number of good size orders have been placed and several large projects have been announced. Chicago Surface Lines, Chicago, Ill., has placed orders for 110 80-ft. center radius switch tongues, 50 160-ft. center radius switch tongues, 6,500 lb. of high carbon welding rod, 2,000 lb. of high manganese coated welding rod, 4,000 lb. of low carbon coated welding rod of grade 200, 2,000 6x8-in.x8-ft. sawed red oak ties creosoted, 50,000 lb. of 1x4⅛-in. track bolts with square nuts, 24 spring switch throw boxes, 400 16x2¾x1¾-in. grinding wheels, 18,900 gal. of Tarvia-X and 8,900 gal. of Tarvia-A.

Creosoted pine ties numbering 3,200 and 1,000 white oak cross ties have been ordered by the Arkansas Valley Interurban Railway, Wichita, Kan. This company has also ordered switches and other material for two sidings and five double-end sidings. Paving of its double track right-of-way on Broadway, Gary, Ind., has been started by the Gary Railway, Gary, Ind. Also between 40th and 45th Avenues on Broadway, this company is raising its track to the new surface level and is thermit welding the rails.

Replacement of the present track in Michigan City, Ind., with 130-lb. rail has just been started by the Chicago, South Shore & South Bend Railroad, Michigan City, Ind. Lengths of 66-ft. rail will be set on creosoted ties in concrete for a distance of 2 miles. It is expected that this work will be finished shortly after the first of the year.

Rail Relaying Completed

The Chicago, South Shore & South Bend Railroad rail relaying program for this fall was completed with the recent installation of 100-lb. rail laid along LaSalle Avenue from College Street to Cummins Siding. The new Buchanan siding using 3,800 ft. of 100-lb. rail has just been completed. Track on the state line curve at Hammond is now being re-layed with Sanborn Sorabatic 100-lb. rail. This stretch of curved track will be reinforced with girder type rail and new protective devices will be installed at the Western Indiana crossing when 2,000 ft. of new track is laid.

Progress on the new interchange with the Monon Railroad, west of Michigan City, which is the company's biggest construction job of the year, has been maintained with approximately 7,000 ft. of track now laid and 60 per cent of the grading completed.

The Memphis Street Railway, Memphis, Tenn., is progressing with its extension on the Jackson Avenue line from Watkins Street to University Boulevard. Work was begun on this project on July 10 and is reported now to be approximately 50 per cent completed. This company is also replacing old T-rails and gravel pavement with 7-in. rail and asphalt paving on Commerce Street between Chelsea Avenue and the city limits. This company has purchased a road oil heating kettle with an attachment for distributing the oil under pressure. The company is doing a large part of the asphalt paving repairs formerly made by the city. Rock asphalt is being used. Fifty 35-ft. tubular steel poles, 50 pieces of 8-in. extra heavy steel pipe and 50 pieces of 6-in. standard steel pipe, 201 Manchester positive plates and 110 positive and negative elements have been ordered by the Chicago Surface Lines. The Arkansas Valley Interurban Railway has ordered 2 miles of 0000 grooved trolley wire.

Rehabilitation Program

The first step in a rehabilitation program which will provide complete new feeder wire from Gary to Crown Point, Ind., was begun recently by the Gary & Southern Traction Company, a 12-mile interurban line now operated by the Gary Railways. The present work consists of renewing all center poles on 45th Avenue between Broadway and Grant Street and the installation of span construction. Two freight trailer cars have been ordered by the Arkansas Valley Interurban Railway. The Chicago Surface Lines has ordered three dual motor type Twin coaches and the Boston Elevated Railway, Boston, Mass., has ordered six urban 28-ft. Twin coaches.

The Pacific Electric Railway, Los Angeles, Cal., has ordered one 16-passenger Fageol special parlor car type bus. The Washington Railway & Electric Company, Washington, D. C., has received four new type V 29-passenger Yellow coaches. The Community Traction Company, Toledo, Ohio, has ordered twelve buses from the White Motor Company, costing $114,000.

Excavation work for the foundation of a $400,000 addition to the company's power plant has been started by the Columbus, Delaware & Marion Electric Company, Marion, Ohio. This power plant will house two boilers capable of developing 8,000 hp.

Car and Bus Station for Milwaukee

A sheltered loading station for street cars and motor buses, erected so that all loading and unloading of passengers will be under cover, will be constructed at a cost of $40,000 by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., at 27th and Hopkins Streets, Milwaukee, Wis. The growing flow of traffic through the intersection is hampered by loading of street cars, and the situation becomes particularly acute during rush hours.

The company has agreed to remove the switching, layover and loading of

Digitized by Google

its cars entirely from this point. The new station will be on private property of the company, extending from the congested district and located about 100 ft. from the intersection. Double loop tracks will be constructed to accommodate both 12th and 27th Street cars, and a driveway will be provided for buses.

Improvements in Alliance

To reduce damage claims from grade crossing accidents, the Stark Electric Railroad, Alliance, Ohio, has filed a standing order for one flashing signal to be delivered each month. More than a dozen are to be installed at a cost of $1,000 each.

Work of improving the track between Alliance and Sebring has been started by workmen. New ties are being placed and joints improved. Cost of the improvement is estimated at $8,000.

In the Mount Union district of Alliance workmen are completing a street improvement project estimated at $56,000. The company is placing a new base and installing new track for a distance of nearly ½ mile on this project.

Paving Brick Association Reports on Highway Conditions

The Engineering Commission appointed by the National Paving Brick Manufacturers Association, Washington, D. C., has made its report on the investigation of paving and general highway conditions. This investigation embraces conferences and correspondence with the United States government, state, city, county, borough and township officials in charge of paving throughout the country, a comprehensive study of technical literature on paving, and a general field inspection of typical paving conditions in the Southern, Middle Atlantic, New England, Eastern and Mid-Western states.

The object of the investigation was to obtain an up-to-date picture of the trend of the highway business in the territory embraced in the survey and also to especially investigate the brick paving situation throughout the country.

The report contains a general discussion of the highway business and the engineering and economic principles that should govern the business. A statement of the standard types of road surfacing and pavements applicable to the different traffic, social, local, climatic and subsoil conditions throughout the country. A general discussion of the brick paving situation, results of special tests and investigations and recommendations relative to method of construction and specifications for brick pavements are also included.

The report places the total highway expenditures at about $2,000,000,000 a year and the waste due to incompetent supervision is estimated to be about $400,000,000 a year. Considerable stress is placed upon the necessity of employing only trained highway engineers to supervise all highway work so that this waste can be eliminated. The statement is made that the paving programs including new construction and reconstruction will grow larger each year in both the centers of population and on rural highways and, due to the constantly increasing traffic, there will be a considerable increase in the higher type construction, particularly on the rural highways.

The report discusses various phases of the highway business, such as lack of understanding of highway problems by public, highway administration, the ultimate highway transportation system, how hard-surfaced roads pay for themselves, through savings in motor vehicle operating costs, planning highway systems, highway transportation investigations, location of highways, savings in motor vehicle transportation costs due to relocations resulting in shortening the distance, by-pass highways, ultimate width of highway rights-of-way, day and night signals, elimination of dangerous conditions, trend in highway construction, standard types of pavements and traffic and maintenance data.

The advantages of vitrified paving brick for street railway tracks and for progressive construction lie in the fact that unit type pavements are unquestionably the most desirable and economical pavements between and adjacent to street railway tracks, and brick pavements are very extensively used under such circumstances. With this type of pavement, repairs can be made to the rails without destroying the paving.

Weekly Business Conditions

The volume of business during the week ended Nov. 3, as seen from check payments, was somewhat smaller than in the previous week but was larger than a year ago, according to the weekly statement of the Department of Commerce. Activity in steel plants showed expansion, as compared with both the preceding week and the corresponding period of 1927. Prices for iron and steel and copper averaged higher than in either the previous week or the same period a year earlier.

WEEKLY BUSINESS INDICATORS

(Weeks ended Saturday. Average 1923-25 = 100)

	1928				1927			
	Nov. 3	Oct. 27	Oct. 20	Oct. 13	Nov. 5	Oct. 29	Oct. 22	Oct. 15
Steel operations	114.5	113.2	115.8	115.8	86.0	86.0	84.0	87.0
Bituminous-coal production	.....	115.4	111.1	115.7	92.6	102.8	105.5	108.3
Lumber production	.....	92.3	92.3	90.9	105.5	104.5	105.5	106.4
Petroleum production (daily average)	.....	.....	120.2	120.3	117.8	118.4	119.2	119.7
Building contracts 37 states (daily average)	122.4	144.9	135.7	134.3	86.3	131.8	152.0	115.1
Price iron and steel composite	86.3	86.1	85.9	85.6	85.8	85.8	85.9	85.9
Copper, electrolytic, price	113.0	110.1	108.7	108.7	94.9	94.2	93.5	94.2
Interest rates, call money	181.8	160.6	157.6	157.6	87.9	84.8	93.9	97.0
Interest rates, time money	160.0	160.0	155.3	165.7	100.0	102.9	100.0	97.1
Federal reserve ratio	86.7	87.7	86.8	87.2	96.0	97.2	96.9	96.8

Bond prices averaged higher than in the preceding week but were lower than a year ago. Interest rates for time funds showed no change from the previous week but were higher than last year. Interest rates for call money averaged higher than in either prior period. Stock prices receded from the high level of the preceding week but were still considerably above the level of last year.

The production of bituminous coal during the week ended Oct. 27 showed gains over both the previous week and the same period of last year. Freight car loadings for the latest available week were larger than in the corresponding period of 1927.

METAL, COAL AND MATERIAL PRICES F. O. B. REFINERY

	Nov. 7, 1928

Turpentine (bbl. lots), N. Y., per gal	$0.60

ADVERTISING LITERATURE

OHIO BRASS COMPANY, Mansfield, Ohio, has just published a sixteen-page booklet with complete descriptions and illustrations of the new 250 and 600-volt light-weight portable electric arc welding machines for use on electric railway track circuit bonding and general repair work. The principle of unit construction of the resistance elements in these machines is fully described and brief illustrated reference is made to the various types of rail bonds manufactured by that company.

SULLIVAN MACHINERY COMPANY, Chicago, Ill., has issued a new bulletin 76-J describing Sullivan electric portable hoists. This bulletin includes hoists from 10 to 35 hp., in both single and double drum patterns.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued bulletins 821A descriptive of pressure and vacuum switches, 71B descriptive of wound-rotor induction motors 900 series, and 81B describing high-torque, double squirrel-cage motors.

Get Ready for Winter

THE winter season brings added work to most maintenance departments. Passenger loads are heavier because rain, snow and slush make walking and automobile driving disagreeable, and more people seek the comforts of street cars and buses. Stops are longer and so the schedule is more severe. The equipment itself is subjected to more abuse. Frequently cars must operate through water or slush. More sand must be used and this adds another potential source of trouble. Salt used to keep switches open sometimes causes electrical equipment difficulties.

All this means that increased attention must be given to maintenance work and added precautions taken to prevent service delays. Regular and thorough inspection of equipment is of course, the first step in avoiding failures. At this season of the year many precautions can be taken that will avoid difficulty later. Stocks of repair parts should be checked to make certain that sufficient are on hand to take care of added requirements. Lubrication must be watched closely and care taken to make certain that gear cases are tight and that covers for journal boxes and bearing housings fit tightly. Car wiring at such points as resistors and motors should be gone over carefully. Leads should be cleated firmly to prevent rubbing and chafing. A little extra work now will pay liberal dividends in reduced trouble during the winter.

From Coal to Current

FROM Philadelphia has come news of another electrification. It is the announcement of the plan of the Reading Railroad to spend $20,000,000 on through routes embracing the community territory of Philadelphia. But the matter does not stop here. The work soon to begin presages ultimate electrification from Langhorne to New York, from Jenkintown to Philadelphia, and, after the completion of grade crossing elimination at Manayunk, through the Schuylkill Valley to Reading and Pottsville.

While the work now announced by the Reading is overshadowed by the immensity of the program contained in the recent statement of the Pennsylvania Railroad, in many respects it is no less significant than the Pennsylvania announcement, particularly in that it portends the application of electricity to the entire Reading main line. Obviously the process is one of piecemeal application. Still the facts as stated change from their nebulous form to one of real substance plans that have long been in the process of making.

However fascinating it may be to ruminate over the reported prediction of the president of the largest locomotive works in the United States that all railroads along the Atlantic coast from Boston to Washington may be electrified within ten years and to cogitate the statement that steam gradually is being driven to the great open spaces, tangible evidences are sufficient for the present. Among them are the fact that the Reading, like the Pennsylvania, is going to use the 11,000-volt a.c. system, that it presumably will purchase its power, and that bids on the preliminary work of electrification, as well as on the construction of 100 coaches, will be asked within the next two or three weeks.

So it is that the Reading statement reflects the growing realization of the value of electric propulsion as an aid in speeding up service and in increasing track capacity. It also reflects the feeling of confidence in the efficacy of superpower as best instanced in the case of the Conowingo development and the interconnection of the power systems along the north Atlantic seaboard. In other words, the steam roads have concluded that the great utilities along the railroad lines, already customers of the railroads for transportation, can well supply them with electric energy. Whether or not one accepts the prognostications of the most optimistic of the prophets of the coming age of electric propulsion for main lines, attrition is gradually changing from a prediction to a fact the process summed up in the slogan "from coal to current."

In the Interest of the Company and the Community

OUT of the chaos incident to an expiring franchise, the maturity of bonds, the impending destruction of its credit, and distrust of the company by the public, order is slowly being restored at Omaha, but this will be only a beginning toward better transit if the city continues to play fair with the management. It is easy to dismiss this work of a year with a single sentence that records the double news that the new franchise for 30 years was passed at the recent election and that the proposal was lost to authorize a bond issue to provide funds for establishing a free bridge instead of the communities buying the present one from the railway, but that would take very little account of the record of the past and none of the possibilities of the future. And that is not a good thing.

To say that the vote of confidence in the company at Omaha was well deserved is to reiterate a truth, but it is equally true that similar favorable response is not always secured. Present concern is not with the academic question of what is and what is not ethical treatment, rather is it with the prospects ahead. The new franchise represents the work of several months by its sponsors. It protects the company and the city. It is not of the so-called service-at-cost variety, but it is forward looking in that it provides for orderly development of the local transportation system in Omaha in the future and for

This is the issue in November that is devoted essentially to maintenance and construction subjects

Digitized by Google

co-ordination of cars and buses. The drafting of the grant, the principal provisions of which were reviewed in the issue of ELECTRIC RAILWAY JOURNAL for Nov. 10, was approached by the management from the angle that Omaha is a great progressive city, but that to maintain that position, the city must have an up-to-date local transportation system with the railway as its backbone. And in urging the grant the representatives of the company suggested to the voters that they try to visualize Omaha without street cars.

On the bridge proposal, discussed in an editorial in the JOURNAL for Nov. 3, page 789, the public certainly reacted favorably to the clear-cut, frank explanation of the position of the company, since the voters rejected the proposal to erect a new free bridge. Negotiations will now be begun for the sale of the railway's present bridge to the community.

During the franchise campaign President Shannahan did not mince words about the fact that the company was fighting for its very life, even saying to the rank and file that that "means that you men are fighting for your jobs, for if the franchise is lost that means receivership and probably bankruptcy." The disposition of the franchise and bridge issues appear to indicate that the new management has been successful in converting the public to the understanding that the best service at the lowest cost can only be obtained in a community through the operation of all public transportation by one efficient organization. Certainly the management has succeeded in having the employees realize that their interests and those of the company are the same, with the result that they are making every effort to be useful public servants in an honest endeavor to make friends for themselves and the company. These are the fundamental principles essential to successful local transportation. In securing their acceptance the company has accomplished something really worth while for itself and for the community which it serves.

Detroit Rid of Its Jitneys

AT LAST Detroit has gotten rid of its jitneys. It was a six-year fight. Offhand it might seem that a city would have control of its own streets, and the United States Supreme Court has so ruled in certain cases, but in the jitney case that issue did not apply or was not raised. The case has been followed in the JOURNAL in its various legal phases, but present concern is not so much with the technical issues involved in the suit as it is with the prospects for the future.

No sooner had their rights been abridged than the jitneys became very humble. Whereas they had been amenable only to their own self-imposed regulation, operators are now ready to submit to any reasonable regulation, to run under the direction and control of the very officials whose authority they had questioned and to furnish suitable bond or surety and to comply with any requests of the city. But it would appear that their humility has come too late.

The jitney as a jitney is an anachronism. In Detroit it found a place for itself only because of the peculiar local situation incident to the city taking over the local lines of the Detroit United Railway and being required to convert an inheritance of junk into an articulate system during the period of Detroit's most rapid growth, an era that saw great advance by the automobile as a public transportation agency. This was the period that saw the development of the local transportation system under city auspices to the point where the property had been virtually rebuilt, the articulation of the railway and the bus in service under the same auspices, the subsequent use of the bus in mass transportation by the Detroit Motor Bus Company, and the promulgation of grandiose plans for rapid transit development which have not yet materialized. Meanwhile resort was made to various expedients, the jitneys being forgotten except for the legal battle being waged against them.

With the jitneys off the streets, the municipal railway department is going ahead with its plans for still greater co-ordination of rail and bus lines, but it remains a fact that it has been quite a problem to assume over night the traffic load so suddenly thrown upon the local transportation system by the withdrawal of the 500 jitneys. The latest proposal is a de luxe bus service for Grand Avenue and for Woodward Avenue, with 16-passenger vehicles, a service the municipal railway department was precluded from rendering so long as the jitneys were being protected temporarily in what they assumed were their rights. This is another move and a forward-looking one in the greater articulation of the transportation services of the city, anticipatory of the time the city actually does something really worth while transit-wise. The management of the systems as now constituted is able, but under the present conditions limitations are imposed that preclude anything like the realization of real rapid transit service.

To Help Them Stop, Look, And Listen

THE need for uniformity in highway crossing protective devices grows daily. Last year, according to figures compiled by the Interstate Commerce Commission from reports of Common Carrier Railroads of the United States, 2,371 persons were killed and 6,613 were injured in highway grade crossing accidents. Compared to this only 402 individuals were killed and 675 injured in similar mishaps in 1890. It is obvious that this increase in casualties from 1890 to 1928 can be credited almost, if not wholly, to the advent of the automobile as an attractive private transportation vehicle.

Vehicular speeds have steadily increased from those possible in the '90's until at present automobiles are traveling the highways of the country at rates equaling and in some instances exceeding those of our fastest trains. To beat the Twentieth Century Limited is a sport which has stirred the imaginations of motorists and even engaged the efforts of motorboat speedsters. Despite the recent Supreme Court decision putting the blame on the motorist for collisions involving railroad trains, such accidents continue to exact their toll of human lives. Apparently the mechanical limitations to the speed of modern motor cars—still far from reached—constitute the only deterrent to the rate at which occupants of these fast-moving vehicles can and do approach and pass over railroad crossings. Whatever effect the precautionary "Stop, Look and Listen" appeal ever possessed has long since been completely dissipated.

The horse-drawn vehicle carried, at best, three or four persons in addition to the driver, and everyone generally was in a position to protect himself from dangers incidental to crossing railroad tracks. Except for a runaway the rate of travel with horses was sufficiently leisurely to permit of the safe abandonment of the carriage in any emergency and at any normal pace. Not so with the modern motor car, to say nothing of the 30 to 40-passenger bus. In either instance the passengers are wholly dependent upon the skill and discretion of the driver to protect them from hazards of the road, including col-

Digitized by Google

lisions with other mediums of transportation. Motor vehicles travel distances never possible with horses. Single trips may extend through several states or even from coast to coast. A trip of 300 to 500 miles in a day is no longer uncommon. Highway travel such as this, when considered in the light of the annual grade crossing casualties resulting therefrom, represents an incontestable reason for the standardizing of railroad crossing warning and protective devices whose very uniformity will constitute a factor favorable to their observation by travelers.

There is certainly the most acute need for the development of a system of signs, so standardized in size, shape, color and wording, that a motorist, speeding over improved highways, perhaps through entirely unfamiliar territory, may instantly comprehend the specific warning intended by that type of sign wherever he encounters it. An attempt at uniformity is to be found in the signs bearing the numbers of the so-called federal highways. It becomes all the more necessary then, that from this beginning in standardization as applied to highway markings these same motorists, growing accustomed to uniform highway markings, be given the benefit and the added protection of a similar standardization in devices or signals denoting the presence of railway trains.

Take Advantage of Improved Parts and Repair Materials

IN ELECTRIC railway maintenance it has been proved again and again that the use of the highest grade repair parts and materials obtainable is most economical in the long run. Very little calculation is needed to demonstrate that fact. The cost of a single service failure will wipe out many dollars of apparent savings made in the purchase of materials or parts. But the use of high-grade parts is not alone sufficient. The opportunity frequently exists to incorporate improved designs that offer better performance, increased reliability or other distinct advantages in comparison with the original part or material that is being replaced.

When a car is down it should stay down until thoroughly ready to be placed in service again. The best insurance against service failures lies in doing a thorough job of repair or overhaul. Frequently that involves, also, taking advantage of the many new materials and improved parts available to the maintenance departments. One company is installing manganese wear plates at truck points subject to excess wear. Another is substituting higher grade springs for those used in the original design, as the original springs were found to sag after considerable use. In the repairing of armatures, modern insulation permits the use of a dielectric strength superior sometimes to that of the original armatures.

Serious defects may appear in original equipment. Obviously it is poor business to perpetuate the trouble, and the only remedy lies in the adoption of an improved part or material. On one large property which experienced a great deal of trouble from broken armature shafts on practically all types of motors, the adoption of a high-grade alloy steel at considerably higher unit cost of material, resulted in a large reduction in service failures and effected a large ultimate saving in actual repair bills. Changes in design of standard parts should, of course, be made only with extreme caution and after thorough experiment and consultation with the manufacturer of the original equipment. But there should be no hesitation in the adoption of improved parts or materials that will increase reliability, improve performance or reduce operating or maintenance costs. When overhauling or repairing equipment there is frequently an opportunity to take a step forward instead of merely making replacements in kind. Failure to take advantage of this opportunity is not in keeping with the modern spirit of progress in the industry.

Robots Not Wanted on the Platform

CONCEPTIONS of Carl Capek, creator of the fictional robot and successor to Mrs. Shelley, who introduced Frankenstein as the father of automata, appear likely to be outdone by the engineer in his developments of the mechanical man. Televox proved this at Cleveland, although the application was not one with which the man on the street is likely to come into contact. But your average man won't have to wait long. Capital, big capital, has promised us that soon the nickel cigar in our favorite emporium will be handed to us by a mechanical figure in the outward garments of a man who will thank us no less feelingly than does his slightly more human counterpart now behind the counter. And the 5 and 10's are going in for the same thing. Yet there is not much reason to fear that soon all of us will have nothing to do but move about in a world in which the automata about us will make man conspicuous by his very mobility.

We cannot, for instance, conceive the automatic conductor, even though some of the present generation of conductors have at times by their seeming indifference offended much more than could any mechanical man, from whom cut and dried answers are to be expected. If a conductor was nothing more than a mechanism for ringing up fares, then street railway men might be expected to welcome Televox. But the man on the platform must be far more than that. "Ride salesmanship" or "trainmanship" express present-day thought on the requirements of the platform man. To achieve these qualifications, methods of education and training are receiving wide attention.

Drill was one of the words used in Cleveland. This at first has a strange connotation. Too often it is associated purely with physical movements. But there are far greater possibilities in the word. The conductor has become a great asset to his company who can always be counted upon to enforce a rule so that the rule will not be made to appear to have been drawn to govern the passenger. Likewise that man on the back platform is an asset who always shows a sincere desire to serve the public. Again, by careful training the platform man can be so instructed as never to try to prove the passenger wrong even when he really is.

There are some men who never could be made to understand the niceties of passenger psychology so that the reaction of routine contacts will redound to their own benefit at the same time they appease the passenger. But they can perhaps be taught and trained, through a process of drilling, to handle the many situations that arise on a car platform in a manner calculated to produce desirable reactions. Drill does not necessarily make robots of men. The actor and the public speaker are drilled. The debutante's finishing school includes the process of drilling. Drill consists of practice which makes proper performance easy and semi-automatic. A school of trainmanship may profitably be a course in platform drill.

Mechanical Methods

Expedite Track Paving

Machines and organization in Milwaukee permit the laying of 700 to 900 sq.yd. of concrete pavement in eight hours

By F. G. Hibbard
Assistant Engineer of Way and Structures
The Milwaukee Electric Railway & Light Company,
Milwaukee, Wis.

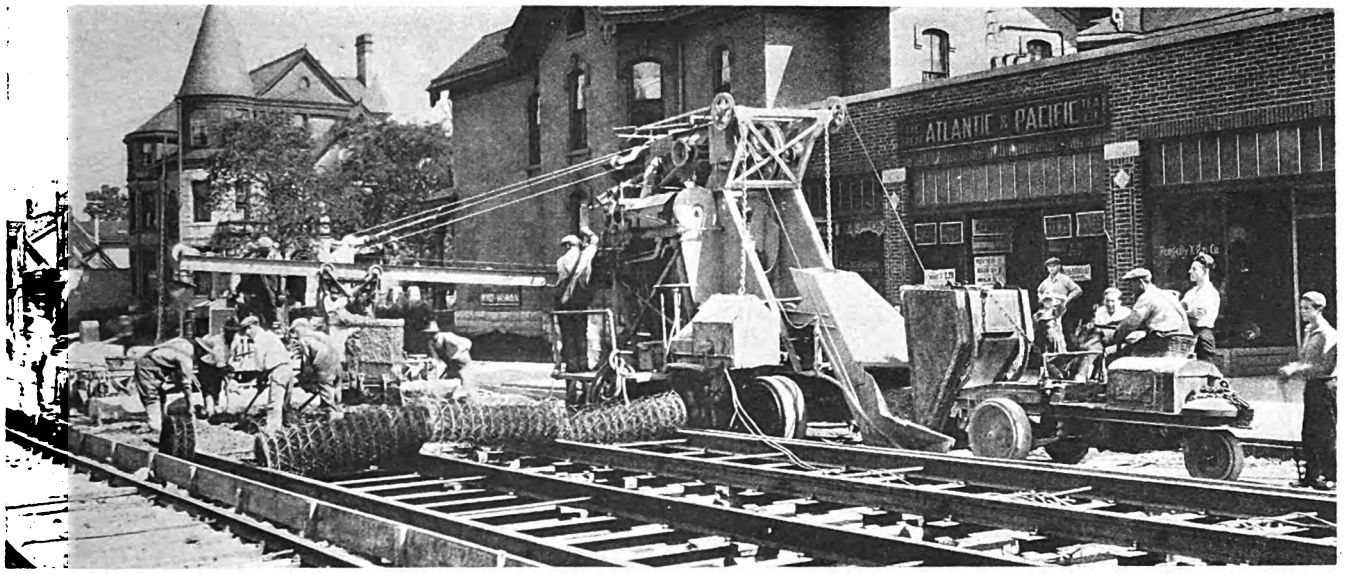
The systematic arrangement of the mechanical equipment on the street expedites the track paving operations

ON MANY railways, both large and small, concrete is now the standard for track zone pavement. This increased popularity of concrete for street railway track zone pavement must be justified, for its extended use by traction engineers is undoubtedly based on satisfactory experience.

Good materials are essentially necessary for good concrete pavements. For guidance in the selection and testing of materials for concrete pavements, the Milwaukee Electric Railway & Light Company uses specifications of the American Society of Testing Materials. The company is fortunate in having an exceptionally good deposit of sand and gravel; also an excellent quarry supplying a high grade of crushed stone. When thoroughly washed, these materials are well adapted for the manufacture of concrete.

For several years we have been using the fineness modulus theory developed by Prof. Duff Abrams and

Digitized by Google



Laying the top course, handling the "mix" almost entirely by machines

methods proposed by the Portland Cement Association in the designing of concrete mixtures. Our specifications call for a 1:2:3½ mix or a ratio of one part of cement to 5½ parts of sand and coarse aggregate. Instead of starting with a specified strength as is usually done and working to obtain this with a minimum of cement, we start with a fixed amount of cement and strive to secure concrete with the highest possible strength and wearing qualities.

Modern Equipment Reduces Labor

In determining the equipment for laying concrete pavement we were obliged to give first consideration to the limited space between car tracks and curbs. Our plant was laid out to work efficiently in this restricted area. A 21-E mixer mounted on rubber-tired wheels, which permits easy transportation over city streets, is equipped with a boom of sufficient length to dump the concrete into the track zone when the mixer is placed on the side of the street. Two Barber-Greene loaders, one for sand and one for gravel, with accurate measuring hoppers are used for loading these materials into three-wheel Clark Tructractors for transportation to the mixer. These tractors can be maneuvered in a very limited space and are equipped with dumping bodies of sufficient size to carry a full charge for the mixer. The cement is loaded by a specially designed skip so as not to slow up the operation of the tractors, as a result the loading of cement directly from stock piles takes place. A special adaptation of the Lakewood finishing machine, which was developed by our company after a year of experimental work, permits us to strike off, tamp, form the throatways and belt the concrete so that a minimum amount of labor is required in spreading the concrete and finishing the pavement.

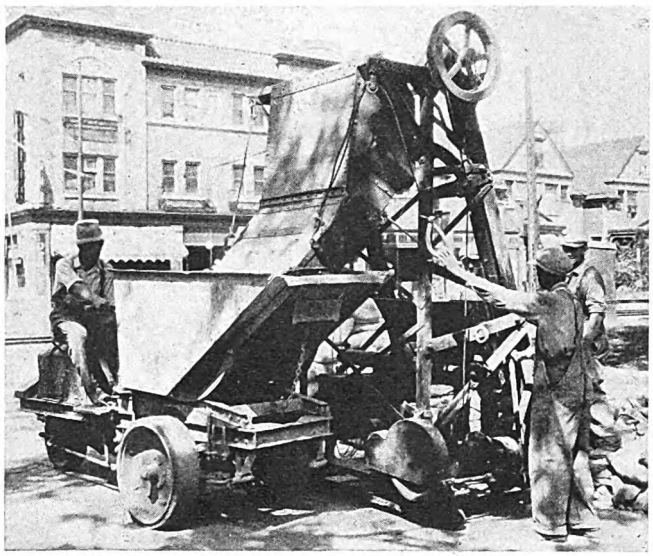
Materials Carefully Measured

The amount of material per foot of track is carefully calculated, and where sufficient room is available between the curb and track, the necessary sand and gravel are dumped from differential motor dumping cars approximately as shown in an accompanying illustration, and the cement is piled on the parking strip between curb and sidewalk. When the street width is too limited to permit of the proper storage of materials, a temporary curved track is used to carry the storage piles to the intersecting side streets. This track is specially constructed in sections so that it may be laid on top of the permanent track and removed in a short time and at little expense. After the materials have been placed, the equipment is moved into position, the loader hopper set to measure the predetermined quantities of sand, gravel and cement, and the water gage on the mixer set for the correct amount of water for each batch.

The sequence of the operations is as follows: The tractor receives the proper amount of gravel for one batch from the loader, proceeds to the cement skip and then to the sand loader for the correct amount of these constituents, and then dumps the load directly into the mixer skip. As the cement is loaded between the gravel and the sand there is little danger of its being carried around the street on windy days, and it does not adhere as readily to the mixer skip. After the proper mixing time which is controlled by a batch meter, has elapsed, the concrete is so deposited as to avoid an undue amount

The gravel loader speeds the handling of the aggregate

Digitized by Google



Cement skip shown in action

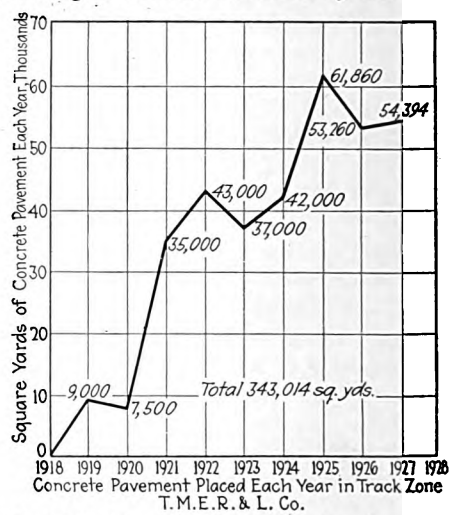
of shoveling. It is then carefully spaded around the rails and ties to a depth of 2½ in. below the top of the rail for a length of approximately 50 ft. Type 0583 American Steel & Wire triangular mesh reinforcement is then placed in position and immediately covered with a top course of concrete which is struck off flush with the running surface of the rail by the finishing machine at the same time it tamps and forms the throatways. The surface is then belted and the edges of the throatways dressed by hand finishing. The reinforcement is handled in rolls and is spread out as required. The concrete is laid with about a 1 in. slump which requires tamping but once to produce sufficient mortar on the surface for finishing. Excessive tamping produces too much mortar on the surface, disturbs the uniformity of the mix and does not leave the wearing surface in a good condition to resist impact and abrasion.

The following crew is employed in placing concrete pavement: Three men spreading concrete, one man on reinforcement, one man operating finishing machine, one man operating mixer, two men operating loaders, three men operating tractors, two men handling cement, three men cleaning up behind mixer and loaders, two men finishing and one foreman.

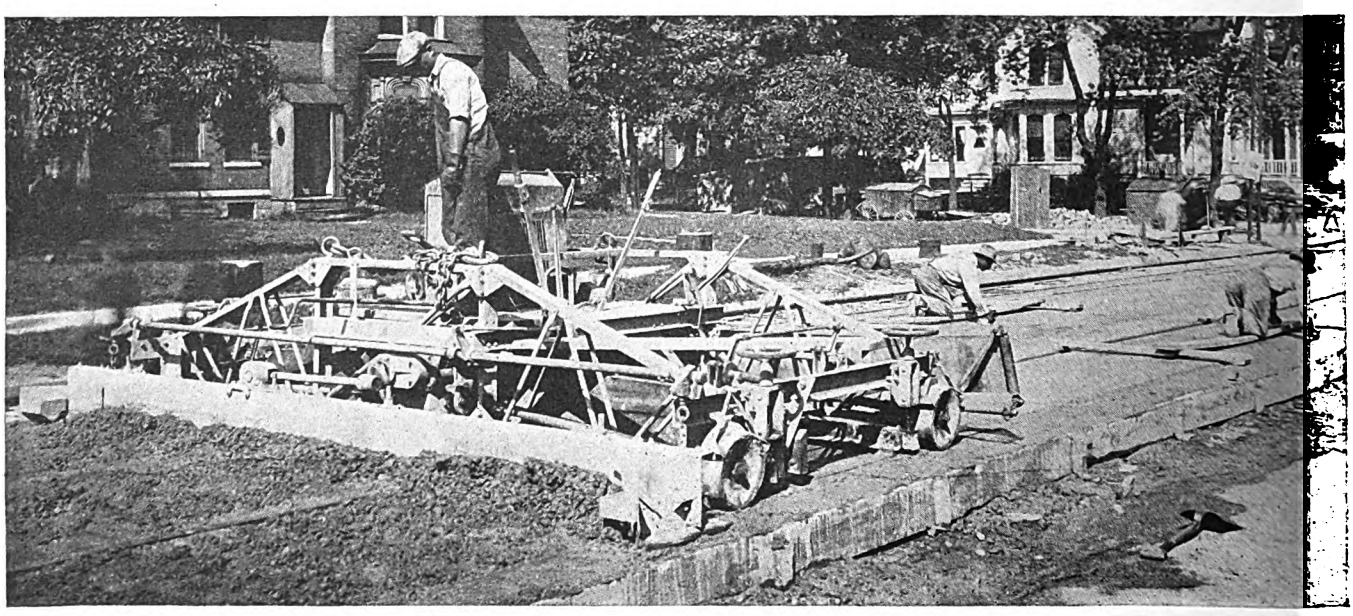
When steel tie construction is used, two men with tamping bars are added to the crew to work the concrete around the ties. When cement is handled from stock piles on the side of a street where cement skips cannot be used, an additional man is added to the crew. Our company forces lay about 700 sq.yd. of concrete pavement in eight hours. We have laid as high as 942 sq.yd. in seven hours.

Frequent Field Tests Made

Slump tests are made from time to time to check the consistency of the concrete and 6x12 in. compression test cylinders are molded to check the strength and to determine the length of time required before the pavement is to be opened to traffic. We are working on a method of making strength tests in the field by the use of a simple device for breaking small cantilever beams. These tests are to be conducted day by day, and as soon as sufficient strength is shown by the test specimens, the street will be opened to traffic. A check on the bulking of sand is made by inundating a small sample in a graduated cylinder. An accompanying illustration shows a typical cross-section of standard track construction using concrete pavement. Formerly we used a $\frac{5}{16}$x2-in. flat tierod with 1-in. round terminals which had a marked tendency to crack



T. M. E. R. & L. Company placed a total of 343,014 sq.yd. of concrete pavement in its track zones during the past nine years



Making the first strike-off by machine. Hand finishers are shown at work in the background

Digitized by Google

the pavement. Last year 1-in. round tierods were substituted, materially reducing this cracking.

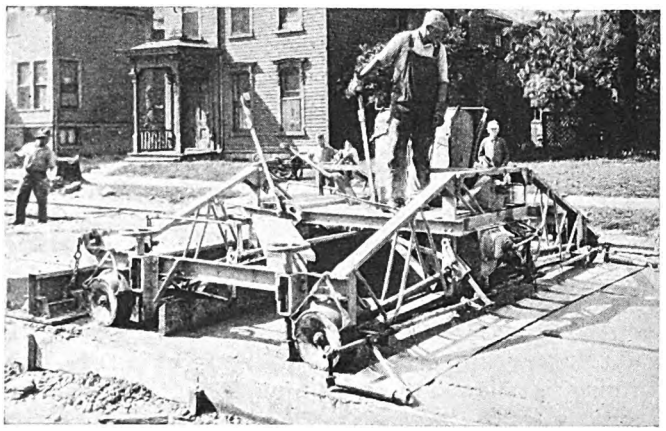
At all street crossings, except in the outlying districts, granite block stretchers are employed along the gage side of the rail for the full street width, to reduce the width of the throatway and to provide a smooth intersection. The throatway width is reduced from 5 in. to 2¼ in. The granite blocks have a greater resistance to crushing than concrete and their use at street crossings adds substantially to the life of the pavement. In placing the concrete pavement, forms are set to provide proper space for the blocks which are later laid on a 1:3 cement-sand cushion and set in a 1:1 cement-sand grout. Where cross street traffic is exceptionally heavy, the entire width of the track zone is paved with granite block pavement.

For the last few years we have been using 2½ lb. of granulated magnesium free calcium chloride per square yard for curing. This material is uniformly spread over the surface of the pavement with a mechanical spreader. If rain falls within four hours after the application of the calcium chloride, a second treatment is required.

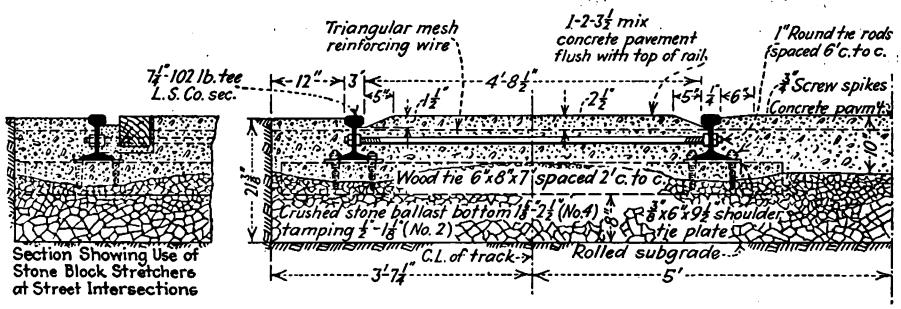
It occasionally becomes necessary to arrange to open the concrete pavement to traffic in a relatively short time and these special conditions are met as follows: If the pavement is to be opened in 24 hours, Lumnite cement is used. If the pavement is to be opened in two to three days, a choice of two methods is available: The use of so-called high-early-strength cement; or a richer mix with a low water-cement ratio. In the second method, increasing the mixing time and the addition of 2 lb. of flaked calcium chloride in solution will aid materially in obtaining desired results.

When it becomes necessary to lay concrete in freezing weather careful consideration is given to the following details: Subgrade must not be frozen; materials must be heated; hot water must be used in mixing concrete; mix is kept as dry as possible; 2 lb. of magnesium free flaked calcium chloride is used in solution to each bag of cement, and sufficient covering is used to protect the pavement from freezing.

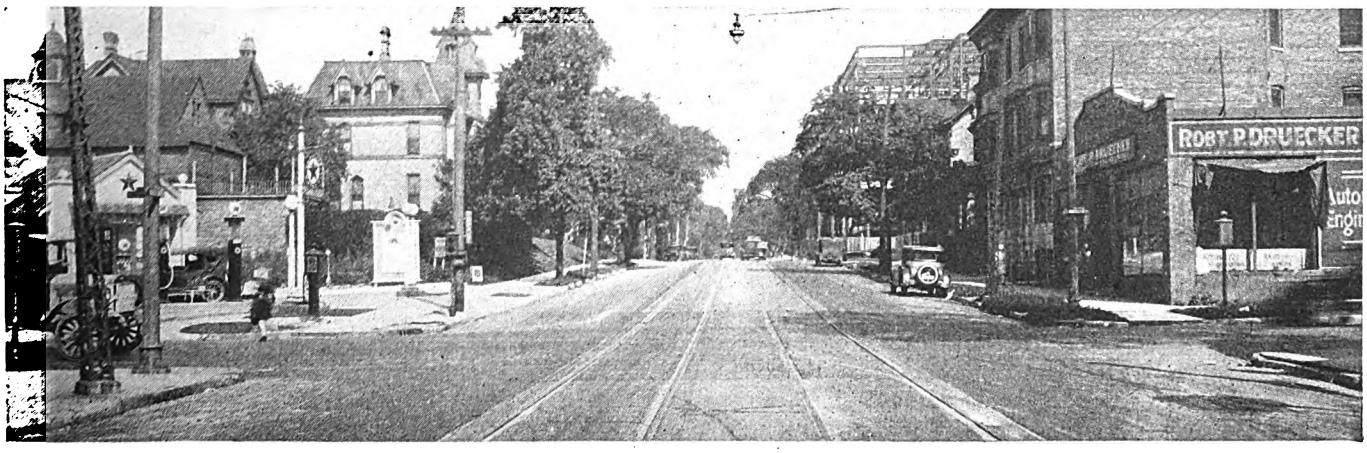
The subgrade is protected against freezing, and with crushed stone ballast this is relatively easy. Gravel is avoided as a coarse aggregate during the winter months as it holds a high percentage of moisture and requires considerable heating before it can be used. Crushed stone is therefore substituted. The crushed limestone and sand are heated over old pipes, or when sufficient drier capacity is available, sand may be dried and heated at the sand drier plant. We have also made use of a hot mixer for laying asphalt pavements to heat the aggregates in cold weather. A sprinkler car is used for transporting hot water. This car is switched into the shops and a steam line run into the tank during the night-time. In the morning a portable boiler mounted on a small flat car is attached and the two are taken to the job where a steam line is run from the boiler to the line carrying the water from the car to the mixer. Air pressure is maintained on the tank to run the water into the mixer. A



Making the second strike-off, tapping, cutting throatway, and belting—four operations handled simultaneously by the same machine



Cross-section of standard track construction in Milwaukee. Wood ties are used with crushed stone ballast, and concrete pavement reinforced with standard wire mesh. The small cross-section at the left shows the stone block stretcher used at street intersections



T. M. E. R. & L. Company's standard 10-in. concrete pavement. It will be noticed that the crossing is of all-granite construction

Digitized by Google

saturated solution of calcium chloride is prepared and one quart of this solution contains approximately 1 lb. of calcium chloride, which is added to the mixing water. By the use of heated aggregates and hot water, a hot mixture is obtained. The calcium chloride solution produces a quicker set and allows the finishing operations to be completed and the covering placed long before there is any danger of freezing.

For covering we lay two-by-fours, 18 ft. long, across the track, blocked up on the rails to keep them off the fresh concrete. Over these supports canvas is placed and then a substantial covering of marsh hay. After 24 hours the supports and canvas are removed but the hay covering is allowed to remain until the pavement is opened to traffic.

Our oldest concrete pavements are down nine years, and so far we have had little maintenance expense. Transverse cracks occur at short intervals, usually over a tierod. In filling them, a truck filled with dry sand, asphalt and fuel is used to tow an air compressor and a tar kettle. The cracks are cleaned out by compressed air, filled with hot Texaco No. 96 asphalt and covered with dry sand. The following constitute the crew: One man cleaning out cracks, two men filling cracks with asphalt, two men sanding cracks, one equipment operator and one truck driver.

The accompanying graph indicates by years the yardage of concrete pavement installed up to and including 1927. It is estimated that approximately 61,500 sq.yd. will be laid in 1928. Starting with 9,000 sq.yd. in 1919, a maximum of 61,860 sy.yd. was laid in one year, in 1925, and a total of 343,014 sq.yd. in nine years.

The advantages gained through the use of concrete pavement in our track zone prompt the following conclusions:

1. Concrete pavement aids materially in holding track to line and surface and thus substantially increases its life. Loads from street traffic are uniformly distributed over the subgrade.
2. Concrete pavement can be successfully laid by company forces.
3. Concrete pavement in track zone provides a smooth surface for street traffic, equally acceptable to the abutting property owners and the drivers of pleasure cars and trucks, and it has won the approval of city officials in all municipalities in which we operate.

Milwaukee originally required the track zones to be paved with the same materials used by the city in paving the rest of the street. In November, 1923, an ordinance was passed by unanimous vote of the Council, permitting the company to install concrete pavement in its track zone in lieu of all other types. This approval has stimulated the development of equipment and control methods to the end that tracks may now be paved expeditiously and with high-grade concrete pavement.

Babbitt Room Modernized with Electrical Equipment

Bearings are boiled in Oakite, after which old babbitt is removed and new babbitt is cast with aid of thermostatically controlled melting pots

BEARINGS of the Los Angeles Railway, both armature and axle, are rebabbitted in an electrically operated babbitt room which is an example of cleanliness and efficiency. Electrically operated pots and a preheating cabinet located in the room are thermostatically controlled, resulting in a uniform pour of metal. In addition to the three pots and the preheating cabinet there is also an electrically operated Oakite boiling vat. This room is an example of the modernization of the South Park shops which has been steadily going on with a view toward making a clean, efficient plant. The appearance of the babbitt room resembles that of a bakery, with its white enameled ovens and orderly appearance of bearing shells and materials. The equipment is also painted white, contrasting with the electric switches on panelboards mounted around the room.

Old bearings received from the division shops are first placed in the Oakite vat, where they are boiled to remove all dirt and grease. This vat is at one end of the table of pots and furnace. The bearing is next placed in the first of the three electric melting pots, where it is heated to between 700 and 800 deg. F. until the old babbitt is removed. Each pot has a capacity of 650 lb. of babbitt. It is set below the surface of the metal table, the heating elements being in a cabinet underneath. The control panel, on which are mounted switches, pyrometer and control unit, is mounted back of each pot.

Cleaned shells removed from the melting pot may follow either one of two courses. If they are to be rebabbitted immediately they are placed around the melting pot so that their temperature will be maintained. Otherwise they are placed in the preheating oven, which is located on the bench between babbitt pots Nos. 2 and 3. This is an airtight oven, electrically heated to between 175 and 200 deg. F. This cabinet measures approximately 24 x 30 in. It occupies one section of the bench.

If either course is followed the shafts are at a temperature of around 200 deg., which permits pouring. Babbitt pots Nos. 2 and 3 are used for pouring. No preparation is made of the iron shells, as they have anchor lugs which hold the babbitt in place. In the case of brass shells, the inside is swabbed with an acid cleaning flux of zinc chloride.

Various types of mandrels and forms are used. With split armature and axle bearings, a clamp is used to hold the form to the split mandrel. The clamp consists of a piece of ½-in. round steel formed to a wishbone shape with one arm extended. This extended end of the clamp is threaded and passed through a lug fastened to the back of the split mandrel. A spring and nut set the tension on the clamp so that when it is swung into position it holds the form against the mandrel. This is shown in an accompanying illustration as applied to a split armature bearing. An example of the work done

Poured bearings before being sent to the machine shop are cleaned by a mechanic in a wire semi-inclosed portion of the workbench

Nos. 1 and 4. Two views of the electrically operated and controlled babbitt pot, preheating furnace and Oakite cleaning vat which are features of a babbitt room which is noteworthy for its cleanliness and orderly appearance. It has an output with one man and helper of approximately 2,500 lb. of babbitt per day for bearings of the Los Angeles Railway.

No. 2. A split mandrel, form and wishbone clamp used for pouring split armature and axle bearings. An unfinished poured bearing is shown at the left.

No. 3. Solid bearings are poured around the mandrel with grooved face.

in this manner is shown in the same illustration by a split axle bearing which has been cast in a larger form than that used for the split armature bearing.

Solid armature bearings are cast around a mandrel which has several grooves in the base to furnish the necessary collar of the bearing to take up end play between the armature and case. The form used to block out the window in the bearing is at the extreme right in the illustration which also shows the mandrel and finished bearing.

In pouring bearings use is made of a self-skimming ladle. After a bearing is poured there is little work to be done on it other than to clean up the edges. A mechanic working in a screened portion of the workbench chips off the superfluous metal, thus preparing the bearing for the finishing. An axle bearing with a diameter of 4½ in. has enough metal left on it for a $\frac{3}{32}$-in. lathe cut for finishing.

With this electrical equipment, the orderly arrangement and utilization of the space in the babbitt room, one operator with a helper can pour approximately 2,500 lb. of babbitt per working day. By arranging the equipment in such a manner that a bearing passes from one process to the next without unnecessary handling, much time is saved.

Accident Information Presented Effectively

ENLISTING the interest of trainmen in accident prevention and the proper preparation of accident reports has been done on the Sacramento Street Railway by a novel method. This was described by S. B. Elmore, assistant superintendent of the company in a paper read before the California Electric Railway Association at the meeting held in San Francisco.

Trainmen's meetings lasting one hour are held monthly at the carhouse at which time one or more of the serious accidents of the previous month are discussed in detail. The report of the accident as turned in by the trainmen is first presented, after which are given excerpts from the statements of witnesses as secured by the company's investigator. Progress of negotiations leading up to the settlement, if one has been effected, are then disclosed. The actual names of interested parties are usually withheld. The trainmen take a keen interest in this method of presentation and the result has been reflected in more care in running the cars and in preparing accident reports, and a record of fewer chargeable accidents in operation.

Engineers Make Suggestions for Track and Line

EXPERIENCE shows that maintenance equipment is unsatisfactory in certain respects for the process of modernization now going forward on electric railway properties. To raise the standard of the maintenance work and permit more economical methods, many improved tools are needed. Prominent men in the industry have recognized this need. To start a campaign for better tools the new executive committee of the American Electric Railway Engineering Association, at its Cleveland meeting, outlined a program for focussing attention on this important subject. It was suggested that this situation be called to the attention of manufacturers through action by the maintenance men themselves in pointing out what new devices are needed and improvements that should be made in available maintenance equipment.

An announcement of the action taken by the executive committee was made in ELECTRIC RAILWAY JOURNAL for Oct. 27, and suggestions were asked for improving machines and equipment for the maintenance of cars, buses, track and line. In answer to this request several engineers have suggested some of the equipment that is needed, particularly for track and line work. These suggestions are published in this article and it is hoped that they will stimulate others to send in their ideas.

ELECTRIC RAILWAY JOURNAL takes this means of co-operating in the program proposed by the executive committee and offers its pages as a clearing house of ideas for improved equipment. We ask that all men who have experienced difficulty in any line of maintenance work send in their suggestions concerning the kind of equipment that will help them. What improvements are needed most? By co-operation of the men actually confronted with these problems, the limitations of present shop, track and line maintenance equipment can be brought forcibly to the attention of interested manufacturers. Suggestions will be published in these columns, and all maintenance men should enter this discussion.

Manufacturers also are urged to enter the discussion, to tell why some of the much-needed tools are not available and to advise how some of the suggestions can be carried out to best advantage. Letters are requested from all those who have suggestions to make regarding needed imrovements in existing equipment or new devices that should be brought out.

Better Wire Stringing Equipment, Electric Hammers and Square Threads on Turnbuckle Screws Needed

Suggestions by F. MCVITTIE
Electrical Engineer New York State Railways
Rochester, N. Y.

REGARDING suggestions for equipment that will provide better, quicker, and less expensive maintenance, I believe that some machine or device can be developed to string new trolley wire and take down the old in one operation. It should be designed so that the new wire can be strung to its proper tension and hung in, and the old wire can be taken down at the same time without letting it down on the ground. The methods now generally used are somewhat cumbersome, and present-day traffic introduces many hazards that may result in serious accident.

600-VOLT ELECTRIC TOOLS NEEDED

Another device that could be used to very good advantage is an electric hammer, somewhat similar to a pneumatic hammer, that would operate directly from the 600-volt trolley. It should be self-contained and reasonably light. It could be used to very good advantage for digging holes to set poles, as it would do away with the use of long digging bars where the holes are in dirt or clay, and it would be extremely valuable to dig holes where concrete or rock is found.

SQUARE THREADS PREVENT TURNING

Turnbuckles of various sizes are used in trolley work, the screws of those now on the market have a standard "V" thread and, after the turnbuckles have been used under a strain the threads upset, making them useless. If turnbuckles for this class of service could be made with a square thread they would have much greater strength and would eliminate the threads turning. This would prevent the possibility of a screw stripping its thread thus allowing the trolley wire to fall into the street.

More Automatic Devices Desirable

Suggestions by HOWARD H. GEORGE
Superintendent of Research Cleveland Railway,
Cleveland, Ohio

IT IS with the idea of stimulating a greater interest among electric railway engineers in the announcement which appeared in ELECTRIC RAILWAY JOURNAL of Oct. 27, asking for suggestions for better machinery for the various maintenance operations on our electric railway systems, that I wish first to congratulate the management of the publication for the prompt action taken on the suggestion of the American Electric Railway Engineering Association executive committee on this matter.

As one of the judges in the Mainte-

Digitized by Google

Improving Maintenance Tools

nance Contest, I have been impressed very strongly by the comparatively large number of home-made devices that have been developed on different properties for practically the same identical operation. Certainly, one of these devices must possess certain merits which the others do not have; one must be more efficient than the others; and, if there is a real need for such machines or devices in one place, there must exist similar needs in many other places. By the same token, if such home-made devices were taken up by a commercial manufacturer and some research development work done on them, there is not much doubt but that a still further improvement in the labor-saving possibilities would result and a machine produced which would be equally applicable on many properties.

On the other hand, there are certain fields which apparently our machinery designers have feared to experiment in. I have in mind two machines which will prove of value.

Automatic Welding of Rail Joints

The human element is a very important factor in the success or failure of arc-welded rail joints. Automatic welding has been developed for other purposes and has not only increased the speed of welding but has vastly improved the uniformity of the product. It is my belief that there would be a big field for an automatic machine for welding rail joints, and one which will justify considerable development work on the part of welding machine manufacturers.

Use Circular Saw for Cutting Rails

There is, so far as I know, no very satisfactory portable machine on the market for cutting rails in the field which does not make it necessary to tear out a considerable amount of pavement and excavate below the rail base in order to permit its operation. These present machines are, I believe, all reciprocating in their action and make use of saw blades, which process is naturally slow. It has for many years been my thought that a machine might be developed for cutting rails in the street which would enable the cut to be made by feeding a circular saw downwards into the rail and so on through the entire rail, which, by reason of its higher speed, would make the cut much more rapidly. I believe this type of machine, if it can be developed, would find a ready market, provided its cost were not prohibitive.

There are, no doubt, many other ideas which this request will bring out, and it is to be hoped that from the suggestions thus made many pieces of equipment of real value to the industry will be developed.

Manufacturers

What have you to say regarding the suggestions for improved equipment made on these pages?

Tools Needed to Permit Track Repairs Without Removing Pavement

Suggestions by E. M. T. RYDER
Way Engineer Third Avenue Railway, New York, N. Y.

AS SUGGESTIONS for improved equipment in connection with the campaign of co-operation with the electric railway industry and equipment manufacturers looking toward the development of new tools for shop track and overhead departments, I would like to propose two way department items for consideration.

Track Drills With Pavement Clearance

There are on the market efficient electric power track drills but none of them, as far as the writer knows, are designed to operate on paved track without requiring the removal of a considerable amount of pavement at the point of operation. It is suggested that a drill should be designed having the underside of the frame 2 in. above the level of the head of the tram rail with the motor mounted above the frame, possibly mounting it so as to operate directly on a vertical shaft. The lower end of the operating shaft should be kept as close to the rail as possible, using a special short bit and driving it through beveled gears. Such an arrangement would save a good deal of expense, as the item of removing and restoring pavement is a very considerable part of the cost of making joint repairs. If designed to work within 8 in. of the rail such a drill would be of especial value on elevated railways, where an inside guard rail is in use on straight track.

Operating Men

We want your suggestions for improving maintenance tools — What new equipment do you find particular need for?

Rail Grinder Designed for Transverse Power Derailing

In order to speed up the grinding of joints and corrugations heavy equipment is necessary, and recently such grinding equipment has been mounted on service cars permitting the grinding of both rails at once. The use of such equipment, however, is limited much by the necessity of running to crossovers to keep out of the way of regular cars. A short wheelbase heavy truck derailing transversely in a few seconds time seems to offer promise of filling a notable want. The cause and relief of corrugation is an ever-present problem which has not been solved satisfactorily. Apparently there is to be a steady field for grinding, and the type of equipment suggested seems to offer a decided improvement over any existing types.

Maintenance of Automatic Substations

A competent crew of maintenance men should be divided into groups for inspection and for maintenance work. Value of proper forms in simplifying work

By M. J. Adams

Switchboard Engineer Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

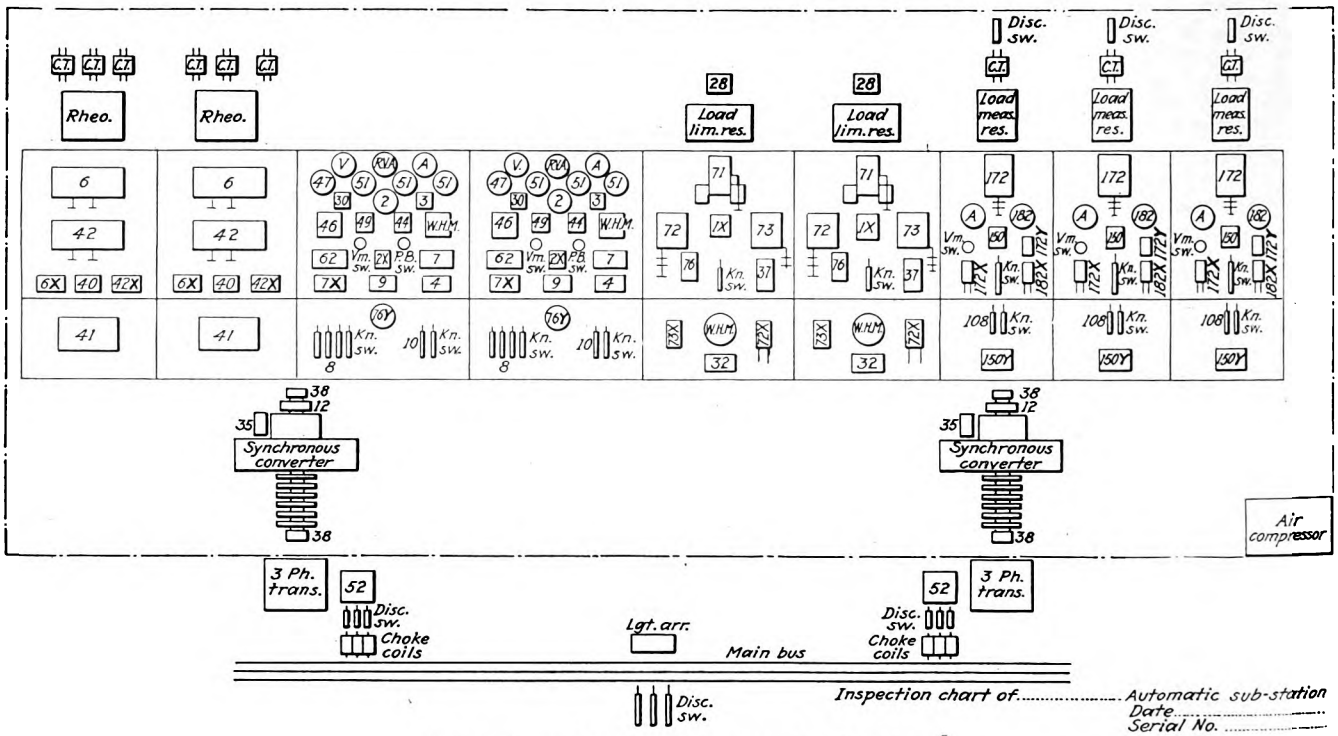

Fig. 1—Inspection chart for automatic substations

AUTOMATIC substations have brought about a change in maintenance and maintenance methods. The work has become more or less specialized and a different type of men is required to care for this type of station. The amount of maintenance and inspection necessary to keep the equipment in proper operating condition varies with the type of equipment and the application, as well as local conditions. It is quite obvious that a hydro-electric station located away from the dirt of the city will not require nearly as much cleaning and blowing out as a railway converter station located on a busy street in the heart of a city. It is also evident that the more complicated stations will require more maintenance work than the simpler type.

This article is based upon maintenance experience in railway converter stations, and all charts and schedules cover this type of equipment. Assume that the operating company has a competent crew of maintenance men, well versed in general maintenance practices and thoroughly familiar with the sequence of operation of the stations placed in their care. These men may be broken up into two groups, the inspectors and the regular maintenance crew. The inspectors should be men who have proved themselves especially adept at working out the causes of trouble and visualizing the conditions which could produce the troubles which they are to locate and cure. The inspector should visit the stations every two or three days, depending upon the severity of service, and make a casual inspection of the equipment, which should consist of reading meters, taking readings on operation indicators, checking oil levels and giving the station a visual check throughout. The inspector should also be charged with the investigation of any troubles which may arise in the operation and should have com-

Digitized by Google

plete charge of the testing and calibrating of all protective devices.

The maintenance crew should consist of trained maintenance men and helpers, working in pairs, the maintenance man doing all the inspecting and adjusting, the helper handling the air hose and taking care of the brushes and wiping down the equipment. The frequency with which this maintenance crew visits the stations will depend entirely upon how severe the service on the station is and also upon the local conditions regarding dust and dirt. In general, however, it is found that a thorough blowing out and cleaning up accompanied by a general inspection about every two weeks is sufficient. It must be understood, however, that this is only a general average and that this amount of work must be increased or decreased according to the needs of the individual installation.

The type of inspection reports and charts varies with the individual operating company, but in general they all follow along the same lines. There are two general forms of inspection charts in common use. One is merely a numerical list of the devices, with suitable blank spaces, to be filled in by the workmen. This report is very much in detail and calls for answers of the "Yes" and "No" variety and has a slight tendency to destroy the individuality of the maintenance man. In general, it is better to let the maintenance man use his own judgement as to cotter pins, contacts and general mechanical conditions of the various devices. Another disadvantage in this report is that with the various devices listed in numerical order it means that to follow the report down from top to bottom the maintenance man must keep moving from one piece of equipment to another numerically and not according to physical location, and unless the report is followed very closely some piece of apparatus may be missed.

The type of inspection report or chart shown in Fig. 1 consists of a general plan of the substation with the switchboard placed flat on the floor. All pieces of equipment are shown in their relative positions by small numbered squares, therefore the inspector or maintenance man using this chart may start in at one end of the switchboard and check each panel as he goes. A common practice is to have the maintenance men use different colored pencils in checking off the equipment which they have inspected and cleaned. In this manner if one man checks a certain panel upon which trouble is found later, he can be held accountable for not having discovered and eliminated the trouble on his previous inspection. This type of chart is also useful in that the superintendent of substations can pick out the devices that have caused trouble at a glance, as trouble is indicated by a "T" placed in the square representing the device. If the inspector or maintenance man has checked the device and found it to be O.K. he indicates this by a check mark in the square, but if he finds that there is trouble in this particular piece of apparatus he places a "T" in the square and turns the inspection report over, indicates on the back the device number and describes the nature of the trouble and what was done to remedy it. This makes a quick and convenient method of locating troubles on the chart and does not necessitate the reading of all of the details.

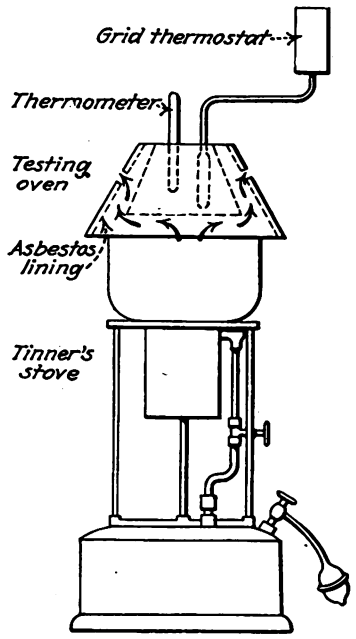

Fig. 2—Oven for testing grid thermostats

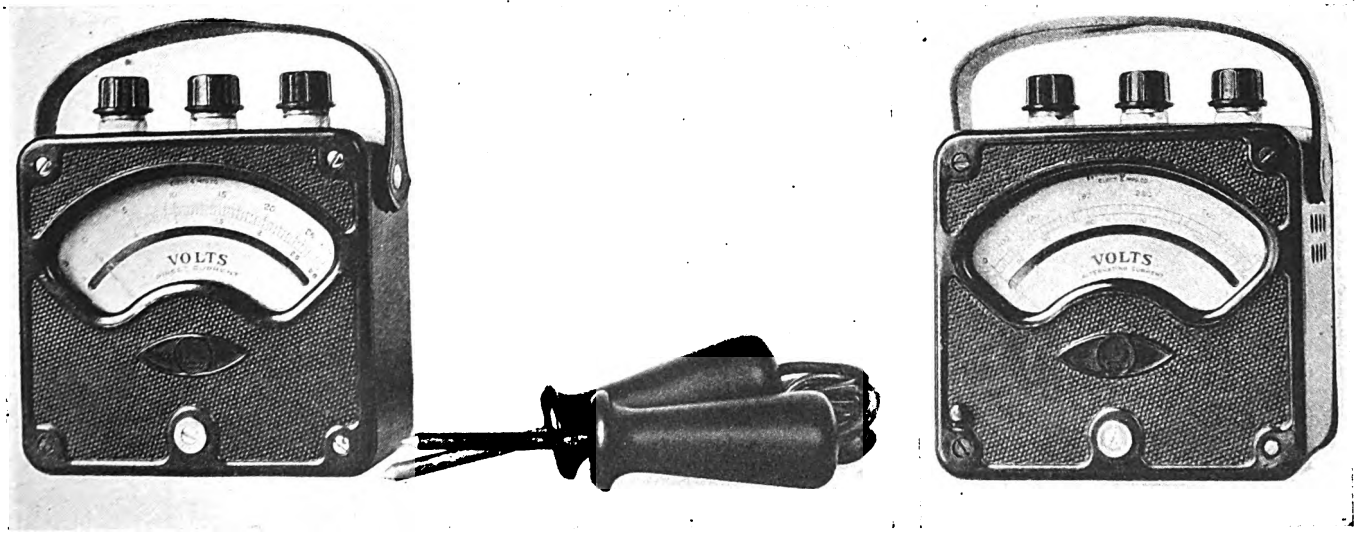
It is impossible to give any definite instructions regarding the amount of maintenance work necessary to keep a chain of automatic substations in the proper operating condition, as the quantity of the work is entirely dependent upon the severity of service to which the equipment is subjected and also upon the local conditions regarding dirt, dust, dampness, etc. However, it will be found after six or eight months' experience in caring for a chain of automatic stations just how much individual maintenance each station will require and a schedule may be arranged accordingly.

In addition to the regular maintenance work consisting of inspecting, cleaning and blowing out, there is also a



At left, direct current volt-ammeter. At right, triple-scale alternating current voltmeter

Digitized by Google

certain amount of routine testing and inspection that should be laid out and followed carefully over each year's period of operation. This type of work consists of testing and calibrating the various protective devices and maintaining and inspecting bearings and testing transformer oil. A sample schedule for work of this kind is given herewith, and while it must be understood that this schedule will not apply to all installations it nevertheless can be used as a basis for a testing program.

Schedule for Routine Testing and Inspection

D.C. Reverse Current Relays, A.C. Reverse Power and Machine Overspeed.—Test and calibrate every six months.

D.C. Overload, A.C. Reverse Phase and Low Voltage.—Test and calibrate every six months.

Bearings of Converters and Auxiliary Rotating Equipment.—Change oil and flush reservoirs every six months. Take out and inspect converter and motor generator, set bearings once a year and touch up spots that show signs of slipping or cutting.

Transformer Oil.—Samples of oil from the oil insulated transformers should be taken every six months and tested for dielectric strength by actual test with an oil testing transformer. If the oil tests are low it should either be changed at once or else run through a dehydrating machine.

Oil in Oil Breakers.—The amount of attention which the oil breakers in a station require is solely dependent upon the number of operations per day and the severity of the loads which they interrupt. For that reason no hard and fast rule can be applied to the number of inspections required. In general, however, the oil should be changed and the contacts inspected and adjusted every three to six months. In case the breaker does not perform very many operations it is often possible to extend this period considerably but this can be proved only by experience.

Thermostats, Grid Resistance and Bearing.—Bearing thermostats since they operate around 100 deg. C. are tested very easily by placing them in a deep pot of oil heated by a Bunsen burner or tinner's furnace. Grid thermostats, however, present a different problem as their operating temperature is usually around 300 deg. C. This prohibits the use of oil as it will boil below that temperature. However, a very inexpensive furnace for testing these thermostats may be made similar to that shown in Fig. 2.

This oven consists merely of a heavy sheet iron cone lined with asbestos and designed to fit over the top of an ordinary tinner's stove. Suspended from the closed top of this cone is another sheet iron cone of smaller dimensions which forms a chamber for heating up the bulb of the grid thermostat and at the same time keeps it away from the direct flame of the tinner's stove. Small openings are left in the outside cone to carry away the flame and gases. The inner chamber maintains practically an even temperature all over so that readings obtained from the thermometer will be equivalent to the temperature to which the grid thermostat bulb is subjected. The grid thermostats and bearing thermostats are probably the most abused of any of the protective devices in an automatic substation, in that, due to the difficulty in testing them, inspectors and maintenance men often allow them to remain in an improperly calibrated condition without ever being aware that they are out of calibration. For this reason they should be tested at least every six months in order to insure the safeguarding of the machine bearings and the load-limiting resistors.

Feeder Resistance Measuring Relays.—In most applications it is sufficient to check the calibration of these relays every six months. This work is commonly done by the use of a resistance capable of carrying the measuring current and equal to the resistance of the load upon which it is desired to reclose.

The remaining protective devices can be checked during the general inspection and clean-up period and no special time for this work is necessary.

Insulation tests should be made on the station equipment every six months. By insulation test it is meant that all control wiring, all high-tension bus work, and all electrical apparatus should be subjected to an insulation test with a megger. In addition, on all 600-volt installations the switchboard risers and supports should be tested for grounds and also for potential. The same applies to the cast-iron framework which supports the grid resistors. Occasionally a bank of grid resistors will be found which has broken down its insulation and has placed potential on the cast-iron end frames. This condition is very dangerous as workmen may accidentally ground these end frames and cause a bad burn-out.

The subjecting of the control wiring to an insulation test often discloses some peculiar condition which would not have been discovered except through the medium of serious trouble. The use of a megger on the control wiring will often disclose minor grounds caused by collections of copper and carbon along wiring and equipment which in its present state could cause no trouble but might at some future time develop into an arcing ground

Digitized by Google

or short which would cause serious damage. When these faults in control wiring show up an elimination process should be started by taking off connections and progressing slowly down the control wiring until the fault is located. This can be accomplished by following the schematic diagram and checking off the points as they are disconnected and cleared.

It is essential that the inspectors and maintenance men be supplied with the proper instruments if they are to find troubles quickly and adjust the various relays properly. For this purpose a set of meters similar to those shown are useful. These meters are very compact and may readily be carried in a small leather carrying case. One is a d.c. volt-ammeter with the following ranges: 0-15, 0-150 volts with external resistor for 600 volts, and 0-3, 0-15 amp. The other is a triple scale a.c. voltmeter 0-150, 0-300 and 0-600 a.c. volts. Instruments of this kind can be carried easily from station to station and will always be available for testing and inspection work. Furthermore, the fact that the maintenance men have these instruments available will lead them to investigate immediately any condition which may not seem exactly right to them, while if it is necessary to secure the proper instruments from headquarters the chances are that it will be postponed until forgotten.

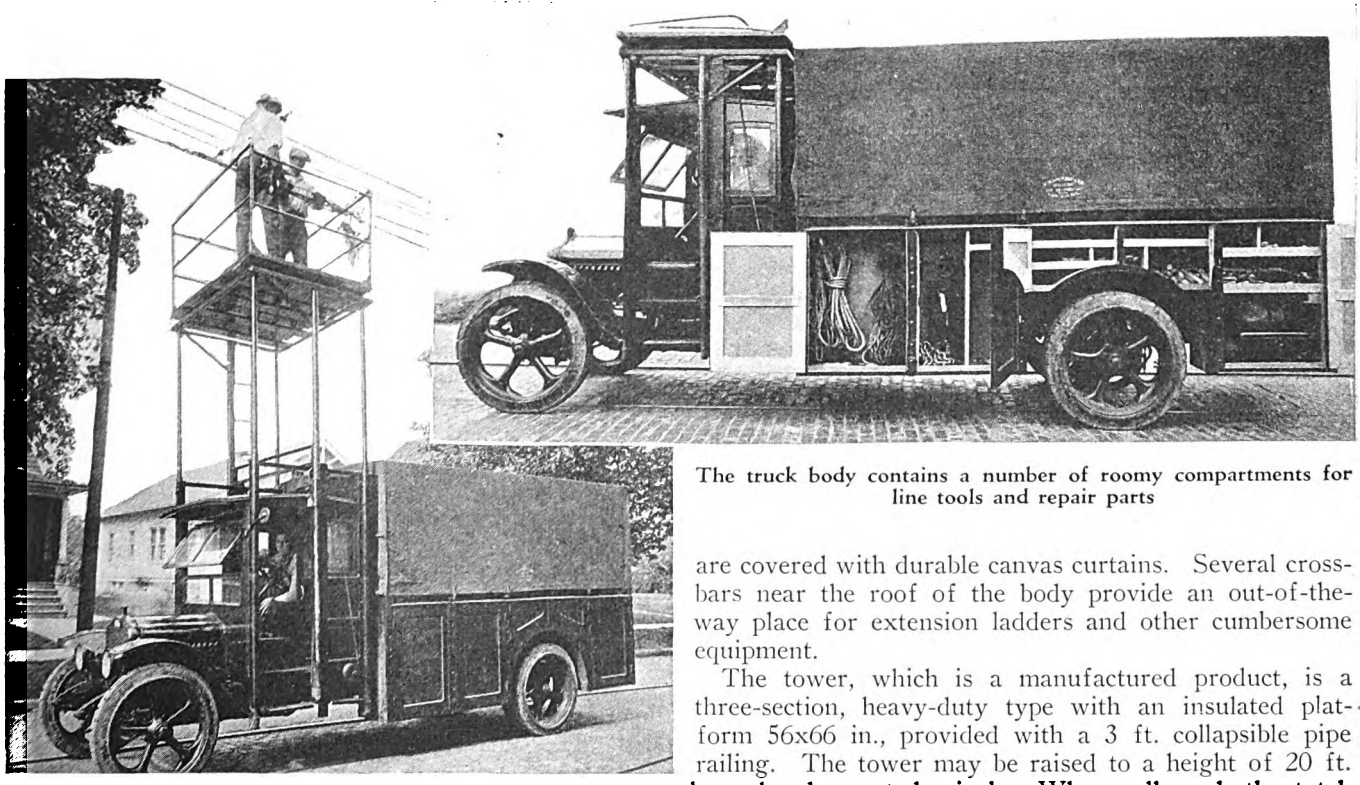
Automatic substation maintenance should be judged not so much by the quantity as by the quality of the work. The maintenance man who understands his station perfectly and understands the characteristics of each individual relay will discover troubles while cleaning up the station that the average maintenance man will pass over without notice. With this in mind all available literature concerning the stations should be turned over to the maintenance men and frequent meetings held in which maintenance problems and methods are discussed. By bringing up new problems and new phases of the work in these meetings the men will be prevented from falling into that routine rut which transforms maintenance men from a state of creative and constructive thinking into a condition where they turn out the routine work mechanically. This condition is obtained through doing the same work day in and day out without learning anything new about the equipment or having any reason to think deeply about its operation.

Line Truck Increases Maintenance Efficiency

IMPROVED working conditions and increased efficiency in city overhead maintenance have resulted from the use of a line truck in place of line cars on the city lines of the Chicago, North Shore & Milwaukee Railroad, Chicago, Ill. After experimenting for some time it was found that much of the city overhead maintenance could be performed during the daytime by the use of a line truck, whereas the line cars must work at night under poor working conditions.

The city systems of this railroad are equipped with direct suspension overhead trolleys while a combination of both simple and compound catenary and direct suspension is used on the interurban system. For work on the interurban system, as well as the city system, the truck is fitted for maintenance and renewal of poles and fixtures, and the stringing of small wire.

The choice of truck chassis and style of body was determined by the type of work and territory to be covered. A 2-ton, 168-in. wheelbase truck with 5-in. single-cushion tires in the front and 5-in. dual-cushion tires in the rear is used. The truck body, exclusive of the cab, is 12-ft. long and 6-ft. wide, and stands 9 ft. above the ground. The truck body contains a number of compartments for rope, chain, line tools and repair parts. The upper side frames and the rear of the truck



The truck body contains a number of roomy compartments for line tools and repair parts

A light metal framework on the platform folds flat when the tower is not in use

are covered with durable canvas curtains. Several crossbars near the roof of the body provide an out-of-the-way place for extension ladders and other cumbersome equipment.

The tower, which is a manufactured product, is a three-section, heavy-duty type with an insulated platform 56x66 in., provided with a 3 ft. collapsible pipe railing. The tower may be raised to a height of 20 ft. by a hand-operated winch. When collapsed, the total height is approximately 10 ft.

Modern Practices in

Lubrication of Electric Railway Equipment

By H. L. Kauffman
Denver, Col.

In an article published in the Oct. 20, 1928, issue, the writer discussed the kinds and grades of lubricants suitable for use on electric railway equipment, hints on the selection of the waste used, how to saturate the waste with oil and modern practice in packing the "down-feed" motor. In this second article information is given on the lubrication of motors of recent design, on modern bearing oiling devices, and causes of bearing lubrication troubles.

IN THE so-called modern type motor there is overcome, from the lubricating viewpoint, all the inherent disadvantages of the "down-feed" motor. In this type of motor a waste well is provided with an opening in the bearing lining through which oil from the waste can reach the bearing. Adjacent to the waste well is an oil well, the two being connected by a hole at the bottom of the partition wall. In late designs the division wall between the wells is slotted throughout its length. This eliminates the possibility of closing the bottom hole with dirt or other foreign matter.

The auxiliary oil well is provided for replenishing the oil supply and for gaging its depth. This well is used when renewing the oil supply, since it conducts the oil to the bottom, from which point the capillarity of the waste is depended upon to raise the oil to the bearing. This arrangement gives a more uniform oil feed and also avoids the introduction of dirt to the bearing surface. The rate of feed is influenced largely by the viscosity of the oil—the higher the viscosity, the lower the feed rate. It is very important that the grade of oil be changed with a change in the seasons, since the viscosity of car oil varies with temperature.

Before opening the cover to pack a bearing, all dirt that might fall into the bearing housing should be removed. Long-fiber all-wool yarn, being of a springy nature even after it is saturated with hot oil, is the most desirable bearing packing now obtainable. The individual pieces of yarn should be at least 12 in. long. Since the oil will climb up straight strands of the packing yarn faster than it will pass through a number of balls or wads of the packing, it is desirable that the packing be in the form of a wick in the housing and the larger the wick, the easier it will be for the oil to reach the shaft.

The pieces of packing required for the wicks for the armature bearings should be made into skein forms of sufficient length to reach from the bottom of the waste chamber up to about 6 in. above the seat for the waste chamber cover. The skeins should then be twisted about one complete turn to hold all of the strands of yarn in place and to produce a more springy wick. As many skeins as possible are packed in the waste chamber, starting at the inner end of the bearing and working outward, and allowing the upper ends of the skeins to hang out over the seat of the cover about 6 in., or enough to hold them in place.

After the wick is formed in the chamber it should be pressed over horizontally, tight against the shaft, by means of a suitable packing iron and held in place by forcing the necessary additional packing behind it. The loose upper ends of the skeins of the wick should then be folded over the other waste and tamped down tightly. Waste chambers of the axle caps should be packed in the same way as those for armature bearings. A pad of the saturated waste, large enough to fill the remainder of the waste chamber, should be placed on top of the wick to catch and hold dirt which might fall in when the bearing housing cover is opened.

When the motors are new particular care should be taken to provide the bearings with plenty of oil, but care should be taken not to flood the motor. After the motors have been "broken in" it is desirable to inspect the bearings for oil depths about every 1,200 to 1,500 miles, but the frequency of inspection depends upon the character of service and general conditions of track and equipment.

On some types of cars it is necessary for the oiler to pack the motors by feeling rather than by sight, due to the bearings being located under and close to the car floor rather than under the floor traps. In such instances, extreme care must be taken to prevent the waste from touching dirty parts of the car under the floor and so introduce dirt into the bearing.

The frame heads are provided with auxiliary oil wells for gaging and for adding oil. The maximum oil level in the bearing pocket should not be above a point $\frac{1}{2}$ in. below the lower edge of the opening in the oil box casting. The minimum depth of oil should not be less than 1 in., depending on the shape and size of the waste pocket. The bearings should not be filled above the maximum depth recommended by the manufacturer or they may be flooded and the oil wasted. The supply of oil should be replenished by the time the minimum depth has been reached or the bearing may run hot. Until the amount of oil required has been determined, the depth should be gaged each day. Measurement can be made

Digitized by Google

by means of a stick or rule placed in the auxiliary oil chambers.

If oil be added to a height above that recommended by the manufacturer, the feed to the bearing is too fast to be economical; further, it may be the cause of short circuits due to the throwing of oil on the commutator. Too low an oil level reduces the rate of feed below that required for satisfactory lubrication. The higher the lift required of the waste, the less oil it will raise. C. Bethel, in an article on packing railway motor bearings, published in the April 19, 1928, issue, states that on a 40-hp. motor, about $2\frac{1}{2}$ grams of oil are fed per hour with a $\frac{1}{2}$-in. lift, this dropping to $1\frac{1}{2}$ grams per hour when the lift is increased to 1 in. and to $\frac{1}{8}$ of a gram per hour with a 3-in. lift. This latter rate is considered a minimum for good lubrication.

On most railway motors of recent design, near the ends of the armature shaft just inside the bearing lining flanges are the thrust collars on which are mounted a series of oil deflectors. The oil that works past the face of the flanges is caught by these deflectors and thrown into grooves in the frame heads, whence it is conducted to drip pockets beneath the bearing. Waste should be kept in the drip pocket to absorb the excess oil. Care should be taken to repack the pocket with dry waste when old waste has become saturated. This is to prevent oil from running out of the pocket possibly entering the motor. Oil should not appear inside the motor, especially on the commutator.

The consumption of oil depends on the mileage made, the condition of the bearings and the severity of the service. The frequency of inspection can be determined best by experience on a particular line, keeping in mind that new equipment should always have careful attention. Most companies find inspection to be necessary at intervals of from ten days to three weeks. A few drops of oil may save many times their cost in babbitt at a critical time. The packing should be turned over occasionally and particular care taken to see that the lining flanges are lubricated properly. Boxes of "down-feed" motors require reoiling more frequently than do those of motors of the modern type, sometimes as often as after each 300 miles of service; in other cases, as frequently as every other day. This period can be extended and better lubrication obtained by the application of the "Rico" type oiler.

The "Rico" type of vacuum oiler was described in ELECTRIC RAILWAY JOURNAL for Oct. 29, 1921, on page 781. With this type, oil is fed to the bearing by means of a feeder wick acting alternately under the influence of capillarity and gravity. The principle employed results in supplying oil to the bearing at rates commensurate with the temperatures at which the bearing operates. This is accomplished automatically by means of the compensator. This feature is important.

The advantages of the "Rico" vacuum oiler can be summed up as follows: (1) The oil supply is contained in a sealed reservoir where no dirt, water or other foreign matter can get to it; (2) the conveyance of oil to the bearing is by the dependable action of gravity; (3) that portion of the waste in contact with the shaft or axle is always well saturated with oil; (4) the lubricating system is automatic, and (5) the lubrication film is always maintained between the bearing surfaces.

In the various types of oil-sealed housings, the oil level in the waste well is kept constant by means of an automatic feed such as that of a "chicken trough." This housing provides a large oil reservoir and keeps out dirt.

With certain types of axle caps and armature housings, where the caps and housings are not worn to the extent requiring replacement, a method has been developed of properly reforming the waste and oil chambers, by the use of a special plastic compound, for conversion to a semi-top feed principle of lubrication, effecting a path for the flow of oil from the oiler directly to the bearing.

The compound consists of a "special" powder which is mixed into a plastic form by a solution of water and flake magnesium chloride. It can be applied readily to the interior of the waste compartments and can be formed by troweling to the proper contours. The mixture requires about 24 hours to harden firmly, after which it is not affected by oil or water, and will not chip or crack. By the use of this method the size of the oil window is reduced greatly, thereby increasing the bearing surface and reducing bearing breakage.

CAUSES OF BEARING LUBRICATION TROUBLES

Proper and efficient bearing lubrication begins with the machining and grooving of the bearings. All edges must be chamfered, both to prevent scraping of the oil film and to permit of oil distribution that otherwise would be impossible. Excessive grooving increases unit pressure and results in rapid wear.

So-called bearing lubrication troubles, upon investigation, are usually found to be due to some mechanical difficulty—assuming the use of the correct grade of a suitable oil and proper saturation of the waste. For example, misalignment in reboring housings or insufficient end play may cause apparent lubrication failures. Or, the trouble may be due to such conditions as the following:

1. Distorted bearings, which are caused by forcing a bearing with too tight a fit into the housing. This condition can be guarded against by being sure that the motor turns over by hand after assembling.
2. Shifting of the bearings in the housing, caused by shearing of dowels or keys. This will prevent the window in the bearing from registering with the window in the waste well, thus shutting off the feed of oil.
3. Loose or stretched housing bolts on the split-type motors. Such a condition is the cause of a poor fit between the bearing and the housing, as a result of which the oil is permitted to escape outside the housing. Misuse of shims gives this same effect.
4. Presence of water in the waste. This may either wash the oil out of the waste or cause waste glazing, or both, depending upon the amount of water present therein.
5. Armature striking pole pieces, due to worn bearings. The life of motor and axle bearings ranges from 50,000 to 250,000 miles. For a maximum length of service it is essential that these bearings receive a sufficient and continuous supply of lubricant; that they be packed and fitted to exclude dirt and water; that they be well and properly machined on all surfaces; and that temperature changes in the bearings due to electric heating be reduced to a minimum. Under ordinary circumstances, motor bearings should be removed when the radial wear is $\frac{1}{16}$ in. to $\frac{3}{32}$ in., or when the air gap is reduced to $\frac{1}{64}$ in.

Axle-bearing wear is apt to be just as harmful as armature bearing wear, since the detrimental effects of excessive clearances are not noticed so quickly in the former as in the latter. Excessive clearances in the axle bearing cause shocks and unnecessary strains in the motor frame and in the axle caps and axle-cap bolts. Also the center to center distance between the axle and the motor shaft is increased. In consequence of this spreading of the gears, the gears and pinions rub instead of roll, and naturally, excessive wear of these parts results. Clearances should be limited to $\frac{1}{8}$ in., though under no conditions should uneven wear of the two axle bearings be tolerated. Close attention to these bearing fits will reduce trouble in service.

Go After a Prize in

Help Your Company to Win Maintenance Trophy to be Awarded at Next A.E.R.A. Convention

Individual Cash Prize of $200 Offered for Best Maintenance Idea of the Year

Twelve Cash Prizes to be Distributed Among Maintenance Men in Various Departments

IN ANSWER to an industry-wide expression of appreciation of the value of ELECTRIC RAILWAY JOURNAL'S maintenance contest conducted in 1927 and extended in 1928, a new series of prizes and a bigger and broader contest have been arranged through the co-operation of the American Electric Railway Association and the committee of judges, for the purpose of stimulating increased recognition of the work of the maintenance man, and raising the standards of maintenance in the local transportation industry.

ALL entries are to be made in the form of short articles describing briefly methods or devices that improve maintenance practice. These will be judged on the idea presented and its adaptability to the maintenance work of local transportation companies. Special writing ability is not necessary. It is the intention to make the prizes available to men engaged in practical maintenance work. The form of presentation will be judged only as to the clearness with which the method or device is described and illustrated, and the extent to which information is given which would be needed by other properties interested in using the idea.

THE opportunities for individual men to win cash prizes include both the capital prize of $200 and the twelve departmental prizes. The departmental prizes will be divided into three groups, as follows: (1) Four prizes of $25 each to be awarded for the best maintenance idea submitted before Jan. 15, 1929, from each of the four departments mentioned, namely, rolling stock and shops, way and structures, electrical and line, buses and garage. (2) Four prizes of $25 each for the best items submitted between Jan. 15, 1929, and April 15, 1929, divided between the four departments as before. (3) Four prizes of $25 each for the best items submitted from April 15, 1929, to July 15, 1929. Announcement of the winners of these departmental prizes will be made

Rules of the Contest—

1 The contest will be judged and the prizes awarded by a committee of the American Electric Railway Engineering Association consisting of A. T. Clark, superintendent of rolling stock and shops United Railways & Electric Company of Baltimore, chairman; Howard H. George, superintendent of research Cleveland Railway; F. McVittie, electrical engineer New York State Railways, Rochester, N. Y.; G. C. Hecker, special engineer American Electric Railway Association; Charles Gordon, editor *Electric Railway Journal*. All decisions of the judges in interpreting the conditions of the contest and in making awards will be final.

2 Any employee or official of an operating electric railway or bus company may compete for the prizes.

3 Each contestant may submit any number of items he desires, each of which will be judged separately. An individual may win several of the prizes.

4 The author does not necessarily have to be the originator of the idea, but it must be adopted and be in use on the property with which he is connected. The idea submitted may have originated on another property or may have been furnished by a manufacturer. No device or method a description of which, to the knowledge of the contestant or the judges, has been previously published will be eligible for this competition.

5 The competition is not limited to those who originated or developed the idea or apparatus described. Any employee, with the approval of the department head concerned, may submit a maintenance practice or device used on his property. More than one article covering the same device or method will not be accepted, however.

6 Where the management of a railway has a practice of requiring approval of articles sent out for publication such approval must accompany the manuscript. If written approval does not accompany the manuscript it will be assumed that such approval is unnecessary.

7 An article may be submitted by several persons or by a department, and need not be written by the person in whose name it is submitted. The prize will be awarded to the individual or department whose name appears on the manuscript, and may be distributed among the winners on any basis they may desire. Should there be a tie for any prize the full amount will be awarded for each of the articles involved in the tie.

8 Articles may describe any maintenance practice or device used by any department of a railway such as the maintenance of rolling stock, buses, shop equipment or methods and equipment for overhead line repairs, power distribution and power generation devices, signal work, track and way maintenance, etc. Unless manuscript submitted is marked to indicate the department to which it is to be credited, the judges will

Digitized by Google

the New Maintenance Contest

READ the conditions of this new and bigger maintenance contest. Any employee or official of an electric railway or bus operating company may compete. No limit on number of items that can be submitted. Don't delay getting started. Winning company, department and individual to be honored at next convention.

READ CAREFULLY

determine the classification under the following divisions: (1) rolling stock and shops; (2) way and structures; (3) electrical and line; (4) buses and garage.

9 Articles submitted for these prizes should be preferably 100 to 200 words in length and should be accompanied by one illustration. Brevity consistent with a proper presentation of necessary information will be given weight in judging articles. In no event should they be longer than 400 words with not more than two illustrations. Articles will be published as promptly as space permits.

10 In rating the various articles the committee will consider the primary value of the method or device as of highest importance. The committee will also consider its practicability, the advantages and economies that are set forth and the clearness and completeness with which the idea is presented.

11 The original manuscript and illustrations will be turned over to the committee of judges for making all awards. These may, however, be published before or after prizes are awarded.

12 All articles must be in the English language and be mailed to the editor of *Electric Railway Journal*, Tenth Avenue and 36th Street, New York City. Items to be eligible for the first group of departmental prizes must bear a postmark not later than midnight, Jan. 15, 1929; for the second group not later than April 15, 1929; for the third group not later than July 15, 1929. All material bearing a postmark not later than midnight, Aug. 17, 1929, will be eligible for individual cash capital prize, company trophy award and departmental certificates of merit.

13 The announcement of winners of departmental prizes will be made in the issue of *Electric Railway Journal* devoted to maintenance and construction (the third issue each month) in the month following the closing date for each group of departmental prizes. Winners of the company trophy, individual capital cash prize and special departmental certificates of merit will be announced, and awards made, at the 1929 annual convention of the American Electric Railway Engineering Association.

14 Any material submitted may be published at any time after its receipt that the editors of *Electric Railway Journal* decide.

15 All articles submitted will become the property of *Electric Railway Journal* and no manuscripts will be returned.

16 A minimum of $5 will be paid for each item published.

[Additional copies of these rules and full details of the contest may be obtained upon application to ELECTRIC RAILWAY JOURNAL or the American Electric Railway Association.]

in the regular maintenance issues of the JOURNAL following each closing date. The annual cash prize of $200 will be awarded at the convention for the best single item submitted in the contest.

AS STATED in the rules, an annual company maintenance trophy will be awarded at the convention to the company making the greatest contribution to the improvement of maintenance practice through participation in this contest. In determining the winning company, the judges will consider: the total number of items submitted by employees or officials of a given company; extent to which each of the four maintenance divisions are represented in the items submitted; number of individual departmental prizes won; relative merit of all material submitted; extent to which the ideas presented are applicable to other properties; value to the industry of the maintenance ideas made available through participation of employees or officials in this contest. In addition, special certificates of merit will be presented to each department making the best individual showing.

GENERAL INSTRUCTIONS

WRITE on one side of the paper only. Have your article typed if possible, but manuscript written long hand will be accepted. Write the article as though you were writing a letter to another maintenance man giving him your experience with a new method or device. "Fine writing" is not necessary. Give merely the facts and a description of the device or method. Include data on cost savings effected whenever possible.

Envelope and manuscript should be marked "Maintenance Competition." Any number of items may be sent in the same envelope. The Maintenance Data Sheet section of this issue contains items of the type desired.

Centralized Control of Emergency Service

By Joe R. Ong,
Transportation Engineer Cincinnati Street Railway, Cincinnati, Ohio

In this article, based on a paper presented at the semi-annual meeting of the Electric Railway Association of Equipment Men, Southern Properties, held recently at Cincinnati, the author describes the latest provisions in Cincinnati to insure prompt and adequate emergency service. Motor trucks have been substituted for the former trolley wrecking cars.—Editor.

CONTROL of the Cincinnati Street Railway emergency service is centralized in a dispatcher's office, manned by three dispatchers, each on an eight-hour shift. By this arrangement the equipment is ready for calls during the full 24-hour period of operation.

At strategic points along the various routes the company keeps uniformed supervisors to direct car movements, report trouble and check running times. The latter are entered in a loose leaf form of supervisor's book so arranged that one double page covers an hourly period. Under the old rule, when the supervisors and car crews reported trouble, they called their own division carhouse, and a wrecking car was sent out if necessary. Under the present plan they call the dispatcher who has control of all emergency service.

The company's telephone system centers in a private branch exchange with trunk lines to the Bell telephone system. The dispatcher is located in a separate office in the transportation department and has one telephone line to the private branch exchange and one direct outside line with an individual number. Anyone calling the dispatcher from a city telephone may reach him on this direct wire, or, if the line is busy, he may be reached through the company's switchboard.

The dispatcher has continuously before him maps, schedules and other data relating to operation. When he receives a trouble call he determines what emergency service is required, from what point it shall be dispatched, and what supervisory officials are to be notified. All of his outgoing calls to carhouses and other points are made through the company's switchboard, and are handled by the regular operator in the same way as any other local call. With but few exceptions, the telephones in the boxes near the supervisors' stations are connected with the private branch exchange and are equipped with relays so that when the operator calls the exchange, the relay closes a five-light circuit on the trolley circuit as a signal to the supervisor that he is wanted.

There are nine operating divisions on the Cincinnati Street Railway system with a carhouse in each division. At five of these, selected for territorial location, motor trucks are stationed for emergency use. Four of these trucks are Fords with ½-ton open bodies, and one is a Dodge-Graham with a 1-ton open body. At a sixth location, just outside the congested area, there is another Dodge-Graham 1-ton truck for emergency service in the downtown section.

These emergency trucks are equipped with necessary tools, such as jacks, chains, blocking, etc. They are found much more effective than the wrecking car of former days as the trucks can more quickly reach the exact scene of the trouble.

The trucks at the carhouses are manned by regular carhouse employees capable of making emergency repairs on the road. This service is available 24 hours per day. At the sixth location near the congested area there is no carhouse. Here, each of the two men assigned to this truck is on a nine-hour shift to cover the eighteen-hour period during which operations are conducted. They have no other duties than to respond to calls.

In addition to these trucks there are two line trouble trucks at the headquarters of the line department near the central section of the city. A third line trouble truck is at one of the carhouses for service to the outlying districts. All line trouble trucks are manned by linemen and only those at headquarters can be used for other work between calls. Whenever a line crew or emergency crew clears trouble after a call, a member of the crew goes to the nearest convenient phone and reports to the dispatcher. Often this saves time in dispatching relief to another point.

The emergency truck drawn up beside a street car permits the change of trolley poles to be effected with a minimum loss of time

Through an arrangement with the fire department, there is a fire alarm indicator in the company's telephone switchboard room. When it indicates an alarm, the telephone operator calls the fire department, finds out the location of the fire and reports it to the dispatcher who, in turn, notifies supervisors and divisions likely to be affected. If the fire call is in the central business area, the dispatcher calls out both the line trouble truck and the emergency truck. The dispatcher's office serves as a clearing house for information for all of the officials of the company who may have occasion to find out what is going on at any particular time.

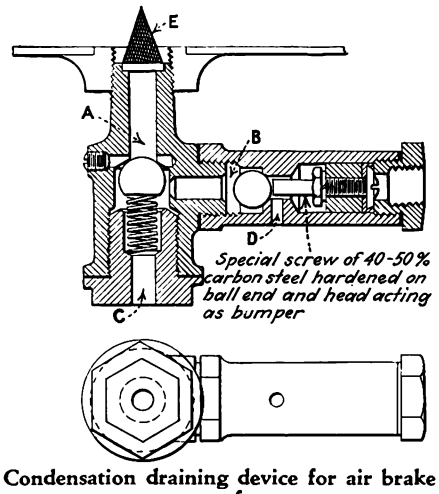
Automatic Drain Valve for Air Reservoirs*

By Harvey L. Bullock

General Foreman of Electrical Equipment
New York Central Railroad
White Plains, N. Y.

FOR ridding the air brake system of cars from water, a new valve mechanism has been installed on some of the cars of the New York Central Railroad. This mechanism operates automatically to remove the condensed water from the air reservoir and piping at all times. When the equipment is laid up and the compressor is cut off the valve opens at any predetermined pressure and closes when the compressor cuts in again. The mechanism also ejects the water accumulation in spurts as the compressor is cut in and out in regular service. This is done through the air compressor governor connected to operate the mechanism.



Condensation draining device for air brake system of cars

In the accompanying drawing there are two valves—a low pressure, and a high pressure valve. The low pressure valve is marked *A* and the high pressure valve, *B*. In the low pressure chamber a spring actuated ball valve opens when the pressure drops below 8 to 10 lb. Any water in the reservoir or piping then drains out of the opening *C*. In the high pressure chamber a single ball valve operates on two seats and is actuated back and forth by the intermittent pressure of the air compressor governor. At each movement of the ball any water accumulated in the system is ejected through the opening marked *D*. A strainer marked *E* keeps dirt out of the mechanism that might tend to cause trouble. All parts are of metal and are indestructible.

This mechanism has been tested out in service on multiple-unit cars for several years, and has been subjected to service in freezing temperatures, and found satisfactory. In addition to using the automatic drain valve for draining reservoirs of car equipment, it can be used on supply lines, air-operated switches, etc.

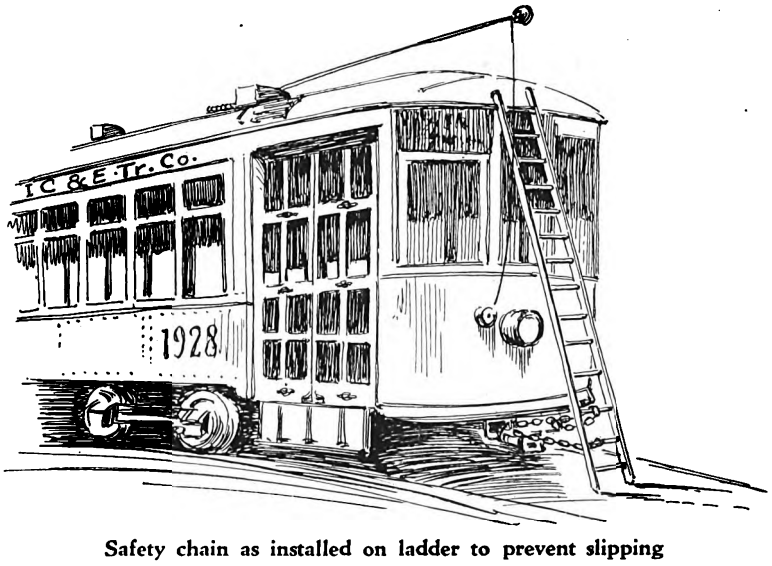
ROLLING STOCK—MISCELLANEOUS—45

Safety Chain on Ladder*

By F. J. Foote

Superintendent of Motive Power and Equipment Indiana, Columbus & Eastern Traction Company, Springfield, Ohio

SAFETY chains are installed on ladders in the shops of the Indiana, Columbus & Eastern Traction Company in the manner shown in the accompanying sketch. Before adopting the chain method, spikes were tried on the ladder feet, also cork-lined pads, etc., but the chain was found to be the safest and most satisfactory. A light, strong steel chain about 10 ft. long is attached to the rung of the ladder at one end. The end of the chain is provided with a strong snap. The ladder is placed in the position desired and then the chain is thrown around a truss rod, truck frame or any convenient part. The slack is taken out and the end snapped into the nearest link of the chain.



Safety chain as installed on ladder to prevent slipping

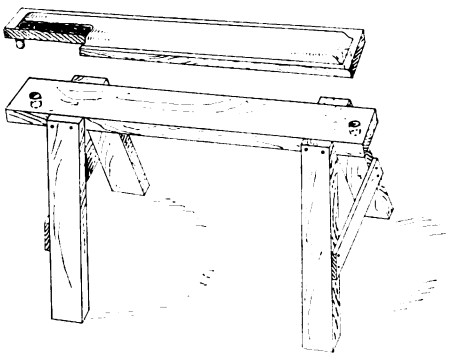
ROLLING STOCK—MISCELLANEOUS—44

Removable Trestle Pads*

By Farrell Tipton
Electrician San Diego Electric Railway
San Diego, Cal.

IN EVERY electric railway carpenter shop there is frequent need for padded trestles for supporting finished work such as street car and bus doors and windows. There is also much other work that is most conveniently supported on trestles but which is of such a character that pads are not needed. To provide a removable type of pad for standard trestles so that it is unnecessary to tie up a trestle for finished work only, the San Diego Electric Railway, San Diego, Cal., uses a comparatively simple method.



Construction of trestle as used by the San Diego Electric Railway with removable padded face

Standard sizes of trestles are used throughout the various departments of the shop, and where padding is necessary a board is cut of a length and width identical with the trestle face. One side of this board is padded and the opposite side is provided with two $\frac{3}{4}$-in. dowel pins. These are located 2 in. from either end, as shown in the accompanying illustration. The faces of the trestles are then drilled to receive the dowel pins. The padded board can be placed in position or be removed quickly by this arrangement.

Brake Adjustment Troubles Eliminated

BRILL 27-G trucks in use on the New York & Queens County Railway, Long Island City, N. Y., originally had turnbuckle brakeshoe adjusting rods. These caused considerable trouble in service as the threads became worn, permitting excessive motion between rod and turnbuckle. This wear finally sheared the turnbuckle cotterpins and caused a loss of the braking power. Troubles of this nature have been eliminated by a new design of adjusting mechanism adopted recently. It is shown in Fig. 1. This mechanism consists of two $2\frac{1}{2}$x$\frac{3}{4}$-in. flat bars riveted together and held $1\frac{1}{16}$ in. apart by pipe spacers. A number of $1\frac{1}{16}$-in. holes provide for shoe adjustment. The dead lever rack was also redesigned with a larger number of $\frac{1}{16}$-in adjusting holes to permit of obtaining a still finer shoe adjustment. This design is shown in Fig. 2.

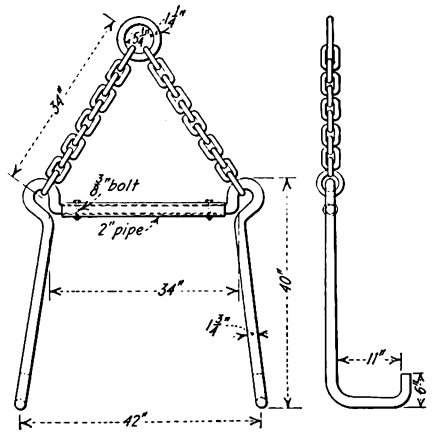
Lifting Hook for Three Operations

WHEN a shop tool can be designed to serve many purposes the number and cost of the tools required and the cost of their maintenance can be reduced. This fact is considered of prime importance in the shop of the Staten Island Rapid Transit Railway, Staten Island, N. Y. It has been determined that the cost of the time involved in constantly changing the lifting tools to perform certain operations amounts to an appreciable sum at the end of a year. For this reason the hooks shown in the accompanying sketch were developed to accomplish three important operations. Motors are lifted from the truck, wheels are handled and trucks are raised.

The hooks are made from 1¾-in. round steel and are 42 in. between centers at the bottom and 34 in. at the top. The top corners are formed with the eye for supporting a ¾-in. lifting chain made of 1¼x2¼-in. links. These chains are fastened to a ring made of 1¼-in. material which has an inside diameter of 5¼ in. To provide additional strength the top horizontal rod is placed inside a 2-in. pipe, the ends of which are in contact with the eye metal. It is held in place by two ½-in. through bolts. The over-all height of this pair of hooks is 40 in. Each hook is 6 in. high and has an opening of 11 in. They have accomplished the purpose for which they were designed and not a single failure or accident of any kind has occurred in the company's shop since they have been placed in service.



This lifting hook can be used for several operations

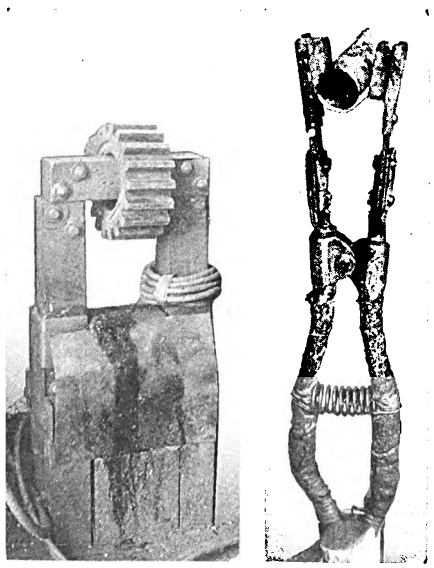
Pinions and Lugs Heated Electrically

FORMER methods of heating pinions for making a shrink fit on armature shafts have been displaced in the Chicago, Milwaukee, St. Paul & Pacific Railroad shops at Deer Lodge, Mont., by the induction heater illustrated. The heater consists of a closed core transformer with 160 turns of magnet wire on the primary consuming approximately 1,500 watts at 110 volts. The core is of laminated iron 4 in. square and has a removable section on which the gear is placed. When the primary of the transformer is energized with a gear in place as shown, the gear constitutes a short-circuited secondary winding of one turn, in which a heavy current circulates and produces rapid heating.

For a 45-lb. pinion about 25 minutes is required to bring the temperature to 312 deg., the proper temperature for the shrink fit. This method of heating is uniform and eliminates scale and other objectionable features of a forge or other methods of heating.

Another use for the transformer is for heating lugs with the carbon tipped holder, shown in one of the accompanying pictures. The current which is passed through the lug is obtained from the small coil shown on the right-hand leg of the transformer core. This coil contains twelve turns of No. 5 wire and produces 100 to 130 amp. at about eight volts. The lug heater has been found very handy in reaching into a motor to solder or unsolder a lug.



At left—A gear placed on the transformer becomes a short-circuited secondary and heats quickly

At right—Leads from a stepdown secondary coil facilitate the heating and soldering of lugs

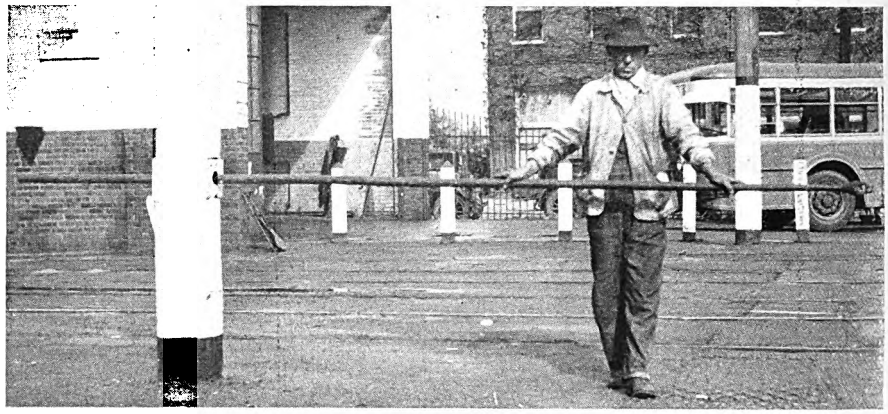
Simple Method of Straightening Trolley Poles*

By C. B. Hall

Chief Clerk Mechanical Department Virginia Electric & Power Company, Norfolk, Va.

STRAIGHTENING trolley poles is a comparatively simple task for the mechanical department of the Virginia Electric & Power Company at Norfolk, Va. One of the poles supporting overhead wires in the carhouse yards was drilled at a point approximately 3 ft. from the ground, the hole being large enough to accommodate any size of trolley pole. To withstand the pressures when poles are being straightened the hole was reinforced by bolting a ½x6x8-in. iron plate at each end. Greatest pressure for straightening necessarily comes at the ends of the hole and the iron plates take care of this.



Straightening a trolley pole by inserting it in a hole and bearing downward

The accompanying illustration shows a workman using the hole for straightening a pole. A 12-ft. 4-in. trolley pole has been inserted through the opening and the mechanic is exerting only a slight down pressure to restore it to its proper shape. The device is a big saver of time and labor.

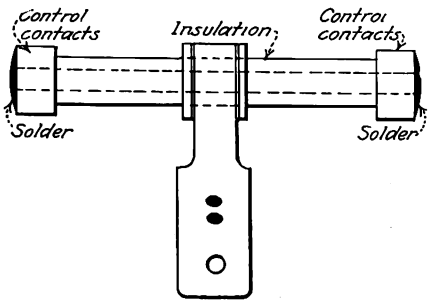
Soldered Breaker Contacts Reduce Trouble*

By H. J. Beadle

Engineer of Equipment Dallas Railway and Terminal Company, Dallas, Tex.

RECENTLY trouble was experienced on one of the cars of the Dallas Railway & Terminal Company, Dallas, Tex., when the line breaker refused to function. Careful investigation showed that the small round control contacts on the control handle, as shown in the accompanying diagram, were loose on the stem. The loosening was caused by the sliding and rolling action while closing. After the round contacts began rolling about the stem which holds them, the latter was worn very badly in a short time, and then poor contact developed. To overcome the difficulty the contacts were soldered to the stem. Since that time it has become standard practice to solder all contacts to the main stem, and the trouble has not occurred since.



Soldered contacts overcome line breaker trouble

The LEADERSHIP *that* CONTINUES *to show the way*

THERE are definite and valuable advantages to the electric railway operator in the fact that DeVilbiss leadership served at the introduction of spray painting and spray finishing into every industry and group now using this new and better method of applying protective and decorative coatings, and that DeVilbiss today offers the most recent new economies and efficiencies in all such operations.

Finish on transportation units, buildings and equipment is now a vital part of the sales operation, as well as a necessary maintenance measure. Good-looking equipment gets the business. And DeVilbiss meets this twofold need with specialized spray-finishing outfits that you can use with the assurance of satisfactory results and economies never before obtainable.

The present comprehensive magnitude of the DeVilbiss organization, its vast manufacturing capacity, its unequalled engineering experience and its firmly established responsibility to the purchaser of its products are all the results of a continuous progression of DeVilbiss leadership in service to all users of spray-painting and spray-finishing equipment.

The individual painting or finishing problems of each class of users are specifically studied and served by specialized DeVilbiss installations, methods and devices. The best practice known today in the field in which you operate, and the most efficient and modern equipment for your particular use, are DeVilbiss methods and equipment. This experience and knowledge will save you money and time and earn the good-will of your customer. Use it freely. We will esteem it a privilege to put it at your disposal.

Four Ways You Profit!

Strength and durability—trolley, span, lighting wires, lighting units, traffic signals, all supported by one pole. Elreco Tubular Steel Poles hold them even under loads of sleet and ice and the shock of hurricanes. Many Elreco Poles have been in service more than 35 years.

Accessibility—Elreco Poles are easy to inspect and maintain.

Beauty—trim, they enhance the looks of any thoroughfare.

Economy—several companies using one pole reduces, to each, the cost of installation and maintenance.

Write for details of why hundreds of railways and cities have adopted Elreco Tubular Steel Poles

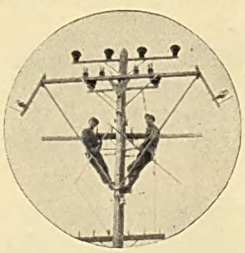
A new technique in live line maintenance and repairs



MASTER Live Line maintenance equipment makes possible a new and safer method of handling live line work. On pin type construction, the advantages of this new method permit maintenance and repairs to be conducted on live lines under normal conditions and deliver several unusual advantages in the handling of this class of work.

Lowered costs, far fewer outages, speed and convenience of handling routine maintenance work, plus considerably greater safety are the direct advantages from the use of Master live line equipment. These advantages are so outstanding and the methods of operation with Master live line equipment so simple and convenient that operating officials who have used this equipment now regard live line work as a matter of routine and would not be induced to go back to the former methods of operation.

Master equipment is fully described and the methods of handling live line work fully illustrated in Bulletin No. 3, copies of which will be sent to interested operating officials upon request.

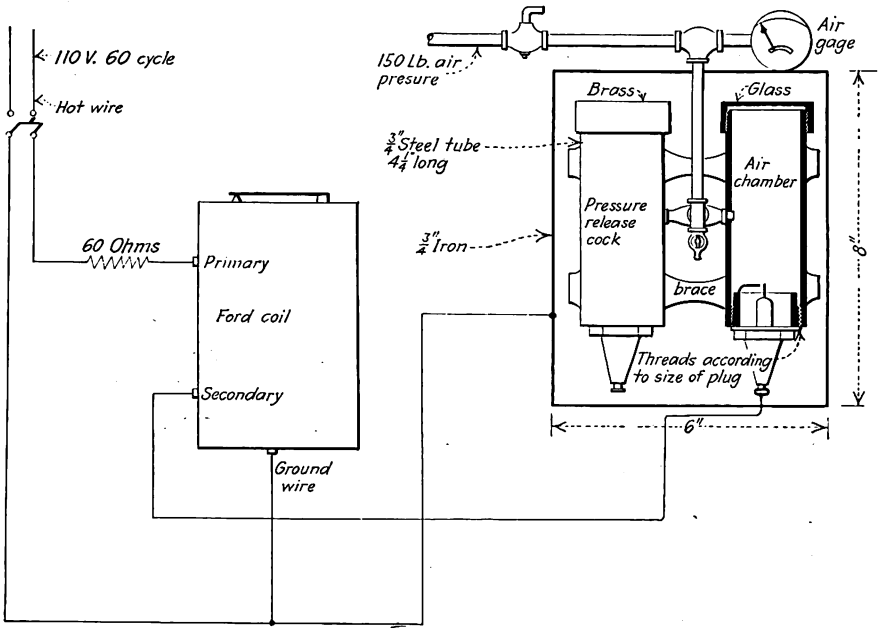
Testing Spark Plugs Under Pressure

By J. A. Doddridge
Garage Foreman San Diego Electric Railway, San Diego, Cal.

MANY spark plugs that will give a suitable spark under ordinary atmospheric conditions will not spark at all when submitted to a pressure corresponding to what they obtain in actual operation. To test spark plugs under pressure and to determine the pressure at which the spark begins to weaken, the San Diego Electric Railway has a special testing equipment in its garage. This consists of two cylinders, each having a glass top and provided with threads at the bottom into which can be screwed various types of spark plugs. These cylinders are connected to the shop air line which has a pressure of 150 lb. The electrical circuit of the spark plug is through an ordinary Ford coil. This has a switch so that when it is closed the coil will vibrate and the spark plug will function.

A shut-off valve is provided in the air line so that air can be admitted and the pressure built up in steps in the air chambers. It is found that some plugs will not operate at 50 lb. and others will fire at 150 lb. pressure. An air gage in the line shows the pressure at which the plugs break down. This tester has proved a great help in locating faults.



Type of spark plug tester used by the San Diego Electric Railway

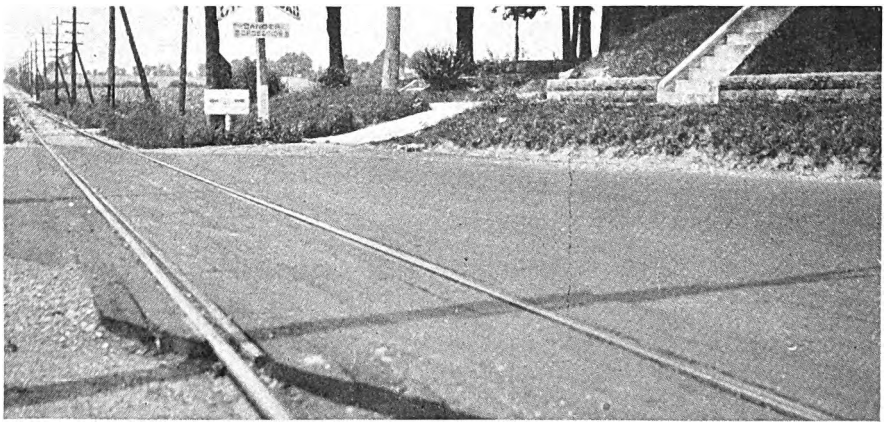
TRACK AND WAY DEPARTMENT—37

Prolonging the Life of Plank Crossings*

By D. H. Walker
Chief Engineer, Terre Haute, Indianapolis & Eastern Traction Company Indianapolis, Ind.

IN AN effort to prolong the life of plank crossings now in place, and yet keep the surface smooth for vehicular traffic, the track forces of the Terre Haute, Indianapolis & Eastern Traction Company have found that good results can be obtained cheaply by the use of cut back asphalt.

The plank is given a thin coating of this asphalt and then sprinkled lightly with grit or sand. The resulting carpet forms a smoother surface and helps prevent rotting of the plank. The cost is but a few cents per yard. The accompanying illustration shows a crossing which was treated more than a year ago. Nothing has been done since. Although this crossing is used by about 2,000 vehicles daily, it is very smooth and shows no appreciable signs of wear.



This plank crossing has been preserved by a thin coating of asphalt

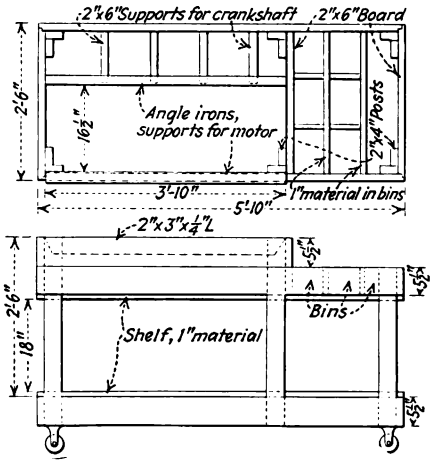
BUSES AND TRUCKS—19

Overhaul Rack for Bus Engines*

By C. B. Lain
Engineer Mechanical Department
San Antonio Public Service Company
San Antonio, Tex.

RACKS for storing parts of bus engines which are to be overhauled are used in the shops of the San Antonio Public Service Company. Each of the three in use consists of an upper and lower deck supported by six vertical members, and equipped with casters to make it portable. The upper deck is divided into compartments, one being arranged with cross supports to receive the crankshaft, one with parallel angle bars to support the engine block in a vertical position and seven compartments or bins to receive smaller engine parts such as carburetors, bolts, nuts, valves, etc. The lower deck has no divisions, and on it are stored the larger parts such as manifolds, crankcase pans, engine heads, generators, starters, etc.



Overhaul rack for buses used by the San Antonio Public Service Company

These racks cost approximately $30 each to construct. By keeping the parts together in an orderly manner a saving of three to six man-hours, or an average of $3.09 per engine, is made. Since no parts are lost and it is unnecessary to search through a mass of parts to find a particular one this saving will more than pay for the rack in one cycle of overhaul.

In addition to the advantages mentioned the use of the rack keeps all parts together so that the shop presents a more orderly appearance. The racks may be pushed to the most convenient place in the shop for doing the work, thus relieving crowding.

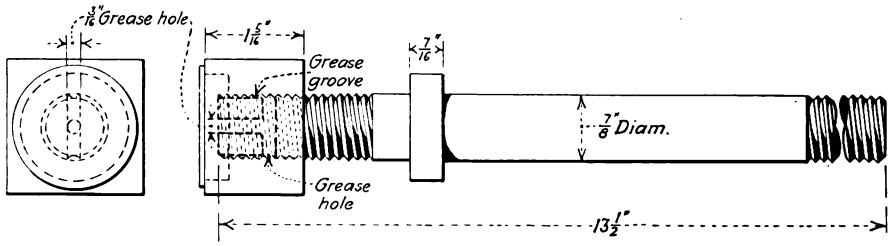
Grease Cup Nut Prevents Rust*

By H. Erdis
Switchman
Toronto Transportation Commission
Toronto, Canada

IN MANY cases of broken switch tongues or switch tongue connector rods on the lines of the Toronto Transportation Commission, considerable time has been required to disconnect the rod from the switch tongue lug, due to formation of rust. To overcome this trouble a nut is now used with a grease chamber.

The accompanying sketch shows the construction of the nut. It is made large enough so that one side will be held from turning by the bottom of the tongue. The top is drilled out and a cap is welded on. This forms a recess which is filled with grease before the installation and when the connecting rod is screwed into the locked nut a certain amount of grease is forced around the thread through $\frac{3}{16}$-in. holes provided in the rod. With this arrangement the rod and nut remain coated with a film of grease or oil which effectively prevents the formation of rust. This in turn insures quick replacement.



Grease cup nut as used on switch box connecting rods

Association Activities

Popularize Transportation Through Better Maintenance

Reducing railway and bus equipment maintenance costs without impairing service, securing good will and solving motor bus problems are principal subjects at Iowa convention

DISCUSSION of both railway and bus maintenance problems was entered into heartily by the hundred or more delegates who attended the eleventh annual convention of the Iowa Electric Railway Association, Operators' Section, held at Cedar Rapids on Nov. 8 and 9. Although maintenance was the principal subject, other interesting papers were presented, including papers on urban transportation by public carriers, the motor bus in commercial transportation, efforts and results of manufacturers in popularizing electric railway and bus transportation, and the Iowa motor carrier law and its administration.

In his paper on the cleaning, painting and lubrication of cars and coaches, F. V. Skelley, superintendent of equipment Des Moines City Railway, called attention to the fact that while everyone admires a clean, well-ventilated street car, to gain this result requires a trained organization that knows how and when to sweep and clean. Let us take, for example, he said, a carbarn that houses 91 cars, 40 of which are regulars and the remainder trippers or extras. Here six men are classified as sweepers on an eight-hour basis and put in 75 per cent of their time at this work. As one man can sweep eighteen to twenty cars in eight hours, the average cost for this work would be about 20 cents per car. As cars are inspected on the 1,200-mile basis, said Mr. Skelley, we are sure of a well-cleaned car every six days. This weekly cleaning requires 45 minutes and costs 75 cents per car.

Buses and coaches are not washed on a mileage basis. They are swept, dusted and mopped on the inside every time they come in, and are washed on the outside only when they need it. This is not unusual, as some buses are on lines where it is very easy to keep them clean, while others such as specials require a thorough cleaning every time they come in.

The shop schedule calls for the complete overhauling and painting of two cars a week, added Mr. Skelley. City cars are painted every 24 months, and interurban cars and coaches when money is available. He gave the approximate cost for painting as follows: city cars, $125; interurban cars, $200; locomotives, $100; city buses, $76, and interurban coaches, $140. This work is handled in a paint room with a capacity for two cars and a working force of seven men, including a foreman.

Transferring his attention to the subject of lubrication, Mr. Skelley said that the armature bearings are the most vital parts of the truck to be lubricated, and with waste and oil well types of housings require tests every 1,200 miles. "We use no less than five grades of oils and greases on our buses," continued Mr. Skelley, "and the time and thought given to this subject have been worth while. During the past six months several oils have been tested and the results have varied from $1.04 to $2.83 per 1,000 bus-miles."

The main factors in the proper lubrication of a bus engine were summarized by Mr. Skelley as follows: (1) replenish oil frequently and fill crankcase to the level recommended by the manufacturers; (2) use only oil of the highest quality and proper viscosity; (3) keep the engine in as perfect operating condition as possible, and (4) test the oil drained from the crankcase for reclaiming.

Maintaining the Electrical Equipment

Shop practices in connection with the maintenance and operation of electrical equipment was the subject of an exhaustive paper by Ben Dawson, electrician Cedar Rapids & Marion City Railway. The proper maintenance of every piece of electrical equipment for street cars was discussed in detail, particular attention being paid to the controllers and motors.

In speaking of controllers, Mr. Dawson gave the following advice: The care of controllers should be given to one person. If there are too many controllers to look after, prorate the work to more men. Internal cleanliness is essential. Keep out all dust, excess grease and oil. See that all fingers are set firmly and properly. Remove all worn-out fingers. File all burned segments and finger tips. Replace the bad ones. Most segments can be reversed; this prolongs the wearing life of the segments. Look carefully for free contacts on reverse drums. These fingers are easily caught and may be shoved back in case of reversal. Replace all pierced arc deflector plates at once. The main cylinder should be thoroughly cleaned at every car inspection. It is good practice to shellac the control drum twice a year. Examine carefully all wiring contacts at inspection time. Remedying a poor contact upon discovery may save a good deal of time and money for the company later on. Examine carefully the cut-out switches. See that they work freely and fit the switch jaws snugly in both the in and out positions. Use a good grade of petrolatum for the finger tips and segments. A good rule is to use a little at a time, but to use it often. Oil drum bearings once a month for good results. Eternal vigilance is the price of safety in the care of controllers, for no auxiliary on a street car is used more or abused more.

Electric railway motors should be capable of operating at scheduled speed under all loads, in all kinds of weather and for long hours of service, emphasized Mr. Dawson. They should be built for the most severe service conditions with long life and low upkeep characteristics. The most essential requisite in caring for railway motors is to lubricate them properly. No matter whether split, solid or roller bearings are used, proper and constant care is needed in the matter of lubrication.

James Thompson, superintendent of overhead construction Tri-City Railway, Davenport, outlined the procedure followed on his property in maintaining 94 miles of overhead with a crew of only two linemen, a groundman, a driver and a foreman. He called particular attention to the service record of a type of hanger designed by his own line department in 1906 and still in excellent condition.

Variable Load Brake Equipment

"Introduction by electric railways of light-weight, relatively large capacity cars has brought braking problems not heretofore encountered" said J. S. Y. Fralich, district manager Westinghouse Air Brake Company, Chicago, Ill. This he attributed to the fact that single-truck cars frequently carry loads equal to the weight of the cars themselves and that many double-truck cars weighing approximately 30,000 lb. empty, weigh from 45,000 to 50,000 lb. when loaded with passengers. A wide variation between empty and loaded weights makes it impossible to provide suitable braking facilities under variable conditions of loading with the ordinary type of straight air brake equipment.

The speaker cited average brake design standards on electric railway straight air brake installations to show that under reservoir pressures varying from 50 to 65 lb. per square inch, braking ratios on empty, modern light-weight cars vary from 85 to 100 per cent with minimum reservoir pressure,

Digitized by Google

and from 110 to 130 per cent with maximum reservoir pressure. Even with these braking ratios which the speaker considered higher than necessary for empty car conditions, in some cases traffic distances are excessive when such a car is fully loaded.

It was because of this unsatisfactory braking that the Westinghouse Company developed its variable load brake, according to Mr. Fralich. This device, he explained, constitutes an automatically adjusted seat valve that is set for the brake pressure desired to meet the change in weight brought about by the variation from empty to full car loads. The speaker called attention to the importance of the equipment from the standpoint of safe operation and increased schedule speed.

Popularizing Transportation

Summarizing the efforts of manufacturers to popularize electric railway and bus transportation, W. A. Clough, engineer General Electric Company, emphasized that transportation to be acceptable to people must be swift, safe and sure, and must embody comfort, convenience and class. Engineers have made it possible, continued Mr. Clough, to make schedules that were considered impossible a few years ago. They have learned to make materials do more work, have reduced weight with added strength, have made it possible to accelerate and retard street cars at rates hitherto considered impractical and have learned how to make the losses of the equipment do useful work in heating the cars.

To make transportation acceptable is still the problem of the engineer, but the artist and the salesman have to work alongside. The whims of human beings have to be considered, and as far back as classic times these whims have been recognized as fickle. Comfort, convenience and class have been introduced to the people by the bus and the public has declared in no uncertain terms that it will continue to demand these things. This change in the demands with regard to transportation has entirely upset the old ideas and methods used by transportation companies for many years.

It is safe to say, continued Mr. Clough, that no one really knows what kind of equipment, what kind of cars, what kind of buses they want to use. The entire industry is torn between an automotive street car and a street car bus, between rail and rubber. With all this confusion, with all the changing ideas of the operator and the public with regard to what they need, it seems of the greatest importance to the entire industry that transportation be made intelligible to the people. And people must be brought to realize that present-day conditions call for community rights rather than individual rights; that the thoroughfares and rights-of-way which are paid for by the people collectively, should be reserved and preserved for the use of the people collectively; that private conveyances should not have the right to monopolize the street, and that vehicles for public transportation should at all times have the right of way.

Specifically then, the task is to establish in the minds of the American people correct fundamental facts concerning transportation. Teach them what it means in time and energy to accelerate rapidly and brake rapidly, and to have the right-of-way unimpeded so that intermediate stops and slow-downs are not necessary, urged Mr. Clough, and it will not be difficult to secure ordinances and regulations that will favor community transportation.

Concluding, Mr. Clough asked the railway operators what they in turn had done to popularize their electric railway and bus transportation services. "Have you visualized your product as transportation or only as a street car ride? Have you used the tools available to you to the best advantage? Have you undertaken any research to find the underlying reasons for the change in the demands of the people? Have you educated your people to think correctly about this business of yours?" These things you must do, he declared, adding that railway men and manufacturers need a better understanding of their mutual problems to the end that the public may be better served and the transportation industry be made more prosperous.

Problems of the Motor Bus

L. A. Rossman of the Northland Transportation Company, St. Paul, Minn., in his paper on "The Motor Bus and Commercial Transportation," told of the development of his company and its relation with the parent company, the Great Northern Railway. As one of the leading problems of the motor bus industry Mr. Rossman mentioned that of income. Too many motor bus lines pay well in summer and operate at a loss in other months, he stated. The returns of the good season are eaten up by the months of losing operations. To overcome this situation, a motor bus enterprise must have diversification. Some of the service must be rendered to sections in which there is winter traffic.

Economy in motor bus operations is essential but a low operating cost is not necessarily a measure of success, according to Mr. Rossman. Some motor bus operators should spend more than they do. It is a question as to whether or not an expenditure of an additional cent for developing business, another penny for better equipment and another penny for a better man behind the wheel, might not bring larger patronage and larger net earnings. The great progress in the motor bus industry in the coming few years will not be so much in the lowered costs as in fair costs, larger incomes and greater net returns. The speaker also discussed at some length the problems of safety, taxation and regulation.

Securing Good Will of the Public

In his paper on urban transportation by public carriers, F. S. Welty, assistant general manager Omaha & Council Bluffs Street Railway, called attention to the need for developing good employee and public relations. Good will, said Mr. Welty, is not acquired merely for the asking. It requires courtesy, good service, good equipment, judicious advertising and a genuine desire to serve the public faithfully and well. Courtesy, he continued, goes into the matter of salesmanship and is the meat of selling better transportation better. It should be differentiated from politeness in that the latter quality is an acquired polish while courtesy comes from the heart. Good service cannot be given, added Mr. Welty, with unattractive, obsolete cars, operated over broken-down tracks by dissatisfied and discourteous employees. People today expect more and are in a position to demand it because there are other means of transportation available. Mr. Welty described in some detail the program of good-will development which has been followed in Omaha and cited the variety of employee contacts with the public which has been encouraged with the advent of the new management.

In the common carrier and utility field a regulated monopoly is better for the public than are numerous competitors serving the public, declared C. M.

Digitized by Google

Richardson, commissioner Iowa Railroad Commission, in discussing the Iowa motor carrier law and its administration. It is my belief, he continued, that the commission should at the disposition of motor carrier applications determine whether the existing transportation is adequate to the needs of the public, whether there is public demand for additional service, whether the applicant is able to engage in the undertaking which he proposes and whether the highways will permit of continued and reliable operation. The commission also should analyze the probable effect the establishment of other service would have from that which already exists. Mr. Richardson spoke at some length of the present Iowa motor carrier law and pointed out that it was enacted to bring about a comprehensive and coordinated scheme of transportation.

The meetings on two days of the convention were presided over by E. J. Anderson, general superintendent Tri-City Railway, Davenport. The delegates were welcomed to Cedar Rapids by Mayor J. F. Rall, who noted with pride that the delegates were assembling in the first Iowa city to voluntarily effect an upward adjustment of street car fares. Maurice Welsh, chairman of the executive committee, replied to the Mayor on behalf of the association. The annual banquet was the entertainment feature of Thursday evening, while on Friday afternoon the delegates were taken on a sightseeing tour of Cedar Rapids. Next year's convention will be held in Waterloo with Frank McDonald of the Waterloo, Cedar Falls & Northern Railway as chairman.

Group Luncheon Meetings at Virginia Convention

FOR the first time the Public Utilities Association of Virginia will hold group luncheon meetings at its annual convention, which opens for a two-day session at the Hotel Roanoke, Roanoke, Va., on Nov. 21. These groups will meet at 1 p.m. on the first day, and will be divided as follows: Electric Light, Power and Telephone; Transportation; and Gas and Water. A leader will be in charge of each group to conduct the discussion of the subjects.

According to a statement made by A. B. Tunis, secretary of the association, about 350 delegates, men and women, are expected to attend the convention.

Several prominent public utility representatives from over the state and from Eastern cities have been secured to address the delegates. The addresses will include "The Relation Between Public Utilities and the Public," by William Meade Fletcher of the State Corporation Commission; "Some Problems of Urban Transportation," by Tom P. Walker, vice-president Virginia Electric & Power Company; "The State Conservation and Development Commission," by William E. Carson, chairman of the commission; "Investment Banking Views on the Public Utilities Business," by Harry R. Hayes, vice-president of Stone & Webster and Blodget, Inc., New York City, and "Fundamental Rate Base," by N. M. Argabrite, vice-president of the American Gas & Electric Company, New York City.

Recognizing the large activities of women folks in the industry, the association plans to organize a women's committee or auxiliary at the convention, according to an announcement made by the president, J. W. Hancock. With this in mind, Mr. Hancock said, a part of the program has been set aside for the formation of the auxiliary. Prominent women will address the group.

Anticipating the presence of about 100 women at the convention, several special features have been arranged by the committee in charge of the convention for their benefit and entertainment. Apart from sightseeing trips about Roanoke, the visiting women are scheduled to hold a luncheon at the Hotel Roanoke on Nov. 22, after which they will go to the Roanoke Country Club for a bridge tournament and a buffet supper dance.

American Association News

Special Reports Being Prepared

Following is a list of special reports that are being prepared by the bureau of information and service of the American Electric Railway Association and that will be available to member companies upon request:

Bulletin No. 221—CHARTS ILLUSTRATING RECENT TRENDS IN ELECTRIC RAILWAY OPERATIONS AND ELECTRIC RAILWAY BUS OPERATIONS.—A reproduction of a series of charts prepared for exhibition at the 1928 convention, showing trends of traffic, revenues and expenses, fares and wages, automobile registrations and their effect on passenger traffic, growth of electric railway bus operations, methods of handling depreciation of buses, distribution of bus operating expenses and electric railway operating expenses, comparison of operating costs in 1927 and 1926, and other charts designed to show the outstanding trends in the transportation industry. The charts are accompanied by a running story explaining how they were compared and their significance.

Bulletin No. 222—ANALYSIS OF BUS OPERATIONS IN CALIFORNIA—This bulletin gives a comparison of the reports of independent bus companies of the California Railroad Commission for the years 1922 to 1926 inclusive. For each of the five years covered there is given for each company a complete income statement, balance sheet and statistics on the number of buses operated, car-miles run, passengers carried, etc. By means of this bulletin, therefore, one is able to trace over a period covering more than the ordinary life of a bus the record of investment and operating costs and their effects on bus operating profits.

Bulletin No. 223—TRAFFIC PROMOTION ON ELECTRIC RAILWAYS—This is a compendium of material collected from various sources, describing methods adopted and experiments tried out by electric railways in their efforts to build up increased traffic on their lines. In each case the experiment is described in some detail, together with the condition under which it was tried and a brief summary of results obtained. It is a revision of the material contained in Bulletin No. 37, issued Aug. 1, 1925, and includes all of the outstanding methods and innovations attempted since that time.

Bulletin No. 224—ELECTRIC RAILWAYS OPERATING MOTOR BUS LINES.—A new, revised list of electric railways now operating motor buses covering approximately 365 companies and showing for each company the date bus service started, the number of buses operated, miles of route, type of service, type and seating capacity of buses used, fares, and transfer privileges in effect.

Bulletin No. 225—COST OF LIVING STUDIES.

Bulletin No. 226—EFFECT OF FARE CHANGES ON REVENUES AND RIDING HABIT.—This is a revision of Bulletin No. 116, issued Dec. 1, 1926, bringing up to date the information contained in that bulletin and in addition including data on several more companies. The compilation contains a detailed record of the revenue passengers and passenger revenue month by month before and after the date of a fare change, and covers companies having had two or more fare changes. The average daily number of passengers carried and the average daily passenger revenue under each rate of fare is compared, and there is also shown a comparison of the percentage of revenue passengers using transfers and reduced rate tickets under each rate of fare.

Bulletin No. 227—TREND OF ELECTRIC RAILWAY OPERATIONS—A comparative record of the revenues, expenses, taxes, car-miles, revenue passengers, and operating ratio of a group of 127 companies for the first six months of 1925 compared with the first six months of 1924 and monthly thereafter, up through June, 1928. The group is also subdivided into separate similar statements for each of the geographical divisions of the country.

Bulletin No. 228—DEPRECIATION DECISIONS.—This compilation brings down to date the information given in Bulletin No. 158, issued Sept. 1, 1927, containing extracts from decisions of public utility commissions fixing the rate of depreciation to be allowed on electric railway properties. It is preceded by a tabulation arranged by states of the rates allowed by commissions, showing the name of the commission and the depreciation rate fixed, the basis of the rate, whether on valuation or earnings, and the reference to the decision. It is followed by abstracts from the decisions, giving the commission's discussions and comments on the subject.

Bulletin No. 229—COST OF LIVING STUDIES.

In addition to the above bulletins the following supplements have been prepared, bringing the information they cover down to date:

Supplements Nos. 12 and 13 to Bulletins Nos. 163 and 164—ELECTRIC RAILWAY FARES.

Supplements Nos. 1 and 2 to Bulletin No. 218—WAGES OF TRAINMEN.

Supplements Nos. 1 and 2 to Bulletin No. 219—WAGES OF BUS MEN.

News of the Industry

Fare Increase in Minneapolis Formally Sought

Application was made by the Minneapolis Street Railway, Minneapolis, Minn., before the Minnesota Railroad & Warehouse Commission on Nov. 15 for an increase in the rate of fare, which is now 8 cents cash and six tokens for 40 cents. The company regards this the only recourse in the light of the decrease in patronage and the necessity of maintaining service at the present high standard. In other words, it is not possible to cut operating expenses in the ratio of the decrease in revenue and at the same time give good service.

The St. Paul City Railway, which has the same rate of fare as Minneapolis, applied on Sept. 8, 1927, for an increase, but this application was never acted upon. That application was made only after voters at St. Paul had twice at special elections refused to indorse an amendment to enable the City Council to give the railway relief in the case of some onerous taxes and charges which originated in horse-car days. The first defeat was in an election on Nov. 2, 1926, and the second Sept. 6, 1927, and the application for increase was made two days later.

Horace Lowry, president of the Twin City Rapid Transit Company, the holding corporation for the two cities' lines, accompanied the application with a statement which follows in part:

The local situation reflects the national condition. We are carrying 25,000,000 a year fewer passengers this year than we carried in 1925. The increase granted us on Jan. 1, 1926, did not anticipate this unprecedented falling off in passengers. Consequently, at no time since this date has the company earned a fair return on the value of the property.

Let it be understood that a fair return does not mean a return on the outstanding stocks and bonds of the company. A reasonable return on the fair value of the property never has been nor cannot be a guarantee of any earnings on stocks and bonds. It is a return on the established value of the property.

The existing rate of fare—8 cents cash or six tokens for 40 cents—is lower by 1 cent than the average fare being charged in the United States despite the fact that it is generally recognized that the Twin City railway service and equipment are as good or better than any other.

The average increase in the general price level of this country between 1913 and 1928 is approximately 60 per cent. In other words, it takes $1.60 today to buy goods costing but $1 in 1913. Applying this percentage of increase to street railway fares we find that an 8-cent fare would be the equivalent of a 5-cent fare before the war, but practically all of our patrons are paying only 6⅔ cents.

St. Paul and Minneapolis are growing, but this growth and the street car travel incident to it does not begin to offset the decrease in patronage. From 1920 to 1927 the population of the Twin Cities increased 10 per cent. During this same period revenue passengers decreased 25 per cent and passenger automobiles registered increased 102 per cent. And this 25 per cent passenger decrease occurred in the face of a determined and sustained advertising and promotional effort on the part of the company to increase street car riding.

If good street railway service is to be maintained it is not possible for the company to cut operating expenses in proportion to the decrease in revenues. Some service must be furnished which is not self-supporting. Therefore, the company's only recourse at this time is to ask for an increase in the street car fare.

Post Graduate Courses in Louisville

The Louisville Railway, Louisville, Ky., recently held a second session of its post-graduate course for trainmen at which 85 attended. Examinations were taken by 82 men; 75 passed with a grade of better than 60 per cent, eighteen of whom made an average of more than 90 per cent. Of this number twenty were trainmen who had been in service three months and, of course, under the educational system it was compulsory for these men to attend. Sixty-five men attended the school of their own volition.

Pressing Problems in Seattle

Municipal railway debt not to be foisted on city. Avery plans retrenchment. Taxi franchise up again

SEATTLE'S remaining railway debt of approximately $11,000,000 will continue purely as a utility obligation against the railway system itself, according to a decision handed down Nov. 5 by the Circuit Court of Appeals in San Francisco. The decision was given in the suit of the Puget Sound Power & Light Company, in which the company sought to compel the city to resort to the general tax fund for maintenance of the railway. Under the ruling all efforts have failed to make the debt a general obligation upon the city because part of the street car revenues are used for the payment of salaries and current expenses.

Arthur Schramn, assistant corporation counsel, who assisted his chief T. J. L. Kennedy in arguing the case during a session of the Circuit Court in Seattle on Sept. 13, declared that the decision "contraverts the contention of the Puget Sound company that it holds a pledge in gross upon the Seattle railway revenues for the bonds which the city gave at the time the system was purchased." This contention was presented in a suit brought in January, 1927.

As a result of the recent joint conference between Mayor Frank Edwards, G. B. Avery, superintendent of city utilities, and members of the utility committee of the City Council called to discuss railway problems following the recent death of D. W. Henderson, former superintendent of railways, it was agreed to give Superintendent Avery free rein in his plan for reorganization of the railway department. Temporarily, at least, Superintendent Avery will be in charge.

Mr. Avery plans to create four divisions in the railway department, under which Roy E. Furse, present acting general superintendent, will become superintendent of the transportation division; A. E. Pierce, superintendent of the track maintenance division; A. H. Campbell, superintendent of the shops division, and Allen B. Hiatt, superintendent of the accounting division. Abolition of approximately 25 positions in the railway department is contemplated including a cut of one-half in the force of fourteen inspectors and a heavy reduction in the track maintenance division. Further reduction of operating costs aggregating $300,000 annually will result from a rerouting of car lines which he proposes.

Seattle voters will probably be asked to decide whether the city's deeply involved railway system should be leased to private operators, even if Mayor Frank Edwards and City Council members favor the leasing plan proposed by Karl H. Kaye. Mr. Kaye, member and representative of a group of investors, has offered to lease the railway system for 50 years, on a basis of 25 per cent of its net earnings, and to turn it back to the city debt free at the end of that time. He also seeks an exclusive franchise for the operation of taxicab and for-hire car service in Seattle for the same period, in order that the entire transportation system of the city may be harmonized. The Kaye proposal is to be considered at a general discussion of the railway problems by the Council and Mayor Edwards shortly. Pending a decision on the Kaye proposals, all other negotiations for an exclusive franchise on the taxicab service of the city, notably the application of Sam T. Taggart, which has been on file with the city for some time, will be suspended. Moritz Thomsen, widely known Seattle capitalist and business man, has announced that he is prepared

Digitized by Google

to give his financial as well as moral support to the proposed Taggart taxicab ordinance. Mr. Thomsen declares he is convinced that it provides a solution for some of the city's pressing transportation problems. The proposed ordinance would grant a 40-year franchise exclusively to Mr. Taggart, who operates the Red Top cab fleet, and return to the city 2 per cent of the gross receipts. It provides for the purchase by Taggart of all existing taxicab businesses.

Aid of the organized employees of the municipal railway system in bringing about a general financial and physical survey for the railway department to determine its status and needs before any drastic policy is carried out, is suggested by Councilman Otto Case. He has asked the Street Car Men's Union to join with him in asking for a general survey of the entire situation.

Prizes Awarded in Illinois Station Beauty Contest

The Illinois Terminal Railroad System, electrified lines, has announced the winners of its station beautification contest conducted during the past summer season. In order to secure wide distribution of the prizes, the contest was divided into divisions, cash awards being made to the stations in each division making the best appearance by the planting, cultivation and care of flowers and grass, and also to the stations showing the best utilization of possibilities. There was also a grand prize for the station from all divisions which in the opinion of the judges made the best rating both in appearance and best utilization. This high award went to the station force at Gillespie, Ill., composed of Mr. and Mrs. E. Blauer, H. Johnson and R. D. Hays.

Ohio Roads Seek Fare Increases

The Lake Shore Electric Railway and the Lorain Street Railroad have filed a request with the Ohio Public Utilities Commission for an increase of 5 cents in the fare between Lorain and Elyria. The present fare is 15 cents. Some time ago the commission granted the companies the right to raise the city fare in Lorain from 5 to 8 cents.

Windsor Radial Line Does Well

Fares on the street railway system at Windsor, Ontario, cannot be reduced at the present time but if present revenues continue a reduction will be made at "some future time," W. R. Robertson, superintendent of Ontario hydro radial lines, told members of a joint transportation committee recently. A year or so, he said, may be sufficient to wipe out deficits. A motion made by Clyde Curry, Alderman, calling for the sale of nine tickets for 50 cents went over to another meeting to be held in two weeks, after members study a financial statement, copies of which are to be sent by Mr. Robertson to each Municipal Council.

New Street Car Loading Plan in Vancouver

Use of automatic traffic signals has necessitated a change of policy in the handling of street car loading by the British Columbia Electric Railway Company, Vancouver, B. C. Loading berths for two cars have been established on all four sides of points where these traffic signals have been erected.

Some loading zones or platforms were used only as two-car loading berths during the rush hours, prior to the erection of traffic signals. At other hours during the day a car which had stopped in the second berth would stop again in the first berth to pick up any passengers standing there. Under the plan now in effect cars which stop in the second berth during all the hours of the day will not stop again at the first berth if the automatic signals will permit them to follow the first car around the bend or across intersections.

Omaha Grant Accepted

Railway ready for rerouting. Negotiations for sale of bridge between Omaha and Council Bluffs to cities to be resumed

THE Omaha & Council Bluffs Street Railway, Omaha, Neb., has accepted the 30-year franchise granted by a three to one vote of the people of Omaha on Nov. 6. Within a short time committees representing civic organizations and the Council will take up with the management a rerouting of the lines in the belief that by this means revenues of the company can be materially increased, and the people served better. The present layout of the lines is not satisfactory to the company or to others, as many recent developments have tended to negative the value of routes established years ago.

Mayor Dahlman will also appoint a committee of officials and citizens to negotiate with the company for the sale to the two counties in which Omaha and Council Bluffs are located of the bridge across the Missouri River, over which street car and public traffic are carried. The voters in Council Bluffs approved a $400,000 bond issue to build that town's part of a new free bridge, but the proposal was beaten in Omaha, by 4,000 majority, where an $800,000 issue was submitted.

President Shannahan of the railway is credited by the local newspapers with having won the people over to confidence in the company and a desire to assist it out of financial difficulties. He says the company will enter into negotiations for the sale of the bridge, but points out that the proposal to charge the company for using the structure after the public becomes the owner is unfair. If it is really to be a free bridge the railway should operate over it without any tax as any rental would force the company to impose that rental on passengers in terms of fare and that this would result in the impossible situation of street railway passengers paying tolls while auto and bus passengers and others would ride free. The railway now pays the bridge company $60,000 a year rental.

Refinancing plans for the railway may be held in abeyance pending the settlement of this issue since the price and the other details of transfer of the bridge are likely to have a direct effect on net income. Under the agreement for their extension, bonds of the company still have two years to run before they mature.

Case of Kansas City Company Before Council

At a meeting of the board of directors of the Kansas City Public Service Company, Kansas City, Mo., on Nov. 13, a report on the railway situation in Kansas City was approved to go before the City Council, probably on Nov. 19. The report is not in the nature of an application for a 10-cent fare or any other specified rate, but it states the facts in the situation as seen by the company and shows that since the city wants certain improvements made and the company would like to increase the wages of its employees, these things can perhaps be accomplished with an advance in fare, with 10 cents cash apparently the most logical rate.

To acquaint the public with the facts the board of directors authorized that the report be published in installments in the local press as advertisements.

One-Man Cars on Four Lines in Oakland

Authority has been granted by the California Railroad Commission to the Key System Transit Company to operate one-man street cars on four lines, all in the city of Oakland, Alameda County.

Safety Rewarded in Milwaukee

Bronze medals denoting completion of six consecutive months of safe railway operation were presented on Nov. 9, to 850 trainmen of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. The presentations, made by division superintendents at the various car stations, marked the first milestone in a safety contest entered by the company's 1,700 motormen and conductors on April 1, 1928.

Silver medals will be awarded trainmen after twelve consecutive months of safe operation, and gold medals after two years. Trainmen who have chargeable accidents at any period of the contest must start anew to earn the gold award. Every accident, no matter how trivial, is recorded and only those in which trainmen are clearly not to blame are eliminated in determining the safety awards.

The medal is in the form of a small shield, to be worn on the lapel. A gold watch chain is attached.

Sympathy from Seattle Car Men

More than 2,000 old friends and workers of David W. Henderson, superintendent of the Seattle Municipal Railway, Seattle, Wash., who died on Oct. 27 in that city, attended his funeral on Oct. 30. Hundreds of motormen and conductors were present in the uniform which Mr. Henderson wore for years when he was employed by the Puget Sound Railway & Power Company, and from whose ranks he worked up to the head of the city's railways. Among the hundreds of floral pieces was a gigantic emblem, a replica of car No. 312, which he drove over Queen Anne Hill for many years. This was made of yellow chrysanthemums, with the windows blocked in white and the borders in dark flowers. It was a tribute from the men with whom he worked.

Mayor Wants Subway to Northeast Philadelphia

Mayor Mackey of Philadelphia declares that transit is the crux of the northeast situation and he wants to see transit lines pushed rapidly into the open spaces to the county line. He has in mind a $30,000,000 subway along Bensalem Avenue from Broad Street to the city limits.

For the 80 per Cent Who Use Philadelphia Street Cars

PRESIDENT SENTER of the Philadelphia Rapid Transit Company, Philadelphia, Pa., has addressed a letter to all members of the P.R.T. family, requesting their closest co-operation in this effort to speed up the general movement of traffic. The entire organization will be keyed up for a united effort along this line. Operators of cabs and buses under Philadelphia Rapid Transit direction have been instructed to keep off the street car tracks unless it is absolutely necessary to drive there. The company says a similar appreciation by motorists and drivers of commercial vehicles of the need for keeping the car tracks open will aid tremendously. It is the hope of the company that the forthcoming advertising campaign in behalf of the 80 per cent will bring about an intelligent appreciation of mutual problems and will help to loosen the strangling grip of traffic congestion on the city streets.

Mr. Senter's letter follows in part:

P.R.T. has planned another campaign in the interest of the car-riders of Philadelphia, who constitute 80 per cent of the total users of our city streets.

Extreme traffic congestion in the central business district is already seriously hampering us in our task of transporting 2,500,000 riders daily, and when this congestions is increased by the Christmas shopping season efficient operation and close adherence to schedules will be still more difficult. There is no doubt that this year will bring the heaviest street traffic we have ever experienced.

Almost unlimited parking privileges, loading and unloading of trucks and numerous grade crossing interruptions are some of the things which daily cause so much delay to the car rider. Such snow storms as are experienced this year will, of course, greatly add to these difficulties.

Churches, civic bodies, business and improvement associations, and fleet truck owners throughout the city will be asked to co-operate with us in speeding up transit service. Coal dealers will be asked to help by not making deliveries during the morning and evening rush hour periods. Motorbus and taxicab operators will do their share by keeping clear of car tracks. Our supervisory forces will offer all the relief possible in cases of blockades and irregular car spacing. The aid of P.R.T. and M.B.S.C. stockholders will also be sought.

Advertising will appear in the daily newspapers, and folders and signs in cars, buses and cabs will be used to refresh the minds of the public on the causes of these delays, which are beyond our control.

Management is thus doing everything in its power to win the co-operation of the public. Every employee-owner, especially those manning our cars, buses and cabs, should do his part in rendering to the 80 per cent transportation as efficient as traffic conditions will permit.

Numerous opportunities will be afforded during these trying periods of operation to display courtesy, patience and salesmanship. P.R.T. employees, however, have never failed to rise to the occasion, and these are the things which I know you will give to the fullest extent. The willingness to do just that little bit more has made P.R.T.'s position in the transportation world such an enviable one. Be worthy of it this winter.

An announcement in the New Orleans dailies about the discerning patrons who ride the street cars

W. A. Draper in Aviation

Walter A. Draper, president of the Cincinnati Street Railway, Cincinnati, Ohio, is one of the principal backers of the new Cincinnati Aviation Industry, incorporated on Nov. 12 at Columbus. It will manufacture airplanes, airplane motors and equipment in a factory to be built adjoining the Cincinnati Municipal airport. It has acquired the manufacturing rights, designs and patents of the Dietz Experimental Laboratories, Dayton, Ohio. It is anticipated that Mr. Draper will be named president.

Interest in Community Fund in St. Louis

The Community Fund drive in St. Louis, Mo., will be in charge of a special committee so far as the activities of the St. Louis Public Service Company is concerned in this enterprise. Department heads will act as chairmen of subcommittees to be selected by them from the employees of their departments. Samuel Greenland, general manager, recently stressed the point that the collection was for a good cause, and as a matter of pride it was incumbent on the railway to make a creditable showing. The campaign dates have not yet been announced.

Agreement Reached on Stupendous Newark Undertaking

After more than a year of negotiation the city of Newark reached agreements on Nov. 15 with the Pennsylvania Railroad and the Public Service Co-ordinated Transport on contracts providing for construction of a new railroad station, additional trackage, extension of the Hudson Tubes to Parkhurst Street in the south end of Newark, the building of a rapid transit trolley line in the bed of the abandoned Morris Canal, with a terminal beneath the new railroad station, and the opening of new streets and boulevards to hook up with the station plans. The whole project will cost nearly $25,000,000, with the railroad spending more than $10,000,000 and the city the balance.

Under the original plans worked out by railroad and trolley officials before Mayor Raymond died, Oct. 7, the city was to bear the cost of constructing the trolley terminal under the railroad station. At a conference on Nov. 15 at the Newark City Hall the railroad agreed to pay this part of the expense, providing the city gave up its effort to have the railroad pay for a new street on the east side of the new station.

President McCarter of Public Service is said to have agreed to pay the city a yearly rental of $125,000 for use of the canal bed trolley line in addition to the franchise tax of 5 per cent on gross receipts which it now pays. Originally the trolley company wanted to pay 4¼ per cent of the cost of construction with the franchise taxes deducted.

The city of Newark plans to construct a 100-ft. street west of the railroad for more than a mile and to build and rearrange other streets in the vicin-

Digitized by Google

ity of the station and the new tube extension station.

The project will take more than five years to complete. When it is finished Manhattan Transfer on the Kearny Meadows will be abandoned and transfers of passengers from electric to steam trains and vice versa will be made at Market Street, Newark, the site of the new station.

P.R.T. Wants New Lease

The temporary lease of the Broad Street subway to the Philadelphia Rapid Transit Company, Philadelphia, Pa., expires on Nov. 30. Operation is resulting in a loss to the company of $10,000 a day. The P.R.T. feels it impossible to continue operation after Nov. 30 on the present terms. That is the substance of the formal notification sent by the company on Nov. 9 to Mayor Mackey.

One of the questions which President Senter of the company propounds is "How should this burden properly be borne?" He says in part:

The city has constructed a $100,000,000 subway which has added many millions of dollars a year to the cost of supplying transit to the people of Philadelphia without providing the revenue necessary to support it. That revenue can come only from the taxpayer by way of the city treasury, from the car rider by way of fares collected, or from both.

P.R.T. car riders now support the transit system in its entirety, aside from the Broad Street subway, out of fares collected. They can do more only if called upon to pay an increased fare. But why should the car rider be asked to pay the cost of a facility from which the greatest financial benefit goes to the real estate owners, the business interests and the city?

Mitten Management, faced with a similar situation in 1920, fought against a departure from the basic 5-cent fare, because we recognized the loss in riding which would follow a flat increase in fare. When the increase was forced upon us, P.R.T. lost 100,000,000 passengers the following year, almost three times as many as the $100,000,000 Broad Street subway will carry in 1929. For all these reasons Mitten Management will be found fighting on the side of the car rider.

As the Philadelphia *Ledger* sees it, this notice by the railway creates an acute situation. That paper says:

Somehow the city must solve a problem that includes the question of the city tax rate as well as the future usefulness of this $100,000,000 city investment. Philadelphia cannot afford and will not narrow the present wide gap between subway earnings and operating costs.

Taxpayers are now reaping the benefits of the city's high-speed transit facilities in the form of increased property values. The city is getting an increased tax revenue from the rise in these values. Car riders are now carrying as large a burden in carfares as they should.

In the face of this situation, the Mayor and Council should quit the "policy of drift" that has been followed and adopt a fair, business-like attitude looking to a just apportionment of the first costs of an improvement that will ultimately be of great value to the whole community. It stands now as a burden, for whose support no preparations have been made.

Survey Under Way in Pittsburgh

Allied Boards of Trade submit questionnaire to Pittsburgh Railways intended to be the basis for future study there. Query covers bus operation.

THE Allied Boards of Trade at Pittsburgh, Pa., has made public a list of questions put to A. W. Robertson, president of the Philadelphia Company and the Pittsburgh Railways, as part of the plan of a committee designated to make inquiries into the transportation situation in the city of Pittsburgh and its environs. An offer was made to arrange a joint meeting. The allied bodies, through a sub-committee of the transportation committee, queried the railway executive on many points of company financing, salaries and operating methods. The board said:

We are submitting the list of inquiries for the purpose of developing the situation. It is to be understood that the appointment of this committee and its resulting inquiry are prompted by a volume and number of complaints which have reached our body with reference to the quality and quantity of service furnished by the transportation company, together with disquieting rumors of operating losses. The list of queries follows:

1. *Ownership*—What is the stock and bond structure upon which interest or dividends are being now paid, or on which interest or dividends are accruing as a liability?

2. *Comparison* — Compare the present stock and bond structure with that existing as of Jan. 1, 1926.

3. *Byllesby Engineering & Management Corporation*—

A. What is the relation between the Pittsburgh Railways, the Philadelphia Company, and the Byllesby Engineering & Management Corporation?

B. What contracts, if any, exist between the Pittsburgh Railways, the Philadelphia Company, and the Byllesby Engineering & Management Corporation?

C. If no contracts, written or oral, exist, then what business relations are maintained between the Pittsburgh Railways, the Philadelphia Company, and the Byllesby Engineering & Management Corporation?

D. Does the Byllesby Engineering & Management Corporation manage the operation of the Pittsburgh Railways directly or indirectly?

E. If so, what remuneration or consideration is paid for this service?

F. Does the Byllesby Engineering & Management Corporation receive a percentage out of the income of the Pittsburgh Railways?

4. *Maintenance, new construction and improvements*—

A. What, if any, contracts exist between the Pittsburgh Railways, the Philadelphia Company, and the Byllesby Engineering & Management Corporation, covering maintenance, new construction and improvements? What emolument or consideration is received by the Byllesby Engineering & Management Corporation on sums expended for such work?

B. Is this consideration or emolument always for actual service rendered, and does the company receive full value for the sums so expended?

C. Is such payment a charge against the income resulting from the operations of the railways system?

D. Does the Byllesby Engineering & Management Corporation use its own capital, or are these improvements or additions made by the use of the capital or income of the Pittsburgh Railways?

5. *Finance*—

A. What, if any, contracts or arrangements exist between the Pittsburgh Railways, the Philadelphia Company and the Byllesby Engineering & Management Corporation in reference to financing the Pittsburgh Railways or any of its subordinate companies?

B. Does your company make financing cost a capital charge or is it paid out of the operating income?

C. Is this consideration or emolument always for actual service rendered and does the company receive full value for the sums so expended?

D. Is such payment a charge against the income resulting from operations of the railway system?

6. *Inter-company relations*—

A. What proportion of the income of the Pittsburgh Railways or its subsidiaries is absorbed by the other companies or corporations controlled by the Philadelphia Company or other companies controlled by or controlling the Philadelphia Company?

B. What contract, if any, now exists for the furnishing of power to the Pittsburgh Railways? How does this compare with the contract in force in 1926?

7. *Compare your total inventory as of today (nearest period) with your total inventory as of January 1, 1926.*

8. A. *What is the basis of the statements credited to your Mr. Fitzgerald asserting a loss of $60,000 a month in the operations of the railway?*

B. How does this compare with your operating results during the year 1926?

9. A. *Is your company willing to furnish the public a list of the salaries paid to its salaried officers? If so, does it?*

B. Compare these with salaries paid as of Jan. 1, 1926.

10. *Street car facilities*—

A. Does your company contend that the present railway facilities are adequate for public needs?

B. Does your company contend that they cannot afford to furnish better facilities to the public at the present 8⅓-cent rate of fare?

11. *One-man cars*—

A. Do your records show by increase of accidents that the hazard to the public is greater through operation of one-man cars?

B. Does the use of one-man cars result in slower traffic and delays to the public?

C. Do you not operate the one-man lines with substantially the same number of cars formerly manned by two men?

12. *Buses*—

A. Does your company contend that the 25-cent fare is necessary to operate buses at a profit?

B. Is not your fare very much in excess of that charged in other cities of like topography? If so, why?

C. What amount of percentage of the income from bus lines is consumed in salaries, other than wages paid to operatives?

D. Has the Pittsburgh Motor Coach Company been operating at a profit since Jan. 1, 1928?

Digitized by Google

$30,000,000 Northern New Jersey Line

The North Jersey Transit Commission, on Nov. 15 decided to ask the New Jersey Legislature to authorize the immediate financing of a $30,000,000 rapid transit line between Newark and Paterson. This is the first step in the commission's program to link nine counties of northern New Jersey in a comprehensive system of rapid transit.

No suggestions as to the method of financing the plan will be made in the official request, but the commission has already opened negotiations with officials of the Erie Railroad for the use of the Erie tracks between Newark and Paterson and hopes to reach a satisfactory agreement before the Legislature convenes in January.

The proposed line, according to members of the commission, would save from twenty minutes to an hour in the traveling time between the two towns. By bus and trolley the time now required for the trip are 55 and 91 minutes respectively, as against the 36-minute schedule which the commission plans to operate.

The Newark-Paterson line is the first "leg" in the system planned by the commission to link the country seats and principal towns of Bergen, Hudson, Passaic, Essex, Union, Monmouth, Middlesex, Somerset and Morris Counties with rapid transit service, augmented by bus and trolley lines into the less thickly populated districts.

The commission, was created by the Legislature six years ago to study plans for the development of transit facilities in the northern end of the State. In February, 1927, it recommended the establishment of a transit loop, or belt line, linking New York and New Jersey. Some time later the problem of interstate transit was turned over to the Suburban Transit Engineering Board and the North Jersey Transit Commission was left free to formulate a transit plan for Northern New Jersey.

Changes on *Electrical World* Staff

W. H. Onken, Jr., has been appointed senior editor of *Electrical World*, a McGraw-Hill paper. He has been connected with the organization since 1900. In 1906 he became managing editor of the publication and was made editor in 1916. His wide acquaintance throughout the electric light and power industry and his intimate familiarity with its problems have been important factors in bringing *Electrical World* into its present authoritative position in the electrical field. The position of senior editor will enable him to devote his editorial talents and knowledge of industry with greater freedom to special industry problems and to other editorial duties in the McGraw-Hill Publishing Company.

L. W. W. Morrow, managing editor, has been appointed editor with full authority and responsibility for the editorial conduct of the paper. Mr. Morrow joined the staff in 1922 as associate editor, coming directly from the electrical engineering department of Yale University. Prior to that experience, he was director of the school of electrical engineering in the University of Oklahoma. He was appointed managing editor of *Electrical World* in 1925.

Allen M. Perry, recently associate editor, becomes managing editor. In his fifteen years' service with the paper, Mr. Perry has been field man, junior and senior engineering editor, Western editor and associate editor at the home office.

Brooklyn Company Sells Interborough Holdngs

As *Barron's* sees it the change in ownership by which the Brooklyn-Manhattan Transit Corporation divested itself of its holdings of Interborough stock is likely to have important bearing on New York traction mergers. Procedure by a strong group of stockholders would probably have been different from that which present officials of the company will probably take. In the one case profit on securities held would have been the main consideration; on the other hand, maintenance of present official positions is likely to dictate policy. In other words, if Interborough wins its 7-cent fare case the officials will probably not enter negotiations with the city with a view to merger of that property with the new city system and B.-M.T. properties. A 7-cent fare will probably prevent an I.R.T. receivership, and with that achieved the officials are not likely to risk loss of control in a merger.

To *Barron's* it seems likely that, Chairman Dahl, Chairman Wiggin of finance committee and their associates, said to have working control of Interborough Rapid Transit at such time as the Interborough Rapid Transit stock was released from voting trust agreement (last year), parted with their holdings also. It was brought out in hearings before Transit Commission last year that Gerhard M. Dahl held 6,600 voting trust certificates of Interborough Rapid Transit and that Waubesa Corporation, in which Mr. Dahl was interested, also held 6,600 certificates. A. H. Wiggin held 3,000 certificates and Thomas L. Chadbourne, associate of Mr. Dahl, had 9,800. Says the source quoted:

> The B.-M. T. is an able management and there is no reason why it might not get the contract for operating the new subway system if B.-M. T. rapid transit lines are merged with the new system being built by the city. Again, as part consideration for favorable action by B.-M. T. in reaching agreement as to merging its subway and elevated lines with the city, the latter might be induced to look with favor on a merger of the company's surface lines with Brooklyn City Railroad, or at least award it the franchise for bus routes in Brooklyn. If Brooklyn City and B.-M. T. surface lines were merged and proper 5-cent fare zone laid out, surface lines in Brooklyn could be put on a paying basis.

Bigger and Better Records in Chicago

THE increase in the number of riders on Chicago's street railways, which amounted to 26,322,000 rides for the first nine months this year compared with a similar period in 1927, has attracted attention as offering further concrete and tangible evidence indicative of the importance of the street car in the populous centers.

Each month this year has set a new record in total rides for that month, although there were slight decreases in revenue passengers in April and June compared with corresponding months in 1927, according to figures furnished by the Chicago Surface Lines.

The increase for the nine months, according to these statistics, is more than twice as many rides as the total annual increase of 1927 over 1926. This demand has been met by schedule revisions and additions to the rolling stock of 27 city lines.

German Visitor Says Railway Is Backbone of Transportation

Motion pictures of traffic congestion in leading American cities are to be used by officials of German electric railways as a warning of what may occur in Germany if the growing traffic problem there is not met at once.

Dr. Phillip Kremer, assistant to the general manager of the Berlin street railways, sailed on the *Columbus* recently for Germany with a set of films which he had made in several cities within six weeks.

Traffic congestion is increasing and the number of automobiles is expected to double within the next year in Germany, Dr. Kremer said on sailing. He added that he would recommend that street cars be continued as the backbone of Berlin's transportation system. The system now uses 3,500 cars and 600 buses, and he said he believed this proportion was about correct. He said:

> We are going to use the street car as the major means of transportation for the dual reasons that we can carry passengers cheaper by car than by bus and that the car causes less street congestion. I came to the United States with an open mind on this question, and I am returning firmly convinced that the American method of using the bus as a supplement service only is the proper one.

A Tramway Jubilee

The Nottingham Tramways, Nottingham, England, completed a half century of existence on Sept. 17. It was in 1878 that the first horse cars were put into service in the town. They were single-deckers, and each seated 24 passengers. The Town Council took over the undertaking in 1898 and now there are 200 electric cars, 76 buses and twelve trackless trolleys.

Foreign News

Berlin Consolidates All Transportation Lines

The City Council of Berlin has voted to consolidate under one management the rapid transit surface car and bus lines in the city.

For some years, the city has owned the surface lines outright, as well as a large controlling interest in both the rapid transit system and the Berlin General Omnibus Company, which controls all bus operation in Berlin. Separate corporate management was retained for these three undertakings, but their general policies were determined by a central commission. Now there will be actual consolidation, which it is expected will bring about a number of economies. In 1926 the division of traffic between the different agencies was approximately 813,000,000 passengers carried by the surface lines, 113,000,000 by the bus lines and 163,000,000 by the rapid transit lines. It is expected the consolidation will go into effect on Jan. 1, 1929.

Poland Extends Railways

Extensions of electric tramways and light railways in Poland are being made. The Société des Tramways Electriques du Bassin de Dombrowa, a Belgian firm, has recently completed and opened to traffic a number of lines in the Dombrowa district. The Société des Chemins de Fer Electriques Suburbains, another Belgian firm, has completed a line 20 miles in length in the Warsaw district.

Ninth Report from Melbourne

For the year ended June 30, 1928, the total revenue of the Melbourne & Metropolitan Tramways Board, Melbourne, Australia, was £2,494,100 compared with £2,505,855 for the previous year. Receipts from passenger fares totaled £2,476,644 compared with £2,487,573 for the preceding year. This decrease and failure to obtain the "normal" increase in revenue which usually follows the yearly increase in the population of the metropolis is attributable, according to the report of the Tramways Board, to the prevailing industrial depression and increasing use of the private motor car, particularly during the week-ends. Passengers carried totaled 220,353,333 compared with 224,211,867 for the previous year.

The traffic receipts per bus-mile of the Williamstown bus service were 14.79 pence, resulting in a loss of approximately £3,000 on the year's operation after making provision for standing charges, interest, and reserves. The Balwyn bus route showed a loss for the year of approximately £6,000.

Total working expenses amounted to £1,722,967 compared with £1,777,107 for the previous year. The net surplus from operation was £771,133 and when carried to the appropriation account was reduced to £445,178. After consideration of appropriations there was a deficit of £27,061 met by transfer from general reserve fund and balance brought forward from the previous year.

A reference is made to the conversion to electric traction of the Richmond Cable Tramway, opened on Dec. 4, 1927.

Improvements in Rio de Janeiro

Program for track improvements including paving, repairs, and extension of lines is being carried out consistently by the Rio de Janeiro Tramway, Light & Power Company, Ltd., and the affiliated Jardim Botanico company. These two companies laid nearly 16 kilometers of new lines and relaid 49 kilometers during the year ended June 30, 1928. During the year 49 per cent of the cars of these two companies were repaired and repainted. The distance between stopping places for trams has been modified, the average being 200 meters, which greatly assists in accelerating the movement of traffic.

Swiss Railways Show Great Progress in Electrification

Roads make best showing recorded in any year since 1913. Passenger receipts make new high record

WITH the conversion of an additional 109 miles of line to electric traction in 1927, the total length of electrified mileage of the Swiss Federal Railways is now 1,035 miles, or approximately 58 per cent of the total length of the system, namely, 1,791 miles. In 1922 only 12 per cent of the total length was electrified, so that progress has been remarkably rapid. Naturally this development has been stimulated by the excellent water power facilities in Switzerland.

Electric train mileage rose last year by about 25 per cent, compared with 1926, but the cost of electric power rose only 15 per cent, a result which is considered to be due chiefly to the more efficient utilization of current. All the main arteries of railway traffic in Switzerland are now electrified, and about 94 per cent of the total power required is produced by the Federal Railways Administration at its own power stations. These are in two groups—one in the Gothard district and the other in Valais. A notable feature is the great fall in the cost per unit which occurred as the scale of electrification was extended so swiftly. Conditions have been fairly normal in this matter since 1924, and a comparison starting from that year shows a sharp fall in the cost of energy from 9¼ centimes per kilowatt-hour in 1924 to 5⅜ centimes in 1927. It is calculated that the saving in fuel costs consequent upon electrification has been very large.

The Swiss railways have been shielded from severe road competition by the nature of the territory served and the introduction of improved travel facilities. Such competition as has been encountered appears to have affected freight traffic rather than passenger business, for the proportion of gross railway revenue derived from the latter class of business has actually risen slightly of recent years—from 33 per cent in 1924 to more than 36 per cent in 1927. On the other hand, the ratio of freight revenue to the total has fallen over the same period from 60 to 55 per cent. The total receipts of the system in 1927 were 395,000,000 francs, and it is estimated by the administration that were it not for road competition they would have been 36,000,000 larger.

Partial reduction of freight tariffs have, however, had a beneficial effect on the financial position of the system, for they have led to a big rise in the tonnage transported, which was 17,813,000 in 1927, a steady rise from 13,245,000 tons in 1922. At 12¾ francs per ton, the average receipts from freights in 1927 were lower than for several years, owing to reduced charges, but, as a result of the big growth of traffic, the total receipts are among the best recorded in the history of the system. Passenger receipts, moreover, set up a fresh high record, and undoubtedly the enterprising advertising policy which the administration adopts in order to attract foreign tourists is a powerful factor in this satisfactory showing.

After allowing for working expenses, which are being kept well within bounds, and for debt interest, which has been increasing rather rapidly of late, the surplus from 1927 operations was 21,000,000 francs—the second best result since before 1914, and almost as good a surplus as that realized in 1913, when debt charges were very much smaller.

London Paper Changes Name

The Electric Railway, Bus & Tram Journal is the new name of the well-known *Electric Railway & Tramway Journal* of London. The new name appears with the issue of Oct. 12, 1928. An editorial explanation says that tramways are still the only possible vehicles for the cheap transportation of great masses of people who have to travel by necessity at the peak hours, but there are many tramway systems which also need a more mobile vehicle. On some such systems motor bus service will replace the cars.

Recent Bus Developments

Situation Due to Withdrawal of Detroit Jitneys Well in Hand

Del A. Smith, general manager of the Department of Street Railways at Detroit, Mich., is of the opinion that the situation created by the withdrawal of the jitneys is well in hand. He was confident additional equipment obtained by the railway department would meet any demand placed upon it. He said that so far as transporting passengers was concerned a normal condition had been established.

Mr. Smith is seeking to improve service on all lines, but particularly on Woodward, Jefferson, Grand River Avenues and Fort Street. On these arteries many persons formerly were served by the jitneys.

Mayor John C. Lodge has approved the rental of the additional equipment from Cleveland, although the figure at which these cars are to be rented has not been determined. The cars were shipped from Cleveland over the interurban lines and are now in regular service in Detroit.

Between Hackensack and Rutherford by Bus

Abandonment of the Public Service Co-ordinated Transport Company's trolley line between Hackensack and Rutherford, as contemplated by five of the affected municipalities and the company, has been approved by the Bergen County Board of Freeholders at Hackensack. The trolley line to be taken up is part of the route between Newark and Hackensack. Three of the communities have already completed arrangements with Public Service. They are Hackensack, East Rutherford and Carlstadt. Woodridge and Hasbrouck Heights are now negotiating.

It is planned to substitute an adequate bus service on the route. Public Service, it was said, was losing money on the line.

Normal to Have New Service

The State Railway Commission has granted the Lincoln Traction Company, Lincoln, Neb., permission to substitute bus service for car service to Normal, an eastern suburb. The proposal was opposed by the city and also by some of the people in the section served by the railway, which, when first built, cut diagonally across open country. This section is fairly well settled, but has little or no paving. In opening a street necessary to connect present paving with that contemplated the city would have inflicted an expenditure upon the railway which has no reserve for that purpose.

The railway commission took the ground that it was more interested in seeing railway service maintained than in paving, and that as the company could not be compelled to invest more capital in the enterprise, the case would be continued so as to permit an agreement to be made. This, however, was found impossible, and when the second hearing date arrived, the commission authorized the railway to take up the rails and to supply service by bus over paved streets to sections now without organized transportation routes.

Another Move in Knoxville Bus Case

The Knoxville Power & Light Company, Knoxville, Tenn., has placed a new bus proposal before the City Council's bus committee. The company is willing to establish four bus routes within the city. At the same time it has asked permission to abandon its Kingston Pike trackage from Third Creek west to the city limits. Bus service will be substituted on this route, under the plan.

> The City Council of Knoxville, Tenn., voted on Nov. 9 in executive session to consider the bus proposal of the Knoxville Power & Light Company carrying 7-cent car and bus fares.

The proposal comes as a result of an invitation from City Manager Otto Roehl for the company to clarify its position on this matter in order that disposition may be made of it in the Council.

A 7-cent fare would apply to any combination street car and bus line. Free transfers would be given.

The four bus lines proposed would penetrate the areas originally laid out for extension of transportation facilities. These are: One out Sevierville Pike; one northward to Whittle Springs territory connecting with the Sixth Avenue car line; one through Beaumont; another through West Lonsdale.

It is understood that the 7-cent fare comes nearer meeting the ideas of City Manager Roehl than the original 6-and-4 cent plan, the passenger to pay 6 cents on boarding the street car and 4 cents additional for his transfer.

Expansion by Pacific Electric

The Pacific Electric Railway has applied to the California Railroad Commission for a certificate of public convenience and necessity to operate auto stage service between Huntington Drive and Eastern Avenue in Los Angeles, and Commonwealth Avenue and Fremont Street in Alhambra.

Discontinuance Petition Dismissed in Indiana

A petition filed by the Evansville & Ohio Valley Railway to discontinue freight car service between Evansville and Mount Vernon, Ind., has been dismissed by the Public Service Commission on request of the petitioner. The line has been abandoned and motor truck service substituted.

Controversy Over Abandoned Ohio Territory

Another Eastern Ohio traffic controversy has been carried to the Ohio Public Utilities Commission for settlement. Objections were raised when the Youngstown & Suburban Transportation Company, subsidiary of the Youngstown & Suburban Railway, abandoned its bus lines between Canton and Salem, a run of 33 miles. It was under approval of the Ohio commission that this route was abandoned, and a new service begun in conjunction with the Stark Electric Railroad. Instead of buses every two hours out of Canton for Youngstown, Stark Electric cars now leave every hour, making connections at Salem with the Youngstown & Suburban buses for Youngstown. Through co-operation on the part of the two companies the service was doubled.

Hardly had the new service been started before two transportation companies filed petitions with the Ohio Public Utilities Commission, asking permission to operate over part of the route abandoned by the Youngstown & Suburban. The latter has protested to the Ohio commission, asking that petitions filed by the Warren-Salem Coach Line and the Salem-Akron Transit Company for passenger service certificates be denied.

Hearings on the original petitions for certificates are scheduled for early next month.

Survey Will Determine Possibilities of Bus in Memphis

Permission to establish a bus line in Memphis, Tenn., will not be acted upon by the city until a careful survey and study is made of other cities where trolley cars and buses operate. This statement was made by Mayor Watkins Overton on Nov. 13.

Application of an unnamed bus company for a franchise to operate in Memphis with a capital of more than $1,000,000, was to be heard by the City Commission, the Mayor said, but the matter will be taken under advisement until after the city's investigation is completed.

Statements of T. H. Tutwiler, president of the Memphis Street Railway, that his company would operate buses if a real need for them existed also will be considered by the City Commission before a franchise is awarded or denied, according to the Mayor.

Financial *and* Corporate

Seeking to Lift Receivership

Another move to straighten out affairs of Secon d Avenue Railroad, New York, in court's hands since 1921

THE committee representing the holders of certificates issued by the receiver of the Second Avenue Railroad, New York, has made public a plan for terminating the receivership and reorganizing the company.

The committee bid in the property at the sale on Sept. 22, 1927. On confirmation of the sale it proposes to organize a corporation with a capital of 34,000 shares of no-par common stock, to which it is proposed to assign the bid so that a conveyance may be made directly to the corporation.

It is expected that the new company will be called the Second Avenue Railroad Corporation. Under the plan, for each $1,000 of receiver's certificates the holders will be allotted ten shares of the new company's stock. This allotment will require 31,400 shares, and the remaining 2,600 shares, or so much thereof as is necessary, may be used in the discretion of the committee, on the same basis, to satisfy the contract creditors whose claims are on a parity with the preferred certificates.

When the plan is consummated the property will have been fully cleared of the long receivership and the ownership and management will be vested in the certificate holders. Unless the holders of more than one-third in amount of the outstanding certificates of deposit within 30 days from the filing of the plan with the depositories file with the latter written notice of their dissent specifying the number of certificates held by them, the plan will become effective and will be binding upon all depositors.

A. W. Hutchins, acting for the committee, bid in the properties at the sale in September last year for $500,000, payable in receiver's certificates as autorized by the judgment of the Supreme Court of New York County on June 29, 1921, conditioned on the approval of the plan of Aug. 18, 1927, by the Transit Commission. This approval was denied by the commission by order dated Feb. 2, 1928.

Land and buildings owned by the railroad and covering the block bounded by 96th and 97th Streets and First and Second Avenues, were appraised by the Transit Commission in 1921 at cost less depreciation at $2,428,148, and are assessed for taxation on the 1928 list at $1,425,000.

The committee is informed that the receiver's accounts will show upward of $300,000 available for distribution to meet personal and property damage claims which have accumulated, to which will be added about $35,000, the proceeds of sale of certain real estate, and it is anticipated that the committee will receive sufficient moneys from this source to pay all its obligations, counsel fees and compensation, and effect the reorganization. In the event the amount received is not sufficient for the purposes, the committee will borrow any additional sum on mortgage of the property or a part thereof.

Receiver's certificates were outstanding to $3,030,000 principal amount at the judgment of June 29, 1921. This sum with $1,727,100 interest due and unpaid to Oct. 1, 1928, will run the aggregate to $4,757,100.

Lease of 10-Mile Electric Branch Authorized

The Interstate Commerce Commission has just announced that division 4 had approved a report and order authorizing acquisition by lease of the Chowchilla branch of the Visalia Electric Railroad, extending from a connection with the Central Pacific Railway at Chowchilla, Cal., to a point in block 42 of Dairyland Farms subdivision No. 2, a distance of 10 miles.

Separating Transportation and Power on Ohio Property

Application to buy the power and light properties of the Cleveland Southwestern Railway & Light Company, Cleveland, Ohio, was filed by the Reserve Power & Light Company with the Ohio Public Utilities Commission, on Nov. 9. The purchase price was given at $2,087,165. The properties are located in the counties of Cuyahoga, Medina, Lorain, Wayne, Richland, Crawford, Ashland and Morrow, and are located along the right-of-way of the Southwestern.

Interurban and motor coach transportation business of the Southwestern will not be affected by the purchase. According to attorneys of the company, F. H. Wilson, president and general manager of the Southwestern, is an official of the Reserve Power & Light Company. The application to sell the light and power properties is said to be the start of a movement to divide the power and transportation business into separate managerial organizations.

James Ketner a Kansas City Director

James Ketner has been elected a director of the Kansas City Public Service Company, Kansas City, Mo., operating the co-ordinated railway and bus service in that city, to succeed Herbert M. Woolf, who had asked to be relieved to conserve his time for his many other interests, among them an expanding group of stores and a growing chain of theaters.

$5,000,000 Bond Issue in New Orleans

The Commission Council of New Orleans has approved the $5,000,000 bond issue of the New Orleans Public Service, Inc. The proceeds of the sale, which is expected to realize approximately $4,600,000, will be devoted to the retirement of a bond issue in connection with the purchase of the Edison Electric Company and improvements. The bond issue to be retired amounts to $2,000,000 and about $2,500,000 will be used for improvements.

In connection with the bond issue Commissioner of Public Utilities Hall submitted a report from R. V. Whittaker & Company, auditors for the department, showing the financial condition of the company and approving the issue. Only that part of the proceeds of the bond sale actually used for improving the company's facilities will be added to the capital rate base.

The auditing firm also submitted a report on its investigation of the opposition of the company to the Fernandez bills before the last session of the General Assembly. The auditors said the money spent was a legitimate expense. It amounted to slightly more than $6,000. Of that sum $4,500 went to W. A. Porteous, Jr., an attorney regularly employed during sessions of the Legislature, and $2,485 to Forrest Pendleton, another representative. The bills in question were designed to give the city of New Orleans the right to acquire all property of the Public Service.

The New Orleans Public Service, Inc., supplies electric power and light, natural gas and street railway service in the city of New Orleans. In 1922 a settlement was effected with the city under the terms of which the sum of $44,700,000 was agreed upon as the value of the properties in the system as of Dec. 31, 1920, for the purposes of the settlement, to be increased by future investments in the property. The settlement ordinance provided for the allowance of such rates for the company's various public services as would produce a 7½ per cent return on the rate base as determined from time to time, after operating expenses, taxes and reserve for renewals and replacements.

The rate base as at Sept. 30, 1928, was in excess of $79,800,000, upon which the present allowed return, before deducting appropriations for renewal and replacement reserve at the current rate of $1,866,000 per annum, is about $7,851,000. This compares with actual net revenues of $7,082,600 for the twelve months ended Sept. 30, 1928. In addition to the allowed return on the rate base, the settlement provides, among other things, for indeterminate permits, for the approval by the Commission Council of the city of the issue of securities and for an option to the city to purchase any or all of the three departments of the company at the current rate base valuation. These departments embrace gas, electric light, power, and railway services.

Mr. Cabot Answers Mr. Scharff

Phillip Cabot has contributed to the *Atlantic Monthly* for November an article entitled, "Ethics and Politics—the Public and their Utilities." In some respects it is in the nature of a reply to the article by Maurice R. Scharff, which appeared in the September *Atlantic* and was digested in the ELECTRIC RAILWAY JOURNAL for Sept. 1, page 362, under the title "A Dictator Suggested."

Mr. Cabot finds that the American people are overwhelmingly opposed to government interference in business. He finds that the public is protected by regulation through state commissions from excessive prices paid to operating companies and that holding companies cannot possibly oppress customers of local companies because holding companies have no contact with them.

Mr. Cabot's chief point seems to be that commissions have erred in seeking to regulate profits of operating companies, rather than prices. He declares that "profit is the spur to private initiative; without it ambition and progress are destroyed, and, therefore, profit regulation as a method of price regulation is vicious."

The author says that the "present tendency of commissions to determine net income, or profit, and to regulate that is wholly opposed to the best interest of the consumers." He believes that by this system the investor is pampered while the consumer is neglected. Mr. Cabot says:

> It is entirely possible to regulate gross income—that is, prices—directly, and if this is skillfully done profit will be effectively and justly regulated. Today this is not done. Profits are not regulated—they are confiscated.

Baltimore Depreciation Hearing Advanced

The Maryland Public Service Commission has set Nov. 19 as the date to open the depreciation hearing in the fare case of the United Railways & Electric Company, Baltimore. Details of the survey of the company's property could not be fully completed by Nov. 15, the time originally set.

Equipment of Penn Yan Road to Be Removed

Under a Federal court permit issued by Judge Simon L. Adler of Rochester, William J. Tylee, Penn Yan, as receiver for the Penn Yan & Lake Shore Railway is now allowed to sell the assets to benefit the creditors and bondholders. This 9-mile railway ceased operation some time ago.

The rails, power line and rolling stock and the equipment in the yards have already been sold to the S. Snyder Corporation of Rochester. Work is expected to begin at once in removing the tracks from the streets of Penn Yan and along the west lake road. The line leaves the state road at Keuka Park and runs in past Keuka College.

Buses have taken the place of the old line now, with daily service furnished along the lake from Penn Yan to Hammondsport and Bath. The trolley cars are now "parked" in the power house at Keuka Park. Years ago Electric Park, near the power house, with a dance hall and other attractions, was a rendezvous for pleasure seekers. The real estate owned by the Penn Yan & Lake Shore Railway will be sold later.

New Member on Springfield Board

Bentley W. Warren, for some years counsel for the Springfield Street Railway, Springfield, Mass., was added to the board of directors of the company at the annual meeting on Nov. 8. He will continue to serve in the capacity of counsel. Mr. Warren is unusually well informed on railway economic problems.

Finis Written to Detroit United

Exchange of securities under way in new company successor under foreclosure to Michigan road

A. L. DRUM, president of the Eastern Michigan Railways, the successor to Detroit United Railways, states that the new company is now in possession of the properties and that he confidently expected that the full interest on the new adjustment mortgage bonds would be earned and paid when due on April 1 next. Eastern Michigan-Toledo Railway is a wholly owned subsidiary formed to take over the Detroit, Monroe & Toledo Short Line Railway. Properties were acquired on behalf of bondholders at recent foreclosure sale.

The reorganization committee of Detroit United Railway recently issued the following notice:

On and after Oct. 18 cash and bonds and voting trust certificates for common stock of Eastern Michigan Railways, bonds of Eastern Michigan Toledo Railroad, and fractional scrip certificates will be ready for delivery to holders of certificates of deposit entitled thereto under the provisions of the reorganization plan. Bonds and fractional scrip certificates will be delivered in bearer form.

To obtain deliveries of new securities the holders of certificates of deposit must surrender the same in negotiable form to the depositary which issued them. In all cases where voting trust certificates are desired in names other than those in which certificates of deposit were issued or are registered the cost of the required federal and state transfer tax stamps must be paid to the appropriate depositary by those surrendering such certificates of deposit.

Those desiring new securities forwarded to them must state the forwarding agency desired and remit the cost of transmission to the appropriate depositary. They must likewise state whether and at what valuation they desire such new securities to be insured and must similarly provide the cost of such insurance.

Until Nov. 17, 1928, first mortgage and collateral trust sinking fund five-year 6 per cent bonds of Detroit United Railway and first mortgage 5 per cent 30-year gold bonds of Detroit, Monroe & Toledo Short Line Railway may be deposited under the reorganization plan without penalty.

Securities of Eastern Michigan Railways will consist of first mortgage and collateral trust bonds limited to $5,000,000, of which $3,350,000 are to be issued immediately and the balance reserved for issue under various restrictions as set forth in the reorganization plan promulgated last April, and $4,915,000 of convertible adjustment mortgage bonds. Both issues bear 7 per cent interest.

First mortgage bonds of the Toledo company will total $2,000,000 and bear 7 per cent interest.

Common stock of the parent company will be issued in the amount of 200,000 shares. An additional authorized 200,000 shares will be reserved for conversion of adjustment mortgage bonds. The subsidiary company's stock will consist of 50,000 shares. The parent company will not assume liability for the payment of interest or principal of the subsidiary company's bonds.

Ohio Interurban Set for Suspension

Abandonment of the Southern Ohio Public Service Company's interurban line between Columbus and Zanesville was authorized on Nov. 13 by the Ohio Public Utilities Commission. Service between Columbus and Newark will be discontinued after Jan. 15, and from Newark to Zanesville later.

The company contended that it lost $80,644 in the year ended Sept. 30, and that it was not financially able to meet the cost of street improvements in the cities it serves. Such contemplated improvements would cost the company an aggregate of $600,000, the company contended.

The late date for the abandonment of the Zanesville-Newark section was set so that application for bus service in the region may be acted upon before interurban service stops.

Fort Wayne Stock Offered

Authority to issue and sell 85,000 shares of its common stock without par value to yield $850,000 was asked in a petition filed with the Public Service Commission on Nov. 10 by the Indiana Service Corporation, Fort Wayne, Ind. The petition recites that the proceeds will be used for capital expenditure already made or planned to the company's interurban and local electric railways and electric light and power facilities.

The company during the year has made extensive improvements in its railway properties, including several miles of track extensions in the city of Fort Wayne, and has built additional mileage in electric transmission lines. The Indiana Service Corporation is a subsidiary of the Midland Utilities Company, Chicago.

Dividend Payment by Brooklyn City Railroad

The Brooklyn City Railroad, Brooklyn, N. Y., has declared a dividend of 10 cents a share on the capital stock of $10 par value. This is the first payment on the issue since March 1, 1927, when a distribution of the same amount was made. The dividend is made payable on Dec. 15 to holders of record of Dec. 1.

Twin City Net Lower—President Sees Earnings at Ebb

The Twin City Rapid Transit Company and subsidiaries, Minneapolis, Minn., report for the quarter ended on Sept. 30, a net loss of $17,867 after taxes and fixed charges. This contrasts with net income of $149,111 in the preceding quarter, equivalent after allowing for preferred dividend requirements to 44 cents a share on 222,000 shares of common stock, and with a net income of $93,663 or 18 cents a common share in the third quarter of 1927. Net income for the first nine months of 1928 was $555,804, equal after preferred dividends to $1.81 a common share, against $838,058 or $3.09 a share in the first nine months of the preceding year.

Horace Lowry, president of the Twin City Transit, in a recent letter to a Canadian shareholder, says that he personally is optimistic as to the future and expresses the hope that Canadian shareholders of the company will not be tempted to sell their stock at the present low price.

The Canadian *Financial Post* says that President Lowry apparently bases his hopes for improvement on the fact that, while the number of street-car riders has been decreasing from year to year, the year 1928 so far has shown smaller decrease than has been the case in any year since 1920.

Explanation for the interest of the Canadian financial paper in the Twin Cities case is to be found in the fact that the company has a large financial following in the markets of Toronto and Montreal.

Elsewhere in this issue is an item referring to the fare situation in the Twin Cities that includes a statement in which President Lowry reviews the past in them and the probable prospects for the future.

Income from Dividends in Washington Taxable

The dividends received by the Washington Railway & Electric Company, Washington, D. C., from the stock of the Potomac Electric Power Company, which it owns, form a part of its "gross receipts" and are taxable under the law at 4 per cent, according to an opinion of the District Court of Appeals rendered by Justice Charles H. Robb. Interest and dividends from investments and rent from lands, buildings and equipment received by the Potomac Electric Power Company are also held to be taxable as part of "gross earnings" after allowance for cost of raw materials and the like.

The decision means that the railway company will be called upon to pay $151,200 to the District tax collector, representing 4 per cent on the dividends paid by the power company since the case was taken to court in 1925.

The total of dividends paid since the case went to court to date is $3,780,000. Of this $840,000 was paid in 1925, $960,000 in 1926, $1,080,000 in 1927 and $900,000 thus far in 1928. The dividend rates in the various years were as follows: 1925, 14 per cent; 1926, 16 per cent; 1927, 18 per cent, and 1928, 20 per cent.

The railway owns $6,000,000, or the entire issue of common stock in the power company. In addition to this stock issue there is outstanding $5,000,000 of 5½ per cent preferred stock and $2,000,000 of 6 per cent preferred stock not owned by the railway and therefore not affected by this decision.

The commissioners included the power company items in the assessment, but the companies disputed the matter and brought suit in the District Supreme Court for an injunction to prevent the collection of the taxes. The lower court upheld the action of the commissioners and the companies appealed.

Earnings Increase in Indianapolis

Net earnings of the Indianapolis Street Railway, Indianapolis, Ind., showed an increase in October of $9,572, according to a report filed with the Indiana Public Service Commission. Earnings were $114,209, against $104,637 for the similar month of 1927. Net earnings for the first nine months of the present year are $107,016 more than for the corresponding period of 1927.

Personal Items

Messrs. Blair and Egolf in the News

Col. Edward J. Blair, general manager of the Chicago, Aurora & Elgin Railroad, Aurora, Ill., has been summoned to Chicago by the surface and the elevated lines to assist in working out a solution of the railway problem in that city. John F. Egolf, vice-president of the Western United Gas & Electric Company and former general manager of the Chicago North Shore & Milwaukee Railroad, succeeds Colonel Blair as general manager of the "Aurora and Elgin." The order transferring Colonel Blair and appointing his successor became effective Nov. 1.

Prior to his appointment as general manager of the Chicago, Aurora & Elgin three years ago, he had been connected with the Chicago Rapid Transit Lines for twenty years. Following his graduation from Cornell University, he went to work in the shops of the Chicago elevated lines. His ability was soon recognized, resulting in rapid promotion from one position to another. When the country entered the World War in 1917, Colonel Blair, who at that time was chief electrical engineer for the elevated system, volunteered his service and received a commission in the 311th Engineers. He quickly rose to captain and major and his regiment was ordered overseas, where it was an important unit in the construction of railroads in France. On his retirement from the Army with the rank of colonel, he returned to the Chicago Rapid Transit Lines and was made assistant to Britton I. Budd, president of the elevated system and of other electric railways entering Chicago. In that capacity he had an opportunity to acquire intimate knowledge of the transportation problems in the Chicago metropolitan area, not only of the operations, but also of the financial plans of the railroad.

As negotiations are now under way between the transportation companies and the city of Chicago with a view to effecting a merger of surface, elevated and bus lines and the building of a downtown subway, the wide experience of Colonel Blair makes his services indispensable to the company committees engaged in this work.

Mr. Egolf, who succeeds Colonel Blair, is well known in electric railway operations in metropolitan Chicago. For several years he was manager of the Aurora, Elgin & Fox River Electric Railway, leaving that position for a time to become general manager of the North Shore Line. He resigned that position last year to return to Aurora as vice-president of the Western United Company. Mr. Egolf will remain in his present position with the gas and electric utility in addition to the active operation and management of the Chicago, Aurora & Elgin.

Changes in Stone & Webster, Inc., Organization

Walter H. Burke has resigned as district manager of the companies under the executive management of Stone & Webster, Inc., in the Southwestern district, and is returning to the East.

Effective Jan. 1, 1928, James F. McLaughlin has been appointed to succeed Mr. Burke as district manager of the companies in the Southwestern district comprising the properties located in Texas, Louisiana, New Mexico and Mexico.

Tom P. Walker, vice-president of Virginia Electric & Power Company, is to be transferred from Norfolk to Richmond and, effective Dec. 1, 1928, will

Digitized by Google

be in general charge of all operations of the company, succeeding Mr. McLaughlin.

Joseph Bowes, formerly manager of the El Paso Electric Company, El Paso, Tex., has been transferred to the Virginia Electric & Power Company and will assume charge of the Norfolk division of that company, effective Dec. 1, 1928.

Francis J. Gannon, formerly assistant treasurer and secretary of Davis Islands, Inc., Davis Islands, Tampa, Fla., and previous to that assistant treasurer for varying periods of time of various of the companies under the executive management of Stone & Webster, Inc., has been appointed, effective Nov. 15, 1928, manager of El Paso Electric Company (Texas corporation), El Paso & Juarez Traction Company, Rio Grande Valley Traction Company and Mesilla Valley Electric Company.

J. F. Gilchrist Formally Resigns

John F. Gilchrist, chairman of the New York Transit Commission, tendered his resignation to Governor Smith, effective Nov. 15. Mr. Gilchrist resigns in order to accept an attractive business offer. The Governor has accepted Mr. Gilchrist's resignation. The latter's activities in the regulatory field and his new business connection were mentioned in ELECTRIC RAILWAY JOURNAL, issue of Oct. 13, 1928.

New Division Manager of Northern States

Glen V. Rork has been appointed manager of the Wisconsin division of the Northern States Power Company, with headquarters at Eau Clair, Wis. For a number of years after his graduation from college at Ripon, Wis., in 1910, he was employed in various branches of electrical work for one of the operating subsidiaries of the Northern Pacific Railroad.

Mr. Rork entered the employ of the Wisconsin-Minnesota Light & Power Company, now the Wisconsin division of Northern States Power Company, in 1920. Following the purchase of the Midland Public Service Company, with headquarters at Owen, Wis., by the Northern States Power Company, Mr. Rork developed that company's system from a five-town unit to its present size of 23 towns.

Mr. Rork, whose appointment was announced by R. F. Pack, vice-president and general manager, was born at Reedsburg, Wis.

Since the resignation of George H. Wilmarth as manager of the Wisconsin division of Northern States Power Company, to become chief operating engineer of the company, with offices in Minneapolis, Harold L. Geisse, vice-president and general manager of Wisconsin Valley Electric Company, has supervised operations of the Wisconsin division.

W. L. Haymond Promoted by Brill

Wirt L. Haymond, assistant sales manager of the American Car Company, St. Louis, since 1918, was appointed sales manager, effective Oct. 1. In this position he succeeds F. A. Richards, whose resignation to become president of the Metropolitan Railway Equipment Company, St. Louis, was announced in the ELECTRIC RAILWAY JOURNAL issue of Oct. 20.

Mr. Haymond has grown up in the Brill organization. Starting in December, 1897, when only sixteen years of age, his early activities were devoted to the accounting division of the Brill plant in Philadelphia. In 1902 he was transferred to the American plant and placed in charge of the time and cost departments. From 1908 until 1918, when he became assistant sales manager, he acted as chief clerk to the general manager.

W. L. Haymond

By training and experience Mr. Haymond is well fitted to "head up" the sales organization of the American Car Company. His close association with the sales activities of the company for so many years assures the industry the same careful consideration which its equipment problems have always received in the past. He is a member of various local activities in St. Louis, including the Missouri Athletic Association, Westborough Country Club, the Chamber of Commerce, the Traffic and the Birney Clubs.

Promotions on West Penn System

William R. Hinchman, formerly assistant treasurer and assistant secretary of the American Water Works & Electric Company, Inc., has been elected treasurer of the West Penn Electric Company and will be permanently located in Pittsburgh. Mr. Hinchman has been connected with the "American" system for seven years, having started in the New York office in May, 1921. He worked during different periods at the Chattanooga, Little Rock, and South Pittsburgh plants where he conducted efficiency tests, and subsequently joined the treasury department in New York. In February, 1926, he was made assistant treasurer and assistant secretary.

D. P. Guest has been promoted from senior assistant treasurer of the West Penn Power Company and West Penn Railways to treasurer of both companies. He will continue as assistant treasurer of the West Penn Electric Company. Mr. Guest became associated with the West Penn Oct. 10, 1927.

LUKE C. BRADLEY of the Electric Bond & Share Company plans to spend about three months abroad soon, principally in South American countries, in an inspection of the utility properties of the American & Foreign Power Corporation, which is under Electric Bond & Share auspices. The properties controlled include electric railway, electric light and power plants, waterworks and telephone installations.

W. A. BUTTRICK, president of the Twin State Gas & Electric Company, Boston, Mass., has been elected chairman of the New England Bureau of Public Service Information. D. D. BARNUM, president of the Boston Consolidated Gas Company, is vice-chairman, and JOSEPH B. GROCE, of the Edison Electric Illuminating Company of Boston, is treasurer.

OBITUARY

MURRY A. VERNER, 76 years old, formerly prominent in the political and business life of Pittsburgh, and interested at one time in a number of electric railways, many of which he financed in the early days of the application of electricity as motive power to city and suburban lines, died on Nov. 3. He was born on the site now occupied by the Fort Pitt Hotel in Pittsburgh.

FRANK WALTER STEVENS, consulting valuation counsel for the New York Central Lines, died in Covina, Cal., on Nov. 8. In 1907 he was appointed chairman of the Public Service Commission of the Second District of New York, serving until 1913 when he became valuation counsel for the New York Central lines. He continued in this capacity until 1924, when he was appointed consulting valuation counsel. In addition to these activities he was known for his work "The Beginnings of the New York Central Railroad," covering the history of the steam railroads traversing the territory of the Hudson River, Buffalo, and the Niagara River. These roads were consolidated in 1853 into the New York Central Lines. Mr. Stevens was born in Leon, N. Y., 81 years ago. He was graduated from the Harvard Law School and later began practice in Jamestown, where he served as local attorney for the New York Central.

W. H. MAY, vice-president of the Shuler Axle Company, died on Oct. 30. Mr. May was 80 years of age and had been an executive of the Shuler company for the past eight years. He had been prominent in business circles of Louisville and was formerly president of the National Casket Company.

More Large Orders for Heavy Equipment to Be Made

$20,000,000 electrification authorized by Reading Railroad. Bids for 100 coaches to be asked immediately. Equipment market continues good

EXPENDITURE of $20,000,000 for electrification of most of the Reading Railroad within the Philadelphia metropolitan district has been authorized by the directors, according to announcement made by Andrew T. Dice, president of the company.

It is expected that bids on the preliminary work of the electrification, as well as the construction of 100 cars, will be asked within the next two or three weeks. The road distance of the branches to be converted is 49.9 miles, and will include 110 miles of actual track to be electrified.

It is indicated that the program includes the electrification of all four main tracks between Reading Terminal and Wayne Junction, and the two tracks from Wayne Junction to Lansdale from Langhorne and Chestnut Hill. Service on these lines will be increased about 25 per cent and the speed of travel increased from 20 to 24 per cent.

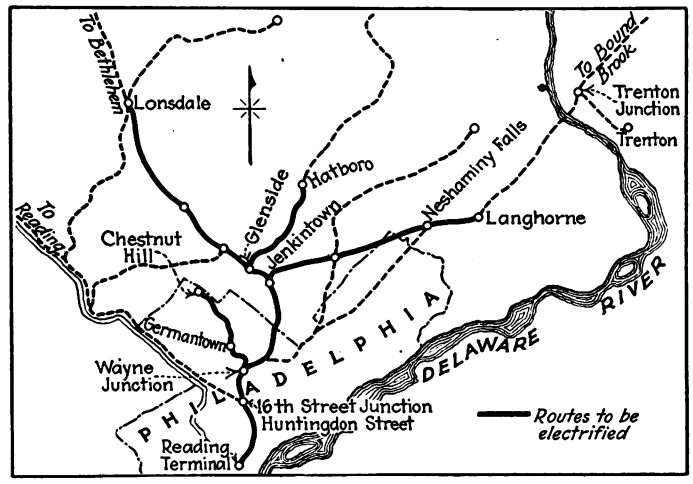
Overhead Single-Phase System

Like the Pennsylvania electrification, it is planned in this project to use single-phase alternating current at 11,000 volts. Overhead trolley wires will be installed and pantographs will be used on both cars and locomotives. The lines will be supported by steel bridges at intervals of about every 300 ft.

Active progress is now being made on the detailed plans required. Erection of the catenary overhead will be the first physical work undertaken, and it is planned to begin construction at outlying points. The work will then proceed toward the more congested part of the railroad system. A number of substations will be built at various points for the most effective and reliable distribution of power to all parts of the system.

The coaches are to be of the multiple-unit type, and will release 35 steam locomotives in use, and also 120 coaches will be diverted to service in other points on the system. The new arrangement will provide express service to the outlying territory throughout the day instead of providing only local service at certain times, as at present.

At Wayne Junction, a large car storage yard and electrical repair shop will be erected on the ground between Chestnut Hill and Tavor branches, and immediately north of Wayne Junction station. The railway has already purchased ground at this location. Coincident with the electrification, the railway will install color light signals in the entire territory, replacing the present semaphore signals.



Electrification of Reading Railroad has been authorized in the Philadelphia metropolitan area at a cost of $20,000,000

This program, to be completed in three years, is a start toward the eventual electrification of virtually the entire system, including the New York division. According to Mr. Dice, the installation of electric trains on the Schuylkill Valley branch to Reading and Pottsville might be expected to follow the completion of the present undertaking; it was felt unlikely, however, that any definite announcement about electrification of this branch or the New York division would be made before completion of the first routes.

Reading's Forward Step

ANNOUNCEMENT by the Reading company of its program for the electrification of all its lines within the metropolitan district of Philadelphia marks another forward step in the progress of modern transportation that will be of great benefit to the entire community. Upon its completion this work will result in an increase of the Reading's suburban train service, a marked shortening of time for commuters, and, of course, in a material reduction in the smoke and dust menace. Philadelphians will not overlook the significance of the fact that this program involves the substitution of electric for steam power on all the main lines of the company.

The Reading company, by this decision, puts itself in the van in a movement in the transportation world that is bound to cover the entire country. With the electrification of the entire suburban service of the Reading and Pennsylvania systems, this city will possess transportation facilities unsurpassed anywhere—*Philadelphia Ledger.*

Track Purchases

Track purchases through the past month have been fairly large. Pittsburgh Railways, Pittsburgh, Pa., has placed orders for 10,000 6 in. x 8 in. x 8 ft. ties, 10,000 tie plates, 20 pairs of switch points, 20 kegs of tierod washers, six switch stands, one car of molding sand, 5,000 tierods, three cars of ½-in. Ligonier screenings, and 40 kegs of track bolts of various sizes.

Arkansas Power & Light Company, Little Rock, Ark., has placed orders for one double-track electric over steam road crossing, and one single-track electric over steam road crossing. This company has also ordered material consisting of frogs, switches, mates, and curved rail for seven jobs in Little Rock, Ark., at an approximate cost of $6,000.

Lehigh Valley Transit Company, Allentown, Pa., has ordered one standard model 38-B Barber-Greene snow loader. The St. Louis Public Service Company, St. Louis, Mo., has installed double tracks in conjunction with the widening and repaving of Franklin Avenue between Third and High Streets.

Line Materials Ordered

Considerable line material has been ordered recently, according to reports received from several railways. The Lehigh Valley Transit Company, Allentown, Pa., has placed orders for three miles of 00 grooved copper trolley wire, 10,280 ft. of ¼-in. galvanized steel strand wire, and 5,000 ft. of ⅜-in. galvanized steel strand wire. Arkansas Power & Light Company has ordered 6,000 lb. of trolley wire, 600 lb. of 0000 clinch ears, 50 lb. of 0000 hangers and three 20-in. frogs.

Digitized by Google

Pittsburgh Railways, Pittsburgh, Pa., has ordered 200 72-in. 0000 type CAE bonds, 500 46-in. CAE type bonds, and 500 40-in. CAE bonds. This company has also ordered 5,000 15-in. 00 champion line ears, 25,000 ft. ¼-in. dead soft-annealed galvanized wire, six electric track switches with type T-3 ground boxes, and electric circuit changers, and has let a contract for the purchase of four blocks track circuit type APB signals, and one block track circuit facing signals between Boggs Passing Siding, and South Bank Stop. Another contract has been let for the purchase of ten tracks circuit type spacing signals for use on the interurban system.

Ten sets of door and step engines have been ordered by the Lehigh Valley Transit Company. Other car equipment and supplies ordered by this company include fifty 34-in. forged steel wheels, 2,000 variable size brake pins, and sixteen sets of armature coils. The Arkansas Power & Light Company has ordered four 16-passenger city type buses at an approximate cost of $18,000.

The Pittsburgh Railways has remodeled seven 4300 type low floor center entrance cars for one-man operation. This company has also just received the last of its order of fifteen interurban cars.

The Pittsburgh Railways has also let a contract for the purchase of a high-tension oil circuit breaker and structure with one spare breaker unit for its Broad Street substation. Shop equipment ordered by the Lehigh Valley Transit Company includes three frame unit heaters and three air vents.

In Canada, the London & Port Stanley Railway, London, Ontario, has been authorized to build an additional track across Bridge Street, to rearrange yard tracks, and to build a connecting track crossing Bessie Street, Port Stanley, Ontario.

The Regina Municipal Railway, Regina, Saskatchewan, is considering the extension of its car service from the northwest section of the city to the heart of the industrial area, which will involve a track installation costing about $75,000.

British Columbia Electric Railway, Vancouver, B. C., has let a contract for a cable subway in the vicinity of Point Grey substation at an approximate cost of $9,000. Calgary Municipal Railway, Calgary, Alberta, has ordered two cars and a snow sweeper.

120 Buses Bought for Service in Detroit

The Detroit Municipal Railway, Detroit, Mich., has contracted to buy 120 buses. Ninety will be 16-passenger Graham-Dodge coaches at $4,535 per unit. Deliveries are to be made at rate of four a day. The city will pay 20 cents a mile for each coach for the first 120 days and thereafter 11½ cents a mile until the purchase price has been paid.

Fifteen will be 40-passenger single-deck metropolitan type made by the American Car & Foundry Company costing $10,962 each, to be delivered at once and paid for on time, and fifteen are 40-passenger buses of the Twin Coach Company costing $12,550 each, to be bought under the same arrangement and to arrive by Dec. 1.

Representatives have been sent to Chicago to study a 10-passenger bus, 50 of which may possibly be purchased.

ELECTRIC RAILWAY MATERIAL PRICES—NOV. 13, 1928

Metals—New York

Copper, electrolytic, cents per lb	15.775
Lead, cents per lb	6.35
Nickel, cents per lb., ingot	35.00
Zinc, cents per lb	6.60
Tin, Straits, cents per lb	50.00
Aluminum, 98 or 99 per cent, cents per lb.	23.90
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	53.00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	4.375
Somerset mine run, f.o.b. mines, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	1 8
Franklin, Ill., screenings, Chicago	1.35
Central, Ill., screenings, Chicago	1 00
Kansas screenings, Kansas City	1.625

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb	2.80
Tie plates (flat type), cents per lb	2.15
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	1.95
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb	2.75
Sheet iron, galvanized (24 gage), cents per lb.	3.55
Galvanized barbed wire, cents per lb	3.20
Galvanized wire, ordinary, cents per lb	3.00

Waste—New York

Waste, wool, cents per lb	18.
Waste, cotton (100 lb. bale), cents per lb.:	
White	17.25
Colored	13.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.3
White lead in oil (100 lb. keg), cents per lb.	13.25
Turpentine (bbl. lots), per gal	$0.65
Putty, 100 lb. tins, cents per lb	5.725

Wire—New York

Copper wire, cents per lb	17.875
Rubber-covered wire, No. 14, per 1,000 ft.	5.3
Weatherproof wire base, cents per lb	17.125

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	$2.78
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.375
Cement, Chicago consumers' net prices, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered	3.375
Sand, cu.yd., delivered	2.125

Old Metals—New York and Chicago

Heavy copper, cents per lb	13.375
Light copper, cents per lb	11.625
Heavy yellow brass, cents per lb	7.875
Zinc, old scrap, cents per lb	3.25
Lead, cents per lb. (heavy)	5.125
Steel car axles, Chicago, net ton	$15.75
Cast iron car wheels, Chicago, gross ton	14.375
Rails (short), Chicago, gross ton	17.50
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.75

North Shore Receives Three New Cars

The Chicago North Shore & Milwaukee Railroad, Chicago, Ill., has recently received and placed in regular service between Chicago and Milwaukee two additional dining cars and one parlor observation car built by the Pullman Car & Manufacturing Corporation.

Delivery of this new equipment brings the total of new all-steel cars placed in service by the North Shore Line this year to eighteen. Fifteen passenger motor cars incorporating many advanced features for passenger comfort and safety, including plush-covered bucket type seats were delivered by the same manufacturer during the spring and summer.

The three cars just placed in service are modishly designed. The diners, seating 24 persons each, are finished in buff paint with walnut panels and have ornamental sidelights. The parlor-observation car has seventeen revolving easy-chairs, upholstered in light blue frieze plush. The walls are finished entirely in walnut. On the floors of both the parlor car and the diners is black and gold carpeting, with felt padding underneath. The observation platform in the rear is entirely enclosed with glass.

Including these latest cars the North Shore Line this year has added new freight and passenger equipment costing over $900,000. Other rolling stock includes ten light-weight double-truck Safety cars for Milwaukee and Waukegan city service, two new electric freight locomotives, fifteen additional steel semi-trailers for handling door-to-door merchandise despatch shipments and three 5-ton tractors for hauling trailers to and from freight receiving stations.

Detroit Car Award Stands

Circuit Court Judge Gilbert has dismissed the suit to secure a permanent injunction restraining the city of Detroit from carrying out a contract to buy 100 street cars from the Perley A. Thomas Company, High Point, N. C. A temporary restraining order was dissolved.

ADVERTISING LITERATURE

ANACONDA COPPER MINING COMPANY, through its subsidiary, the American Brass Company, Waterbury, Conn., is rebuilding its electrical cable plant at Hastings-on-Hudson, New York, N. Y. This plant will be constructed to produce quality power cable of all types. A testing laboratory for advanced high-tension cable work and for the examination of insulating oils, paper and cable sheath is being provided. The Hastings plant, was originally operated by the National Conduit Cable Company.

MONEY-METERS, INC., Detroit, Mich., has published a booklet on modern fare collection describing the use and advantages of Money-Meters products.

Decision in New York Fare Case Again Postponed

ACTION this week by the United States Supreme Court in the New York City fare case has received various interpretations. Some advocates of the 5-cent fare profess to see in the order for a reargument an indication that the court inclines to their view. On the other hand, believers in a higher fare point out that the order shows only that the court is prepared to hear arguments. This means, they conclude, that the court considers the case within its jurisdiction.

The authority of the federal courts to intervene in such essentially local matters as franchises and rates of fare of intrastate railways comes from the 14th Amendment to the Constitution which forbids any state to deprive "any person of life, liberty or property without due process of law." Utility rates come under this clause because, as the property of a utility is devoted to public use, its rates may be regulated by the state. If they are regulated by the state, it is violating the federal constitution if it imposes a confiscatory rate or if it refuses to relieve a company from a confiscatory rate.

Not all utility franchises, of course, are awarded by the state—at least not wholly by the state. The city in which the utility is located often is a party to the franchise grant. Where this occurs, the city may have the power to act independently of the state in awarding the franchise, it may do so simply as an agent of the state, or it may act jointly with the state. If there is nothing in the state constitution or in its basic law to prevent it doing so, a state may authorize a city to be the sole grantor and empower it to award a franchise which in essence would be a contract. There are decisions which indicate that the Federal Supreme Court will not intervene in such a case to overturn the contract, no matter how improvident to one side or the other it may have been. But its decisions also indicate that not only must any such surrender be very clear and unmistakable but that it must also be definitely shown that the state had the power at the time to delegate such authority. This takes the question back again to the wording of the State Constitution, as well as to its basic laws.

From this it will be seen that a federal decision in one city on utility rates may not necessarily control in another, or even that two decisions in the same city may not be identical, if the franchises were awarded at different times.

It is the contention of the Interborough Rapid Transit Company, of course, that New York State never delegated to New York City so much of the state power over utility rates as to prevent the state from raising such rates if they became confiscatory but that they were subject to the public service commission law and hence subject to the state's regulatory power over rates. It is also the contention of the Interborough that its applications to the state commission for rate increases have been disregarded, so that its only recourse for relief had to be to the federal courts.

From its recent action it appears that the United States Supreme Court is willing to consider this case on its merits, but nothing thus far disclosed gives any real clue as to what its final decision will be.

Four Years of Unification at Akron

FOUR years ago the city of Akron Ohio, was just beginning to recover from the effects of a controversy in which all railway service was withdrawn. The local company's franchise had expired and the city and the management were unable to reach a settlement over terms that involved a readjustment of fares. It was a story long drawn out, but fully reviewed in the JOURNAL at the time. Out of the controversy grew a settlement which provided for operation by the Northern Ohio Power & Light Company over a period during which strict account was to be kept of income and outgo so that the basis might be reached for the negotiation of a new contract. That period has now expired, but service will be continued under the terms of the temporary grant until negotiations can be concluded, based on the results of the study of the last four years.

Since the temporary grant was arranged in Akron the transit situation there has undergone changes probably greater than those of any other city, certainly any other city comparable with it in size. Car and bus lines now form a complete network in and about Akron, so that the company has become the largest bus operator in Ohio and one of the largest operators in the United States. In every way possible the company has developed bus transportation. It has done this not only in its own interest but in the interest of all Akron as well, since that is what Akron apparently desired. That which has been accomplished is the result of united effort. The people of Akron aided materially, first by gladly voting for a progressive franchise, and, second, by the application of a proper supporting spirit.

Traffic conditions in Akron are becoming worse as the years go by. Demands are certain to become heavier on the city's transportation system. A committee of citizens—men who desire to see advancement—undertook several months ago to investigate the company's transportation system thoroughly and to study the city's future needs and requirements. This report is said to be nearly ready. Officials of the company pledge their continued co-operation.

Out of Akron ought to come a tale of experience of benefit to the entire industry. Certainly if nothing is permitted to mar the spirit of friendly co-operation which has been so much in evidence the last four years, a new operating contract ought to result with terms based on a period of experience under new conditions and leaving very little chance for controversy in the future.

Co-ordination Gaining Favor Abroad

WHEN the Board of Estimate in New York City was debating recently the relative merits of competitive vs. co-ordinated bus operation in connection with the Equitable proposals, there may have been those who thought the problem a purely local one. Actually the same question is alive in many other cities both here and abroad. For example, there is the situation in Havana, which was discussed in detail in the Oct. 27 issue of the JOURNAL. This seems to have a counterpart in Buenos Aires. According to a paper presented at the local branch of the Institute of Transport in that city on June 21, 1928, it appears that serious evils have followed unregulated competition in the Argentine capital, where for many years the subways and street cars had a monopoly of public carrier transport. Instead of advantage being taken of the possibilities of the bus for special service, independent buses have been allowed to confine their operation almost entirely to the more congested city districts, where patronage was greatest but where the existing facilities were adequate to care for the business offered. The result has been too much service in some parts of the city and not enough in others, unsatisfactory returns for all carriers, and a demand from traffic experts for the consolidation of all lines into one company.

In European cities the unified system is becoming more and more usual. Just this past week dispatches from Berlin told of final accomplishment of the long-pending consolidation of rapid transit, surface car and bus lines. Reports from London are to the effect that negotiations are progressing favorably for the operation of the municipal tramways by the present bus and rapid transit combine. In Paris the buses and surface cars have been under one management from the beginning. Thus it goes. On every hand co-ordination is being found to be the best policy.

Charter Bus Service a Means of Learning Passengers' Desires

EXECUTIVES of electric railways who have encouraged the use of buses in charter service, even if they have gained nothing else from the venture, at least are in an excellent position to study the requirements of their regular patrons from a point of view otherwise denied to them. What the well-intentioned patron wants in the way of car service can be learned from the demands of a group of passengers seeking chartered bus service. The best viewpoints can be obtained when the company has several different types of buses which it is prepared to charter at various rates.

The agent in direct charge of charter service is in an excellent position to study passenger psychology and estimate its bearing on general passenger requirements. To him come people of a class who obviously are seeking something which, while not expected to possess the individuality of the private automobile, is superior to the regularly scheduled car or bus. What they seek may be termed de luxe mass transportation. If the chartered bus fulfills their requirements, it is interesting to determine which points of superiority commend it. If a choice is made among several types of equipment, the reasons for that choice are of great value. Is economy or comfort a deciding factor? Is the passenger willing to pay more for mere appearance, other things being equal? Is expense really much of an object if the passengers get what they want? Is speed the most important factor or is safety the first requisite? Is there a preference for any type of seat, any type of finish of interior, and so on? For instance, if there is a general preference for the bucket type of seat and for leather or plush upholstery, it is quite evident that the stiff-backed, rattan-upholstered seats or the wood slat seats such as are used in many street cars are not highly regarded by the patrons. If complaints are made after the trip that the passengers were cramped in their seats or that the buses are poorly sprung or are poorly ventilated, such information is of value and can be turned to good account the next time an order is placed for rolling stock. It may even lead to modifications of the present equipment.

While there will always be a difference in attractiveness and comfort between a mass transportation vehicle and a de luxe one, a study of passenger preference will make it possible to eliminate many features considered objectionable by the patrons and incorporate others considered desirable, when it can be done at a cost commensurate with the service the vehicle is to render. In obtaining such opinion there is no means more direct or more satisfactory than to heed the demands of the users of chartered service.

Faster and Faster

SECONDS, not so long ago, were considered almost negligible units of time. Even minutes held no great interest for a comparatively slow-moving age. The people were not accustomed to rapid means of transportation and did not think of their trips to town or to work in terms of so many minutes and so many seconds. However, the "Good Old Days" are now past history and a new demand has been created—a demand for speed. How usual it is to hear someone say: "It takes me two minutes to reach the subway station, about a half minute to catch a train, from eighteen to nineteen minutes to reach Utopia Avenue and another nine minutes to reach the office by taking a crosstown trolley." Just as the public now measures its traveling time in minutes and fractions of minutes, so must the transportation man measure his service in smaller units of time.

Countless suggestions for increasing the speed of cars have been made. Many of these have been impracticable or have involved elaborate programs costing enormous sums. Perhaps the most helpful recent outline of ways and means of increasing speed is that prepared by the service betterment committee of the T. & T. Association. Although the suggestions are fundamental and not intended to be applicable to all properties, they cover almost every possible time saver and hold many practical suggestions for any company. Increasing the proportion of time during which cars move at maximum free running speed by reducing the number of passenger stops, locating the others scientifically and regulating traffic properly are ways of shortening running time. Another is to reduce the duration of stops by using the most efficient method of fare collection and designing the cars to aid passenger flow. Better equipped cars, a properly designed track layout, a reliable power system and sufficient emergency and wrecking facilities also are necessary elements. The final and probably most important suggestion of the group is to train car operators to use to the full every opportunity for saving time. A summary of these suggestions appears elsewhere in this issue.

Faster and faster is the urge of the present day. Electric railway managements notice it on all sides and

Digitized by Google

realize that unless speed can be obtained that is comparable with the speed of other modes of travel available today, difficulty will be experienced in retaining their present patrons. For this reason they will undoubtedly welcome the excellent report prepared by the committee on service betterment and will study it carefully with the aim of putting the ideas into practice on their own systems. Delays can be lessened and the over-all running time over routes reduced to the satisfaction of the passengers by taking advantage of the efforts of the executives who composed the report.

Counsel from Caledonia

SCOTCHMEN are world-renowned for thrift. They do not spend a penny wastefully. They are sometimes thrifty to the extent of being parsimonious, if one can believe popular tales. Yet the City of Glasgow has just been installing upholstered seats on all of its street cars; moquette on the lower deck and genuine leather on the inclosed upper deck. The wooden seats just discarded were as good as wooden seats can be. They and their predecessors had answered all requirements in Glasgow since street cars had run in that city on the Clyde. But in this day and for this generation they sufficed no longer. The automobile in its various forms was responsible for the change. As in other cities, the traveling public had become used to the upholstered seats on private cars and buses. The tramway receipts began to fall off. It was to meet this competition that the Glasgow trams were modernized with more comfortable seats and in other ways at a cost of nearly $5,000 per car.

Utilities in American cities that have not yet realized the need for meeting modern conditions can well consider this example. Automobiles are less expensive to buy and operate here than in Scotland and consequently are much more common. The average American is a spendthrift in matters concerning his personal comfort. In this particular, he is the antithesis of the canny Scot. Will electric railway companies here keep any considerable portion of their patronage if they continue to operate antiquated, slow and uncomfortable cars? The answer is that they cannot, when other means of transportation are available to the traveling public. Many railway companies understand the need for better service, but too many obsolete cars are still being used.

Making the Best Use of Available Information

COMMENDABLE indeed is the attitude of the committee appointed by the National Educational Association to investigate the use in schools of publicity material supplied by propaganda agencies and other organizations. The chairman of this committee, Dr. Edwin C. Broome, superintendent of Philadelphia schools, takes a moderate and unbiased position. He says that:

"There has been a growing tendency since the war, throughout the United States, to bring into the public schools of the country enterprises which, while they may be good in themselves, are not so sufficiently educational in value that they should be allowed to interfere with the plan and purpose of the public schools. Some of these enterprises are out and out advertising schemes. Others are propaganda, some good and some bad. Some are efforts to use the schools to raise money for various enterprises which may be good in themselves, but raise the question as to whether the public schools which the children are compelled to attend by law, should be fields for money raising or projects outside of the activities of the school."

The expressed purpose of the committee is to study constructively the question of how schools can bring themselves into closer touch with everyday life through the proper use of the vast amount of material which various organizations and agencies now have available for school use. The committee will endeavor to outline the principles which should guide school officials and teachers in using such material so that the children may be protected from onesided viewpoints and from exploitations for advertising purposes.

Certainly no reasonable person can take exception to this. Least of all will the electric railways raise any objection. The committee recognizes the desirability of bringing the schools into touch with everyday life—in which nowadays the public utilities play so important a part. That, indeed, is all that any one can ask.

Taxi Regulation Needed in Public Interest

DEFINITE suggestion that regulation of taxi-cabs is needed was made at the recent meeting of the National Association of Railway and Utilities Commissioners at New Orleans by President J. P. Barnes of the American Electric Railway Association, as told in the report of the meeting printed elsewhere in this issue. That the JOURNAL is heartily in accord with this suggestion was indicated by an editorial published in the issue of Nov. 10.

Of course, the inference is quite natural that street railway men have a selfish interest in the regulation of the taxi business. But their interest is not entirely a selfish one. Taxis operated by responsible, organized companies are not serious competitors of street cars. They render an entirely distinct class of service at a different level of rates. It is when cut-throat competition by more or less irresponsible operators forces taxi rates below the cost of giving service that the taxi deteriorates into little more than a jitney and invades the field of the mass transportation vehicle. This form of competition, though experienced in a number of cities, has so far done little serious harm to the street railways. It threatens to prove far more serious to the taxi business itself than to the other carriers with which taxis may compete.

It seems reasonable, therefore, to point out that suggestions of the need for regulation of taxi-cabs, coming from the street railway industry, are not dictated entirely by selfish motives. Although it is beyond the scope of this discussion to go into the details, it could be demonstrated readily that regulation would be extremely desirable from the standpoint of existing operators and manufacturers of taxi-cabs. It would exert a stabilizing influence, the lack of which has produced a high mortality rate in the taxi business during recent years. But above all, regulation is needed from the standpoint of the public interest. Reliability and responsibility of management soon break down under the influence of unregulated competition. Duplication of facilities and service produces inefficiency and waste. Then again, the cruising taxi, intent on picking up the stray passenger before a competitor sees him, is a large element in the traffic congestion on present city streets. These and many more factors indicate that the question of regulation is indeed a matter of public and not private interest.

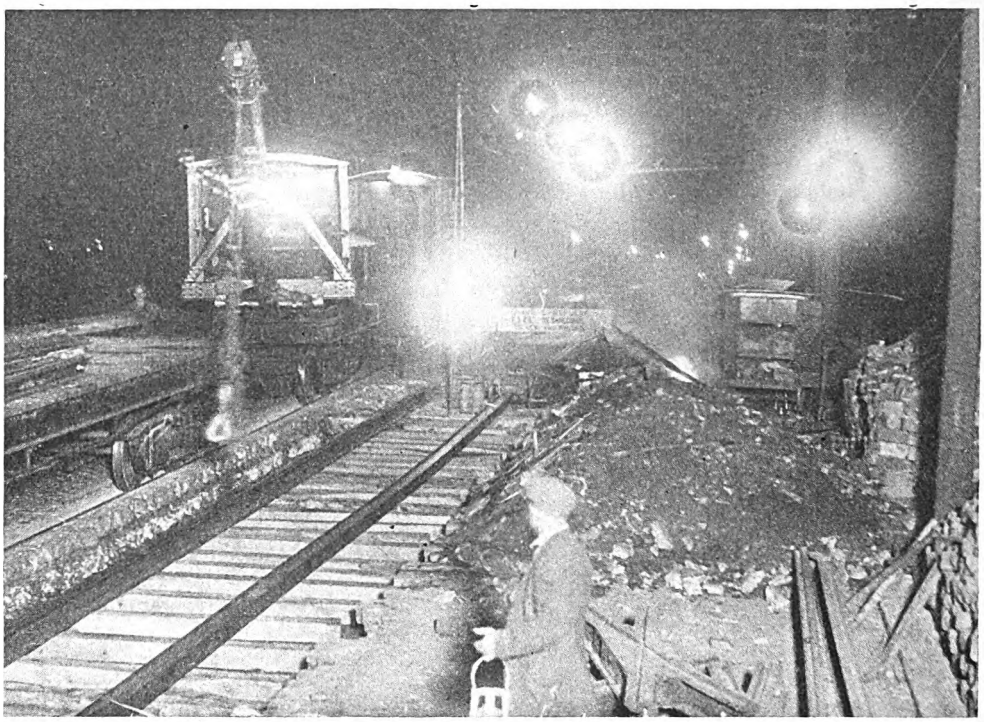
Buffalo Railway Invests Heavily in Street Improvements

I.R.C.'s reconstruction program is co-ordinated with the city's repaving program. New standards of track construction adopted for extensive program



Much of the reconstruction work in Buffalo is being done at night

RECONSTRUCTION of tracks and paving in the city of Buffalo has progressed rapidly. The International Railway, under Mitten management, mapped out a program for the current year involving an expenditure of $375,000, an amount 50 per cent more than the sum spent last year and more than has been spent for the past five years. In addition $400,000 is being spent this year, as was spent last year, on track and paving maintenance, bringing the total cost of the street improvement program to a point where it absorbs 7 cents of every dollar collected in fares, a limit beyond which the company does not feel it can go under present rates.

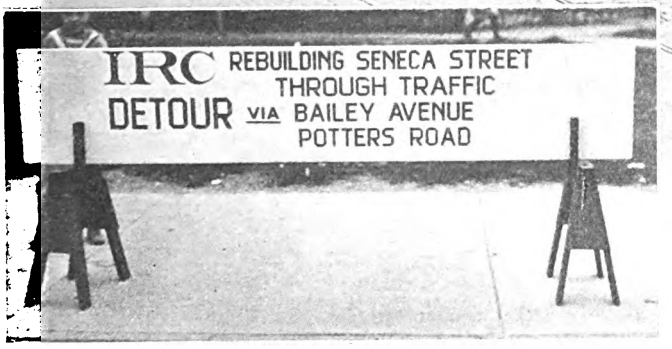
Several interesting features distinguish the International Railway program from the average job of this kind. In the first place, after the amount of money available has been determined, the streets on which it is to be expended are decided upon in a conference between city and company officials. The company does not arbitrarily make its own decisions regardless of the wishes of city officials or of civic associations. The importance of each street on which reconstruction is needed is considered carefully from the standpoint of general traffic as well as of street railway service. Thus, every interest is considered and the company's reconstruction program is co-ordinated with the city's street repaving program. This co-operative development of the track and paving reconstruction program has created much good will.

As soon as the streets to be repaired in 1928 were selected, the program was announced in the newspapers. Since the original announcement every effort has been made to keep the public informed regarding the progress of track and paving reconstruction and regarding the features that limit the company's ability to do such work. A part of this program of informing the public was the publishing in newspapers of weekly progress reports.

As each job was begun, a public relations representative of the company called on every resident and business man in the section, outlining the details of the company's arrangement for that particular job and assuring them that every effort would be made to minimize inconvenience. Much favorable comment followed this procedure.

Digitized by Google

On some of the narrow streets the space for storing material is very limited



Traffic is diverted to other streets wherever possible to avoid congestion on streets being repaired

Similar information was given to the business associations in the various communities effected, with the result that the closest of co-operation was developed between these organizations and the railway. So favorable an opinion was created with one business men's association in whose district reconstruction was under way, that a resolution was passed unanimously urging that street railways be relieved of the paving obligation inherited from horse car days.

Signs Inform Public of the Railway's Track Activities

Although the International Railway had been spending large sums for maintenance in years past, it was discovered that little was known about this phase of the company's work. To keep the public informed, the company began last year to post signs at each location where track repairs, however minor, were under way. These signs read "Drive carefully, I.R.C. repairing track and paving." They were placed in all sections of the city where large or small gangs of company workmen were carrying on track or paving repairing. Favorable public reaction followed almost immediately.

The same idea was applied to the reconstruction program, except that large buckboard signs were employed. These signs read "Drive carefully, I.R.C. rebuilding track and paving." In co-operation with the Automobile

Cross-section of the new type of track construction adopted by the International Railway

Digitized by Google

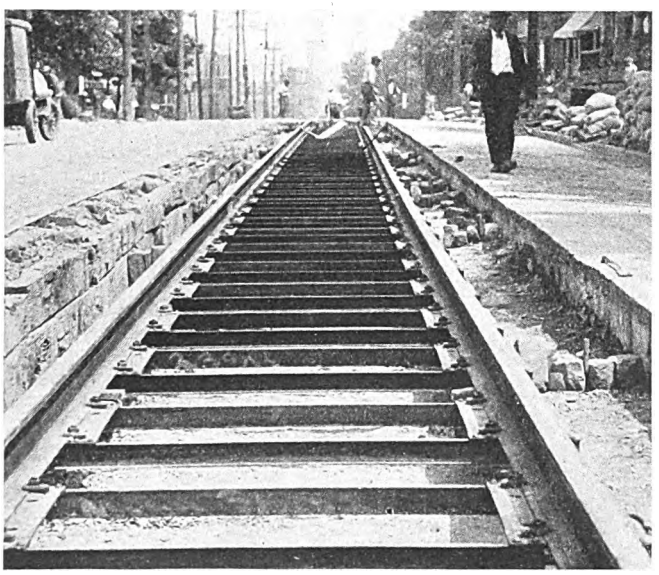
Club of Buffalo, detour signs were posted at dangerous points, greatly reducing the amount of traffic through the areas under construction.

Railways in New York State are required by law to pave the area between the track and 2 ft. on each side. The total width of pavement, therefore, including a 5-ft. devil strip for which the railway is responsible, is 18 ft. 11 in. In a 49-ft. street the cost of the railway track and paving work is approximately 47 per cent of the total street improvement. This information is conveyed to car riders and to the public generally through buckboard signs and through ceiling signs displayed in the company's cars.

Bringing the track into line before pouring the concrete base

Most of the existing trackwork in the city of Buffalo is of grooved girder rail construction with blockstone between the tracks and in the devil strip. However, an improved type of construction, involving many changes in the old specifications, has been adopted for the work now under way. Among these changes are the use of T-rails, steel ties, Thermit-welded joints and asphalt pavement between the rails in place of blockstone.

International steel ties are being used on all new track construction work. They are being placed 6 ft. apart. The company is laying its rail on a concrete base, the distance from the ballast base to the top of the asphalt paving being 15 in. The concrete layer is 11½ in. thick.



Assembled track, aligned and ready for the concrete base

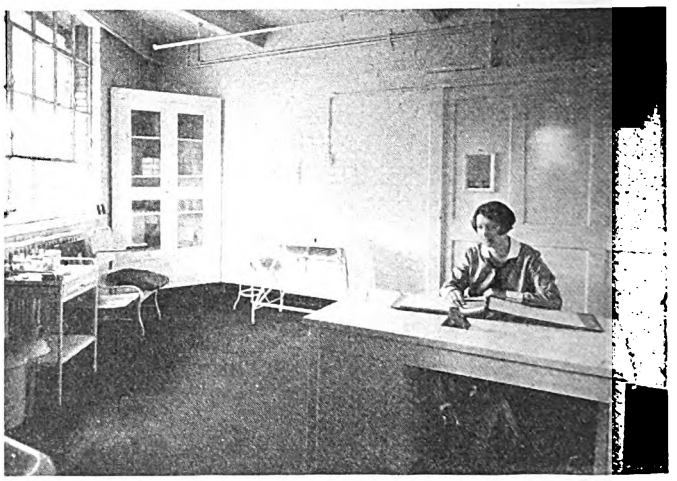
View of Seneca Street with the track reconstruction about completed. The sign calls attention to the fact that the I.R.C. is paying 47 per cent of the total cost

Over this is a 1½-in. layer of binder and a 2-in. layer of asphalt. The T-type rails being used are of standard gage, weigh 102 lb. and measure 7¼ in. high. All joints are Thermit welded, making one continuous rail. The devil strip between tracks is 4 ft. 6 in.

Asphalt is being used for street surfacing between rails in place of the old blockstone pavement, but a single row of the stone is placed for toothing on the outer rail of each track. The asphalt gives a far smoother surface between rails than the old blockstone paving and it has been made standard on all new work which is being done by the company.

At important intersections where special trackwork is required, such as crossovers, switches, etc., the International Railway uses night shifts to speed up the construction program and to eliminate delays caused by daytime traffic.

Medical Dispensary a Shop Feature



A corner of the carpenter shop closed off by the erection of tile walls provide the Kenmore shops in Akron with a simple, yet adequate, medical dispensary

WITH the fitting up of a corner of the carpenter shop of the Kenmore shops of the Northern Ohio Power & Light Company, Akron, Ohio, as a medical dispensary and first aid room, a new feature has been added. Two tile walls have been built in one corner to form a room 18x14 ft. The ceiling and walls have been finished with a high gloss, hospital white enamel; the floor has been covered with a brown and yellow fibre tile.

First-aid treatment is given at this dispensary and provision for the handling of necessary later surgical dressings has also been made. Medical supplies for the emergency first-aid kits used all over the system are stored at this centralized point.

Horse-and-Buggy Speed

Will Not Do Today

Scientifically located stops, increased frequency of service, headways, traffic regulations, fare collection, better equipment, instruction of trainmen—all deserve consideration by electric railways from the standpoint of time saving

CONGESTION, inadequate traffic regulation, slow-moving trucks and wagons, and street cars are among the principal hindrances to traffic movement in large cities. The remedies in the cases of the first three apparently are radical ones, but the street car is physically capable of higher speeds—of such speeds as are regarded safe on city streets—and need not remain in this category of delay producers. Every increase in the over-all speed of the street car, it should be remembered also, will automatically speed up the flow of all vehicular traffic, and thus make possible easier and still faster street car operation. With this foreword, the committee on service betterment of the American Electric Railway Transportation and Traffic Association introduced a report that is a "mine" of ideas for increasing the speed of operation.

Many ideas have been advanced previously, but most of them have been more or less impracticable and have involved too great cost. The underlying thought in the suggestions in this report was to present ways and means of reducing the running time which could be easily effected and which involved no great expenditures. An abstract of this report was published in the Sept. 29 issue of the JOURNAL. The subject is one of such interest and importance, however, that a more comprehensive treatment of the report appears warranted.

The foreword of the report is followed by a brief editorial treatment by the committee on the subject, after which the sources of increasing speed are outlined. The rapidly developed competition which the railway industry is facing from the low-priced automobile and the public's demand for better service has created a need for a definitely improved type of street railway service rather than for a superficial refinement of the old. The American people no longer marvel at the space-annihilating inventions of the Twentieth Century, such as the radio and motor vehicle, and have become impatient with anything which does not compare favorably with the newer means of travel and communication. With transportation revolutionized in the past ten years, it is absurd to attempt to place in competition with the new modes of travel the same railway equipment and operating policies which were considered the last word in "horse-and-buggy" days. The street car operating at 9 m.p.h. was an immense improvement over the horse-drawn vehicle traveling at 6 m.p.h., but this speed cannot compete with the average of 12 to 15 m.p.h. easily attained by the ordinary automobile of today in traffic. People who are accustomed to averaging 12 to 15 m.p.h. through city streets in their own cars object to the relatively low speed of the street car. The consequence is that street railways continue to lose their patrons to the motor vehicle.

With the market already flooded by low-price, speedy automobiles within the reach of almost every citizen, and with a veritable deluge in the offing, the street railway industry, if it is to regain its former pre-eminence as a means of mass transportation or even to maintain its present position, must supply a service which satisfies this demand of the public for rapid riding.

Sources of Speed Improvement

It cannot be too strongly emphasized that the problem of securing faster operation covers everything that happens to a car between terminals. Approached with this idea, the analysis discloses four main sources of speed improvements: (1) Increasing the proportion of car-run time during which cars can move at a maximum free running speed, and by making full use of such time; (2) reducing the time spent at stops; (3) installing superior mechanical equipment, and (4) training car operators to utilize to the full, opportunities for increasing speed. The means of increasing time during which cars can move at maximum free running speed may be classed, in turn, under the headings: Reduction in number of passenger stops, scientific spacing of cars and location of time points, and traffic regulation.

Reduction in Number of Passenger Stops

Continuous motion at top speed between terminals is neither a practicable nor a desirable ideal, but reduction in the number of passenger stops is not only feasible but is an important means of increasing speed of operation. In eliminating stops in congested areas, however, it must in all cases be remembered that here the short rider is found, and that if forced to walk in search of a stop he may continue walking to his destination.

Stops to take on passengers can be reduced in number in two ways—directly, by eliminating stopping points, and indirectly, by increasing service. Several methods of eliminating stops have been successfully used in various circumstances. Though reference is made hereafter to the "skip-stop" plan, the "staggered skip-stop," etc., the public use of such terminology is not recommended. The terms are used here for the sake of clarity, but it is believed some other terminology should be devised which would not suggest the idea of less convenient service.

Relocation of Stops—Speed of operation can be increased by reducing the number of fixed stopping points and relocating them at so many per mile. These stops

Scanlon, Northern Ohio Power & Light Company; D. A. Smith, Department of Street Railways of Detroit; Charles H. Strong, Georgia Power Company; J. C. Thirlwall, General Electric Company; W. E. Thompson, Third Avenue Railway; Claude L. Van Auken, Electric Traction, and C. W. Wilson, Pittsburgh Railways.

need not necessarily be evenly spaced, but should be located at sites which scientific analysis indicates will serve the maximum number of passengers.

Skip-Stop Plan—Some cities have increased car speeds by using a skip-stop peak operation, while making all stops during off-peak hours. Under this plan all stops are made during the off-peak hours, and only every other stop during rush hours. Operation during congested periods is thus automatically speeded up. Use of this plan in off-peak hours is possible, but is unnecessary because many stops are not actually made.

Staggered Skip-Stop—This plan is similar to the skip-stop arrangement except that during the peak hours and in the off-peak hours, if desirable, a stop is made inbound at one stop and outbound at the next. Any inconvenience to car riders is equalized by this scheme.

Express Street Car and Local Bus Operation—Express service, with local bus operation in support, is under experiment in more than one city. Generally, the street cars, being the more economical means of mass transportation, are operated on express service supported by bus operation for local stops.

Express Street Car and Local Street Car Operation—Another type of express service is a combination of local and express cars on the same tracks. Such service is suitable only in territory where present headways are not too short and where a fairly infrequent local-car service can be applied.

Reducing Stops by Increasing Service—It is possible to increase average car speeds by providing a shorter headway between cars. Putting more cars on the routes means less passengers per car, and consequently, decreases the number of stops which each car has to make, and also the time spent at stops, since fewer passengers board and leave each car.

Frequency of service can be economically increased through the operation of one-man cars. To realize to the full the increased speed potentialities of such one-man operation, it is essential that the most efficient car equipment possible be used.

Scientific Spacing of Cars and Location of Time Points

To realize on the maximum speed possibilities afforded by the free running time, a system of car spacing is essential. Time points and spacing signals are the devices generally employed to space cars. In this connection some success has been had with dispatching.

Time Points—It is unsound to locate time points in an arbitrary manner, rather than in accordance with the carefully analyzed requirements of a situation. The effect of too frequent time points is to slow down cars. A technical study of each property should identify those elements which retard speed and disclose opportunities for securing faster speeds over certain portions of the runs. Traffic conditions vary widely over a city. Even near-by streets differ greatly in traffic density and, consequently, in speed of traffic. The physical barriers to speedy operation met on certain thoroughfares, such as steep grades, small radius curves, congested throats, frequent intersections, etc., should all receive consideration in the selection of time points.

Spacing Signals—Automatic, electrically operated signals, properly located, can be used to keep cars properly spaced and to enforce adherence to schedules. When spacing signals are used, cars are dispatched at regular intervals and the automatic changing of lights along the route from red to green informs the operator as to whether he is ahead or behind schedule.

Headway Recorders—When the effort to maintain equal spacing of cars is confined to the use of a definite schedule and of inspectors for handling emergencies, the apprehension of incipient trouble is not usually possible, inasmuch as the inspection forces are limited in number in comparison with the territory which must be covered.

By means of certain mechanical devices for recording headway, it is possible to obtain an indelible record of the cars passing and of the time of their passing a certain point. These devices make possible a centralized control of car spacing, and detect incipient service failures much earlier than is possible by a system of personal inspection.

Decreasing Running Time—On routes where increased service is not warranted by the traffic, and where, consequently, slow running time is provided, it may be advisable to provide faster movement, to reduce the actual running time and provide a cushion in the form of longer layovers to absorb delays.

Traffic Regulation An Important Factor

Proper traffic regulation, which makes possible more advantageous use of thoroughfares, is an important means of securing faster car operation.

Traffic Control Signals—The stationing of a traffic officer or the installation of electric "Stop" and "Go" signals on congested streets will usually expedite traffic movement, provided adjustment to the respective volumes of the intersecting traffic lines is made. In busy sections, the installation of some co-ordinated signal control system may prove successful, as it has in several cities. However, if the traffic volume does not warrant signals, and if the signals installed are not some form of the co-ordinated type, they may prove an obstacle to rapid traffic movement.

vehicles, and in giving the street cars the right of way over other traffic by changing signals at proper moments, will expedite car operation. Lights to signal the officers that the car is ready to go could be used to advantage in this connection.

Parking Restrictions—Traffic authorities are agreed that the street space now available is not used to the best advantage and that economic losses result from the unnecessarily retarded traffic movement. Primarily, streets are constructed for moving traffic, so that their use for storage purposes should be allowed only when such use does not interfere with traffic. Consequently, in congested districts parking should be restricted. On the very busiest thoroughfares it may be necessary to prohibit parking entirely during the day. This may arouse opposition among merchants and automobile owners, but an educational campaign may be conducted to show the advantages of parking prohibition.

Heavy Merchandise Loading—The restriction of heavy loading on congested streets to certain hours of the day or night or to adjacent alleys should eliminate many unnecessary delays. End-gate unloading from vehicles backed at right angles to the curb should never be permitted on busy streets, as this practice interferes with all traffic on the street. Heavy commercial operations, such as the delivery of coal and other bulky material and the collection of garbage and rubbish, could be restricted, with advantage, to the night hours.

Segregation of Traffic—The segregation of types of traffic is worthy of consideration. In all probability only partial segregation is possible at present, including prohibiting the use of the more important thoroughfares to certain types of vehicles during the rush hours.

Terminals—Underground, elevated, or street-level terminals may be advantageous in congested areas of some large cities. These would allow centralized control and dispatching of cars and, by taking cars from the congested streets, would eliminate many traffic delays.

Prepayment areas, equipped with turnstiles, can be used to expedite loading at terminals and at parks and on private rights-of-way. Since fares are collected at the areas before the car arrives, passengers enter the cars without delay. Provided these areas are equipped with exit facilities, they may be used for unloading purposes, as well, thus speeding up "pay-as-you-leave" car movement.

Street Car Loading Zones—The creation of street car loading zones, with proper traffic regulations in support to allow by-passing, should relieve congestion and tend to increase the speed of street car operation. Car loading is facilitated by loading zones, since they enable patrons, unhindered by passing automobiles, to be at the doors of cars when they come to a stop.

Protection of Important Street Car Arteries—Cars can be operated with safety at higher speeds when regulations protect street car arteries from sudden intrusions of cross-street traffic. The boulevard-stop plan, requiring all traffic to come to a complete stop before entering certain thoroughfares, will give this protection.

Means of Reducing Time Spent at Stops

The second large source of time saving is found in the passenger stop. Cars cannot be in motion at all times. They must stop to take on and let off passengers. The elimination of waste motion at the stops which have to be made is therefore an integral part of the general problem of increasing speed.

The loading and unloading of passengers is a factor in this phase of the problem which offers great opportunity for time saving. The problem of handling passengers

Digitized by Google

divides itself into the sub-problems of fare collection, the provision of facilities which expedite passenger flow, and berthing.

Collection of Fares

Advance Sale of Fares (Ticket, Token, Pass)—Wherever possible, passengers should be induced to buy tickets or tokens in quantity. This practice could be encouraged through publicity and by allowing a sufficient differential between the cash and the token or ticket fare. Some properties are using the pass in various forms—weekly, Sunday, holiday, etc. It has been found to be an agent for expediting movement of passengers through the elimination of cash and transfer transactions between operator and passenger.

Odd-Cent Fares—A great deal of delay at stops is caused by change-making transactions. This source of delay cannot be eliminated entirely, but much can be done to make these transactions as simple as possible.

Hand Registers—Hand registers sometimes continue in use more because of precedent than because of their actual value. The time losses for which they are responsible should be fully realized, and, where feasible, more modern registration devices should be installed. Hand registration can in some instances be abandoned without loss.

"Pay-As-You-Pass" Collection—On center door cars, a "Pay-As-You-Pass" fare collection has been found in some instances to speed up the handling of passengers.

"Pay-Enter" and "Pay-Leave" Collection—The system of "pay-enter" collection on cars inbound to the business center and "pay-leave" collection on outbound cars has reduced delay in many cases by distributing the work of the fare collector over the line rather than concentrating it at the busy terminal.

Motormen as Fare Collectors—Motormen on two-man cars can sometimes be utilized to inspect passes, collect exact fares and transfers.

Street Collectors—Passenger movement may be expedited in congested districts by having unattended doors of one-man cars and the door at the motorman's position on two-man cars attended by a fare collector, at least for transfer transactions.

Queue Loading—Queue loading has been used at certain heavy loading points to speed up passenger loading, particularly at factories. This method allows only one passenger to enter the car at a time and also reduces the number of accidents and fare losses.

Car Body Design—To Aid Passenger Flow

The design of some types of cars has been a direct hindrance to the expeditious handling of passengers rather than an aid. If increased speed is to be obtained it is essential that all parts of a car should be designed to contribute to the rapid handling of passengers.

Doors—Doors should be placed where they facilitate ingress and egress, should be adequate in width, and should be equipped with devices that make quick operation possible. The feasibility of eliminating doors entirely, as has been done in several instances, is also worthy of attention.

The over-emphasis on safety is particularly noticeable in the case of door operation. On many properties, the doors are kept closed until the car comes to a stop and they are closed before cars are started again. In some instances interlocking devices have been installed, making it impossible to operate cars with the doors open.

Investigation would probably show that accidents due to open-door operation are negligible. The gain in speed which should result from such operation makes its use a matter deserving of careful attention, especially in congested areas where frequent stops are made.

Space Around Fare Box—A large open floor space around the fare boxes is conducive to the expeditious handling of passengers at heavy loading points.

Berthing—Some cities have speeded up car movement by berthing their cars at stops or by providing parallel loading tracks at heavy loading points. Under these methods a car does not have to wait until the car or traffic ahead moves on before it can receive or discharge passengers.

Position of Stops Affects Speed

Different traffic conditions and street situations require different stop locations. Stops may be located at the near or far side of an intersection (i.e., just short of the crossing or just beyond it) or in mid-block.

The Near-Side Stop—The near-side stop is preferable in most instances since in general it offers less interference to traffic and eliminates unnecessary stops. At practically every street crossing traffic proceeds in four directions, with vehicles turning constantly from one line of traffic into the lines moving at right angles to it. Since the near-side stop halts only one of these lanes and backs this traffic up within the block instead of the intersection, the other three lanes are free to proceed. At many intersections cars have to stop in any case at the near side of the crossing, either because of traffic control or because of cross traffic; therefore, at ordinary crossings it is believed to be unwise, generally, to locate the car stop at any other position, thus frequently forcing a car to stop twice in a block.

The Far-Side Stop—Stops at the far side of intersections are particularly suitable where streets or car lines diverge, for these stops enable traffic bound in a direction different from that of the loading car to proceed on its way without delay. If traffic is heavy, however, a line of traffic may extend across the intersection, thus stopping both traffic lanes. At "Y" intersections and on streets of adequate width to permit vehicular by-passing, this objection is not serious.

Mid-Block Stops—The mid-block stop can be used in light traffic sections to make one stop take the place of two located at both ends of the block, or in special circumstances, as when street or track repairing is under way. With this type of stop, however, it is frequently necessary for traffic to stop at the ends of the block also in cases where traffic is controlled or where cross-street traffic is heavy. Moreover, the mid-block stop tends to increase jay-walking, which many cities are attempting to eliminate.

Superior Equipment a Means of Increasing Speed

The discussion so far has dealt primarily with ways and means of securing superior performance out of present equipment. It is believed that perfect performance of this equipment will be found inadequate to meet the stiff automobile competition, and that fast, lightweight, strictly modern cars, more power, and better maintenance are necessary, also, to enable the railway industry to maintain its position, not to speak of winning back lost ground.

Motive Power—Ample motor capacity, with a proper gear ratio to enable a car to take and keep its place in fast-moving traffic at all times during the day, is essential.

Digitized by Google

To prevent automobiles from getting ahead of cars after a traffic stop, and thus from swinging onto the tracks and blocking rail traffic, the cars must be equipped to accelerate at least as rapidly as the automobiles.

Braking—The attainment of faster speeds must be accompanied by corresponding developments in deceleration. For cars to maintain high speeds between stops, brakes must provide rapid deceleration. The increased hazards developed by increased speeds must be counteracted by superior braking. In this connection, variable load, dynamic and magnetic braking, and other devices are in operation and are being further developed.

Warning Signals—Instead of the traditional gong, up-to-date warning signals operating by air or electricity may be installed. These signals can be heard above the din of present-day traffic, and should aid materially in moving the cars over congested streets.

Track Layout—Improper track layout and poor maintenance create delays which slow down car movement. Non-clearance curves and improperly located sidings on a single track make it physically impossible to maintain fast schedules. Switches that give the crews trouble in throwing, bad curves, run-down special work, and low joints in particular make low speed necessary. Hand signals should be replaced by automatic signals, so that operators need not leave their cars to operate them. Automatic switches should also be installed wherever possible.

Emergency and Wrecking Facilities—The effect of higher speeds will be occasionally lost unless an efficient emergency and wrecking service is available to keep the tracks open in case of breakdown or blockade. Adequate maintenance and inspection of the cars and overhead lines, by decreasing breakdowns, will aid in keeping the cars on schedule.

Increasing Speed by Educating Car Operators

Training for Speed—Car operators must be trained to take advantage of every opportunity for rapid operation, if the full possibilities of increased speed are to be realized. In the past, safe handling of the cars and safety in general have at times been over-emphasized and the need of reasonably rapid operation has been unduly subordinated.

To obtain the full benefits from the measures and methods proposed for securing decreased running time, it will be necessary to impress upon the trainmen the importance of greater speed and convince them that it can be obtained without sacrificing safety. Confidence in the ability of the brakes to stop the cars in emergencies must be instilled in the operators' minds. They must receive training in the rapid acceleration of cars, so as to enable the cars to start at "GO" signals before other vehicles, and to remain ahead of them between stops.

Improvement in the handling of passengers can be secured if the platform men are trained to call stops clearly and in advance, to supply information in a courteous manner concerning the use of doors, the importance of moving up into the cars away from the platform, etc.

Trainmen as Salesmen—The platform men are the salesmen of the railway industry, the medium through which personal contact between the management and the public is made possible. In order that they may contribute intelligently toward the solution of the problems facing the industry, such as speed, they should be acquainted with the facts of operation.

Instruction in courtesy, cleanliness, loyalty and honesty is essenital, but for the men to be in position to co-operate most effectively with the management, they must also be informed concerning its problems. When the trainmen understand the competition which the street railway industry must meet from motor vehicles, and the necessity which has been forced upon it to increase the speed of its operation, then these trainmen will utilize those seconds of delay, which, soon mounting up into minutes, now cause the street car to lag so far behind the automobile.

Schedule Testing Crews — Something beyond mere planning for speed of operation and endeavors to sell to trainmen the idea of speed is necessary to secure complete and uniform accomplishment. The years of relatively slow operation have imprinted in the minds of some train operators rather permanently the idea that speed such as is necessary will be difficult to attain. A corps of engineer-operators or expert trainmen who are available, when the study of a line indicates that a certain speed can be maintained, to take over the line and by actual operation demonstrate the feasibility of the schedules suggested, would without doubt form a highly effective means of increasing speed on a system.

Mitten Tours Open Additional Terminal

Auxiliary terminal for Mitten Tours at 1432 Market Street, Philadelphia

TO CARE for its growing long-distance motor coach business the Philadelphia Rapid Transit company recently opened another terminal and waiting room at 1432 Market Street, Philadelphia. This location, which is adjacent to the Mitten Bank, is opposite the Broad Street Station of the Pennsylvania Railroad Company and close to the City Hall. The main terminal at Broad and Locust Streets will continue, but all buses for New York, Atlantic City, Washington, Wilmington, Doylestown and Valley Forge will stop at the new terminal on their way in and out of the city. A complete information bureau will also be maintained here and tickets will be sold to all points served by the extensive Mitten Tours system.

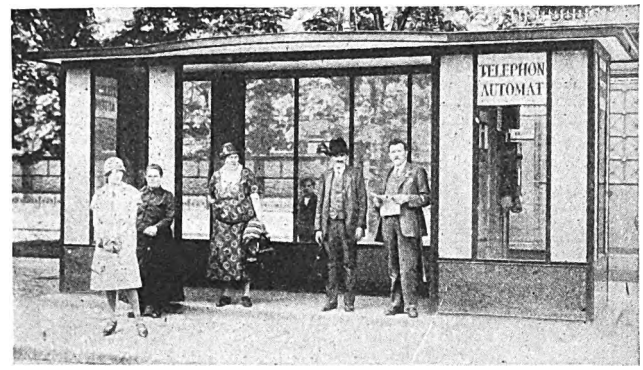
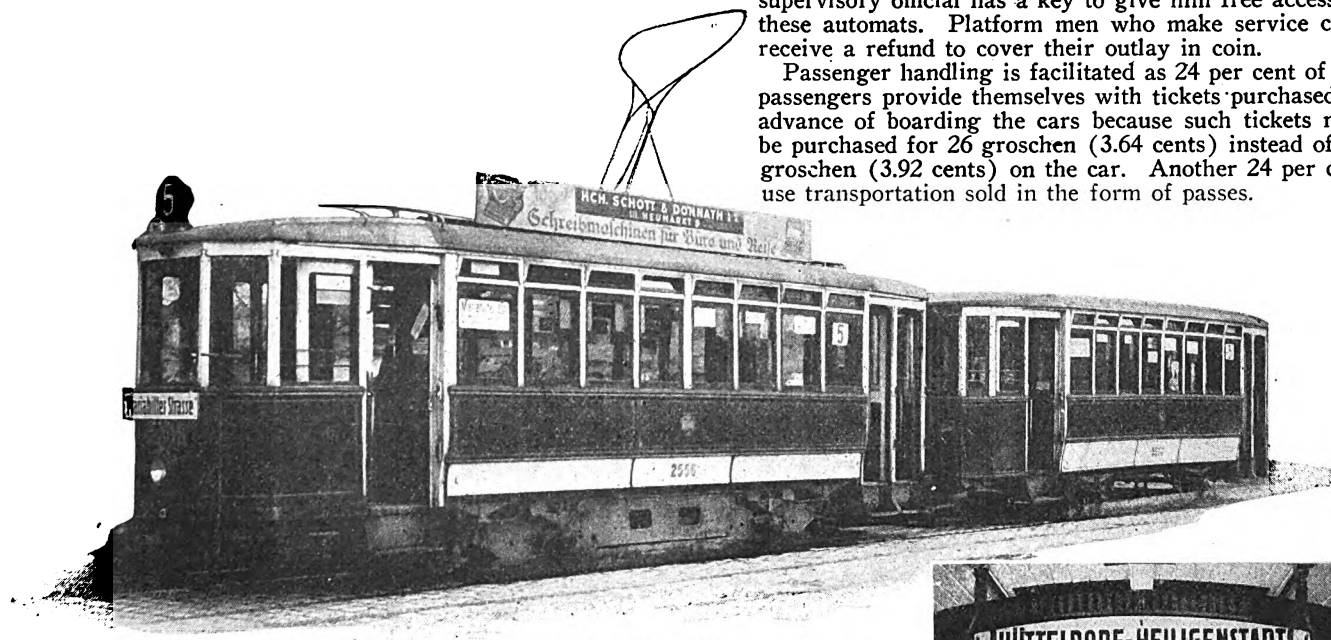
Passenger to USE ITS SERVICE



AT MORE important points, are handsome glazed shelters, in which system time tables are posted, reading in 24-hour time. A number of these stations are combined with automatic telephone booths. By agreement with the telephone company, the original street railway telephones have been discarded. Each supervisory official has a key to give him free access to these automats. Platform men who make service calls receive a refund to cover their outlay in coin.

Passenger handling is facilitated as 24 per cent of the passengers provide themselves with tickets purchased in advance of boarding the cars because such tickets may be purchased for 26 groschen (3.64 cents) instead of 28 groschen (3.92 cents) on the car. Another 24 per cent use transportation sold in the form of passes.



AS THE car approaches, the passenger is apprised of the route name by the front dasher sign and by the illuminated route number over the hood. As the car stops, he can read a window placard which supplements the route name by giving the main streets or places passed. The route number is repeated by a window marker and is also on the rear hood.

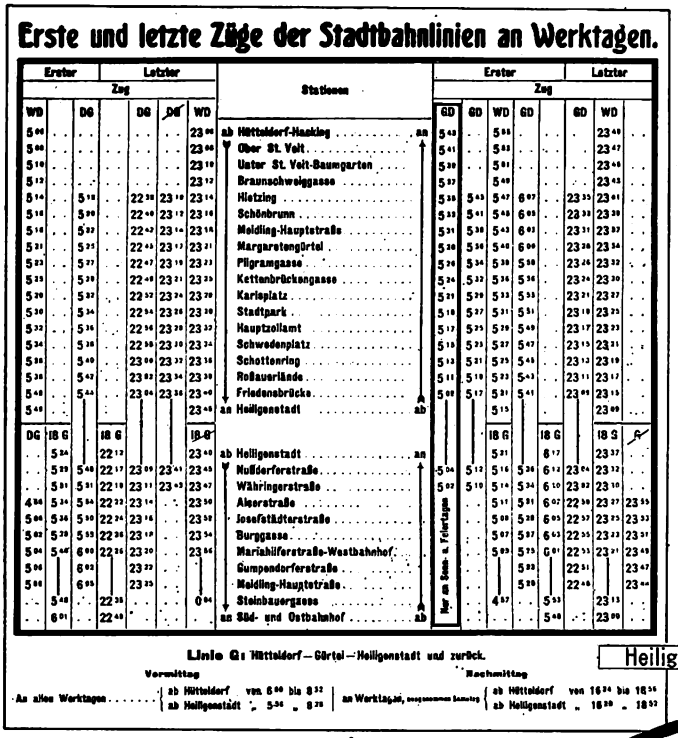
Prater Lusthaus
über Opernring Erdbergstr.
Kaiser Josefs-Brücke

THIS is a typical window card. It shows that the Prater Lusthaus (pleasure pavilion) is reached via Opera Belt, Erdberg St. and Kaiser Joseph's Bridge.

THE shape of the Stadtbahn car vestibules leads to the placing of the destination signs off-side as shown. It will be noted that the dividing rail on the platform is wound with wire to give a firmer hold to the passenger. The division for entrance and exit has proved impracticable, but the rail is retained because of its value as a support.

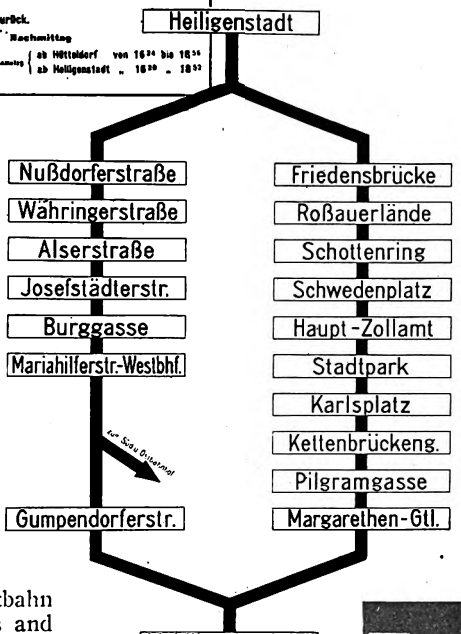
INSIDE a city car, the passenger can orient himself by reading the inner side of the route card. On the Stadtbahn, the name appears over the doorway. Note the use of cabinets for the control equipment.

Digitized by Google



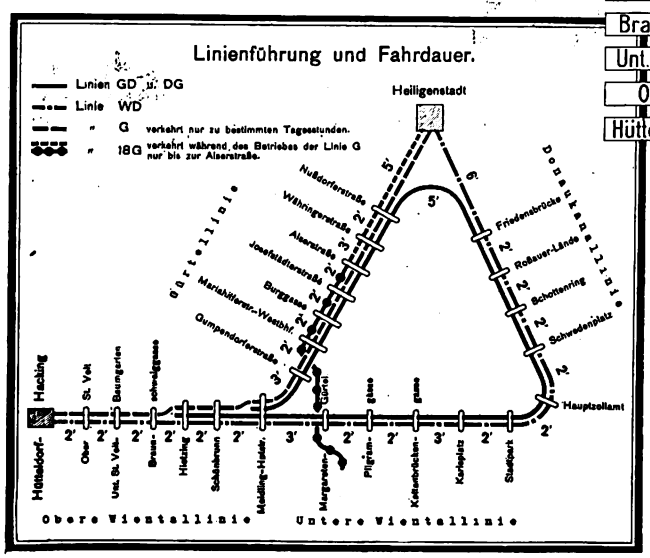
ALL stations of the Stadtbahn are posted with schedules like this showing the first and last trains of each route at the various stations. The initials "WD," "DG," etc., are route designations.

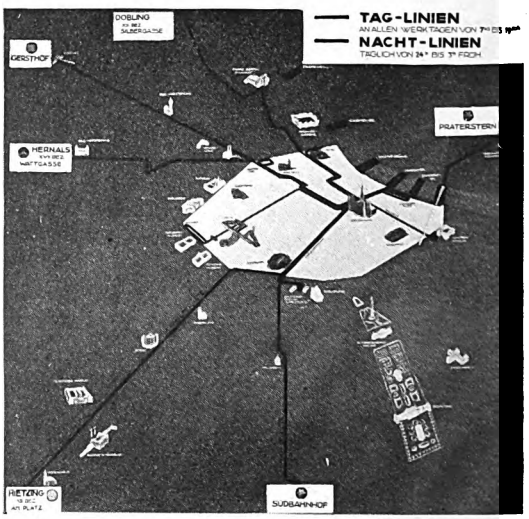
THIS motorbus, now used for short-haul inner-city service, carries its route sign on the sides, in addition to the illuminated route symbols at front and rear.



THE Stadtbahn was converted from a sick steam railway to a healthy electric railway, and is now carrying 110,000,000 passengers a year instead of the 40,000,000 formerly carried by steam. It is a rapid transit system operated as a part of the street railway system with free transfers to the street railways. These transfers are used by some 90 per cent of the Stadtbahn riders. This order-of-stations chart appears in large form on the station walls of the Stadtbahn, and in small form as enameled shields on the car doors.

THIS skeletonized layout of Stadtbahn routes is also posted on station walls and in the cars. It shows each route in a separate color or style of line, and gives the running times between stations.





ON EVERY glazed-type "stop" pillar used for bus traffic, there is painted a map which shows the course of each route in relation to buildings, monuments, parks and other places of special interest. The route symbol and name of terminus are also given.

The storage yard with its 24 tracks has a capacity of 183 cars. Three lead-ins and interconnecting tracks give great flexibility in the movement of cars

Brooklyn Car Terminal Enlarged

Many improvements incorporated in the remodeled Canarsie shop and storage yard of the Brooklyn-Manhattan Transit Corporation. New depot with recreation room for the trainmen and ample office space has been added

MODERN in every detail is the recently remodeled Canarsie car terminal of the Brooklyn-Manhattan Transit Corporation. The terminal now has a well-arranged track storage system, a seven-track car repair shop with modern machinery, and a new depot with headquarters for the trainmen and offices for the division superintendent, the depot master, transfer clerk and dispatch clerk. Before the changes were made the shop was inadequate, the storage tracks were not arranged for the most efficient handling of cars, and the trainmen had no recreation rooms. Now the plant is equipped in every respect to accommodate the men and cars of the seven lines which use it.

The new depot, which occupies a corner of the large plot, is a 2½-story structure of fireproof construction. The building has an archway on one side with two tracks which lead from the storage yard to Rockaway Avenue, on the east side of the plot. The starter's office is located on the ground floor, as well as a locker and washroom for the shop employees and toilet rooms for both the shop men and depot forces. A steam heating plant also is located on this floor and space for storing coal.

A stairway from the ground floor entrance on the north side leads to a mezzanine floor, which is used for a locker room and washroom for the car crews. The second floor proper, above the mezzanine, has a large assembly room for the trainmen, a locker and washroom, a partitioned office for the transfer and dispatch clerks, and offices for the division superintendent, the depot master and the stenographic department. The floor has windows on three sides, giving it a pleasant atmosphere.

Large Recreation Room for Trainmen

The assembly room, which occupies more than half of the entire floor, is well equipped for the trainmen. It has three pool tables, checker tables and chairs, and a long counting table, with a double set of compartments for the use of conductors making up their reports. Bulletin boards for announcements of interest to the crews also are located in this room.

The large office for the dispatchers and transfer clerks adjoins the crew room and has windows opening into the crew room, so that conductors and motormen can transact their business without entering the office. The other offices are grouped at one end of the building. The depot master's office is in the corner of the building, overlooking the two streets at the corner of the plot. The division superintendent's office is in the center of the group, and the room for the stenographers and record clerks is in the other corner.

A large number of the lockers are located on this floor. Three hundred lockers are provided in the entire build-

Digitized by Google

Digitized by Google

ing, and of this number 298 are being used. The company plans to add 50 more, so that with an increase of men there will be no need for doubling up. In the depot master's office is a case with duplicate keys for each locker and a master key.

Four carhouse bays adjoin the new depot building. These bays formerly were open at both ends and the tracks were joined to the tracks on Rockaway Avenue, on the east side of the building. When remodeled the

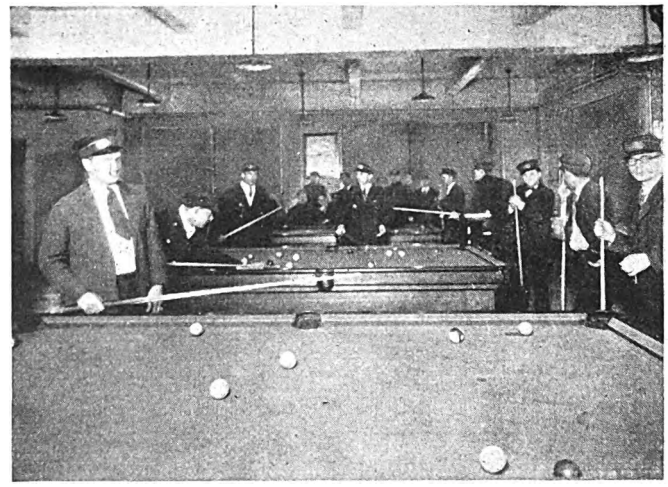
The new depot at the extreme northeast corner of the plot is a 2½-story structure of fireproof construction

Rockaway ends of the bays were closed and the tracks extending into the street removed. Two of the bays, each having four tracks, are used for storage only.

Bays Well Equipped for Light Repairs

The other two bays, nearest the depot, are used for a car shop. These were enlarged during the reconstruction program and four inspection and repair pits added. The artificial and natural lighting facilities also were improved and several new machines were installed. The second bay from the depot has four tracks, each accommodating three cars and having an inspection pit. These four pits were constructed in the recent program. The pits are used for the schedule inspection of cars as they complete the mileage allowed between inspections, and some 20 to 25 cars go through the inspection daily. All motor and truck repairs are made in this bay, about eight cars being repaired each day. At the rear of the four tracks are located the machine and blacksmith shops,

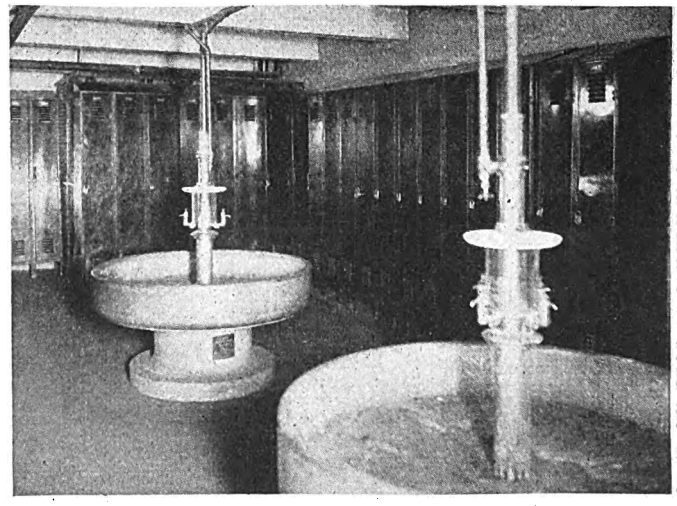
The counting table where the conductors can make up their reports. The office for the dispatchers and transfer clerks may be seen in this view



Pool tables in the recreation room may be used by the trainmen before and after runs

which have all the necessary machines and tools for light repair work. An air compressor in the machine shop supplies air for the various pneumatic tools used in the repair work. Other equipment includes a lathe compressor, drill press, work bench, a forge and two armature racks. An overhead 5-ton crane travels the full width of this bay, so that materials can be transferred

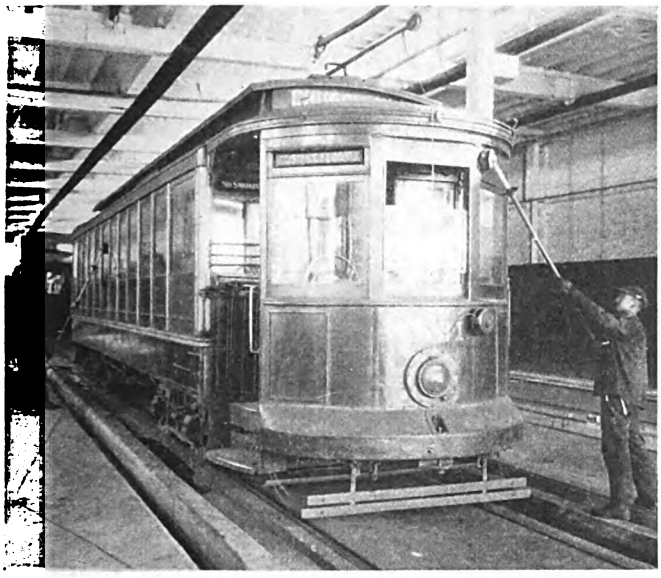
Storeroom at the rear of the car track for working tools and materials



Locker and washroom for the shop employee, showing the large wash fountains

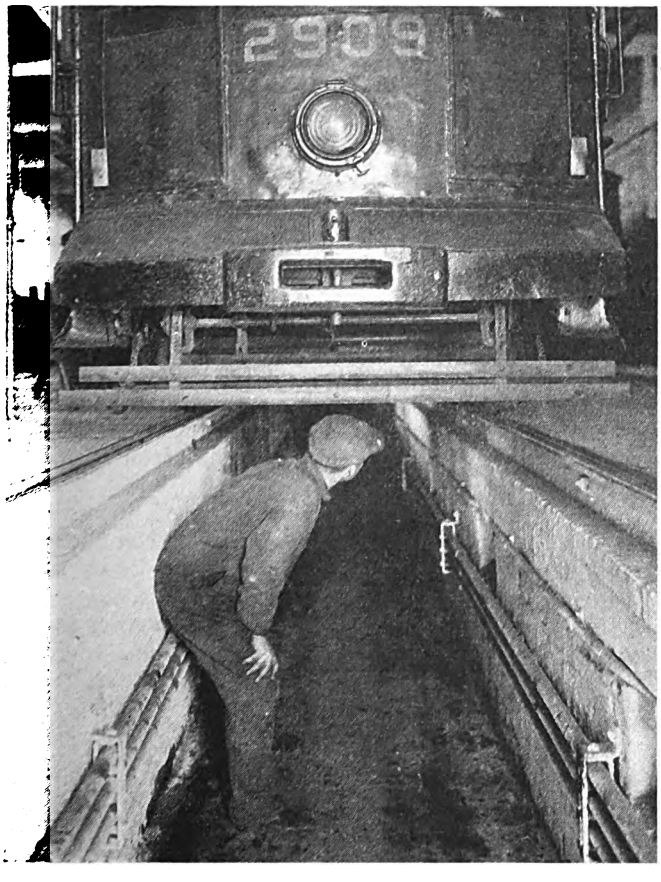
Digitized by Google

Digitized by Google



From 30 to 35 cars are washed every night on this car wash rack

side of the rack, extending the full length of a car. The two troughs nearest the track are used for fresh water, while the other two are used as spillways leading to the sewer. Car washers dip their brushes in the clean water and wash the windows and sides of the car. With this arrangement it is possible to wash from 30 to 35 cars each day. Three cars are run into the shop on this track at a time and the one nearest the door is brushed and swept on the interior. It is then moved on to the wash rack which is near the door, and while it is being washed, the second car is cleaned on the inside. The clean car is then moved outside and the second one moved into place on the wash rack. Along a section of the north wall of this bay are numerous racks and bins for the storage of heavy parts. Along the remaining section of this wall there will be a carpenter shop. At the extreme end of the bay is a storeroom where working tools and materials are kept in their individual racks and storage bins. The locker room and washroom for the shop employees are on the ground floor of the depot. The washroom has two large Bradley wash fountains and numerous lockers.



The inspection pits are of concrete and are well lighted and drained

Each of the shop bays is equipped with steel roller doors. These are kept closed during the cold weather, but are easily moved so that no great inconvenience is caused. In remodeling the car shop the roof of the second bay, which was formerly of wood, was removed and skylights erected in their place. The new roof permits the entrance of ample daylight to permit a great deal of the repair work to be done without artificial illumination.

Storage Yard Tracks Arranged for Maximum Flexibility

The storage yard covers an area of 161,000 sq.ft., and has a capacity for 183 cars on its 24 storage tracks. There are three separate track leads to the yard, so that cars can be moved to and out of the yard at any time of the day with no difficulty. The terminal serves seven car lines which requires a maximum amount of flexibility. One lead is to Rockaway Avenue, and passes under the archway of the depot building at the northeast corner of the yard. Another track leads to Rockaway Avenue and leaves the yard at the southeast corner of the plot. The third lead is to Hegeman Avenue and leaves the yard at the northwest corner. The yard tracks all have been reconstructed and most of the floor of the yard has been paved. The lead-in or ladder tracks are so interconnected that it is possible to switch cars from any group of tracks branching from a lead-in to another group. The tracks leading into the inspection pits and storage bays also can be reached from the various lead-in tracks, making the shop accessible for the cars of any line which need repairs.

Anti-Friction Bearings and Special Trial Drives at Vienna

LIKE many other European electric railways, the Vienna Municipal Tramways uses anti-friction journal bearings on a large scale. It now has 100 trail cars with roller bearings in every-day operation. Another 100 trailers have been equipped with a French bearing of conventional design, termed "Isothermos," which is designed to let oil be thrown on the bearings centrifugally with no need for waste or packing.

Experiments are also under way with ten cars having various types of drive. All of these cars have roller-bearing journals, but the drives differ. Two are to be of Cardan type, two of worm design, two of Buchli 1: 9.5 drive with radial axles and body-hung motors, and two more of double reduction gearing run in oil, etc. Two cars will be equipped with the automotive style of levers and disk brakes. The high-speed 1,300 r.p.m. motors to be tried will be of 45 kw. or 60 hp. rating.

In general, these ten cars will be studied from the laboratory and research viewpoint with the idea of applying the knowledge gained to the design of future equipment.

Commissioners Urge Need for Interstate Bus Regulation

REPORTS and addresses bearing upon a number of important questions of direct interest to utility and local transportation executives occupied the attention of state regulatory officials during the 40th annual convention of the National Association of Railroad and Utility Commissioners, held at New Orleans, La., Nov. 13-16, 1928. These included the questions of interstate bus regulation, the present investigation of public utilities under the Walsh resolution, and the conservation of street and highway space through regulation of commercial vehicles using the streets.

J. P. Barnes, president of the American Electric Railway Association, addressing the commissioners on behalf of the local transportation industry, suggested the need for regulation of taxicabs and other commercial users of the public streets, in order that destructive competition may be eliminated and congested street space conserved. "Commercial use of the public streets must come more and more completely under public control and regulation," said Mr. Barnes. "Already this principle is well defined in the franchise and regulatory restrictions surrounding the commercial operation of street cars and buses. To some degree and in some communities it is recognized in the operation of taxicabs. Not yet has it been extended to the commercial operation of trucks and delivery vehicles. But recent developments in taxicab operation in some centers are tending to demonstrate the necessity of a firm public hand on this commercial use of the city's property in its streets." An abstract of Mr. Barnes' address is printed elsewhere in this issue.

Impatient With Bus Regulation Delay

Considerable impatience with the delay that has been experienced in the attempt to bring about federal legislation for the regulation of interstate bus operation, was expressed in the discussion of the report of the special committee on motor vehicle legislation presented by John E. Benton, chairman, general solicitor of the association. An entire evening session was devoted to the discussion of the report and to addresses bearing on the motor vehicle question by representatives of several interested groups. These included Ivan Bowen, former Minnesota commissioner, counsel for Motor Transit Management Company, H. L. Brown, general counsel National Automobile Chamber of Commerce, and S. A. Markel, chairman legislative committee American Automobile Association. Mr. Bowen held that regulation should not extend much beyond the requirement of a certificate of convenience and necessity. In his address, which is abstracted elsewhere in this issue, he also questioned the practicability of the attempt to delegate regulation of interstate carriers to the state commissions through the machinery of the Parker bill.

Mr. Markel outlined the attitude of the Bus Division of the American Automobile Association and expressed the hope that a reasonable bill for the regulation of interstate buses could be passed by Congress promptly. He said that conferences have been held recently with the several groups interested in this subject and that a modified bill embodying an attempt to eliminate some of the objections raised against the Parker bill had been drafted for purposes of discussion. Speaking for the operators of motor buses, Mr. Markel said: "We are extremely anxious to have a reasonable bill enacted by Congress promptly. We are willing, if no violence is done to principles, to accommodate our views to those of our conferees wherever possible. The Bus Division has not acted upon the proposed draft of a bill which has recently been prepared. In my opinion, however, any practical bill which would permit the orderly growth and development of motor bus transportation would be agreeable to the Bus Division if it met with your approval."

Mr. Brown Explains N.A.C.C. Position

Charged with broken faith on the part of representatives of the National Automobile Chamber of Commerce in opposing the Parker bill at the hearings before a committee of Congress, Mr. Brown explained that he considered the machinery of the Parker bill to be inadequate and unworkable. He said there is no disagreement by any group on the need for certificates of convenience and necessity for interstate bus operation. He suggested further that there seems to be general agreement that it is desirable to utilize the experience and knowledge of state regulatory commissions in the granting and control of certificates. To accomplish this, while at the same time overcoming the objections to the machinery of the Parker bill, Mr. Brown suggested that applications for certificates for interstate operations be made directly to the Interstate Commerce Commission and referred automatically for hearings and reports, to boards made up of one representative from each state affected by the application, selected by the Public Utilities Commission or whatever other board may in each state be charged with the regulation of intrastate commerce.

Commissioner J. S. Benn of Pennsylvania again repeated charges of bad faith directed against representatives of the N.A.C.C., which he had made preceding Mr. Bowen's address. He took exception also to the inference in Mr. Bowen's address that state commissions in either state regulation or proposed national regulation of buses have approached the matter of determining public convenience and necessity from the standpoint of protecting the railroads, existing bus lines or other forms of transportation.

Referring specifically to the effort to obtain national legislation for the regulation of interstate buses, Commissioner Benn said that there has been a process of whittling down the scope and authority of the state commissions in proposed legislation to the point where little is left. He charged that the National Automobile Chamber of Commerce had broken a gentlemen's agreement to support proposed legislation before Congress, provided certain railway groups agreed to eliminate the provision for the regulation of trucks as well as buses in the proposed bill.

After considerable further discussion of this subject, the commissioners voted to continue their committee on motor bus legislation, with power to act in co-operation with the committee on state and federal legislation. The committee was instructed to work for adoption in any law which is passed, of the principles of the Parker bill with such minor modifications in machinery as may seem desirable.

Report Made on Walsh Resolution

First vice-president L. E. Gettle, chairman of the special committee on the Walsh resolution for the investigation of public utilities, presented a report outlining the reasons for the formation of this committee and the steps

Digitized by Google

taken regarding this investigation. In making this report Mr. Gettle strongly condemned the suggestion by members of the U. S. Senate tending to impute the motives of himself and members of his committee in appearing before the Senate interstate commerce committee in the hearings on Senate Resolution 83, introduced by Senator Walsh of Montana.

Louis E. Gettle, chairman of the Wisconsin Railroad Commission, was elected president for the ensuing year. Charles Webster of Iowa was elected first vice-president, and A. J. Maxwell, North Carolina, second vice-president. Glacier Park, Montana, was selected as the location for the next meeting, which will be held beginning Aug. 27, 1929.

Wider Regulation of Commercial Vehicles Needed

Opinions expressed at New Orleans meeting that the use of the streets is a matter of public concern and should be under public control

By J. P. Barnes
President American Electric Railway Association

THE local transportation industry has learned that its right of survival is based not on an investment made or a plant constructed, but on a service rendered. We have learned that by our service we shall be judged and by the measure of its usefulness shall we be rewarded. With our acceptance of new types of vehicles has come the adoption of a new philosophy that the street car must and shall be used where and only where it best suits the needs of mass transportation; that the bus, large or small, shall by the same test be assigned its proper place in our operations; that we will not fear that which is new either in vehicle or method. We have cast our problem in terms of transporting comfortably the largest number of people at the smallest cost and we have refined and perfected the efficiency of these operations. We have insisted that as our vehicles serve the largest groups of travelers they should have, to a degree, preferential use of the streets. In this our insistence has been greater than our accomplishment, for today the individual vehicle moving and standing throws so heavy a burden upon the traffic arteries of our city that all movement is impeded. Imagine a railroad using two of its four tracks for a storage of cars while the other two were so crowded as to reduce operation to half speed or less, and you have the prototype of conditions in the present city street.

Along with this crowding of arteries has grown quietly and to a degree unrecognized a further taxing of horizontal facilities through the tremendous development of vertical transportation, which has brought about great concentrations of population in high buildings without corresponding enlargement of traffic facilities to and from their locations.

Our problem has grown from its initial dimensions of mere carrying of groups of people with speed, safety and convenience. By the addition and multiplication of individual vehicles and the population concentrations it has expanded to the point of developing a new limiting feature, namely, street capacity, and has become the problem of the community. To sustain community activity a free circulation of traffic from part to part is as essential as is free circulation of blood in the body. Already, due largely if not wholly to the difficulties of traffic, branch stores, branch banks and neighborhood shopping centers, are everywhere developing. It may or may not be that this decentralization is a step forward even though difficulties and complexities of administration be increased and inventories multiplied. What is important is that these developments are taking place not as a result of economic study and sound merchandising, but mainly because of the sheer physical difficulty of getting from place to place in a busy American city. Far be it from a street railway man to decry or discourage the tendency to move about, but if the combination of this tendency with inadequate physical facilities for its indulgence is already affecting the habits of communities, then it is time that all agencies socially or economically concerned with those habits, pause to take stock.

Too many traffic engineering studies result only in recommendations for mere temporary relief. Too many city plans reflect the architectural or landscaping genesis of the planner. There must be profound fundamental study and understanding of all the elements and influences that affect the growth and habits of communities. It is a fundamental and general problem and will yield only to the co-operative effort of all interested groups. There is no place for individual or class selfishness in developing the movement which is the life of the modern community, but there is abundant place for a service of high order.

The transportation problem of a modern city involves and includes all of its transportation. The city's transportation plant includes every vehicle and every public way in the city. The load factor on this plant is highly irregular and at times parts of it are grievously overloaded. At the points of greatest overload the least adequate of the facilities are the streets themselves and their inadequacy is frequently exaggerated by their partial use for storage purposes. Multiplication of vehicles in the future, as in the past, cannot but aggravate an already burdensome condition. Relief lies not in the addition of vehicles to the city's transportation equipment.

The use of the streets is a matter of public concern and is, of course, under public control. Commercial use of the public streets must come more and more completely under public control and regulation. Already this principle is well defined in the franchise and regulatory restrictions surrounding the commercial operation of street cars and buses. To some degree and in some communities it is recognized in the operation of taxicabs.

Digitized by Google

Not yet has it been extended to the commercial operation of trucks and delivery vehicles.

Recent developments in taxicab operations in some centers are tending to demonstrate the necessity of a firm public hand on this commercial use of the city's property in its streets. There are two plans of taxicab exploitation in operation, different in detail but alike in that each tends to wipe out by destructive competition that adequate and acceptable service which every modern city requires.

Under one plan the manufacturer encourages some operator to extend his fleet until his cash and credit resources are completely embarked in the operation. The same or another manufacturer then points to the operator's success and enlists some competitor operator in a similar enterprise with the result that more service is offered than necessary. Usually a price war develops in the course of which both operators become so hard pressed that service and maintenance alike deteriorate. One or both of the operators may fail, which is an individual chance and an individual misfortune. The important thing is that in the process of elimination the service has failed and the city has been deprived perhaps for a considerable time of that adequate service it desires and which it could have if it controlled the use of its own streets in its own interest.

The other plan, which is spreading rapidly, is for the operator to purchase a fleet of cheap cars which he rents by the day to individual drivers. The owner of the cars receives a fixed rental from the driver and is consequently not interested in the gross earnings of the cab. Consequently the venture is usually inaugurated with some such ridiculously low rates as two or three miles for a quarter. Novelty produces enough initial business to encourage expansion to such degree that, as in the other case, the city is over-cabbed and the elimination process works out with precisely the same effect upon the public service.

Competition may be the life of trade, but regulation is the life of public service. Destructive competition is no longer permitted in the field of the established public utilities, but in how many new directions must the community apply the proven principles of regulation in the future? Obviously in all which threaten a breakdown or a dangerous overload of the basis transportation facility—the streets. Only by the application of regulatory practice can the public protect itself from the hazards of useless duplication and destructive competition.

In the course of study of such things as these, it has been vividly impressed upon our industry that new times have brought new problems and that new methods must be devised to meet them. The American Electric Railway Association has visualized the problem of its industry as one of public transportation, not merely of street car operation. We have made a start and are rapidly broadening our activities to include studies of the fundamental problems of modern public transportation. We have turned our backs upon the superficial expediencies which have served as temporary solutions in the past and we are looking forward to solutions based on correct application of sound fundamentals. We are studying the economics of our industry, not from the narrow viewpoint of past methods and present equipment, but in search of the way by which we may render the maximum of public transportation service in every direction and with every available means. There is a place in the modern community for general co-ordination of public transportation services. That place we mean to determine to define and, if we may properly do so, to occupy it as well.

Our committees are seeking to define the economic foundations of street traffic, of fare structure, and of public transportation co-ordination. The expansion and adaptation of our service must be based upon these fundamentals and so based will not fail to merit and receive the rewards of public approval. Only by continuing to render a useful public service can we establish our right of survival, and only by increasing our service can we keep abreast of a rapid development which is taking place about us.

Have You Received Your Copy of Instructions and Rules for the Contest?

AN ATTRACTIVE folder giving full information and suggestions for preparing items for submission in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest has been sent to electric railway officials and department heads. Additional copies for posting on bulletin boards or distribution among maintenance men are available. Let us know your requirements.

Material entered in the new contest is coming in with each mail. The sooner you get started the greater opportunity you will have of winning one of the valuable prizes. Don't delay in getting started. There is no limit to the number of items that may be sent in by one person. The more you submit the better chance you have of winning one or more of the big prizes. Some companies are organizing all maintenance departments to go after the award. Look up the announcement in the Oct. 20 issue of the JOURNAL or send for copies of the instruction folder.

The main individual prize of $200 will be awarded at next year's annual convention to the person submitting the best maintenance idea during the contest. There are twelve $25 departmental prizes to be awarded to individuals sending in winning maintenance ideas. These will be divided equally between the following four maintenance divisions:

1. Rolling stock and shops.
2. Way and structures.
3. Electrical and line.
4. Buses and garage including shop equipment for bus maintenance.

An attractive trophy will go to the company making the greatest contribution to improved maintenance through participation in the contest and special certificates of merit will be awarded to each department making the best individual showing. Each item published will be paid $5 for regardless whether it wins a prize or not. Read over the instructions and conditions and send in your material.

Bus Regulation Should Not Be Restrictive

In these views presented at New Orleans it is held that effective federal regulation of interstate operations requires little more than the issuance of certificates of convenience and necessity

By Ivan Bowen
Counsel for Motor Transit Management Company

SINCE the beginning of the current year, the first regularly scheduled motor bus service has been put into operation between Chicago and New York. Now there are at least four separate lines with regular service between the two points, each operating several schedules daily. There are two lines, which either directly or by traffic interchange carry passengers between the Pacific and Atlantic Coast on regular schedules. As to a considerable portion of their route, both of these lines operate only interstate, being prohibited from carrying passengers between points within states. When motor carriers successfully carry on such business, the question whether the service is convenient and necessary and demanded by the public has been answered in the affirmative. The number of passengers carried runs into the millions per year and one of these carriers has operated as high as 2,000,000 bus-miles per month in the past six months.

Federal Regulation Needed

Necessity for federal legislation to regulate the passenger-carrying motor vehicle in the interstate field has for a number of years been recognized. There has been, it is true, some difference of opinion as to the form the regulatory measure shall take; but among the representatives of the passenger motor carrier there has been no protest raised to the efforts to induce Congress to act. On the contrary the bus division of the American Automobile Association has consistently labored to co-ordinate the views of the various groups which have from time to time met in conference.

What then is the extent of the necessity for legislation today, it being admitted that legislation is necessary? Federal legislation should certainly go no further than the necessities of the situation warrant; and the requirement of a certificate of convenience and necessity for interstate operation would appear to be the extreme. Bond and insurance protection of the public as a matter of course, follow. Nothing has occurred in my opinion that requires legislation beyond that minimum. Ralph Budd, president of the Great Northern Railway, and whose company through a subsidiary operates one of the largest intrastate motor carriers in Minnesota, said at a meeting in New York this past year:

"The requirement of a certificate of necessity and convenience for interstate operation really seems to be the only pressing necessity for federal legislation."

This undoubtedly was his conclusion as a railroad man, for the Northland company has practically no interstate mileage and is so situated that interstate competition does not affect it.

The best test as to the necessity for specific legislative regulation aside from the need for certificate of convenience and necessity, is probably a determination of the object to be accomplished. The Parker bill covers two additional requirements: rates and schedules.

It will be admitted that both of these are matters of public interest requiring specific regulation if their control is not adequately governed through the hand of the government on the throttle of the regulatory machine—the certificate. It is granted that the authority to issue a certificate embodies the authority to revoke it for cause. Take, then, the question of rates. The passenger motor carrier is the "One and only in captivity"—a public utility where regulatory legislation has been to a considerable extent directed toward restricting it from underselling its established competitor in the commodity offered —transportation.

There then is but slight probability of a present demand for lowering of its service charges—the nature of its competition with the rail carrier will take care of that. It can deliver its form of transportation at a cost not to be met by the rail carrier. Also the private automobile is the leveller of its rates. The industry looks to its natural competitor on the highway—the private car owner—for increase in patronage. To draw this trade the motor bus must convince of its comfort, service and economy.

But assume that the restriction of the field to a single motor carrier on a route might give cause for concern in the matter of excess charges to the public. In addition to these competitive rate regulators, the governor on the operator is the franchise under which he is permitted on the highway. By one gesture toward revocation of this franchise, the regulatory power has the culprit crying for the opportunity to demonstrate his ability to continue in the field. This is no idle figure of speech—control over the certificate is the power to destroy. Furthermore, the mere whisper on the part of the issuing authority that public convenience and necessity were not being served would bring applications for the right to compete on the same route without number. No operator in the field would dare to permit evidence to accumulate that public convenience and necessity were not being reasonably served.

This same club is suspended over the head of the certificate holder in the matter of service. Section 10(b) of the Parker bill was drawn with such warning in mind. It provides:

"That where additional service is necessary or required, the board or commission shall give to the existing motor carrier a reasonable time to furnish said service, etc."

Now on the other hand, what of the necessity for the protection of the rail carrier from competition? If it be conceded that there is "convenience and necessity" for common carrier motor transportation service, then the only thing that should govern the charge for the service

Digitized by Google

is its cost and not its effect on other forms of transportation. A "form of transportation" may be a regulated monopoly entitled to protection from its kind, but "transportation" in and of itself is not and cannot be a monopoly, any more than "light," "heat" or "power."

We are confronted then with the controversial section five of the Parker bill. Controversial because of the conflict of interest between the agencies on the one hand believing that economic transportation can best be produced by confining the field to the one form, and on the other, this new servant of commerce forcing its economic advantages upon the public in the face of restraint.

There is no other instance in the history of transportation where the beckoning hand of legislative welcome did not invite development — "legislative welcome" because the welcome of the public has been an ovation.

Water, rail and air transportation have each been heralded as forerunners of a greater civilization. And yet it is proposed that the extension of the benefits of the motor carrier—a mode of travel that has revolutionized the world and made the average citizen a master of distance—be made to depend upon the effect it may have upon other forms of transportation, instead of solely upon the benefits to the public. The public is entitled to have written into the law relating to highway transportation, a like declaration of policy as that prescribed for the water and rail agencies, to wit:

> It is hereby declared to be the policy of Congress to promote, encourage and develop highway transportation, service and facilities in connection with the commerce of the United States, and to foster and preserve the same in full vigor.

This was recognized in the report of the Interstate Commerce Commission in Docket No. 18,300:

> The public interest and national welfare are fundamental in legislation affecting transportation, and in the administration of regulatory law. Where there is conflict between public interest and private interest, the former is paramount and the latter must give way.
>
> Railroads have no more economic right to any traffic than had the canals and stage coaches which opposed the constructions of railroads on the ground that they would take traffic already being carried on the canals and highways.

In consideration of the Parker bill before the House Committee on Interstate and Foreign Commerce, there developed a difference of opinion as to the workability of the administrative machinery proposed. Some doubt was voiced as to the constitutionality of delegating authority to issue certificates to the state commissions. The constitutionality question can well be left with Congress in the first instance. What we are all interested in, is the practicability of administration and the preservation of the existing authority in the states.

No state can, nor should, attempt to exercise control over strictly interstate commerce. That is a matter that the constitution lodges in the federal government. The state is interested, however, in the physical operation of the transportation agency within its own borders. A regulatory law should be designed to preserve these prerogatives which the decisions of the courts have determined belong to the state in the absence of federal legislation. This may seem a contradictory proposal, but an examination of the opinions of the Supreme Court in the highway transportation field will disclose the line of demarcation, and indicate that the state jurisdiction is best preserved by confining federal legislation to the narrowest possible limits.

What then is the simplest machinery for certificating operators in interstate commerce? The Parker bill lodges the power in the state boards, or joint state boards. The situation existing in the motor carrier field is not the same today as existed when such administrative machinery was first proposed. Then the transportation of interstate passengers was largely across one state line and at the most two. Today single motor carriers operate through lines from the Pacific to the Atlantic, and from the Lakes to the Gulf. The cumbersomeness of a joint body representing all states exercising administrative duties on applications from coast to coast is apparent.

Application to extend a certificate which has been granted through half a dozen or more states to another state involves the question of interstate commerce in all of them. Are they all to participate in the joint board on such an application? That would be their right and the right of the applicant to have them. The state commission in such a proceeding is called upon to regulate interstate commerce, acting for the country as a whole, while as a representative of the state its interest primarily is confined to the physical operation of the carrier over the state's highways. In attempting by such machinery to preserve to the states the jurisdiction that rightfully belongs to them, they are having thrust upon them control over commerce which constitutionally is lodged in the federal government.

The Interstate Commerce Commission, pursuant to the authority given under paragraph 3 of section 13 of the transportation act of 1920, has adopted rules and regulations under which joint hearings are conducted. The authority given to the states in that enactment may not be adequate to meet the demands of the situations in the highway transportation field, but the basic principle for co-ordination of the regulatory machinery of the federal and state governments is there. It should be expanded. Let legislation clarify the compulsitory clause as to holding joint hearings, let it give to the state representatives sitting in such hearings the dignity of participating in the determinations, but recognize that control of interstate commerce is a federal prerogative and that police control of the highways belongs to the states.

State Regulation Under Its Police Power

The Supreme Court of the United States has already confirmed in the states numerous regulatory powers over interstate carriers in the absence of federal legislation. Any law passed by Congress should be designed to protect and preserve these constitutional prerogatives of the state. The following principles have been established:

1. Registration of motor vehicles. (Hendrick vs. Maryland, 235 U. S. 610.)
2. Payment of state tax, graduated according to the number and capacity of the vehicles operated. (Clark vs. Commission of Ohio, U. S. Sup. Ct., May 31, 1927.)
3. The interstate carrier is subject to regulation of the state imposed to prevent injury and damage to the highways. (Morris vs. Duby, 47 U. S. Sup. Ct. Rep. 548.)
4. A state may require a certificate of a carrier to carry both interstate and intrastate passengers. (Cannon Ball Transportation Co. vs. P. U. Comm., U. S. Sup. Ct., Interstate Busses Corp. vs. Holyoke St. Ry. Co., U. S. Sup. Ct.)
5. A state may require a non-resident operator to appoint an official of the state for service of process. (Hess vs. Pawloski, 47 U. S. Ct. Rep. 632.)
6. The state may impose upon vehicles using the highways exclusively in interstate commerce nondescriminatory regulation for the purpose of insuring the public safety and convenience; and that a license fee no larger in amount than is reasonably required to defray the expense of administering the regulation may be demanded. (Sprout vs. City of South Bend.)
7. A state may require users of interstate vehicles on the highways to file contracts providing adequate insurance for the payment of judgments recovered for injuries, if limited to damages suffered within the state, by persons other than passengers. (Sprout vs. City of South Bend.)
8. A purely interstate carrier cannot by subterfuge carry on intrastate business. The destination of the passenger when he begins his journey and known to the carrier determines the character of the commerce. (Sprout vs. City of South Bend.)

Digitized by Google

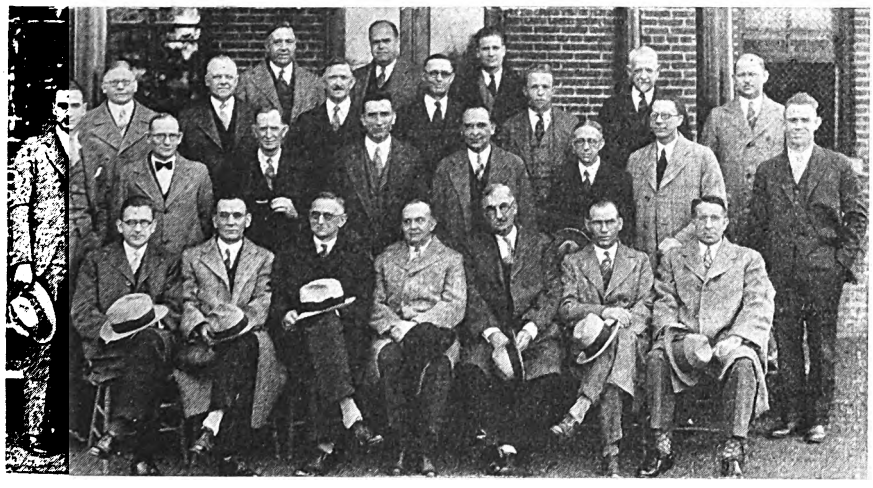
9. A state may impose upon vehicles engaged exclusively in interstate commerce a reasonable charge as their fair contribution to the cost of constructing and maintaining the public highways. (Sprout vs. City of South Bend.)

It is the common "misunderstanding" that motor buses are using the highways without contributing to their cost or upkeep. Such, of course, is not the fact. Motor buses pay a tax for the use of the highway proportionately in excess of that levied on any other vehicles.

It is a common complaint that motor buses are taxing the capacity of the highways. When an analysis will show that on heavily traveled routes motor buses are in the proportion of one to several thousand other vehicles, that claim is disclosed to be without foundation. Motor buses have made available the use of highways to millions who otherwise would be deprived to a large extent of their benefits. The citizen who does not own an automobile, or who for financial reasons cannot afford to make extensive use of it if he has one, is as much entitled to the pleasure of highway travel as his more opulent neighbor. The car owner who occupies the highway with a vehicle accommodating one or two passengers is not in a position to denounce the user of a vehicle which carries thirty or forty passengers. Bus travel, as a matter of fact, results in economy both of the highways and to the passengers. That is the idea the motor carrier is now engaged in selling.

Middle Atlantic Equipment Men Discuss New Cars

WITH the spirit that the mechanical department of electric railways should set the pace for other departments to follow, about 30 men of the Association of Electric Railway Equipment Men, Middle Atlantic States, met and discussed various maintenance problems at Hampton, Va., on Nov. 14.



Middle Atlantic Equipment men attending the Hampton, Va., meeting

In his opening remarks A. T. Clarke, president of the association, spoke about things that should be incorporated in new cars. Later in the meeting D. E. Frame, master mechanic Delaware Electric Power Company, Wilmington, Del., described interesting details of the new Wilmington cars, which were exhibited at the Cleveland convention and described in ELECTRIC RAILWAY JOURNAL for Sept. 22, 1928. These cars weigh 36,840 lb. without passenger load, are 42 ft. long and seat 44 passengers. They are equipped with four 35-hp. motors. In service average acceleration rates of 3½ m.p.h.p.s. are obtained. In the design of these cars comfort of passengers was given first consideration. The cars have been made as light as possible without sacrificing durability. Particular attention was given to the heating and lighting equipment. Large windows, Flexolith floors and thermostatic control of heaters are features. Variable load brakes give uniform braking with loads of from five to 125 passengers. Drop platforms make necessary only a single step from the street to the inside of the cars, the second pair of steps being made by the passenger after his fare is paid. The units are attracting increased patronage so that they earn more per car-mile than other cars of the company.

Mr. Frame also told of some remodeling which his company is doing to arrange present cars for one-man operation. He expressed the belief that in remodeling cars for city service a maximum weight of 40,000 lb. should be the limit. Cars heavier than that should be considered obsolete.

The dragging of brakeshoes was brought up in the discussion of equipment troubles. The general opinion was that it is better to provide a clearance of about ⅛ in. than to run danger of tight brakes and that piston travel of from 5 in. to 5½ in. could be used successfully. Need for a more satisfactory type of dustguard for journal boxes than is commonly used was considered desirable. The dustguards used in Baltimore were described by Mr. Clarke. These are made of leather and the holes are ⅛ in. less in diameter that the axles over which they fit.

Radio interference from the equipment man's standpoint was discussed. Experience with the new type of General Electric choke coils was mentioned. Other causes for interference that were discussed included arcing at trolley wheels, cutting in and out of compression governors, faulty bonding, sand on the track, inaccuracy in line, electric signals and electric track switches.

There was considerable discussion upon various types of window wipers now used on electric cars. The general feeling of those present was that a more satisfactory device for this purpose than those that are now available is desirable.

Officials of the Virginia Public Service Company acted as hosts at a dinner given to the members of the association at the Hampton Golf and Country Club. An inspection was also made of experimental work being done at Langley Flying Field, and later an inspection was made of the railway company's shops at Hampton. The next meeting of the association will be held at Wilmington, Del., on May 15, 1929.

MAINTENANCE HELPS That Have Proved

Cars Improved for One-Man Operation Please Patrons*

By C. B. Hall
Chief Clerk Mechanical Department Virginia Electric & Power Company, Norfolk, Va.

CAR remodeling for one-man operation by the Virginia Electric & Power Company, Norfolk, Va., is going forward with marked success. Seventeen cars have been completed so far and placed into regular service. Many favorable comments from pleased patrons have been received. The accompanying illustration shows the interior of the old and remodeled cars.

While the remodeling was undertaken primarily to facilitate one-man operation advantage was taken to introduce numerous improvements. These include such items as new style ventilators, safety-dome type lighting fixtures, sanitary handstraps, side window guards, genuine buffed leather spring cushion seats with aluminum grab handles, rubber tile flooring of block design with brass seam binding, cylinder cross-seat heaters, Staffless brakes, rotary foot gongs, new destination sign curtains and mechanisms carrying 4-in. lettering, door pull plates, operator's window cleaners, wrought steel trap door lifts and special motorman's seats of spring cushion type with padded backs and with cuspidor castings. The numerous changes appeal to the riders much more than the old arrangement with rattan seats.

An appreciable increase in revenue has resulted from the use of these cars in service. Some of the improvements which facilitate passenger movement and so speed up schedules by reducing stops include pneumatic front and rear treadle doors, air brakes and safety car control equipment, Westinghouse type K-75-A controllers with magnetic line switches and knockout cylinders, new side and head lining with Pantasote window curtains. All heater wiring is housed in ½-in. black enameled conduit pipe.

Geared Control Removed from Destination Sign Boxes*

By Farrell Tipton
Electrician San Diego Electric Railway, San Diego, Cal.

SEVERAL of the cars operated by the San Diego Electric Railway, San Diego, Cal., came from the factory equipped with a destination sign which was controlled from inside the car. This had an index finger to show the number. Due to wear and lost motion in the gear control it became necessary for the operator to inspect the sign box from the outside of the car in order to see that the sign registered properly, as the index finger did not always show the true position. To eliminate the difficulty without great expense, the geared control was removed and other provisions made for operating the sign.

The accompanying illustrations show the arrangement of the box. It is made of sheet metal, except the front, which is a wooden frame to hold the glass. The back is also of sheet metal and is fastened permanently to the body by brackets. The top and two sides at the back of the box have flanges which slide over and hold it to the back. At the end of each shaft a metal disk is fitted to turn the rollers as desired. A coil spring around each shaft between the bottom of the box and the roller keeps tension on the curtain. Each roller is keyed solidly to the shaft. A bracket is mounted in the center of the box to provide the desired height for the lamps. Two automobile headlight receptacles are used.

Valuable

Tool for Placing Hangers on Span Wire*

By Thomas O. Smith
Superintendent of Overhead Charleston Interurban Railroad, Charleston, W. Va.

PLACING span wire insulators on messenger wire or other spans was made a one-man job through the use of a tool constructed in the shops of the Charleston Interurban Railroad, Charleston, W. Va. With this, hangers can be installed by one man at the rate of 100 per eight-hour day. The tool, as shown in the accompanying illustrations, consists of a center clip with two handles shaped so as to hold the hanger and at the same time pull the span wire tight.

The method of installing a hanger consists of placing the hanger marked *F* in the accompanying line drawing, into the clip *B* while the right hand of the workman holds the handle *A*. The handle *C* of the tool is then placed over the span wire and is drawn closed. This pulls the span wire under the lug *D* on the hanger *F*.

*Submitted in Electric Railway Journal *Prize Contest.*

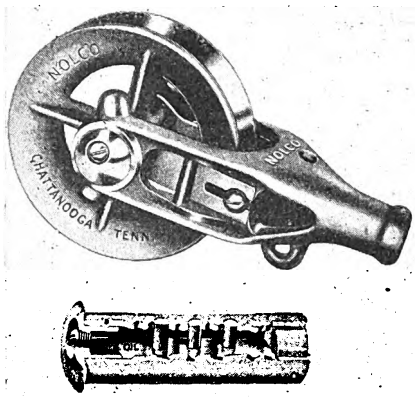
NEW EQUIPMENT for Better Maintenance

Self-Oiling Type of Trolley Harp and Wheel

OIL IS carried in a hardened and ground 1⅛-in. steel axle in the "Nolco" self-oiling non-arcing trolley harp, offered to the industry by the National Oil Lubricating Company, Chattanooga, Tenn. The axle has a reservoir which is filled with oil and



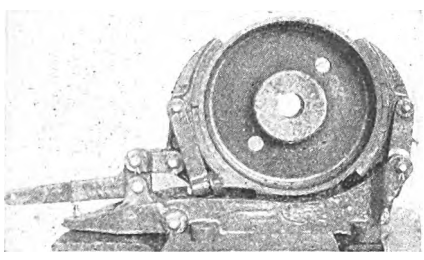
At top, assembled harp and wheel. At bottom, construction of steel axle with oil reservoir

this is lifted to the axle bearing surface by three ¼-in. specially treated wood plugs by capillary action. To refill the reservoir a ¼-in. pipe plug is removed from the large end of the axle.

Trolley wheels supplied are made of an alloy of 91 per cent Lake copper, 7 per cent straight tin and 2 per cent horse-head zinc all soft enough to insure minimum wear on the trolley wire, but strong and tough. The harp is made of gun-metal bronze.

Improved Brake for Cranes

FOR THE bridge drives of electric traveling cranes, lift bridges, electric hoists and other applications requiring foot-operated or hand-lever operated brakes the Electric Controller & Manufacturing Company, Cleveland, Ohio, has brought out an improved type of brake. This is known as type WB, mechanically operated. It is of the shoe type with improved brake and friction linings. The shoes are of unusually thick molded asbestos so that renewal is necessary only after long periods of service.



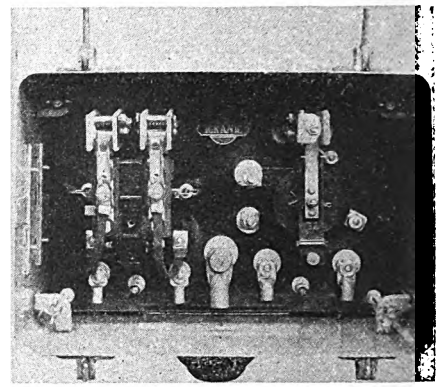
New mechanically operated brake for cranes

The tendency toward the use of anti-friction bearings on cranes and other machinery has resulted in an increased amount of work to be performed by the brake. A crane equipped with anti-friction bearings will drift with practically undiminished speed when the controller is shut off. The result is that the brake must stop the crane unaided by bearing friction. This has necessitated improved brake design with increased wearing qualities of the friction linings.

Field Weakening Device for Tramway Motors

ON ONE of the tram cars in London, a new device has been fitted to weaken the fields of the two driving motors and thus increase the car speed above the normal top value. Field weakening is governed by the current consumption of the motors and not by the speed of the car. Hence, although higher speeds are obtained, overheating and damage to the motors are prevented.

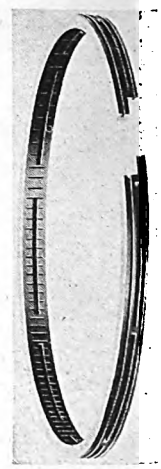
The "Auto Shunt" consists of a double pole contactor switch with powerful magnetic blowouts, mounted on an insulated base with a special controlling relay, and enclosed in a weatherproof housing. The relay has its operating coil in series with the two driving motors. Adjustment is such that when the motor current drops to a suitable value, provided the controller is in the "full parallel" position, the relay causes the contactor switch to close and connect a shunt resistance across the motor fields, whereby the motor is made to take an increased current up to a given limited maximum value. The result is that the motor speed is increased and the car continues to travel at this higher speed until the safe current is exceeded, whereupon the relay opens its contacts and field weakening is discontinued until such time as the lower current value is again reached.



The "Auto Shunt" weakens the fields of driving motors and increases speed

Ventilated Piston Ring for Bus Engines

NEED for a piston ring to serve modern, high-speed bus engines satisfactorily prompted the design of a ventilated ring by the American Hammered Piston Ring Company, Baltimore, Md. As shown in the illustration the new ring is characterized by large closely spaced slots through the center. Above and below these slots are annular grooves. The ring is hammered to establish the tension, so important in an oil control ring.



Slots through center feature new piston ring

As these rings have been designed particularly for high-speed engines, there are four scraping edges to remove excess oil from the cylinder walls. The large vents drain the excess oil rapidly because the tension created by the hammering operation holds the scraping edges in firm contact with the cylinder walls at all speeds. While this new ring is designed primarily to remove excess oil, the two annular grooves retain an ample supply of oil for lubrication at high speeds.

News of the Industry

Atlantic City in 1929

Executive committee confirms recommendation that next year's convention be held in Jersey playground's $12,000,000 auditorium

ATLANTIC CITY is to be the next meeting place of the American Electric Railway Association. The dates are Sept. 28 to Oct. 4, 1929. This the executive committee decided at a meeting on Nov. 23 at which the committee approved the recommendations of the location committee, meeting at association headquarters on Nov. 22. It was the sense of the location committee that the convention open officially Monday morning, instead of on Saturday, and that the convention committee should consider the idea of giving Monday afternoon and Wednesday morning over to an inspection of exhibits. Mr. Dickey, manager of the new Atlantic City auditorium, and Mr. Skene, representing the convention committee of that city, assured the locations committee that the building, now in process of erection, would be completed in time for the installation of exhibits and the holding of the regular meetings of the American and affiliated associations.

Mr. Dickey explained that there would be approximately 100,000 sq.ft., net, of exhibit space on the floor of the main auditorium. For the meetings the stage could be shut off from the exhibit hall by a soundproof curtain and there would also be the main ballroom on the balcony floor seating approximately 3,500, a smoking room which would seat 200, and ten rooms, also on the balcony floor, which would seat comfortably about 125 persons each. Buses under their own power could be run up ramps right onto the main exhibit floor. It was proposed to construct tracks on the plaza in front of the building, looking out upon the ocean, for the accommodation of eighteen cars. Tracks arranged on either side of the main building would provide additional space for the car and allied exhibits.

When completed the Atlantic City auditorium will be the largest and finest building of its kind in the world. It will cost, completely equipped, about $12,000,000. The main auditorium presents a vista from end to end unbroken by columns or supports, with its main spans 350 ft. in width and at an elevation of 130 ft. above the floor. Decoration will be lavish but tasteful. This last feature is advanced as being of some importance in that it will not be necessary for the association to expend any money for decorations. The grand ballroom promises to be one of the most magnificent public rooms in the world. It is located on the balcony level at the end of the building nearest the ocean, and will open onto a superb loggia overlooking the plaza and the ocean.

$12,000,000 meeting place of A.E.R.A. in 1929

Another Use of Weekly Pass on Pacific Electric

Further experimenting and use of the card pass form of ticket on lines of the Pacific Electric Railway, Los Angeles, Cal., was recently announced with a new form of weekly pass. To be tried out exclusively on the railway's lines to Redondo Beach and points en route the $2.75 weekly pass became effective on Oct. 28. This weekly pass supersedes the former monthly pass sold previously on the Redondo Beach lines at a $13 monthly rate and referred to in the JOURNAL of Aug. 11, 1928.

Like the monthly pass, the new weekly pass is transferable and may be used at the option of the holder as frequently as possible during the seven-day period for which its use is prescribed. The new pass becomes effective on Sunday of each week and is good to and including the following Saturday. It also carries the provision of the monthly pass in that it may be used on all local cars of the Pacific Electric within the first zone in Los Angeles.

Decision to try out the weekly form of pass was due to the fact that numerous persons received their pay checks each week and requested that the weekly form be tried out to determine its popularity with patrons.

New York Drafts Plans to Run Its Subways

Plans for the operation of the major part of the Manhattan lines of the new city subway system in New York to begin early in 1930, have been announced by the Board of Transportation. Provisions for passenger transfer facilities with lines of the Brooklyn-Manhattan Transit Corporation and the Interborough Rapid Transit Company at seven points in Manhattan reflect the influence of the unification negotiations now pending with the B.-M. T. and take into consideration also possible recapture of I. R. T. lines.

Negotiations for power supply have reached almost their final stage, after a long series of conferences among engineers of the Board of Transportation and representatives of the New York Edison Company, the United Electric Light & Power Company, the B.-M. T. and the I. R. T. The board has definitely abandoned any intention of building its own power plants.

The city plans to begin operation with express service from 207th Street and Fort Washington Avenue to a temporary terminal at Church and Chambers Streets, and a local service from Broadway and 168th Street to the same temporary terminal. The Manhattan section of the new city system will run along the west side from Fulton Street to 211th Street and Fort Washington Avenue, linking with the line to Queens.

Of the seven connections with existing lines, four will be with the B.-M. T. Interchange of passengers will be possible by means of underground passageways. In the event of unification or recapture, transfers would be permitted, according to present plans. The 300 modern steel cars already ordered for use on the city's own system can be operated on the B.-M. T. The system has been so designed, furthermore, that actual physical connection with the B.-M. T. can be established for interchange of traffic. Similar connections with the I. R. T. would require extensive alterations in I. R. T. platform widths and in other details.

Situation in Akron Clarified

The City Council of Akron, Ohio, has adopted a temporary franchise for the Northern Ohio Power & Light Company to cover the emergency until such time as a permanent franchise can be agreed upon. The railway and bus franchise, approved four years ago by an overwhelming vote of the people of Akron, has expired. On this subject of a franchise A. C. Blinn, vice-president and general manager, made this statement on Nov. 6:

The company is ready and anxious to enter into negotiations for a new transportation franchise at any time. We believe the question should be settled as early as possible in the coming year particularly because of the very large expenditures the company will be called upon to make in the summer of 1929 to keep pace with street improvements and city expansion. Two major projects are the laying of 8,000 ft. of double track on East Exchange Street and 7,000 ft. of double track on South Arlington Street. In addition to those two items, other work to be done will bring the total capital outlay up to $700,000. This work should be started as early in the spring as weather will permit.

The report of the fact finding committee will, so we are informed, be completed in a very short time, probably within the course of ten days or two weeks and negotiations could be started immediately after the report is submitted to the City Council.

As repeatedly stated heretofore, our company desires to co-operate in every way possible in providing the people of Akron with an adequate transportation service. As the city grows the question becomes of greater importance and we haven't the slightest doubt but a contract can be worked out to the complete satisfaction of both the public and ourselves and this without any unnecessary delay.

The city is entering a new area and as many of these public questions as we can dispose of now, the better able we will all be to go forward with other big things for Akron.

Car and bus lines in Akron form a complete network in and about the city. One of the biggest problems now up for settlement covers the matter of traffic. The company feels that demands are certain to become heavier on the transportation system. A committee of citizens undertook several months ago to make a thorough investigation of the company's system and study future needs and requirements. This report has not yet been presented.

Another Step in Wage Case in St. Louis

Briefs have been filed by both sides in the wage dispute between the St. Louis Public Service Company, St. Louis, Mo., and its union carmen and shop workers. The Missouri Public Service Commission has agreed to arbitrate the case. The carmen are asking an increase of 5 cents an hour, increase in number of straight runs, time and half for all overtime and increase in minimum allowance for extra men. Increases for all the non-transportation workers and a reduction in their hour of labor is also asked. The company contends it cannot afford to pay the increase asked.

Supreme Court Denies Jurisdiction in Baltimore Case

The United States Supreme Court on Nov. 19 dismissed for want of jurisdiction appeals by both the United Railways & Electric Company, Baltimore, Md., seeking a 10-cent fare, and by the Maryland Public Service Commission, opposing a 10-cent fare, and a Maryland Court of Appeals decision allowing the company a depreciation credit on valuation on the basis of "present value" of property. The appeals were dismissed because no final judgment had been reached in the cases in the lower courts.

Both the United Railways and the Public Service Commission have sought to get the case before the United States Supreme Court since a decision was handed down by the Maryland Court of Appeals some months ago. In that decision the Maryland court reversed a decision given earlier by Judge Joseph N. Ulman, who held that the rate of return possible under the three-fares-for-a-quarter plan approved by the Public Service Commission was confiscatory. The Court of Appeals held that it was not confiscatory.

The United Railways sought a review of this. The Court of Appeals held that the Public Service Commission had erred in fixing the depreciation allowance to the company on the basis of the cost to the company of the property depreciated. It held that this allowance should be based on the replacement cost; what it would cost the company to replace the property at the present time.

The Public Service Commission sought a review of this element of the case. The decision of the Supreme Court is a refusal to hear the claims of either party.

In the new hearing to settle the depreciation point, H. Carl Wolf, chief engineer of the commission, suggested an increase in the depreciation allowance from $880,000, which was set by the commission in the first hearing, to $1,687,000. In fixing the new figure Mr. Wolf explained that he reached this amount by means of a physical inspection of the company's depreciable property.

On the other hand, Charles Nodder, chief accountant for the commission, favored an annual depreciation allowance of $1,269,000. The United, however, claims a fair amount would be $2,200,000. The commission now has the three amounts with which to deal.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Dec. 7 **— Metropolitan Section, American Electric Railway Association and Metropolitan Section, Society of Automotive Engineers, joint meeting, 33 W. 39th St., New York, N. Y.**

Dec. 10**—National Highway Traffic Association, annual meeting, Automobile Club of America, New York, N. Y.**

Jan. 14-18, 1929**—American Road Builders' Association, convention and road show, Cleveland, Ohio.**

Jan. 22**—New York Electric Railway Association, mid-winter meeting and dinner, Hotel Commodore, New York, N. Y.**

Jan. 23-25, 1929**—Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.**

Jan. 24-25**—Central Electric Railway Association, Claypool Hotel, Indianapolis, Ind.**

Jan. 25-26**—Central Electric Railway Accountants' Association, Claypool Hotel, Indianapolis, Ind.**

Jan. 28-Feb. 1**—American Institute of Electrical Engineers, annual convention, 33 W. 39th St., New York, N. Y.**

Feb. 14**—Central Electric Railway Master Mechanics' Association, Youngstown, Ohio.**

Messrs. McIlraith, Gould and McClintock on Program

Members of the National Highway Traffic Association will hold their Tenth Annual Meeting at the Automobile Club of America in New York City on Dec. 10, 11 and 12. An interesting program has been outlined, which includes the following addresses: "Economic Utilization of Highways," by George H. Pride, Pride Transportation Company; "The Necessity of Research in the Solution of Traffic Control Problems," by H. M. Gould, Consulting Transportation Engineer of Detroit, and "Problems of Efficient Street Use by Vehicles and Pedestrians," by Dr. Miller McClintock, Director of the Erskine Bureau of Street Traffic Research, Harvard University.

Eighteen national committees will present reports at the meeting. Among these are: "Effects and Regulation of Overloading and Overspeeding of Trucks and Buses," to be presented by D. C. Fenner, Public Works Department, International Motor Company; "Safety Code for Brakes and Brake Testing," by H. H. Allen, Bureau of Standards, United States Department of Commerce; "Traffic Control on Car Tracks Adjacent to Safety Zones," by E. J. McIlraith, staff engineer Chicago Surface Lines; "Municipal Organization for Solution of Traffic Control Problems and Formulation of Regulations," by T. Fitzgerald, vice-president Pittsburgh Railways; "Terminology of Traffic Control," by Harold S. Buttenheim, Editor the *American City Magazine*, and "Parking Regulations," by Prof. Roger L. Morrison, University of Michigan.

Ten Cents Sought in Kansas City

Company enumerates reasons for necessity of higher fare. Does not countenance trunk line buses. Decline in traffic alluded to by President Groner

A REPORT setting forth the necessity of a 10-cent fare in Kansas City, Mo., has been submitted by the Kansas City Public Service Company. The report was given to the City Council on Nov. 19, and the Council received and filed the document, indicating that since the report was merely an informative article, the Council would take no action on it at this time. In the form of a 52-page document prepared by Powell C. Groner, president of the company, the statement submits that a 10-cent fare is necessary in order to improve the service, provide employees' pensions, and a wage advance, and eliminate the threat of a receivership.

A proposal to couple three tokens for 25 cents with a basic 10-cent fare was opposed. The company believes that a combination of this kind would be utterly inadequate to apply on the program and pay preferred stock dividends.

It states that the continuance of trunk line buses is an economic mistake, although continuance of bus service with new equipment is promised if the fare increase is made. Bus operations according to the report have resulted in a loss of approximately $280,000 a year, this deficit necessarily being made up from the revenue derived from railway riders. This is a heavy tax on the transportation system as a whole to provide bus service for only 3 per cent of the total passengers. It is said that the seeming public demand for such service was not real if bus patronage can be used as an index, and that apparently such a duplication of transportation facilities at so great a cost is an economic mistake and that the buses would perhaps serve a better purpose if used only for feeders and to supply transportation where none now exists.

The suggested remedy of a return to lower fares is met with a statement that it would require 165,000,000 revenue-passengers at 5 cents to meet the present cost of service, whereas at the peak of riding in 1922 the company had only 136,000,000 passengers.

Service improvements urged at this time are estimated at $835,000. Economies anticipated from the rehabilitation of the system and the complete adoption of one-man operation brought a cut in operating expenses in 1928 of $930,000 under the expenses of 1926. However, with the decline in traffic showing only slight abatement the company warns that it has reached the limit of its ability to effect further operating economies.

Last year the company lacked $453,421 of earning the permissible return of $2,065,110 and in nine months this year has fallen $455,466 short of earning as much as the franchise would permit.

According to Mr. Groner an ordinance for an increase in fare will not be submitted until the public has been acquainted with the facts.

In discussing the decline in street car riding Mr. Groner attributes it to the following four causes:

The 59 per cent increase in motor cars in Jackson and Wyandotte counties since 1922, every new car on Kansas City streets generally meaning at least two fares a day less for the company.

The growth of outlying community business centers, bringing a decrease in shopping or non-rush hour riding.

The radio and outlying theaters cutting night riding.

Traffic congestion, slowing up service.

Elimination of parking, increase in arterial streets, clearing of motor cars from street car tracks and the reduction of the number of street car stops to about seven a mile are listed as methods to speed up service as much as 20 per cent. The Councilmen with the exception of two stated they were opposed to the fare increase.

New York Case Must Be Reargued on Jan. 14

In an order read from the bench on Nov. 19 by Chief Justice Taft, the United States Supreme Court directed a reargument on Jan. 14 next of the case by which the city of New York seeks to prevent the Interborough Rapid Transit Company from increasing the 5-cent fare to 7 cents.

There is an intimation that the present record is too voluminous and that the new one must be curtailed. The court bluntly stated that the new briefs "shall be compact, logically arranged with proper headings, concise and free from burdensome, irrelevant and immaterial matter."

The text of the order follows:

159 Gilchrist, et al., vs. Interborough Rapid Transit Company.

This case is ordered to be restored to the docket for reargument on Jan. 14, 1929.

The same limitations as to the time of argument and the number of counsel as in the original hearing shall apply. It is directed by the court that new briefs shall be filed complete, and that the old briefs heretofore filed shall not be used.

The new briefs shall be compact, logically arranged with proper headings, concise, and free from burdensome, irrelevant and immaterial matter. The appellants shall prepare and file their briefs on or before Dec. 17, 1928.

The appellees shall prepare and file their briefs on or before Jan. 2, 1929, and the appellants shall file reply briefs by Jan. 9.

As a rule, the court directs that a case be reargued only where the court regards a pending record as too voluminous for consideration. In the Interborough case, now pending on appeal from the decree of the statutory court prescribing a 7-cent fare, sixteen briefs, numbering about 2,700 pages and containing about 878,000 words, were filed. This apparently was too much for the court and led to the issuance of the order read by Chief Justice Taft.

The 7-cent fare litigation began on Feb. 1 last, when the company filed its petition with the Transit Commission, and followed this action by filing suit in the United States district court two weeks later. According to the company's counsel the 7-cent fare, although suspended, has been the legal fare on its subway and elevated lines since March 3 last. On this basis the company estimates that it will have lost millions in uncollected fares during the pendency of the case should the ultimate decision be in its favor.

One effect of the order made by the Supreme Court on Nov. 19 will be a drastic reduction in the size and volume of the new briefs as compared with those filed in October.

Out of a Clear Sky

WELL, it was high time something was done about lawyers' English.

It would be a lot more fun for the judges, for the court attendants, for the reporters and for the general public if the lawyers hired writers to do their important briefs. One wishes there had been some way whereby the United States Supreme Court, instead of sending the tangled mass of verbiage in the subway fare case back to the lawyers who had caused the tangle, could have assigned the revision of the briefs to Ring Lardner. A brief on the subway rate increase by Ring Lardner would be more fun than a brief on the same subject by Charlie Craig or Sam Untermyer. Mark Twain should have written the Dred Scott decision, and what Elinor Glyn could have done with the briefs in the famous Danbury hat case is nobody's business.—Frank Sullivan in the New York *World*.

Way and Structures No. 5

Outlining work to be undertaken and the appointment of sub-committees occupied the attention of members of way and structures committee No. 5 on wood preservation at a meeting held at association headquarters, New York City, on Nov. 19. Those present were C. A. Smith, chairman, A. B. Campbell, M. J. Curtin, Chester F. Gailor, Ernest F. Hartman, Leo P. Scanlan, F. H. Swayze, H. J. Lucey representing B. Kuckuck, and George McCaskey representing J. S. Ware.

Illinois Rate Advance Extended

The Illinois Commerce Commission on Nov. 17, extended to May 24, 1929, the proposed advances in rates for street car and bus service sought by the Illinois Power & Light Company. Services in Bloomington, Normal, Danville, Quincy, Galesburg, East Galesburg, Champaign, Urbana, Decatur, Jacksonville and East Jacksonville will be affected.

Michigan Towns to Vote on Franchise

Granting of a 30-year franchise to the Detroit United Railway to operate its interurban cars in Troy and Avon townships is to be voted upon in the two townships at a special election to be held on Dec. 1. Although the proposition has been rejected by the voters at Clawson and Royal Oak it is expected that a favorable vote will be given in both the Rochester townships.

Suburban Long Island's Transit Needs Urged

Daniel L. Turner, transportation expert, was the speaker at the annual luncheon of the Long Island Chamber of Commerce, held at the Hotel Pennsylvania, on Nov. 21. He dealt with the transit needs of that portion of Long Island which lies within the area of the Suburban Transit Engineering Board, established jointly by the North Jersey Transit Commission and the Port of New York Authority to study and recommend a solution of the traffic problem as it affects the area which lies outside the limits of the greater city and within a radius of 40 miles of City Hall.

This territory now includes the townships of Babylon and Huntington in Suffolk County, the whole of Nassau County and that part of Queens County beyond the border of Queens Borough. He said this area is being dealt with as a unit by a sub-committee of the board, as are likewise the two other suburban sectors comprising, on the one hand, Westchester and Connecticut, and on the other, North Jersey and Rockland County.

Commuters Oppose Postponed Advance by Aurora & Elgin Case

A petition was filed with the Illinois Commerce Commission on Nov. 14 by the Commuters' Protective League, asking for the appointment of an auditor to go over the books of the Chicago, Aurora & Elgin Railroad to determine if a proposed increase of 20 per cent in commutation fares between Chicago and western suburbs is justified. The League is a group of west suburban residents organized recently to oppose the railroads' application for higher fares. It charges that an additional fare increase will hamper the growth of their communities and restrict travel to and from Chicago. According to Secretary Brown of the organization the request for an increase in rates is regarded by that body as unreasonable.

Final hearing of the case has been postponed until Nov. 28 at the request of attorneys for the Commuters' League. In opposing the postponement of the hearing, counsel for the company asserted that the delay in hearing the case was costing the railroad $10,000 a month, providing the application is finally approved.

Edward J. Mehren

McGraw-Hill Expands in Middle West

Four McGraw-Hill papers now published in Western metropolis. Fifth soon to move to Chicago. Edward J. Mehren resident executive

SIGNALIZING the rapid development of its publishing operations, the McGraw-Hill Publishing Company, publisher of ELECTRIC RAILWAY JOURNAL, is having erected for it in Chicago a building to bear its name and for the first time is placing there a resident vice-president as head of its Chicago interests. The building is now in course of erection at 520 North Michigan Avenue, two blocks north of the Wrigley Building in a rapidly developing new business center and will house all the McGraw-Hill interests centering in Chicago. The resident vice-president will be Edward J. Mehren, a native Chicagoan, who has been with McGraw-Hill in New York for 22 years in editorial and publishing capacities.

New home of McGraw-Hill in Chicago

These two moves are a logical result of the rapid expansion of the company's activities in Chicago. It now publishes there four papers, *The Magazine of Business, Factory and Industrial Management, System,* and *Harvard Business Review,* the last issued for the Harvard University School of Business Administration. A fifth magazine, *Industrial Engineering,* will shortly be transferred from New York to Chicago.

These developments have long been planned by the company. For 25 years it has maintained in Chicago large editorial, sales and circulation staffs, in intimate contact with those who have been making engineering and industrial history in that territory. This has impressed on the organization the great engineering and industrial strides of the Middle West and its still greater potentialities. To be more intimately a part of that development, present and forthcoming, the company had long planned to publish part of its group of papers there, and having accomplished this purpose, now signalizes its establishment of a great publishing house in Chicago by taking its own building and establishing there a resident vice-president. More than 400 employees are now attached to the Chicago office.

Edward J. Mehren, the resident vice-president, was born in Chicago and educated at the University of Illinois. After a short period of service in the civil engineering corps of the Burlington and the St. Paul railroads, he became associate editor of *Engineering Record,* and in succession, editor of that paper, editor of *Engineering News-Record,* vice-president in charge of publication of four of the company's magazines, and, finally, vice-president and editorial director, in charge of editorial work of all its properties. Recently, he was appointed editor of *The Magazine of Business.* He will continue that responsibility as well as the resident vice-presidency.

James H. McGraw, chairman of the board of the company, commented on these developments as follows:

> The publishing interests of the country have long been aware of the advantages of location near the center of population and industry. These have been advancing steadily westward. The inevitable conclusion is that a house of national interests, particularly when it has a number of papers, should strengthen its position by decentralizing its operations and should not concentrate its forces in one center.
>
> This step constitutes another forward movement in the steady growth in the McGraw-Hill organization as an effective institution for serving American industry and business. It marks the realization of my hope of many years that the company should have a strong publishing house in the Middle West, at a second major radiating point, giving practical expression through the various channels of its activities, of the service opportunities and ideals of the McGraw-Hill company. The organization has always been national and international in thought and purpose. Now it takes another step forward in the physical expression of its aspirations and of the policies expressed in its papers.

Charges Growing Out of New York Accident Dismissed

The last official investigation into the Times Square subway wreck of Aug. 24 closed on Nov. 19 with the dismissal of charges against Harry C. King, towerman. King's case went to jury on Nov. 16. On Monday that body filed with Judge Mancuso a dismissal of the charges against him. He had been held for second degree manslaughter after a hearing in Homicide Court before Justice Corrigan.

The accident cost eighteen lives and occasioned injury to more than 100. The Transit Commission expressed the opinion that the wreck was due to "man failure," but William S. Baldwin, maintenance foreman, had the charges against him dismissed in the Homicide Court hearing which held Mr. King. The action of the jury on Nov. 19 apparently ends the attempt to place the blame for "man failure" on anyone.

Mr. King, a train clerk who occasionally acted as towerman, had been charged by the District Attorney with actuating the devices in the tower which sent the last cars of the heavily loaded south-bound express train hurtling through an open switch and caused one of them to be sliced in half against a concrete pillar.

Another Rapid Transit Act to Be Discussed in St. Louis

The terms of a rapid transit enabling act for St. Louis, Mo., to be introduced when the Missouri Legislature convenes at Jefferson City on Jan. 2, next, will be discussed at the next meeting of the Transportation Survey Commission of the city. Copies of the enabling act of 1927, which failed of passage, have been printed and sent to each member of the commission for consideration. The members have been asked to make a study of the measure and determine how it can be improved.

The last enabling act died in committee because of the opposition of downtown property owners who objected to a clause which provided that the rapid transit improvements should be paid "in whole or in part" by special assessments against property in the areas served by the system.

Renews Request for Increase in St. Paul

With the petition by the Minneapolis Street Railway, Minneapolis, Minn., for an increase in the rate of fare, renewal of the request for an increase was made by the St. Paul City Railway, St. Paul, Minn., and an added petition was for increase in rates for Stillwater and Bayport, which are on a suburban line operated out of St. Paul. A brief cited that the Minnesota Railroad & Warehouse Commission had postponed a hearing on this previous request for St. Paul five times and since the last continuance has failed to set a date for the hearing. In the case of the St. Paul City Railway the company claims a value of at least $16,608,543, as of Jan. 1, 1928, and states it has earned only 2.53 per cent on this valuation the first nine months of the year.

In the case of the Minneapolis company the brief states that while the commission on July 3, 1925, fixed its property valuation as of Jan. 1, 1925, at $26,787,228 the valuation as of Jan. 1, 1928, is at least $27,492,729, a figure arrived at by adding the cost of additions since 1925. On the company's valuation basis the return is estimated at only 4.15 per cent, whereas the commission had set 7½ per cent as a reasonable return.

Taxis a Menace in Massachusetts

The Springfield Street Railway objected to the coming to that city of a taxi company which proposed to charge 50 cents to any part of the city, when the Transportation Board of Springfield, Mass., held a hearing recently on the subject. Under a schedule of this kind the railway contended it would be possible to fill up spare taxis at factories and thereby cut heavily into the revenue of the railway.

In Worcester the Consolidated Street Railway is confronted with the competition of taxis that operate under a flat rate of 35 cents in the city limits. The flat rate started a taxi war, but eventually all the concerns came to an agreement to maintain that rate. The railway has not felt this form of competition to anything like the alarming degree that was anticipated at first.

Time for All Things

PHILADELPHIA RAPID TRANSIT has wisely determined to make necessary track changes in the downtown district hereafter only during the night hours. This practice will make for the greater convenience of the public and reduce the source of traffic delays and congestion. It will be adhered to except in cases of emergency.

In this policy the company should have the practical cooperation of the municipality. There is already in operation a system of co-ordinated effort in the matter of paving repairs on streets occupied by trolley tracks, but the plan might profitably be extended to many other forms of public work involving the opening of streets. Night work, however, promises to be the most effective contribution toward the speeding up of traffic, for, even though the initial cost may be greater, the saving resulting from the reduction in the number of interruptions by traffic should nearly if not quite equalize the cost factor.—*Public Ledger.*

One-Man Car Rights Refused in Oakland

Permission to operate one-man cars over four lines has been refused the Key System Transit Company by the Oakland City Council by a margin of one vote. Mayor John L. Davie voted against the one-man cars and his protest was sufficient to prevent a Council majority in their support. Frank Colbourn, commissioner of public works, who moved to grant permission for their operation, and Charles C. Young, commissioner of public health and safety, voted in favor of the measure.

The four lines involved have been operated under one-man service continously for eight years, part of that time contrary to terms of a city ordinance which forbade one-man car operation in the city of Oakland.

The 90th Avenue, Fruitvale Avenue and 23rd Avenue lines have been operated with one-man cars since 1920, while the Cemetery line at the head of Piedmont Avenue has operated under one-man service since 1903.

No letters of protest against granting permits for the four lines had been filed, according to City Clerk Frank C. Merritt.

A Gesture Which Won Good Publicity in Portland

The Portland Electric Power Company, Portland, Ore., gave free rides recently to the Pacific International Livestock Show to all passengers from the steamer *Malolo*. The landing of this steamer in Portland Harbor was a memorable occasion. It was the first large ship to carry passengers direct from Portland to Hawaii. The vessel was the show place in the city while it remained, and all passengers were highly fêted, being taken for drives and entertained socially.

The steamer landed during the week of a stock show which was attracting thousands, and the rides offered by the Portland company were a courteous gesture much appreciated.

New Subway Plan Advanced for Detroit

Plans for a subway system for Detroit, Mich., are to be submitted at the spring election if the Mayor and the Council approve, says Colonel Waldon, chairman Rapid Transit Commission. The financial plan advanced previously has been revised so that yearly costs will be provided for by bond issue.

Since the new plan has been advanced Councilman Littlefield has announced that he will oppose the Transit Commission's plans for the subway system, and advocate subway dips for street cars downtown. Colonel Waldon, chairman of commission, declares Mr. Littlefield's scheme would not give sufficient relief and tunnels could not be used later as part of the subway system.

Foreign News

New Law in England Curbs Bus Competition

By a vote of 192 against 118, the English House of Commons, passed the second reading of the Nottinghamshire & Derbyshire Tramways trolleys vehicles bill recently. This bill, which was promoted by the tramway, grants a virtual monopoly on the routes operated. The bill provides that so long as the tramway furnishes a service of tramways or trolley buses which adequately meets requirements, it shall be unlawful for any other company or any local authority to run buses along the company's routes in competition with the company. It is also provided that existing bus services are not to be interfered with and that the Minister of Transport is to determine any question arising as to adequate service or competition.

Labor members of Parliament opposed the bill on the ground that it would establish a monopoly detrimental to the public interest. Colonel Ashley, the Minister of Transport, in supporting the bill, pointed out that apart from London the principle of limitation already exists in Oxford and in a bill now passing through Parliament relating to Greenock. In both these instances the privilege was granted to companies, and the same principle should apply to companies as municipalities; that is, the reduction of wasteful competition by restriction of bus services.

Dublin-Lucan Line Reopened

After having been out of operation for a number of years, the street car line running from Dublin to Lucan, Ireland, has been reopened. This line is approximately 9 miles in length and has two competing bus lines.

Tramway Offices Burned

The building occupied as the offices of Salford Corporation Tramways in England was destroyed by fire recently. The basement of the premises was occupied as a wall-paper warehouse and the fire originated there. Many of the records of the tramway department as well as 20,000,000 tickets were lost.

Salford, though a separate borough, is really one city with Manchester in regard to continuity of buildings and streets, and the Manchester tramway department came to the help of Salford and thus prevented tramway traffic arrangements from being disorganized. Tickets were also borrowed from Bury Town Council and the South Lancashire Tramways with which as with Manchester, Salford has inter-running agreements. A new supply was also ordered and delivery began on the following day. To accommodate the tramway office staff the social room of one of the tramway depots was converted into a temporary office and some other municipal offices were utilized.

Argentine Contracts for Great Britain

Contracts have been placed by the Central Argentine Railway with the Metropolitan Carriage Wagon & Finance Company, Birmingham, for the supply of 30 motor bogie first-class coaches and with Cammell, Laird & Company, Nottingham, for thirteen first-class trailer coaches and six second-class trailer coaches. These coaches are for use on the electrified lines around Buenos Aires, Argentina.

Progress in Paris Electrification

Electrification of the steam line connecting Paris, Saint Lazare and Versailles is nearing completion. This work marks an important step in the development of electric lines serving some of the more distant suburbs of Paris, bringing the total electrified mileage operated by the Chemins de Fer de l'Etat to 56 miles and the total daily number of electric train-miles to 9,321.

Four groups of trains will be operated on the new line to Versailles; the first group will provide a local service between Paris and Becon-les-Bruyeres over a distance of 4 miles from Paris; a second group will provide non-stop service to Becon-les-Bruyeres, and local service between that point and Versailles; the third group will provide non-stop service between Paris and Saint Cloud and local service therefrom; the forth group will provide a non-stop service between Paris and Versailles direct.

Street Railway Operation in Zurich

Twenty-one routes, representing 68 miles of track, are now served by the Zurich municipal tramway, Zurich, Switzerland, according to the annual report sent out by the director. This is an increase of 1¾ miles over 1926. The figures show:

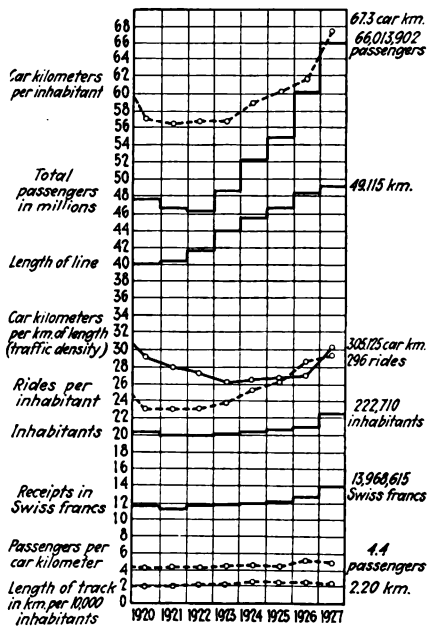
	1927	1926
Car-miles operated	9,366,401	8,137,196
Passengers carried	66,013,902	60,350,836
Total revenue	$2,793,723	$2,608,039
Total operating expense	$2,273,909	$2,072,975

The rolling stock equipment at the end of 1927 consisted of 203 motor cars and 157 trailers, a number of old motor-equipped cars having been converted to trailers. Of the latter 98 are now fitted with electro-magnetic brakes.

The quantity of energy consumed by the six transformer stations supplying the tramway system advanced from 11,761,720 to 13,463,815 kw.-hr. The number of officials and workers employed in connection with the tramways increased from 1,241 in 1926 to 1,344 last year; the last mentioned number includes 304 drivers and 570 conductors.

The report adds that the municipal authorities have voted a sum of $524,000 for the construction of two large car-houses and that considerable discussion took place on a proposal to adopt four-axle cars. Eventually this matter was referred to a committee and as the result of its report an order has been placed for twelve new two-axle cars, each axle being fitted with a 76-hp. motor working at 600 volts.

The accompanying chart gives a number of interesting comparisons of operation which cover a period of about eight years.



Meeting Bus Competition

In order to combat competition by buses, the London & Northeastern Railway is now issuing return tickets at single fare on their electrified lines in the northeast of England.

Ecuador Railway Sold

The Empresa Electrica del Ecuador, controlled by the Electric Bond & Share Company of New York, has sold its local street railway, Tranvias de Guayaquil, to Rodolfo Baquerizo Moreno. It is understood that 50,000 sucres ($10,000), was paid for real property rights, such as rails and rights-of-way; and 200,000 sucres ($40,000) for cars and other equipment. The operations of this line will be extended and it is expected that an increase in fare from $0.01 to $0.02 (U. S. currency) will be granted by the municipal government.

Recent Bus Developments

Competitive Plan Rejected

Los Angeles board turns down plea for franchise for 5-cent line to compete with Los Angeles Railway

NO GRANT for the operation of a bus line with a 5-cent fare over streets used by the Los Angeles Railway, Los Angeles, Cal., can legally be granted to Charles A. Palmer, who made the application, according to information furnished to the Board of Utilities. A report against the plan was adopted.

Mr. Palmer is president of the Comanche Mining & Reduction Company. He had sent a communication to the Mayor proposing the bus line as a rival to the railway service because of the increased fare. He explained that if granted a franchise he would organize a company to establish the bus service. The proposal was passed to the City Council, which passed it to the utilities body. Mr. Palmer asked for a twenty-year franchise.

Deputy City Attorney James Ronald presented an opinion that there was nothing to act upon, as the proposed bus concern had not been organized and everything appeared contingent on the possible granting of the franchise. In addition, the board was without power to grant other than a yearly permit with possibilities of annual renewal, which would not make a twenty-year franchise on which to organize a bus company.

Report of General Manager Marsh of the Board of Public Utilities and Chief Motor Vehicle Inspector Gunn to the board, in part, follows:

In analyzing the communication of Mr. Palmer it would appear that this is not an application for a bus franchise, but is a statement that if the Los Angeles City Council will grant him a twenty-year franchise he will proceed to organize a bus company.

In checking over Ordinance No. 58198, the ordinance regulating the operation of buses over streets of the city, we find:

"It shall be unlawful for any person to operate or cause to be operated, any bus owned or controlled by him for transportation on any street in Los Angeles without first having obtained a permit in writing from the board to do so."

The balance of the section provides how application shall be filed and the procedure to be followed.

Section 5 provides that no bus shall be operated within a certain restricted area which might be defined as Main, Spring, Broadway, between First and Eighth Streets.

From all of the above it would appear that no long-term franchise can be granted by the Council or Board of Public Utilities. It also would appear that there is a certain area in which bus operation is not permitted and if a bus company was to parallel the lines of the Los Angeles Railway it would be necessary for it to enter this area, all of which brings about a condition similar to that of the McAdoo interests, which were presented for a vote of the people several years ago and defeated.

We are not going into the engineering or transportation features of this case at the present time, but are submitting the above to the board for its information and consideration, with recommendation that the information contained therein be transmitted to the Los Angeles City Council through its Public Utilities Committee.

Preparing for Detroit's New Bus Service

The Detroit Department of Street Railways has ordered 120 additional new buses. These, with the ones previously ordered and 50 more, the purchase of which is contemplated immediately if they prove satisfactory, will supply the 200 de luxe buses promised by the department to replace the jitneys. The jitneys were recently ousted from the main Detroit streets as a result of the decision handed down by the Michigan Supreme Court over the long-fought issue. All the buses will be of a de luxe type and will be operated along the same routes or along routes paralleling the former lines of the ousted jitneys.

While the rate of fare to be charged on the new municipal buses which are to replace the jitneys ordered off the streets has not been definitely determined, it has been intimated by Del A. Smith, general manager of the municipal system, that the fare will be based upon a zoning system, and will vary from 25 cents for the extreme length of the line to 10 cents for the shorter rides. This will be somewhat in excess of the rates formerly charged by the jitneys. The general manager expressed the opinion that these 200 de luxe buses will give better service and handle more passengers with less confusion and street traffic delay than did the 500 jitneys.

Nine new bus routes have been approved by the City Council and the buses will be put into operation over these lines as fast as they are delivered. It is planned to have a number of the buses in operation by Dec. 1, and to have them all in operation by Jan. 1, 1929.

Would Accommodate Employees of St. Louis Flying Field

The St. Louis Public Service Company has asked the Missouri Public Service Commission for authority to divert part of its bus service now in operation over federal highway No. 40 between Wellston and St. Charles, Mo., so as to furnish morning and late afternoon service between St. Louis and the St. Louis Flying Field at Bridgeton. It is proposed to have the bus which leaves the Wellston Loop at 7:30 a.m. make a side trip to the flying field over the Lucas and Hunt, the Natural Bridge and the Bridgeton Station roads and the bus leaving St. Charles, Mo., at 4:45 p.m. would make the same side trip for the accommodation of employees of the flying field who reside in St. Louis.

More Bus Rights in Waterloo

Announcement has been made by Supervisor Leroy McDuffle that the Waterloo, N. Y., town board has granted a restricted franchise to the Geneva Railway Bus Lines, Inc. Claude R. Mann, operating the Finger Lakes Rapid Transit, withdrew his request for a franchise and his objections to the Geneva concern. During this meeting of the executive session of the town board of Waterloo, a proposed third line sponsored by Seneca Falls interests entering the field was discussed but no formal application for a franchise was made. Contingent upon the bus franchise being passed is an agreement that the Geneva, Seneca Falls & Auburn Railroad settle with Waterloo for taxes and assessments.

Seeks Ten-Cent Fare in Marlboro

The Massachusetts Public Utilities Commission has asked the Boston, Worcester & New York Street Railway to file an amended schedule reducing the bus fare within Marlboro during the peak hours to 10 cents. This friendly action was the result of a petition filed by Mayor Winfield Temple of Marlboro, the company expressing its willingness to make such reduction if the commissioner ordered it. The bus line was established just previous to discontinuance of the company's cars.

New Lines Will Serve Hudson Valley Route

The New York Public Service Commission granted a certificate on Nov. 16 to the Hudson Transportation Company, Inc., for the operation of bus lines between Glens Falls and Hudson Falls and Fort Edward; in Glens Falls and Saratoga Springs; and between Glens Falls and South Glens Falls.

The Hudson Valley Railway is now operating in communities proposed to be served by the new bus lines. Stockholders of the railway voted on Oct. 11 last to abandon the entire trolley service and the new bus line will provide transportation in its place after Dec. 1. Inasmuch as trolley operations will cease the commission holds that bus service will be necessary. The certificate just issued by the commission follows the granting of consents, where necessary, by the municipalities in which the bus line will operate.

Buses will be operated on practically the same schedule as now in effect by the railway, the company using 24 buses. A 10-cent fare zone will include South Glens Falls, Glens Falls and Hudson Falls, with transfer privileges to other

Digitized by Google

buses in Glens Falls. An additional 10 cents will be charged between Hudson Falls and Fort Edward and the Saratoga-Glens Falls ride will cost 80 cents.

New Services Authorized in San Diego

A certificate of public convenience and necessity has been granted by the California Railroad Commission to the San Diego Electric Railway to operate auto stage service along Market Street in that city between 25th Street and Euclid Avenue (51st Street) and intermediate points. The commission has also granted a certificate to the company to operate auto passenger service between La Mesa and Spring Valley Junction and intermediate points.

Experiment in Portland to Determine Needs

The Portland Electric Power Company, Portland, Ore., has extended its Willamette Boulevard bus route about 1 mile. The experiment is to be tried for 60 days to determine whether the service fills the need of the district according to the opinions of the residents and the City Council. This new service is not only longer in mileage, but affords important connections with other buses and city car lines.

Belt Line in Boston

A license to operate a belt line of buses around Dorchester has been granted to the Boston Elevated Railway, Boston, Mass. The action followed a study of transit conditions covering a period of four weeks. Fare on the route is 6 cents.

Supplementary Service Suggested for Houston

Plans for supplanting present railway service with a local bus service two miles long on Fannin Street, which is to be widened and repaved, were recently submitted to the city of Houston, Tex. These plans involve increased operating expenses estimated at from $72,882 to $126,452, annually, with no commensurate increase in revenue.

The Beeler Organization was asked by Mayor Holcombe to analyze the plans and study the whole problem. Its report does not approve the substitution as planned. It recommends, however, that the Fannin Street car line, the heaviest in the city, be continued as far as McGowen Avenue, which shortens it 0.9 miles, and that a through express bus line, 4.1 miles long, be established on Main Street from Franklin Avenue to Hermann Park.

This service on Main, the principal business street, one block from Fannin, it is pointed out, will improve the service to the whole central south side as well as the central business section, and provide service to Rice Institute, which was not included in the other plans.

It is estimated that this enlarged service may cause a reduction in the net of $10,134 annually, but it is pointed out that this is only a fractional part of what was contemplated in the plans that had been previously submitted. This loss should be speedily wiped out as the proposed line connects the business district with the rapidly growing apartment section.

Service Expanded Near Petersburg

Bus service to the DuPont City section was instituted by the Petersburg-Hopewell & City Point Railway, Petersburg, Va., on Nov. 19. The buses will be run into the Atmospheric Nitrogen Company's plant area. The service will also be continued from the car depot into the plant area, thus giving it better transportation than it has had at any time in the past.

Route to Boylston and Clinton Refused Acme Bus

A permit was refused by the Worcester, Mass., license board to the Acme Bus lines to operate buses on the city streets over a proposed route to Boylston and Clinton. The chairman of the Boylston Selectmen and two Selectmen of Clinton, officials of the Worcester Consolidated Street Railway and the Boston & Maine Railroad opposed the granting of the license.

The license board after careful study decided that public necessity did not demand the operation of two bus lines to Boylston and Clinton. At the present time the Consolidated is operating buses to Clinton by way of West Boylston and also through Boylston. The Acme lines sought to give hourly service from Worcester to Clinton by way of Boylston. Under the Consolidated schedule similar service is given alternating each half hour by way of Boylston and West Boylston.

Financial *and* Corporate

Good Showing by Buffalo Company

Still further improvement in the financial position of the International Railway, Buffalo, N. Y., is shown by the company's consolidated income account for the first nine months of 1928. The statement shows a net income of $577,846, compared with $114,984 for the corresponding period last year. Operating revenue was $27,000 under that of last year, largely because of the poor tourist season, but the decrease was more than offset by operating efficiencies and economies.

Operation and taxes totaled $6,891,485 as compared with $7,306,997 last year. The reduction is due to operating efficiencies and economies, and to the fact that an amortization charge of $253,665 included in the 1927 statement was discontinued, effective on Jan. 1, 1928, with the approval of the Public Service Commission and is therefore not included in the 1928 statement. There was a decrease of nearly $50,000 in fixed charges, largely through retirement of bonds for which the holders accepted preferred stock.

CONSOLIDATED INCOME ACCOUNT OF THE INTERNATIONAL RAILWAY

Nine Months Ended Sept. 30	1928	1927
Operating revenue	$8,430,190	$8,457,031
Operation and taxes	6,891,485	7,306,997
Operating income	$1,538,705	$1,150,033
Non-operating	72,098	46,496
	$1,610,803	$1,196,529
Fixed charges	1,032,957	1,081,545
Net income	$577,846	$114,984

Amortization charge amounting to $253,665 is included in 1927 statement. With approval of Public Service Commission this charge has been discontinued effective Jan. 1, 1928, and is therefore not included in the 1928 statement.

In commenting on the continued improvement in I.R.C. financial position President B. J. Yungbluth said:

In accordance with the long established policy of Mitten Management the public is the first to benefit from the improvement. I.R.C. today is supplying service substantially better than Public Service Commission requirements. Cars are cleaner, brighter and in better mechanical condition than ever before. The number of riders who must stand because of rush-hour crowds has been steadily reduced and is much less than in any other great city of the United States. Although increased traffic congestion presents added difficulties, more than 90 per cent of all I.R.C. cars are operating on time. Safety has been greatly increased, accidents thus far being 28 per cent less than those of last year, on top of a 15 per cent reduction in 1927.

The improvement in I.R.C. credit made possible a large and costly program of track and paving reconstruction, which the company immediately undertook in co-operation with the city. Last year I.R.C. spent $250,000 for this work; this year a total of $375,000 was spent in streets selected co-operatively by the city and the company. In addition $400,000 was spent each year for track and paving maintenance, so last year's program with the work being done this year, reaches the staggering total cost of $1,425,000. In addition to the work contemplated, I.R.C. while unable to meet the demands of the city for reconstruction in additional streets, was able to co-operate by renewing its rails in those portions of Seneca and William Streets not covered by the program jointly agreed to by the city and the company.

As the sincerity of Mitten Management policy to meet its responsibility to the car riders first became evident there has developed a fuller understanding and a widespread spirit of sympathetic co-operation. The substantial accomplishments now on the record prove the wisdom of co-operative effort.

As the spirit of co-operation continues to

Digitized by Google

develop it will become increasingly evident that I.R.C. supplies to the Niagara Frontier a transit service that will compare favorably with that supplied anywhere.

Elsewhere in this issue of ELECTRIC RAILWAY JOURNAL there is an illustrated article descriptive of some of the recent track work of the company.

Net Income on Detroit Municipal Lower for Year

For the year ended Oct. 31, 1928, total operating revenues of the Department of Street Railways, Detroit, Mich., were $24,202,398, including $3,234,332 for coach revenues, as against $23,774,542, including $3,236,849 for the year ended Oct. 31, 1927. Total operating expenses advanced from $18,179,871 to $18,881,729. These figures are inclusive of coach expenses amounting to $3,198,653 and $2,960,492 for 1928 and 1927 respectively. From a gross income of $4,777,267 in 1928 and a gross income in 1927 of $5,098,037, total deductions were $1,910,507 for this year and $1,898,474 for last year. This left a net income of $2,866,760 for this year's period and $3,199,562 for last year's period.

Statistics of the road show that the total number of railway passengers was 451,149,654 for the year ended Oct. 31, 1928, compared with 442,274,352 last year. Total coach passengers numbered 44,253,730 this year and 41,263,207 last year. Total revenue and transfer passengers were given at 495,403,384 for this year's period compared with 483,537,559 for the year ended Oct. 31, 1927.

Improvement in Lincoln's Financial Position

For the first ten months of 1928 the Lincoln Traction Company, Lincoln, Neb., reports that it has earned, applicable to dividends, $22,268, compared with only $6,577 for the corresponding period of 1927. Due to substitution of buses for street cars the revenue from cars continues to decline, while that from buses increases. The total revenues from transportation for the ten months were $383,992, compared with $376,503, an increase of $7,486, while total revenues from all sources were $395,552, an increase of $7,223. Operating expenses and taxes show a decrease of $8,406, from $330,532 to $322,126, leaving the net income after operation and taxes at $73,425, compared with $57,797, a year ago. Deducting bond interest, amortization and interest on current indebtedness, there is carried to the dividend account $22,268. Property valuation exceeded $2,500,000.

Interborough Deficit for Four Months Is $410,701

Gross revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., for the four months ended Oct. 31, 1928, was $21,543,264, an increase of $625,383 over a similar period of last year. Expenditures for operating and maintaining the property were $13,953,164, an increase of $1,145,446. The balance after deducting 5 per cent Manhattan dividend rental showed a deficit of $410,701, which represented a decrease of $107,896 over the four months' period ended Oct. 31, 1927.

More Speculation on Tacoma Situation

First-hand knowledge of the Tacoma railway situation, in all its phases, is being sought by bondholders of the Tacoma Railway & Power Company and the Puget Sound Electric Railway, through the offices of William R. Peabody, Boston attorney, who, while not himself a bondholder, has been selected to gather the information which the bondholders committee desires.

Mr. Peabody is in Tacoma studying the situation. He has conferred with Commissioner Ira S. Davisson, and with Richard T. Sullivan, general manager of the transportation lines, and others of the companies involved, and has made a personal inspection of the properties.

The bondholders have no definite plan for solving the difficulties of the local transportation companies, which are in default upon their bonds, but may formulate some plan when they receive the information he has been asked to obtain. The Puget Sound Electric is now in the hands of a receiver and its property is to be sold for its value as a discontinued line since service is to be withdrawn on Jan. 1.

There has been some talk of the Tacoma Railway & Power Company, a subsidiary of the Puget Sound Electric, also being placed in the hands of a receiver. A plan of local men, headed by S. M. Jackson, to form a new company to take over the properties fell through some weeks ago.

Supreme Court Denies Bondholders' Writ

Application for a *writ of certiorari* filed by the attorneys for the second mortgage bondholders of the old Kansas City Railways has been denied by the Supreme Court of the United States. The move was made in an attempt to get a hearing before that court. The plaintiffs contend they were discriminated against in the reorganization of the property out of which the Kansas City Public Service Company was evolved as the successor company.

Slight Decrease in B.-M.T. Net

For the four months ended Oct. 31, 1928, the total operating revenues of the Brooklyn-Manhattan Transit Company, Brooklyn, N. Y., was $16,030,178, as against $15,657,278 for a similar period of the year previous. Total operating expenses were $10,665,024 against $10,443,562 for the four months' period of 1927. After the consideration of income deductions the net income for the 1928 period was $1,826,509, compared with $1,833,712 for the 1927 period.

Conspectus of Indexes for November, 1928

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Personal Items

New Company Takes Over Ohio Freight Business

D. R. Thomas is president and general manager of a new organization known as the Electric Railways Freight Company. Other officers are S. Jorgensen, secretary-treasurer; C. J. Laney, traffic manager; Edward Ackerman, auditor; F. W. Gerlach, general freight agent in charge of solicitation.

The new company takes over all the freight business of the Northern Ohio Power & Light Company, Pennsylvania-Ohio Power & Light Company and the Lake Shore Electric Railway, following the perfection of such consolidation. Joining these roads on Dec. 1 will be the Toledo & Indiana Railroad and the Ohio Public Service Company. The former line is between Toledo and Bryan, the latter extending from Toledo to Port Clinton.

Mr. Laney, who becomes traffic manager of the new organization, has been traffic manager of the Northern Ohio Power & Light Company for ten years or more. Mr. Gerlach has also been with the same company several years as Cleveland freight agent. Both men know the freight territory and have wide acquaintance. Mr. Laney had his headquarters in the Terminal Building, Akron.

Mr. Thomas has been employed by several companies in investigation work, while Mr. Jorgensen had been with the Lake Shore.

Consolidation of these freight departments will enable the companies to effect economies which could not otherwise be accomplished and it will also work to the benefit of shippers. With one directing head for the roads interchanging freight, equipment can be used to a greater advantage and with less delay. Operation can be so conducted that cars can be loaded going both ways in and out of the territory.

The office of the new company is at 704 Eagle Avenue, Cleveland, Ohio.

R. M. Feustel Mentioned for Indiana Post

Robert M. Feustel, Fort Wayne, president of the Indiana Service Corporation, is being mentioned as probable chief of Insull-owned public utilities in Indiana and as possible successor to the late Robert I. Todd, who was president of the Indianapolis Street Railway. It is regarded as improbable, however, that a successor to Mr. Todd in the directorate and official staff of a dozen or more utilities will be selected until after the Indiana Public Service Commission has acted on the merger petition now before it.

The proposed merger would consolidate into the Indiana Electric Corporation, the vast Insull-owned Central Indiana Power Company, serving 179 Indiana Communities, the Terre Haute, Indianapolis & Eastern Traction Company and the Terre Haute Traction & Light Company.

The Indianapolis Street Railway is not a party to the proposed merger, but because of the interlocking directorate of the company with the companies to be merged with the Insull interests, it is regarded not unlikely that Mr. Feustel's selection to head the corporation would result in his election to succeed Mr. Todd as head of the railway at Indianapolis.

Mr. Feustel is a national utility figure. He was construction engineer for interurban and city railway properties in Northern Indiana from 1905 to 1907; assistant chief engineer of the Wisconsin Railroad Commission from 1907 to 1913; chief engineer of the Public Utilities Commission of Illinois from 1914 to 1915, and since that time president of the Indiana Service Corporation.

W. G. MARKS, general manager of Chesterfield (England) transport department, has been appointed general manager of Nottingham Corporation Tramways, succeeding John Aldworth, who is retiring. Mr. Marks has had 27 years of experience in passenger transport. Among the tramway undertakings with which he has been associated are those of Middlebrough, Rotherham and Chesterfield.

OBITUARY

Alfred A. Green

Al Green, known the country over to electric railway men, died on Nov. 9, at Scranton, Pa., as a result of injuries sustained two weeks previously when he fell down a flight of stairs during one of his regular inspection trips. The remains were interred at Easton, Pa., on Nov. 12.

It has just been said that Al Green was known to electric railway men the country over. He was. But he was, perhaps, best known among such men in the East. For more than twenty years he has been connected with the Galena Signal Oil Company as its representative, except for a period of a few years some time ago when he was associated with the Columbia Machine & Malleable Iron Works.

To the problems of the Galena Company, lubricating experts, Mr. Green brought a well rounded career which covered a wide range of experience in electric railway maintenance and mechanical work. In that service he was one of the industry's pioneers, for he helped to build some of the early roads and then he wrote about his experience for publication, contributing to ELECTRIC RAILWAY JOURNAL a notable service of articles some time ago which stamped him as an expert in his line. Not only that, but Mr. Green contributed freely of his knowledge to the proceedings of the American Electric Railway Engineering Association.

Al Green had been making a name for himself long before 1904, but in that year he resigned as chief electrician and master mechanic of the Rochester Railway after ten years of service with the company. That date is important in the record of the career of the man, since it was destined to mark the turn in events which took him out of the operating end of the business and launched him on his career as lubricating expert.

Early in the year 1890 Mr. Green had gone to Rochester for the Brush Electric Company, Cleveland, to install the Short electric railway system there. On the completing of this work he remained there with the railway. Before that he had been superintendent of the testing department of the Brush Electric Company and previously superintendent of the Memphis Light & Power Company.

So it becomes evident that Mr. Green entered the field of the application of electricity to industry at its inception and that his active term of service covered the period from the little sputtering dynamos of the 80's to the massive machines of the present day. During all that time few men knew more than he about the part that proper lubrication plays in making high duty and high power machinery perform at the greatest mechanical efficiency. News of his death will come as a shock to a wide circle of acquaintances stretching across the country who had contact with Mr. Green over a period of more than a quarter of a century.

Daniel E. Lenahan

Daniel E. Lenahan, assistant superintendent of equipment of the Third Avenue Railway, New York, N. Y., died suddenly on Nov. 21. He began his railroad career at the Seventh Avenue and 50th Street carhouse of the Metropolitan Street Railway in 1898 where he served first in the capacity of car shifter and later as carhouse clerk. Then he became a foreman in the inspection department of the Manhattan Elevated Railroad and in 1905 was transferred to the subway lines of the Interborough Rapid Transit Company where he served first as foreman of car equipment, later as yardmaster and finally as superintendent of car inspection. Some years later he was again transferred to what is now known as the New York Railways, where he served first as assistant superintendent of equipment and later as general superintendent. His appointment as assistant superintendent of equipment of the Third Avenue Railway became effective June 1, 1927.

Activity of Equipment Market Continues

Purchases of both track and line materials numerous. Illinois Central contemplates purchasing locomotives. Many buses ordered

ALTHOUGH no large projects have been announced during the past week, reports from a number of electric railways indicate that the market for material and supplies remains in good condition for this season of the year. Community Traction Company, Toledo, Ohio, continues its activities by placing orders for eighteen new motor coaches which will bring its bus fleet up to 106 coaches. All garage operations of this company will be centralized at a new $150,000 garage being built on the site of the Central Avenue carhouses. Both car and bus repair and maintenance operations will then be centralized in this location.

The Community Traction Company has also rehabilitated its Cherry Street line and overhauled these cars, installing additional motors and new control equipment. In view of the fact of increased earnings of this line, a contract has been let for the purchase of 120 motors with which 45 of the Peter Witt type cars will be equipped. Each car will then be equipped with four motors giving faster acceleration and smoother operation. This $150,000 rehabilitation program is to be completed about Jan. 1.

Track Materials

Five thousand hemlock ties have been ordered by the Ottawa Electric Railway, Ottawa, Ontario. The Capital Traction Company, Washington, D. C., has placed orders for 3,000 steel tie plates for use with 4-in. T-rail. This company has also ordered 100 Thermit rail welding portions at a cost of $441. The Grand Rapids Railroad, Grand Rapids, Mich., has placed orders for 25 kegs of ⅞x5½-in. track bolts.

One hundred thousand granite paving blocks, 20,000 bags of cement, and 3,000 hemlock cross ties have been ordered by the Toronto Transportation Commission, Toronto, Ontario. The Dallas Railway & Terminal Company, Dallas, Tex., has ordered 5,000 creosoted pine ties and one car of mixed timbers and ties. Special work including ten mates and eight track switches has been ordered by the Virginia Electric & Power Company, Richmond, Va. This company has also ordered 500 track rail bonds.

To facilitate construction of the sewerage system to inclose the Des Peres River, the St. Louis Public Service Company, St. Louis, Mo., is making several changes in its track. The Oakland Avenue project calls for a temporary elevated loop structure of all steel construction resting on wood piles, describing a half circle around the old bridge from one shore to the other. In length it is about 150 ft., and connects with the tracks just above and below the bridge entrances. On Manchester Avenue, a short distance west of Oakland Avenue, a new bridge is to be constructed. This will be a permanent structure and will be approximately 150 ft. in length. The estimated cost of the two jobs is about $20,000.

Overhead Line Equipment

Several fairly large orders for line material have been placed. The Toronto Transportation Commission has ordered 61,000 ft. of No. 8 waterproof triple braid copper wire which will be required for its city extension consisting of 7 miles of double track.

Twenty-five thousand feet of ¼-in. galvanized strand and 25,000 ft. of ⅜-in. galvanized strand have been ordered by the Louisville Railway, Louisville, Ky. Other line materials ordered by this company include 200 flexible approaches, 500 No. 00 clinch ears, 500 No. 000 clinch ears, 1,000 ft. of No. 0000 double braid weatherproof stranded copper wire, 500 spring lock hangers and miscellaneous electric switch repairs. The Virginia Electric & Power Company has ordered 100 trolley hangers and ten trolley cross-overs. Fifty splicing ears, 100 line hangers, eight overhead switches, and 200 crossarm pins have been ordered by the Grand Rapids Railroad.

Rolling Stock

The Illinois Central Railroad, Chicago, Ill., is inquiring for four electric switching locomotives. The Virginia Electric & Power Company is remodeling its cars on the Norfolk division, requiring eight type K-75-A controllers. This company has also purchased five Twin Coaches.

The Capital Traction Company, Washington, D. C., has placed orders for one hundred 31-in. solid wrought carbon steel car wheels costing $2,775 and forty 21-in. and forty 31-in. heat-treated solid wrought carbon steel car wheels at a cost of $2,260. Dallas Railway & Terminal Company has ordered one car of brake shoes.

The Capital District Transportation Company, controlled by the United Traction Company, Albany, N. Y., has applied to the Public Service Commission for authority to issue notes for the purchase of three Versare Electric Motor Buses for use in the operation of its Troy Bus Line. The Illinois Power Company, Springfield, Ill., has ordered two 21-passenger street car type Studebaker buses and two 22-passenger Seminole parlor observation Studebaker buses. Two Mack, four-cylinder, 21-passenger city type buses have been delivered to the Wichita Falls Traction Company, Wichita Falls, Tex. The Louisville Railway, Louisville, Ky., has placed orders for fourteen 21-passenger street car type Studebaker buses.

The Toronto Transportation Commission has ordered one model SH-100-hp. Walter snow fighter complete with cab, electric light, starter and pneumatic tires. This company has also ordered 21 trolley loading platform beacons, four supports, equipped with red globe and guards.

The British Columbia Electric Railway is going to expend approximately $270,000 in substation construction in the near future. The Louisville Railway is making extensive repairs to the steam end of a 6,000-kw. turbo-generator and is rewinding the armature of a 3,000-kw. turbo-generator. The Capital Traction Company has ordered a McKee gas-fired steam cleaning outfit consisting of a 4-hp. steam boiler, solution tank, water ejectors, automatic pump unit, etc., for cleaning bus motors and chassis.

Kansas City to Try Twin Coach Car

The Kansas City Public Service Company, Kansas City, Mo., will try out a new Twin Coach street car for a test period beginning in a few days. A Twin Coach bus has been on trial operation for several months. This new automotive-type, light-weight car is being awaited with interest by both the company and the public.

American Standards Association Formed

Unanimous approval by the 37 member bodies of the establishment of the American Standards Association to succeed the American Engineering Standards Committee, is announced by William J. Serrill, assistant general manager of the United Gas Improvement Company of Philadelphia. Mr. Serrill was chairman of the Standards Committee, and now becomes president of the American Standards Association. One of the most important results of the abandonment of the committee form of organization will, according to Mr. Serrill, be a much greater degree of participation by trade associations in the direction of the national industrial standardization movement.

One of the first acts of the association will be the organization of a board of directors composed of twelve industrial executives. This newly created board, which was established in recognition of the increasing part which executives are playing in the standardization movement, will control the general administration and policies of the association. The old main committee, made up of representatives of all the member bodies, now becomes the Standards Council, and in its hands will rest all matters connected with the adoption and approval of national standards.

The officers of the association are, in addition to Mr. Serrill: Vice-president, Cloyd Chapman; secretary, P. G. Agnew; and assistant secretary, F. J. Schlink. The advisory committee of Industrial Executives includes: J. A. Farrell, president of the U. S. Steel Corporation, chairman; George B. Cortelyou, president of the Consolidated

Digitized by Google

Gas Company; John W. Lieb, senior vice-president of the New York Edison Company; L. F. Loree, president of the Delaware & Hudson Company; and Gerard Swope, president of the General Electric Company.

Largest Electric Railway Exports to Canada

Of the $106,692 worth of railway motors, electric locomotives, mining and industrial locomotives, starting and controlling equipment for electric railway and vehicle motors, railway signals, switches, etc., exported from the United States during the month of August, 1928, Canada received $63,811 worth of this equipment. The division of these exports to Canada is as follows: Electric locomotives, $20,000; starting and controlling equipment for electric railway and vehicle motors, $2,439; and railway signals, switches and attachments, $41,372.

Japan was the second largest receiver of American electric railway exports, receiving $12,119 worth of mining and industrial locomotives and $1,100 worth of starting and controlling equipment. The classification of the total exports from the United States consists of railway motors, $450; railway electric locomotives, $20,000; mining and industrial locomotives, $22,876; starting and controlling equipment for railway and vehicle motors, $10,269; railway signals, switches and attachments, $53,097.

Export Day at Power Show

As a result of the number of foreign visitors at the 1927 power show, the manufacturers of equipment who will exhibit at the Seventh National Exposition of Power and Mechanical Engineering at Grand Central Palace, New York, N. Y., Dec. 3 to 8, are showing a marked interest in the program that will be a feature of the exposition on Dec. 6, which will be Export Day.

The opening will take place at 2 p.m. Dec. 3. The Export Day program Thursday, Dec. 6, will be marked by the assembling of the members of the various foreign departments of the exhibitors in order to answer questions peculiar to the exporting of the various products. The foreign attendance last year brought representatives from 33 foreign countries and five insular possessions of the United States.

Requests have been received from a large number of foreign governments for invitations to the power show. Every exhibitor has been notified of the date of Export Day and special announcements in several languages will be posted at the entrances.

Included in the exhibits will be the latest type of equipment for the generation and distribution of power; for heating and ventilating buildings and factories; for handling material; for the control of temperature, pressure, volume and time; and machine shop equipment including metal and woodworking machines and tools.

METAL, COAL AND MATERIAL PRICES F.O.B. REFINERY

	Nov. 20, 1928
Metals—New York	
Copper electrolytic, cents per lb.	15.775
Copper wire, cents per lb.	17.875
Lead, cents per lb.	6.35
Zinc, cents per lb.	6.60
Tin, Straits, cents per lb.	51.
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.375
Somerset mine run, f.o.b. mines, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	1.80
Franklin, Ill., screenings, Chicago, net tons.	1.30
Central, Ill., screenings, Chicago, net tons	1.15
Kansas screenings, Kansas City, net tons	1.625

White lead in oil (100-lb. keg), N. Y., cents per lb.	13.25
Turpentine (bbl. lots), N. Y., per gal.	0.64

Seasonal Decline of Industrial Production

Consumption of electrical energy by manufacturing plants indicates that a seasonal downward trend in rate of production was witnessed during October. Rate of October operations were 1.9 per cent under September, but were 10.1 per cent above October, 1927. Textiles reported an increase in rate of operations of 7.6 per cent over September, and rolling mills and steel plants, 2.5 per cent. Operations in the automobile industry were 14 per cent under September, but were still 24 per cent over October, 1927. Lumber and its products continued on a low plane.

The New England states reported an increase in the rate of production of 4.7 per cent over 1927, the Middle Atlantic states 19.7 per cent, the North Central states 24.8 per cent, and the Western states 18.2 per cent. The Southern states reported operations 3.5 per cent under October last year.

The remaining months of the year will probably witness a gradual drop in rate of activity, though general operations may continue on a comparatively high plane, at least until the opening of spring.

TRADE NOTES

AMERICAN ELECTRIC SWITCH CORPORATION, Minerva, Ohio, has placed a direct factory representative in the metropolitan district discontinuing the services of Holland & Monaghan, manufacturer's representatives. The New York office and warehouse is now located at 430 East 53rd Street with G. E. Lindstrom as manager.

NATIONAL FLUE CLEANER COMPANY, Groveville, N. J., manufacturers of the National Soot Blower for return tubular boilers, announces the appointments of three new Ohio sales representatives; namely, Craun-Liebing Company, Cleveland, Dennis Engineering Company, Columbus, and the Bishop Engineering Company, Cincinnati. Other recent appointments are the Power Plant Efficiency Company of Indianapolis, Ind., and the Rathburn Company of El Paso, Tex.

VERNON B. KING, formerly service manager at Toronto, Ontario, for the White Motor Company, Cleveland, Ohio, has been promoted to the position of export service manager. In his new capacity he will have charge of foreign truck and bus service throughout the world.

TIMKEN ROLLER BEARING COMPANY, Canton, Ohio, put into effect a program which will provide the necessary equipment for raising the company's present output of 175,000 bearings per day to over 200,000 per day. The program has necessitated the expenditure of about $6,000,000 during the current year and covers additions to both the steel mill and bearing factory.

C. F. PEASE COMPANY, Chicago, has moved its New York sales office and display room, formerly located in the Grand Central Terminal, New York City, to new quarters occupying the entire Seventh Floor, Ashforth Building, at 12 East 44th Street, New York City. An increase in sales personnel has also been made.

HAROLD C. OSMAN, secretary of the Nugent Steel Castings Company, Chicago, Ill., and heretofore in charge of sales for that company, has been appointed Works Manager.

RUDD H. BENDER, formerly with the Brown Body Company, has joined the Bender Body Company, Cleveland, Ohio, as sales representative.

ADVERTISING LITERATURE

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., has just issued a new bulletin describing Wagner large RA single-phase repulsion-induction motors. It covers such subjects as type of single-phase motors, history of repulsion-induction motors, operating principles, sleeve and ball bearing construction, ventilation, and construction features of stator, end plate, rotor and rocker arm. The bulletin is illustrated with numerous drawings and photographs.

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, East Pittsburgh, Pa., has just released two publications on electric railway equipment. "High-Speed Motors and W-N Drive—D.M.F. 5126" contains complete construction details of this new double-reduction method of street car drive. "Electric Freight Haulage Increases Earnings—D.M.F. 5113" is a discussion of the possibilities for freight service on electric railways and some facts about Westinghouse equipment available for such service.

AMERICAN ELECTRIC SWITCH CORPORATION, Minerva, Ohio, has issued a new catalog covering its line of safety switches, meter switches and fuse panels.

A Municipal Ownership Fiasco

SOMETHING is wrong with Seattle's Municipal Railway. Something has been wrong with it ever since the city took over the lines of the Puget Sound Traction, Light & Power Company on March 31, 1919, paying for it in twenty-year bonds bearing 5 per cent interest. Instead of taking the utility out of politics the transfer from the private company put the property into the center of that hazardous arena. As a political issue the question of the future of the road has made and unmade Mayors. Each succeeding incumbent has promised to do something about it, but none of them has done so. Fortunately, however, civil service has kept the railway out of the clutches of the patronage seeker.

The Seattle system has been operated at a loss each year it has been under municipal ownership. So acute did the situation become last spring that Councilman Erickson, veteran municipal ownership advocate, declared the railway to be hopelessly insolvent. He wanted to have the general fund contribute to the expenses of the railway, on the ground that it is an asset to the entire city. As matters stand now the system must be self-sustaining. Not only that but the purchase price must be amortized out of earnings. That is where the rub comes. Again Seattle is promised that something will be done about it. To that end both the present Mayor and the city superintendent of utilities would rehabilitate the system with the proceeds of a bond issue and reorganize and develop the property along modern rapid transit lines. An alternative suggestion is that the railways be leased to private operators with a franchise granted to them for long-term taxicab rights, the two services to be combined into one transportation system. As indicated elsewhere in this issue, it appears likely now that these rival programs will be submitted to a vote of the people next March. Such are the past political hazards, however, that there is no certainty that by the time March rolls around this program will then appear propitious.

This is not the first time that something needed to be done about the matter. But conditions would appear to have reached a crisis. The city's reputation has not only been hurt, but the Municipal Railway is now from $500,000 to $600,000 behind in its obligations without taking into consideration the inadequacy of the amounts that have been set aside annually for depreciation. Moreover, the city is losing approximately $525,000 a year that it would receive in the form of taxes upon its property and other payments if the lines were owned by a private company.

The full Seattle story is a long one of which this is merely a sketchy outline. There appears to be no adequate reason for this lack of achievement on the part of the city, for since 1923 the Municipal Railway has been on a rate of fare that provides for the payment of 10 cents in cash with an 8⅓-cent token fare. The record presented here and the accounts which have appeared in Electric Railway Journal from time to time substantiate the truth of the statement that municipal ownership of street railways in Seattle has proved a fiasco.

Suggestions for Improving Convention Attendance

WHILE the American Electric Railway Association convention is a thing of the past, it has not passed so far into the background but that it offers suggestions for improvements next year, particularly in the matter of attendance at affiliated association meetings. It was noticeable in some of the meetings of the several affiliated associations, that the number of delegates who attended all of the sessions of their particular group was relatively small; and while the attendance at the opening sessions was fair, it was by no means what it should have been. But, at the final sessions of some of the affiliated associations, there was hardly more than a corporal's guard.

Many delegates were permitted by their managements to spend only two or three days at the convention. When it is considered that at least a part of the time available must be devoted to an inspection of the exhibits, it will be readily apparent that the time for attendance at meetings becomes very limited indeed. It seems quite obvious that full value from the investment made in sending men to the convention can be derived only by allowing these men sufficient time to attend all of the meetings of their respective associations.

There is, however, another side to this question. It was particularly noticeable at the last convention that a number of managements sent unusually large delegations, which in some instances included all of the men in responsible supervisory positions on their properties. Obviously, under these circumstances it became necessary to limit the time of attendance of each man, for it is an unusual property indeed which can permit all of its principal supervisory officials to be absent at one time. Faced with the alternative of limiting the number of departmental executives who go to the convention, or staggering the time of attendance so that all responsible officials are not away from a property simultaneously, there is much to be said for the latter policy.

There are, therefore, two considerations regarding convention attendance. It is highly desirable, in fact essential, that full attendance of important committee members and officers be assured at affiliated association meetings. It is likewise desirable to permit the maximum possible number of supervisory officials to derive the benefits of convention attendance. It is suggested, therefore, that in apportioning time among delegates preference be given to those men who are actively engaged in committee work or in directing the affairs of their respective associations as officers. Perhaps this would put committee activity at a premium. If so, it would be a healthy condition, for there are, unfortunately, too

Digitized by Google

many responsible departmental executives who give little attention to committee work which is the foundation of association activity and progress.

An Exhibit That Stimulates Interest

LIVELY interest taken by both public and railway men in the exhibit staged by the Interborough Rapid Transit Company in New York during October suggests the desirability of such a temporary exhibit in other cities, when the occasion arises. The ordinary citizen knows very little about the nature of electric car equipment other than that electricity is the propelling force, and that it is taken from an overhead wire and is admitted to unseen motors by a controller on the front platform. The public cannot fail to be impressed by an exhibit which gives an opportunity to see the complicated nature and rugged appearance of the actual transportation equipment, as well as the ingenuity which has been exercised in devising the various parts.

For employees the benefit, of course, is even greater, because very few employees other than those whose work requires them to understand the equipment know much about its actual design. The railway accountant, for instance, should do better work if he has a knowledge of what railway apparatus looks like and does. Even trainmen can get clearer ideas of much of the apparatus under the car than they can from a school car only.

From every point of view the expense of an exhibit of this kind seems more than justified. The foundation of good public and employee relations is interest in the company's operations. There seems to be no better way of stimulating this interest in equipment and methods than that adopted by the I. R. T. in the exhibit which is described elsewhere in this issue.

Canadian Railways Show Increased Earnings

STUDENTS of monthly traffic statistics of electric railways have been impressed for some time with the good record maintained by the Canadian properties. During 1927 the average increase in revenue passengers compared with the previous year of the Canadian companies reporting to the American Electric Railway Association was 3.48 per cent, and the monthly average increase of the same companies during the first ten months of 1928 was 4.63 per cent. The most striking feature of these figures is that during the same two periods, 1927 and the first ten months of 1928, every one of the six sections into which the United States is divided for the purpose of classifying traffic statistics, showed a decrease in the number of revenue passengers.

The American Association statistics are supplemented and confirmed by figures compiled by the Canadian Electric Railway Association. These data extend back to 1913 or earlier and show that while present electric railway traffic in Canada does not quite reach the total of 1920 (the record for all time in that country), there has been a constant gain during the past three years, and in 1927 the 1920 figure was nearly attained. This has been accomplished despite steady increases in automobile registrations in Canada. Even more satisfactory gains are shown in the figures for Canadian passenger revenue and net income. Finally, there has been very little change in the rate of growth of investment in Canadian electric railways for 27 years, except for a brief set back in 1920.

The reasons for this better showing of the Canadian properties compared with those on this side of the border are difficult to discover. It cannot be because of a more satisfactory fare situation, since there has been no material increase in city fares in Canada since 1922, yet the gain in both gross and net during the past three years has been continuous. The present Canadian city fare is now only 140 per cent of the pre-war level. There is probably less competition from private automobiles in Canada than in the United States, although the automobile registration in Canada now is about one to every ten inhabitants, approximately the same as our figures of six or seven years ago. Undoubtedly the longer winters in Canada have had something to do with the continuous patronage of the electric railways, but whatever the cause, the properties in our great neighbor to the north ought to be congratulated.

Making a New Shop Pay for Itself in Three Years

ANTICIPATED economies amounting to $200,000 a year provide the principal motive that led the Philadelphia Rapid Transit Company to build its new $500,000 bus maintenance shop. With 570 gasoline-electric buses operating more than 20,000,000 miles a year, the company was in a position to realize the utmost in maintenance savings by having a central repair shop where all maintenance work can be co-ordinated. The centralized plan eliminates the need for more than 10 per cent spare vehicles, it reduces the amount of spare parts and maintenance stock that must be carried and it eliminates duplication of tools and shop forces that must result necessarily where the work is done at several points.

In the arrangement of the shop particular attention was given to routing the work and interlocking the various repair operations, so that a relatively small number of men employed steadily can make repairs. In deciding on the various departments the railway took a leaf from its book of experience gained in maintaining electric cars. Departments for electrical repairs, machine shop, sheet metal shop, wood-working mill, blacksmith shop, paint shop and tool room are all standard departments for electric car maintenance. Only by the addition of a department for overhauling bus engines has a new type of maintenance work been introduced that requires specialized methods.

Tools are located so as to prevent crowding and give plenty of room for orderly movement of material. Units are arranged so as to give workmen the advantage of good light. Overhead cranes and hoists provide for efficient handling. Lathes are arranged along the windows at one side of the shop and are staggered diagonally to facilitate the handling of bar stock and to prevent work on one machine interfering with that on another.

The fact that bus repair work often requires greater precision and closer fits than are used in electric car maintenance has been recognized by providing a complete assortment of precision instruments and special tools. Micrometers, gages, test blocks, and even a Brinell hardness tester and a scleroscope are included in the tool-room equipment.

More economical maintenance will result from having up-to-date tools for performing the various classes of work and from having experienced men skilled in the particular operations to carry it out. Convenient storage of material will reduce the time needed for repairs and the stock of spare parts can be kept low.

More Evidence of Modern Transportation Merchandising

ADDITIONAL evidence of the disposition of those supplying public transportation to make their service more attractive is furnished by the announcement just made by the New York Central and the West Shore Railroads regarding changes in commuters' tickets and in the rates for excursion tickets. Thus, for use in the coming year, the New York Central and the West Shore Railroads have devised a new form of unlimited commutation ticket, resembling the old-fashioned pass card. It will require no punching, and can be bought for as many months ahead as the purchaser wishes, at the regular monthly rate. At the same time there will be offered a schedule of low-rate excursion tickets to the city and return, to be used at other than rush hours on the stamped date only. This, of course, places emphasis on the value to the companies of the off-peak riding, a type of patronage many electric railways have long since done their best to encourage.

It is true that the systems on which these "innovations" are to be introduced are steam lines, but the proposals now made embody principles which long since were accepted by the electric railways, particularly the principle of adopting changes that lighten the work of the conductor and make the service more attractive to the passenger. Apparently the roads have put aside entirely the idea that excessive use will be made of the cards. As the New York *World* sees it, "no holder is likely to put in time traveling back and forth merely for the fun of riding."

So concerned in the past have some transportation companies been with this possibility of abuse of modified fare plans, that they have permitted the likelihood of the abuse to obscure their view of the benefits of such plans. The announcement of the adoption of the new railroad commutation cards is particularly gratifying, since it carries additional evidence of the alertness of railway managements to the modern merchandising spirit of catering to the customer.

Public Benefits From Crossing Protection

UNDER the terms of an executive ruling adopted by the Pennsylvania Public Service Commission last year, it has been made possible for the State Highway Department to share half of the expense of the installation of flashing light signals actuated by train movement for the protection of state highway crossings. As the result of this ruling, as pointed out in the report of the committee on safety of railroad operation of the National Association of Railroad and Utilities Commissioners recently presented at the annual meeting of that body in New Orleans, hundreds of applications have been made for protection of crossings under this ruling. In addition to the protection at the crossing itself, provision was also made for the installation of warning signs along the highway under the same conditions, i.e., that the railway company and the highway department jointly bear the expense.

Obviously, this general recognition of the public's part in creating the risk at highway crossings, and of the public benefits resulting from protection or grade separation, is a step forward in the protection of human safety and the conservation of life. The report goes a step further in pointing out that since the advent of the automobile in ever-increasing numbers, to the extent that this transportation agency has now become a serious competitor with rail carriers, the owner of the motor vehicle in all equity becomes a unit of assessment for his proportionate share of the cost of separating or eliminating or protecting grade crossings. The report proceeds to the ultimate conclusion that if the costs of separation, elimination and protection of crossings are to be assessed upon those benefited in proportion to the benefits conferred, that federal and state appropriations should be made therefor, so that the entire burden of cost may not rest upon the carriers and the local municipalities within whose limits the particular grade crossing to be protected may exist.

It may be a nice problem indeed to determine the fair allocation of benefits from a grade crossing project between a local community and the public at large. But there is no question but that the public does have a large share in the benefits of crossing protection or separation, and that the policy outlined in the report is constructive and forward looking.

Saying It in 870,000 Words

IN DIRECTING that the Interborough case be reargued before it on Jan. 14, the Supreme Court said bluntly that the briefs "shall be compact, logically arranged with proper headings, concise and free from burdensome, irrelevant and immaterial matter." Washington observers regard this as one of the most severe rebukes that the court has ever administered to attorneys appearing before it. Counsel for the city should bear the brunt of this rebuke, it is felt, because they were the aggressors in the case. According to the order of the court, the decision was due to the voluminous manner with which the case was presented. It is believed, however, that confusion arising out of the injection of too much politics into the case is responsible also.

Those familiar with practice in the United States Supreme Court have stated that the reargument order in this case is the first of its kind in which it has been specified that the former briefs cannot be used. In the statement of the case to the court the city and the Transit Commission filed seven briefs with a total of 992 pages, and the transit companies filed nine briefs with a total of 810 pages. Because of the numerous briefs and appendices, much confusion resulted during the hearing of the former case before the court due to the inability of counsel to obtain prompt reference to statutes and other matter.

By this act, the court has focused attention on a matter that has long called for correction. Time and again, particularly in valuation cases, has it seemed that court and commission proceedings were drawn out beyond all need and the real issue obfuscated in a mass of words. In the New York case many important points are involved, but so far as the companies are concerned, the one central question involved, aside from the details and ramifications of the case, appears to be: Does the public service commission law of New York apply to the rapid transit railways and do the provisions of that law under the statutes of New York enter into and form a part of the fare stipulations in the contracts? If this correctly presents the issue, then the record, particularly that of the city, certainly appears to have been unduly burdensome. The desire of litigants is perfectly human not to want to overlook the presentation of any facts that may tend to strengthen their contentions, but a presentation that is estimated to contain 878,000 words can hardly escape the characterization of being verbose.

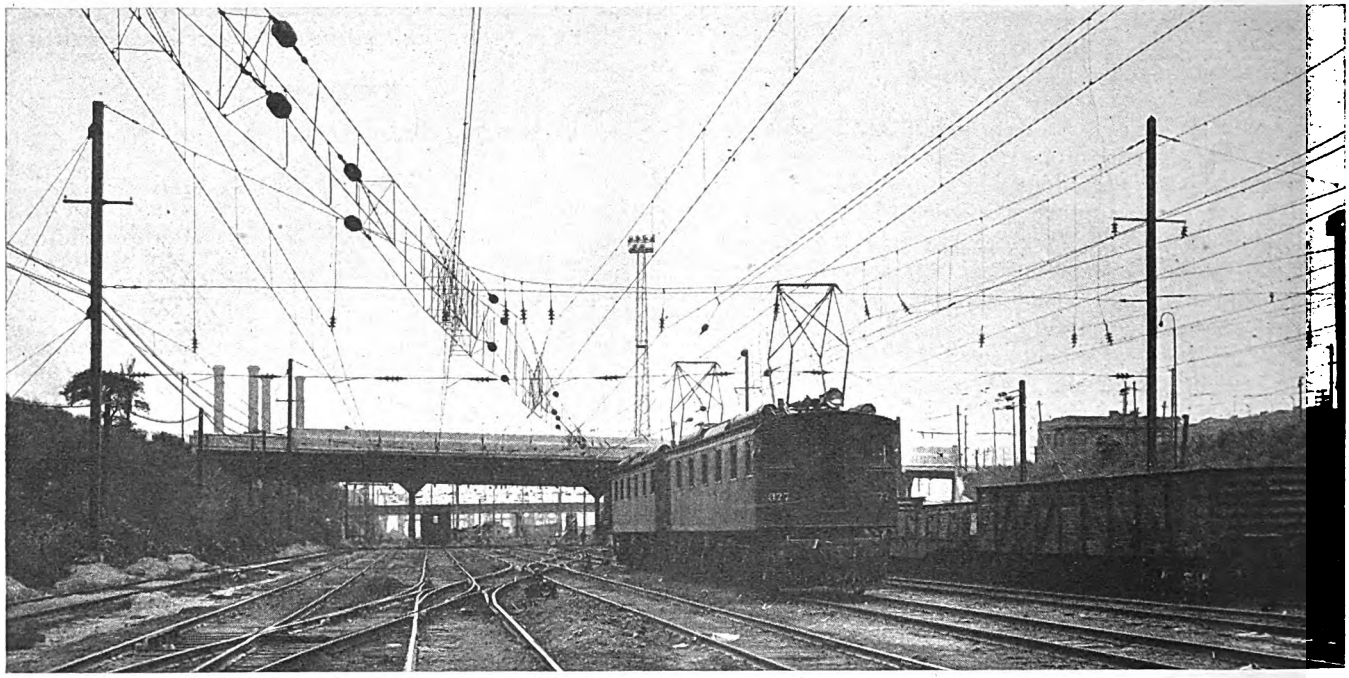
Bay Ridge Electrification Completed

Extension of single-phase system provides better freight connection between New Haven and Pennsylvania Railroads. Financial returns on electrical equipment of New York Connecting Railroad justify its cost



Ladder track catenary and cross-span construction east of Third Avenue, Bay Ridge yard

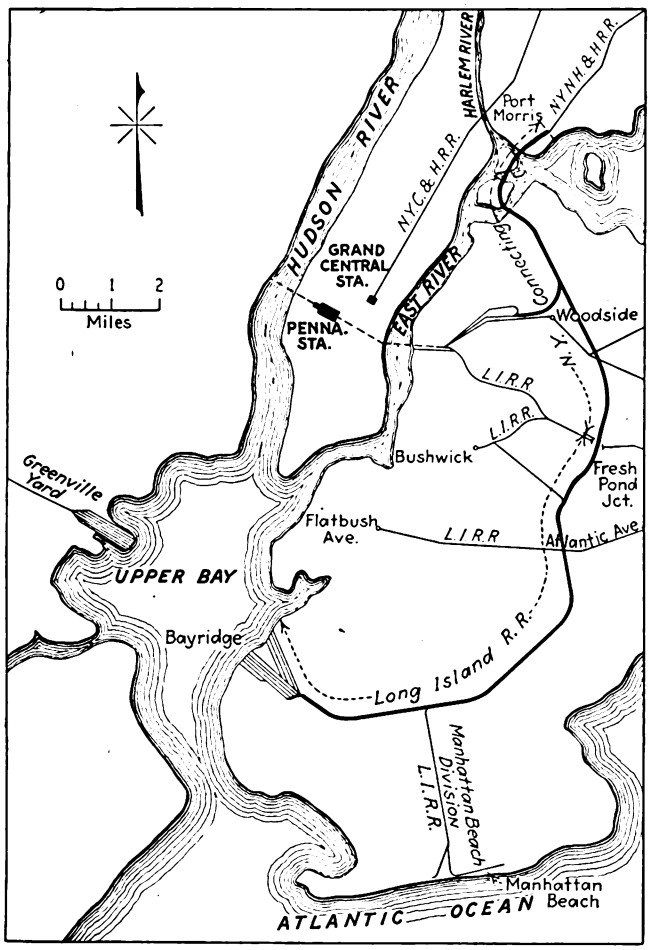
IN 1927, the freight line of the Long Island Railroad and New York Connecting Railroad from Port Morris to Bay Ridge was electrified, electric operation commencing in July of that year. This line carries two services. One is a through freight service operated by the New York, New Haven & Hartford Railroad, and the other a local freight and switching service operated by the Long Island Railroad.

The through service conducted on this railway is that between New Haven, Conn., and Bay Ridge Yard on New York Bay, where freight is handled by car floats across the bay, to and from Greenville, N. J. (the eastern freight terminal of the Pennsylvania Railroad). The Long Island company's service consists of local freight and switching service between Bay Ridge and Fresh Pond, and, at times, interchange of freight at Bay Ridge with its connections.

The so-called Kaufman act of the state of New York (later declared unconstitutional) prescribed the electrification of all railroads within the limits of the city of New York and adjacent counties. But, regardless of this, the returns, both direct and indirect, justified the cost, together with the advantages in eliminating smoke difficulties in the long tunnel under East New York.

A portion of this line had previously been electrified in connection with the inauguration in 1918 of through passenger service between Washington and points in New England, via the Pennsylvania and the New Haven lines over the Hell Gate Bridge. This portion included the New Haven's tracks at Port Morris, just east of the Hell Gate Bridge, and also two of the New York Connecting Railroad Company's tracks from Port Morris over the Hell Gate Bridge through Bowery Bay Junction (where the passenger line branches) to Sunnyside yard of the Pennsylvania Railroad, where connection is made to the tunnels under the East River into New York City. The accompanying map of the district shows that the New York Connecting Railroad section terminates at Fresh Pond Junction, the Long Island Railroad tracks commencing at this point and continuing south and westward through the borough of Brooklyn to Bay Ridge Yard. Adjoining the Bay Ridge Yard of the Long Island Railroad is the freight terminal of the U. S. Army Base, a portion of which was electrified at the same time.

Digitized by Google



Track recently electrified as well as track between Port Morris and Sunnyside yards on which electric passenger service was begun some years ago

The electric system adopted was the 11,000-volt overhead trolley, thus permitting through electric operation of freight trains from New Haven, Conn., to Bay Ridge, N. Y., a distance of some 86 miles.

The total track mileage electrified under this recent electrification is as follows:

Road	Route Miles	Track-Miles
New York Connecting Railroad	8.14	14.00
Long Island Railroad	11.56	80.80
U. S. Army Base	.....	2.50
Total	19.70	97.30

Between Fresh Pond and Manhattan Beach Junction there are four tracks for a distance of 7 miles. The balance of the line is two track. Forty-eight industrial sidings were also electrified at the same time.

The general alignment is a fairly simple one, the average curvature being on the order of 1 deg. with a maximum of 4 deg. 24 min. Grades are fairly heavy, the maximum being 1.2 per cent at the eastern approach to the Hell Gate Bridge.

The road traverses a thickly settled portion of the boroughs of Brooklyn and Queens, and is crossed by 50 highway bridges. There are also two tunnels, one 3,500 ft. long and the other 500 ft. long. In and under many of these the overhead clearance was very limited.

For some ten years freight service has been operated between New Haven and Bay Ridge over the Hell Gate Bridge, but not as a through run on the section from Bay Ridge to Oak Point yards, where steam locomotives were used. The trains were limited to only 2,150 tons, due to limited capacity of the steam locomotives. At Oak Point yard they were filled out to 3,800 tons for handling to New Haven, Conn., by double-headed electric locomotives. Under electric operation 1,600-ton trains (32 cars) for single locomotive and 3,200-ton trains (64 cars) for double locomotive are being operated, east-bound, direct from Bay Ridge to Cedar Hill yard (New Haven), thus eliminating the stopping and filling out at Oak Point.

The total number of through trains east-bound, used as a basis of estimate, was 600 cars, consisting of:

Seven 3,800 ton trains per 24 hours (double-headed).
One 1,750 ton train per 24 hours (double-headed).
Eight trains total per 24 hours.

The movement west-bound from Oak Point to Bay Ridge was also taken as 600 cars handled in eight trains of 75 cars each.

The characteristics of two New Haven 076-0111 type electric freight locomotives compared with the heaviest (J-2) steam locomotives are as follows:

COMPARATIVE TRACTIVE POWER OF STEAM AND ELECTRIC LOCOMOTIVES

	Steam	Two Electrics	Ratio
Weight on drivers, lb	240,000	357,600	1.37
Tractive effort, starting, lb	58,000	100,000	1.71
Tractive effort, continuous rating, lb	.....	34,200	....
Tractive effort, one-hour rating, lb	.....	49,600	....
Tonnage rating from Oak Point to Cedar Hill, tons	.....	3,800	....
Tonnage rating from Bay Ridge to Oak Point, tons, east	2,150	3,200	1.43
west	.....	2,000	0.99

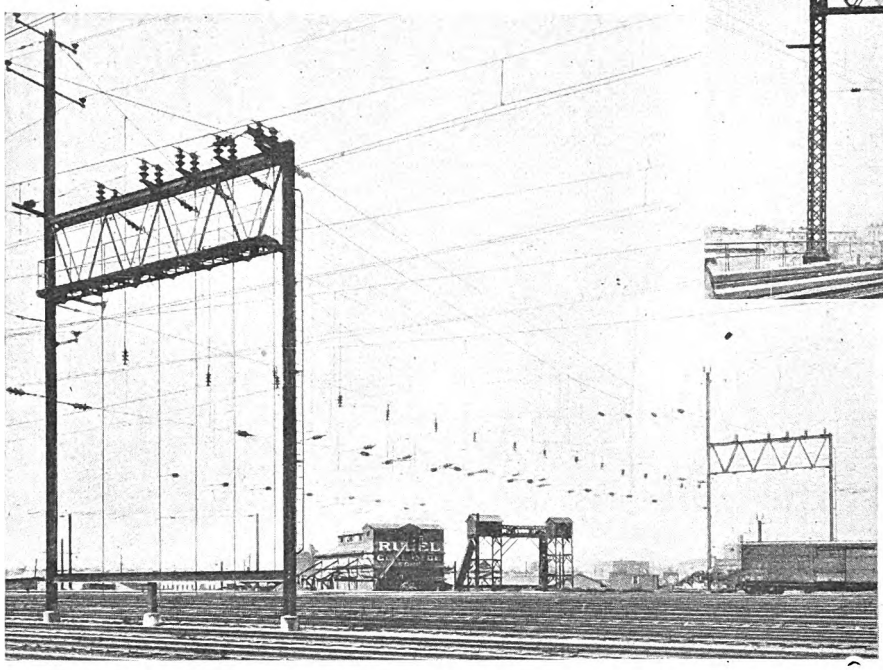
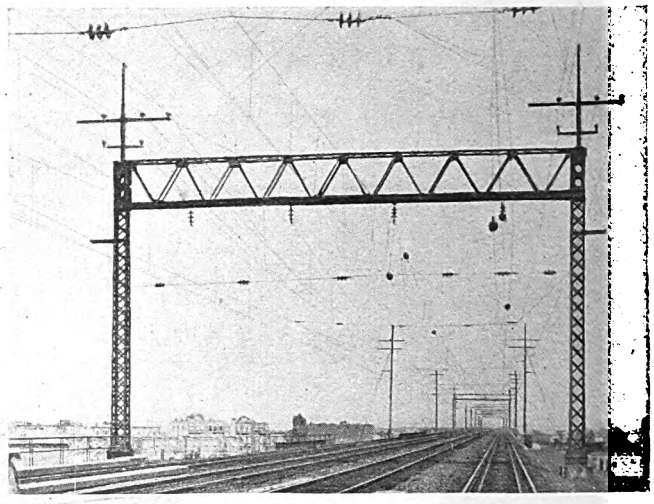
There are many highway bridges on the new line. This view shows the method of supporting the feeders under these bridges



The 22,000-volt power is delivered to six outdoor transformer stations along the right-of-way, as follows:

Location	Kva.
Bungay Street (Bronx)	3,000
Bowery Bay (Queens)	3,000
Fresh Pond (Queens)	3,000
New Lots (Brooklyn)	3,000
Manhattan Beach Junction (Brooklyn)	3,000
Bay. Ridge (Brooklyn)	3,000

The transformers are auto type, outdoor and self-cooling.



At left, sectionalizing switching structure and cross-span details. At right, anchor bridge on four-track tangent

Through operation of the New York, New Haven & Hartford Railroad's a.c. freight locomotives was a prerequisite. These locomotives are not equipped with a.c.-d.c. control, as are the company's passenger locomotives, which have to operate on the New York Central's third rail into Grand Central Station. This, together with its general suitability for this class of service, led to the adoption of the a.c. single-phase trolley system, this also being the standard of the Pennsylvania Railroad which controls the Long Island Railroad. The earlier Long Island electric operation, largely multiple-unit passenger service, is by the d.c. third-rail system.

Power is obtained from the New York, New Haven & Hartford Railroad's power system, which consists of a generating station at Cos Cob, supplemented by purchased power delivered at West Farms in the borough of Bronx, New York City, and Devon and New Haven in Connecticut. This power supply is further supplemented by an emergency supply from a frequency changer station at East New York, capable of delivering 5,000 kw. to or from the Long Island Railroad's power system. This frequency changer set is also operated as a synchronous condenser during heavy load periods to improve the power factor and trolley voltage.

The electrical apparatus was supplied by the Westinghouse Electric & Manufacturing Company, the Pittsburgh Transformer Company, the Electric Power Equipment Corporation and many others.

Distribution

The distribution system is the same as that of the New Haven, which is a 22,000-volt, three-wire system, the trolleys being 11,000 volts, the feeders 11,000 volts of the opposite polarity and the track return the neutral point.

Four No. 0000 copper conductors are carried as feeders on pin insulators on the catenary poles in the open construction. As has already been noted, there are numerous highway bridges of very limited clearance over the tracks, requiring that the feeders be carried on tall poles so as to span over the highways.

On main tracks both rails have joints bonded. The gas flame welded bond is used throughout, welded to the head of the rail.

Catenary Construction

Rolled steel H columns are used for poles throughout the electrification. Two types of foundations are used for these poles, the predominating one being that used for poles not subjected to curve pull from the wires, and also for poles subjected to curve pull but which could be guyed. For this foundation a cylindrical hole was dug in the ground about 3 ft. in diameter and from 6 ft. to 10 ft. deep. The hole was then lined with a length of corrugated steel culvert pipe. A shallow layer of dry concrete mix was then laid at the bottom of the hole,

Digitized by Google

and on top of this was placed a loose steel plate to act as a base for the pole. These plates were all set carefully to correct elevation from the top of the rail and bore guiding angles for placing the pole at correct distance from track. This method permitted the opening up of a quantity of holes prior to the setting of the poles without danger of cave-ins. At a convenient later time the poles were delivered and erected by work train and derrick, then wedged in place in the culvert pipes. A second work train followed, equipped with water tanks and concrete mixer, and the hole was filled with concrete.

	One Motive Power Unit
Wheel arrangement	0-6-0
Rigid wheelbase, ft., in	12-8
Diameter of drivers, in	62
Length over coupler faces, ft., in	63-0½
Total weight, and weight on drivers, lb	158,000
Maximum tractive effort, lb	50,000
Motors, three	190 hp., 235 volts, a.c. series-connected type

Self-supporting poles on curves have the usual square concrete foundations with forms built in place. The signal bridge foundations are of the same type.

Cross catenary is used generally for the support of the messenger and trolley wires. On curves, poles are guyed where possible, a precast reinforced concrete anchor being used with guys of extra high strength steel strand. Where it is impossible to use guys, the beam type of bridge is used, consisting of H column poles, already mentioned, with cross beam of H section with sag braces of angles.

The longitudinal catenary system consists of a phono-electric bronze strand messenger, from which are suspended phono-electric round rod hangers. These hangers support a No. 0000 copper auxiliary messenger to which the No. 0000 bronze contact trolley is fastened by bronze clips and bolts. The cross catenary is also bronze strand with bronze hangers. The entire catenary system, therefore, is of non-corrodible materials.

Character of Construction

Despite the shortness of the route (20 miles), it will be noticed that the track mileage is more than 97 miles. Included in the mileage are 4 interlockings, 48 industrial sidings and 11 yards of from 5 to 30 tracks. It will, therefore, be seen that the amount of special work was very high, making the construction work considerably more difficult than a mere tally of the track mileage would indicate. Construction work started April 1, 1926, and partial electric operation commenced between New Lots and Fresh Pond in April, 1927. Through service between Port Morris and Bay Ridge commenced June 29, 1927.

Switching Locomotives

As before stated, the through freight service of the New York, New Haven & Hartford Railroad is handled by the company's standard electric locomotives, the characteristics of which have already been given.

The Long Island Railroad's switching and transfer service is handled by fourteen motive power units designed to be used either singly or coupled together and operated as one locomotive. These locomotives were designed by the motive power department of the Pennsylvania Railroad, and the mechanical parts were built at that company's shops in Altoona, Pa. The electrical apparatus was supplied by the Westinghouse Electric & Manufacturing Company.

The main characteristics of these locomotives are as given in the table in the preceding column.

Design and Construction

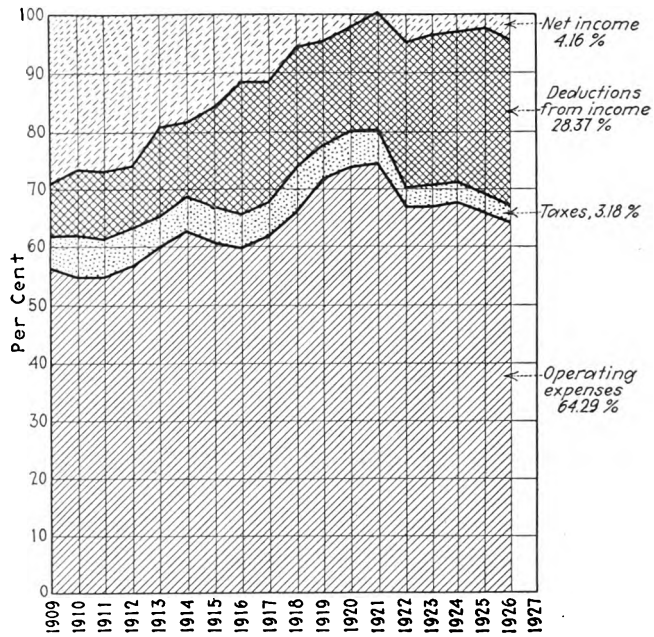
The design and installation of the complete system was done by Gibbs & Hill, Inc., consulting engineers for the railroad, in collaboration with the railroad's operating officials and engineers.

Progress Indicated from Canadian Statistics

Electric railway revenues have shown continuous increase from 1900 to 1927. Capital investment also increases

LAST year the Canadian Electric Railway Association compiled and published some interesting statistics on electric railways in Canada. This year the figures and charts have been brought up to date and new ones added.

The table below shows passenger revenue in 1926 was nearly nine times that in 1900, and that the revenue per



Distribution of total revenue of Canadian electric railways, 1909 to 1926

mile of single track was 2.26 times as great as in 1900. The increase in operating expenses per mile of single track was even greater than the increase in revenue, being

TABLE SHOWING PASSENGER REVENUE AND TOTAL OPERATING EXPENSES. CANADIAN ELECTRIC RAILWAYS

	Total Passenger Revenue	Pass. Rev. per Mile of Single Track	Oper. Exp. per Mile of Single Track
1900	$5,529,687	$8,192	$5,237
1905	8,932,914	11,265	7,463
1910	16,125,994	11,660	7,319
1915	25,579,689	12,211	8,622
1920	43,279,009	17,832	15,757
1925	45,185,402	17,616	13,811
1926	46,810,403	18,509	14,414

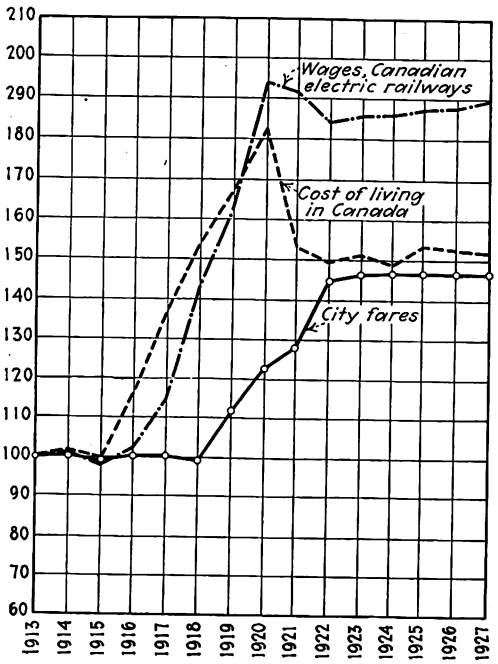
2.75 times as great as its 1900 level. A reduction in operating expenses per mile of track between 1920 and 1925 can be attributed largely to the introduction of one-man cars. The total passenger revenue of the Canadian

Digitized by Google

electric railways in 1927 was $48,289,774, and they had in operation 2,507 miles of single track.

The first chart shows the percentage distribution of total revenue by years from 1909 to 1926. The increase in operating expenses and in deductions from income are notable. The latter increase is due to the large amount of financing which has been done by the issue of bonds, particularly where electric railways have been municipally owned. In such cases, if privately owned, stock would have been issued. The reasons for the reduction in percentage in operating expenses since 1921 have already been outlined.

The second chart gives comparison of fares, electric railway wages and the cost of living in Canada, the curves being charted by index numbers, with 1913 repre-



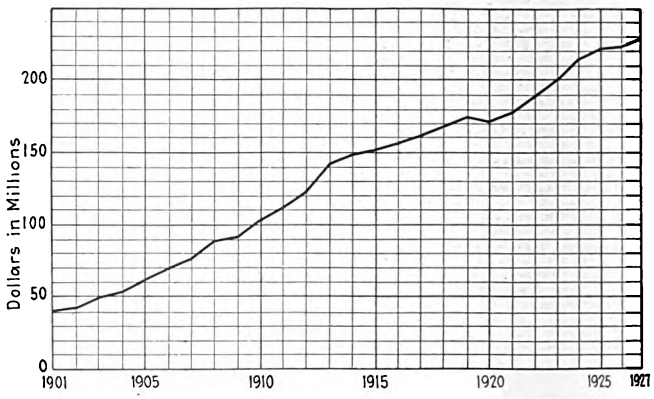
Fares and wages on Canadian electric railways; also the cost of living in Canada

senting 100. The cost of living, which rose rapidly from 1916 to 1920, dropped just about as sharply in the latter year but not so far. Since 1921 it has remained at about 150 per cent of the 1913 figure. Wages have also dropped considerably since 1920, but not in the same proportion as the cost of living, and there has been a slow increase in wages since the low point in 1922. Wages are now 90 per cent higher than in 1913, having had an increase almost twice as great as the cost of living and just about twice that of fares. The figures on wages have been obtained from the Dominion Labor Department and on the cost of living from the *Labor Gazette*.

The third chart gives the capital investment in Canadian electric railways from 1901 to 1927. Continued increase in that investment indicates belief, in the opinion of investors, of the stability of the electric railway industry of Canada. In 1927 the electric railways in Canada operated 4,397 electric cars and 212 buses.

Automobile registrations in Canada have increased from 50,000 in 1913 to 939,000 in 1927. From 1913 to 1916 the annual increase was on an average of 24,000. From 1916 to 1927 the annual increase has been greater, with an average of 74,000. The population of Canada in 1921 was 8,788,483 and in 1927 about 9,500,000.

The number of revenue passengers continued approximately the same, averaging 595,000,000, from 1913 to

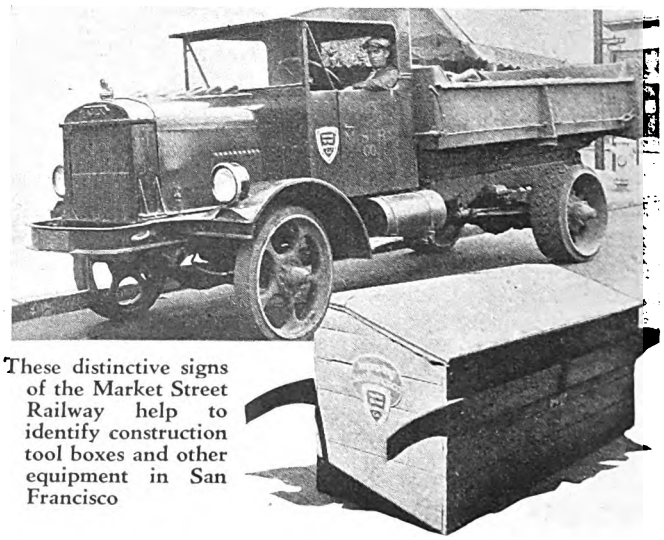


Capital investment in Canadian electric railways

1918. From that date the number increased until the peak was reached in 1920, when 804,711,333 passengers were carried, being an increase of 35.2 per cent over 1918. In 1921 there was a decrease of 85,405,892 from 1920, or 10.6 per cent. From 1921 to 1925 the number of revenue passengers carried showed little if any change. In 1926 an improvement was shown with 748,710,836 against 725,491,101 in 1925, or an increase of 3.20 per cent. In 1927, however, a still greater improvement was shown, 776,615,193 revenue passengers being carried as against 748,710,836 in 1926, or an increase of 3.75 per cent; this in face of the large increase in automobile registrations in the past two years. In 1927 automobile registrations increased 13.3 per cent over 1926.

The 1928 returns during the early months of 1928 register an average gain of 5 per cent over 1927 in the number of revenue passengers carried. These gains appear to be steadily increasing.

Shield Confers Style



These distinctive signs of the Market Street Railway help to identify construction tool boxes and other equipment in San Francisco

CONSTRUCTION tools and other street equipment of the Market Street Railway, San Francisco, Cal., are marked by a large shield, adopted by the company as a standard emblem. The emblem not only identifies the owner of the equipment but is proof to observers of the extended nature of the company's business.

The shield is of baked enamel with a green border and an inside red panel with white lettering. Illustrations show it on a construction truck and a tool box. It is also used on barrier signs, welding equipment, etc.

Looking down the overhaul lines in the new P.R.T. bus shop

New P.R.T. Bus Shop

Puts Maintenance on Production Basis

Expected saving of 1 cent per bus-mile will pay cost of entire plant in three years. Specialized shop departments occupy one side of building while vehicles being overhauled move in four lines along opposite side. Training of workmen an important feature of shop operation

RAPID growth of bus operation in Philadelphia is reflected in the completion recently of a half-million-dollar plant wherein will be conducted all major maintenance operations for the entire bus fleet of the Philadelphia Rapid Transit Company. The new structure, which is situated at Third Street and Hunting Park Avenue, is the largest bus repair shop in America and probably the largest shop in the world devoted exclusively to automotive repairs.

Bus service was inaugurated by the P.R.T. in September, 1923. At that time the fleet consisted of fourteen vehicles. This modest forerunner of the present-day fleet was housed in a corner of the 24th Street and Fairmount Avenue carhouse. Subsequent growth has been rapid and today the company has 570 gasoline-electric vehicles. These are housed in eight operating garages variously located in Philadelphia and Camden, N. J.

The new plant has a ground area of 10 acres. The building is a one-story structure, with a floor area of 110,000 sq.ft. It represents an investment of $500,000, of which more than $100,000 was expended for maintenance facilities and shop equipment. Before attempting to lay out this project H. B. Hewitt, general superintendent of the company, and his associates personally visited and studied many of the important bus operations in this country and Europe in order that no detail in the way of improved methods might be overlooked. The result is a bus shop that embodies the most modern ideas.

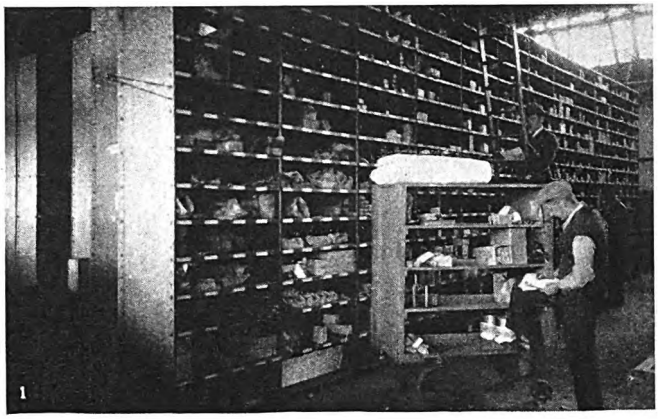
Among the more important items that can be included in the yearly potential production capacity of this plant are: 600 completely overhauled buses; 500 complete paint jobs; 600 rebuilt engines; 3,200 sets of relined brakes; 2,000 power motors overhauled; 1,000 power generators overhauled; 500 distributors and coils rebuilt; 500 batteries partially and completely rebuilt; 2,000 universal joints rebuilt; 600 steering gears overhauled; 650 sets of bus seats reupholstered; 650 sets of window sash rebuilt; 600 front axles rebuilt; 600 rear axles overhauled.

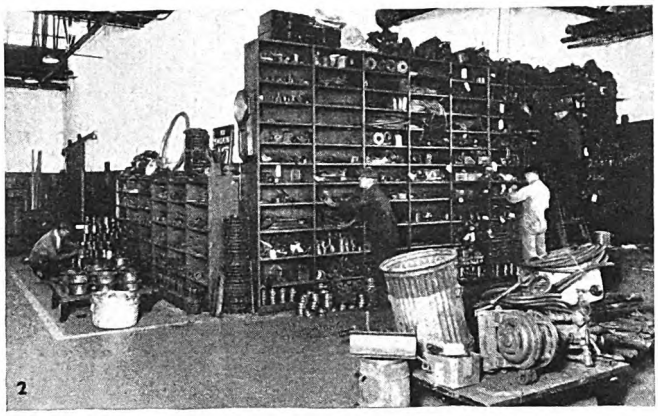
Three important advantages are gained by grouping all facilities under one roof. First, it eliminates the need for more than 10 per cent of spare vehicles. Second, it reduces the size of stock inventories. Third, it is possible to have all major repairs and overhaul work done by a relatively small number of men.

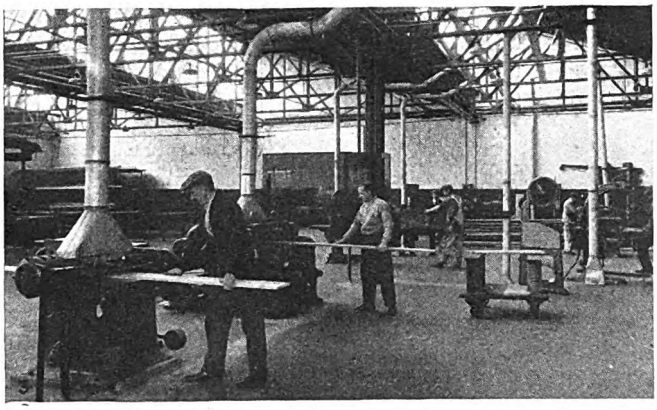
Will Pay for Itself in Three Years

One of the most important factors that influenced the P.R.T. in this undertaking is an anticipated saving of 1 cent per bus-mile. With a yearly operation in excess of 20,000,000 miles, the new shop will pay for itself through these savings in less than three years.

Digitized by Google







The arrangements of the plant and the routing of the work are important factors in the successful operation of this shop. Buses scheduled for repairs are first given a thorough cleaning on the wash rack, to remove grime and dirt that otherwise would be carried into the building.

The bus is then driven over the service pits. Extending over the four lines at this point is an overhead crane for lifting and removing the various chassis units. In the pits are jacks for handling the motors and generators, as well as other under-chassis parts. Here the engine and motive power units are removed and distributed to the respective repair departments. If for any reason the body must be removed the job is done at this time and the unit sent to the body shop on a dolly truck.

As the chassis moves forward on the line, the radiator, steering gear, battery and axles are removed in turn and reconditioned units installed. There is no attempt to make running repairs on these parts except in one high-speed line provided for emergency work.

Units are removed—and replaced—at the point along the line which is most convenient to the respective repair departments. For example, the axles are replaced at a point adjoining the axle overhaul department, the engine installed when the bus is nearest the engine department, and the body repaired when the vehicle is convenient to the sheet metal, the wood-working and the upholstery shops.

At the pits midway along the lines the frames are thoroughly gone over and all loose rivets replaced. The vehicle then moves forward to the body section, where damaged panels are repaired, broken windows and sashes replaced and seats and interior linings carefully gone over. Fenders, when not too badly damaged, are straightened or welded without removing them.

All repairs having been completed on both chassis and body, the vehicle is moved onto the forward pits. Here it is thoroughly inspected—but only for possible imperfections in assembling. The checking of the various units for defects in material, faulty operation or workmanship, is the duty of the inspectors in the various shop departments. Finally, the bus is run onto the brake-testing machine and, if found in good order, is sent to the paint shop, after which it is ready to take its place again in daily operation.

The specialized shop departments are situated, for the most part, along the west wall of the building.

On entering the wood-working shop, which is situated immediately back of the offices, there is an impression of clean, wholesome working conditions which prevails throughout the entire shop—not even excepting the pits and cleaning racks. Although there are some ten mortisers, jointers, planers and other wood-working machines in this area, all busily engaged in work that produces large quantities of wood dust, shavings and chips, the air is singularly clean because all refuse is drawn away from the machines as fast as produced and piped through an overhead exhaust system to a large metal container outside the building. Accumulations are carted away to be burned under heating boilers. This shop furnishes all body frame members, flooring, special seats, doors, window frames and other replacement parts that are

No. 1—The stockroom houses materials worth $150,000. Metal shelves and bins make for economic use of storage space.

No. 2—A corner of the salvaged materials stockroom. Orderly arrangement here means greater speed in filling requisitions.

No. 4—Cradle top lifting devices in the repair pits make removal or installation of heavy parts a simple matter.

Digitized by Google

needed to keep P.R.T. buses in good order. It also supplies a large variety of general millwork that is continually needed by an organization of this size.

The machine shop adjoins the wood-working mill. Here are production tools of the type rarely found outside of manufacturing plants. There is no crowding of machinery in this shop. Each unit is placed so as to give the machinist plenty of light and operating convenience. All machines are served by an overhead monorail crane. The lathes, numbering five in all, are ranged along the windows in the west wall and are staggered diagonally to facilitate the handling of bar stock and at the same time to prevent workmen at one machine from being injured by flying chips from another.

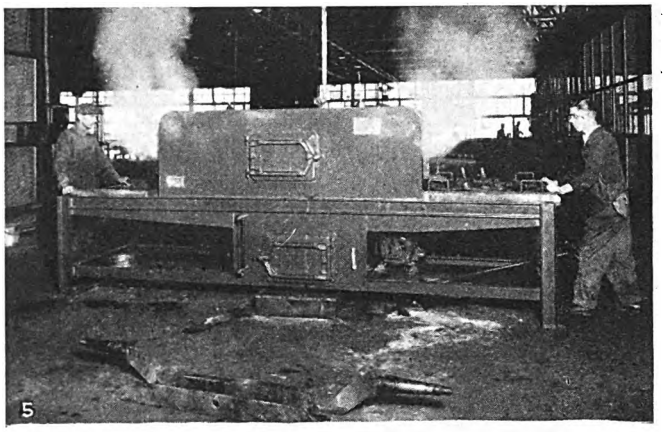
The tool room, which is a part of the machine shop, contains a large variety of precision instruments and special tools. Micrometers, gages, test blocks, every conceivable size of tap and die, and even a Brinell hardness tester and a scleroscope are found here. In addition there is a tool-room lathe, a sensitive drilling machine and a drill point grinder.

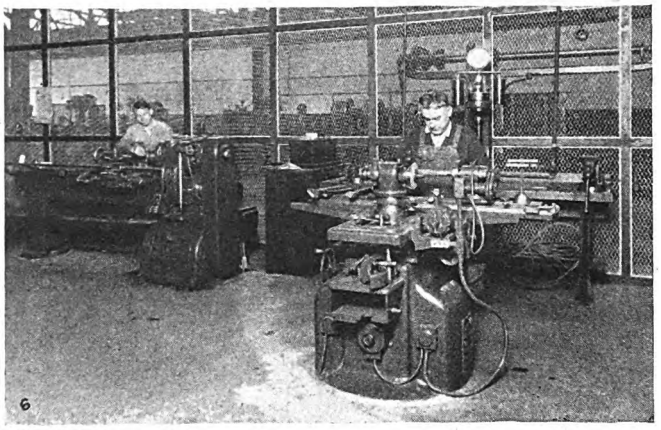
This department designs all of the tools used in the machine shop as well as jigs, fixtures and special appliances required by the other departments. Tools are issued on written order only. The mechanic signs a card check which is held by the tool-room clerk until the borrowed item is returned. Ordinary hand tools are furnished by the mechanics themselves. An agreement with a local dealer enables the men to purchase tools at the same discount allowed the P.R.T.

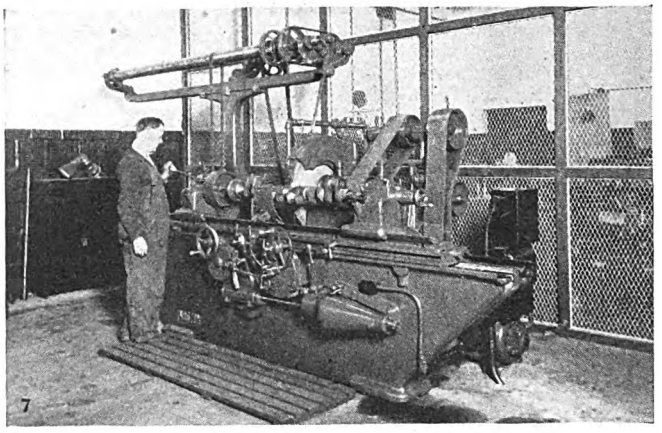
The engine overhaul department can turn out fourteen completely rebuilt engines a week with a force of fourteen men. No repairs of any description are handled in this shop. Its functions are limited to dismantling and reassembling—its job, to guarantee 105,000 kw.-hr. (approximately 90,000 miles) of unimpaired engine operation. Here the units are dismantled and the carbureter, generator, starting motor and other accessories removed and sent to their respective overhaul departments for inspection, adjustment and repairs.

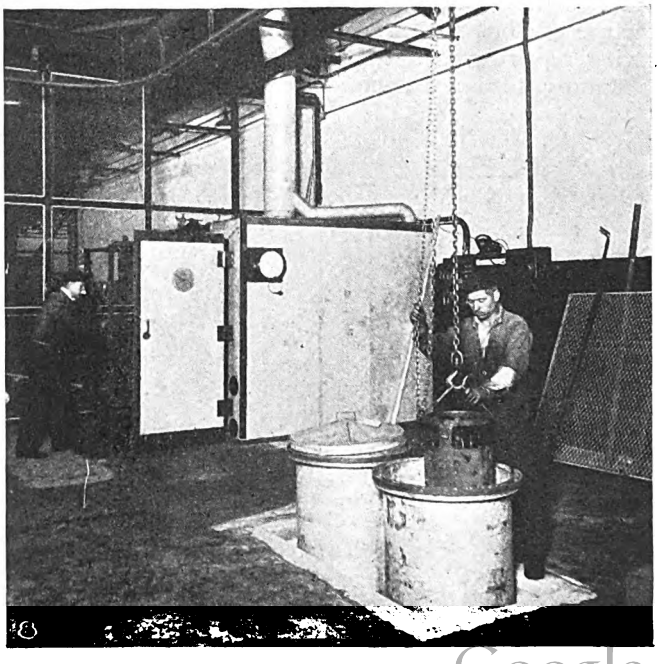
The electrical shop has two subdivisions: one is devoted solely to the maintenance and repair of starting, lighting and ignition units; the other handles nothing but power-electric motor and generator units. The former is well equipped with instruments that simplify the job of the electrical technician and save time for the trouble shooter. All tools and testing equipment are arranged with special regard to the convenience of the workmen. An overhead monorail crane ranges the entire shop and is supplemented at key points by swing arm cranes and portable platform type lift trucks. Thus the need for manual lifting is reduced to a negligible factor.

The motive power shop, differing from practice followed in the engine department, is entirely self-contained and handles every operation from the time the defective motor or generator unit is removed from the chassis until it is finally rebuilt and again ready to be reinstalled. Lathes have been installed for renewing the working surfaces of the commutator, machines for rewinding the armature coils and innumerable other tools for the manifold operations incident to the daily work of this depart-









No. 5—Dismantled parts are cleaned in a steam washing tank to determine if they are worth salvaging.

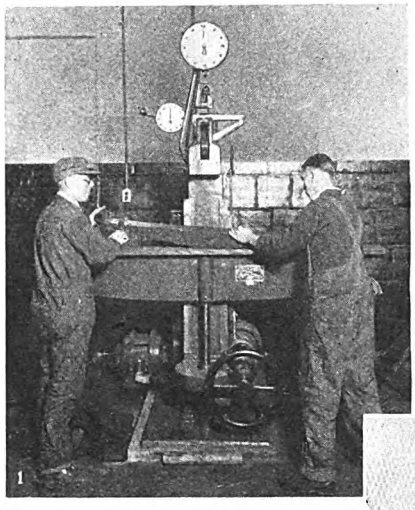
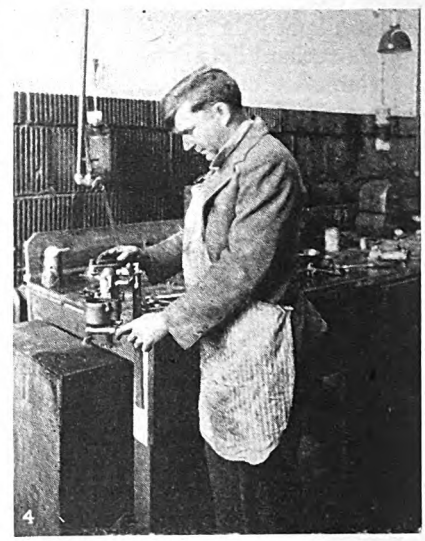
Digitized by Google

ment. Recent installation of an electric oven now enables the P.R.T. to impregnate and bake armature and field coils, a class of work that was formerly handled by the manufacturer.

Adjacent to the motive power shop are the combined radiator and gasoline tank departments and, in a fireproof-partitioned room, the blacksmith shop. The hammer of Vulcan is driven by an electric motor while the flaming forges are fanned by air turbines. Both electric and acetylene welding are needed to carry on the intensive production schedules of this department. Its tasks include not only the repairing of chassis and body parts but also the fabrication of steel framework, the manufacture of "bus stop" sign standards, pipe bending, also spring repairing and testing. For the latter purpose a laboratory testing machine has been installed and in the future springs will be tested for loss of resiliency or other defect each time a vehicle is brought to the plant for scheduled overhaul.





Exacting Tests Insure Proper Operation

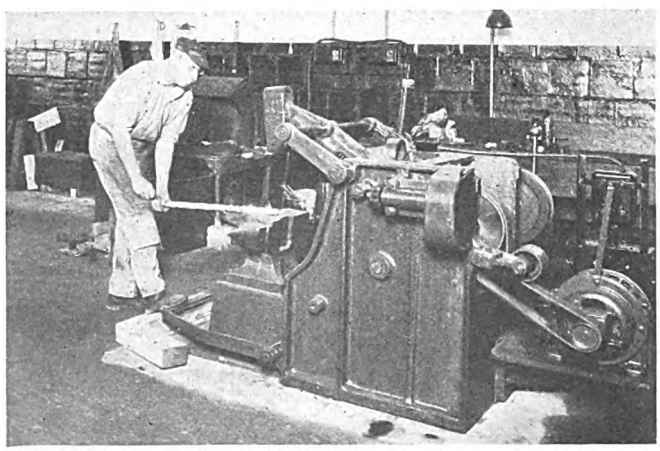
No. 1—A machine that accurately determines spring condition.

No. 2—An instrument for determining hardness of metals is an important item of tool room equipment.

No. 3—Testing brakes. The last step on the overhaul line prior to painting.

No. 4—Frequent carburetor tests are essential to economic fuel consumption.

Brake relining keeps a crew of four busy all day long

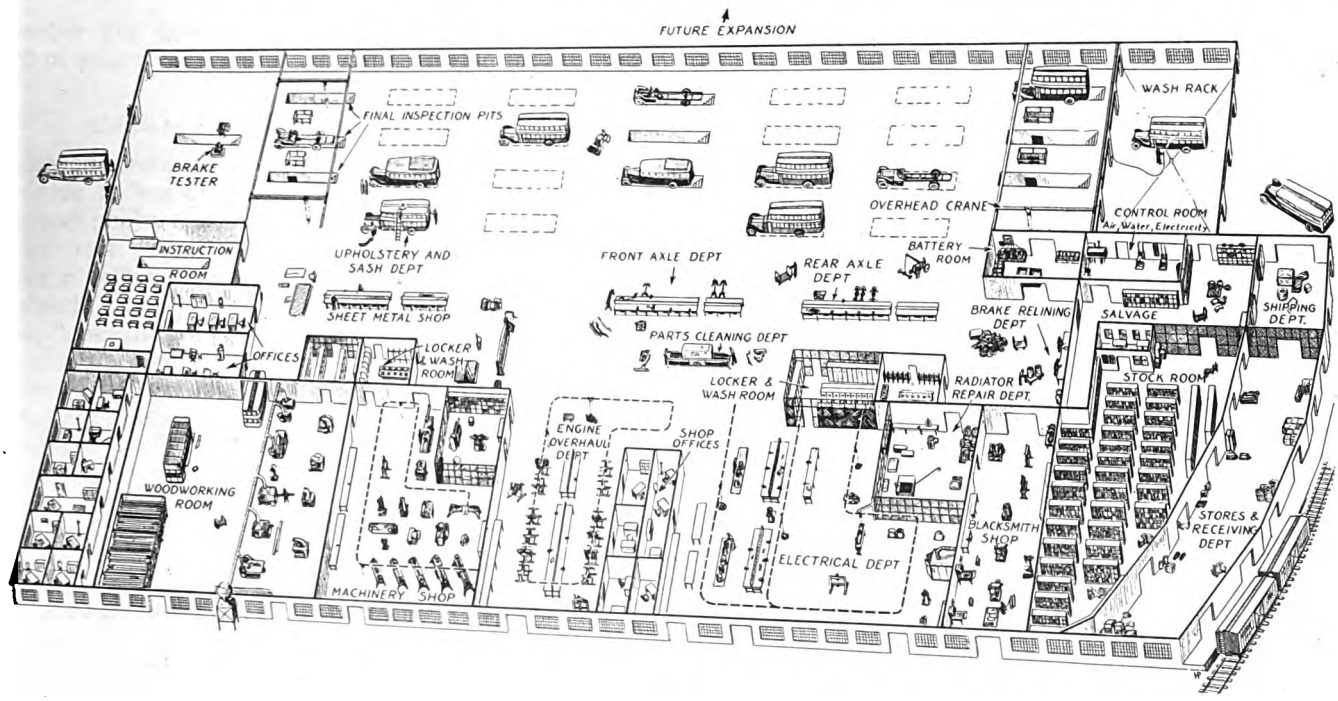


The mechanical sledge makes blacksmithing a one-man job

In the brake relining department four men are kept busy all day long, each with his own particular task. For example, one man does nothing but strip off worn lining, another drills the new materials, a third countersinks and inserts rivets while a fourth operates the pneumatic riveter. Linings are purchased directly from the manufacturers cut to proper size with edges chamfered and ready to apply. To simplify installation each piece is run through rollers which bend it to conform with the face of the brakeshoe.

The battery room is situated at the rear of the plant adjacent to the four vehicular entrance doors, and where buses destined for the overhaul lines can be served with utmost convenience. Inconspicuous with regard to location, the battery shop, nevertheless, is in the front ranks so far as importance is concerned. Each year more than 500 disabled batteries pass through this shop and

Digitized by Google

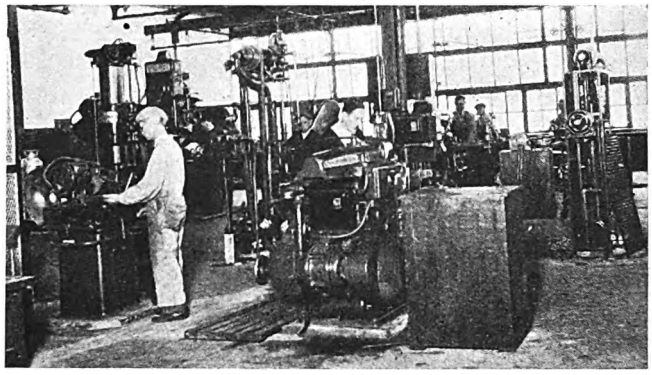


The plant is laid out to secure maximum efficiency and minimum lost motion. The result—lowered unit production costs and increased output from the assembly lines

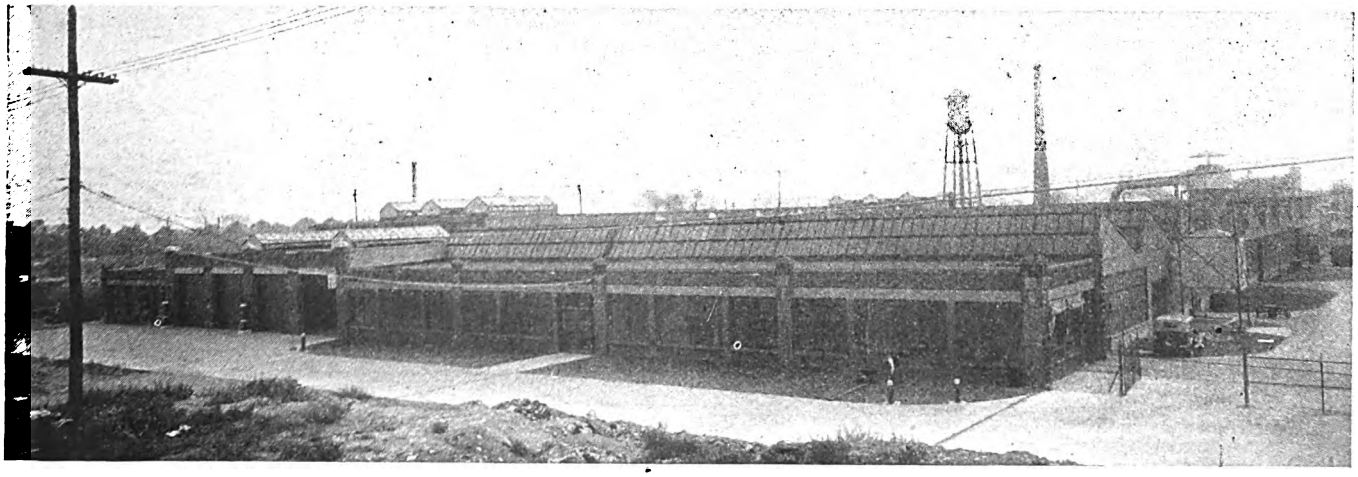
emerge completely rejuvenated, serviceable units. Some of them need complete rebuilding, others need a new cell group or a new case or perhaps only a change of electrolyte. No job is too large or too small for this department. As units are removed from the buses they are placed on grocer-type trucks for delivery to the battery room. Each truck has a normal capacity of five batteries in single tier but will handle ten units in a double tier. In so far as possible, the batteries are serviced and charged without removing them from the trucks, thus doing away with benches and the need for any great amount of manual lifting.

Both the front and rear axle departments, as well as the parts cleaning tank, are placed in the center of the plant midway between the shops and overhaul lines and therefore convenient to both. Axle assemblies as received from the overhaul line are dismantled and parts sent to the steam cleaning tank where dirt, grease and other foreign matters that might prevent careful inspection or accurate measurements are removed. Salvageable parts are sorted out for subsequent reconditioning either by machining or building up process, while those that are too far gone to permit reclamation at reasonable cost are consigned to the junk pile.

On rear axles, the worm carriers are removed and completely gone over and new or rebuilt parts substituted for worn ones. Axle shafts and bearings are replaced, if worn, and the housing thoroughly inspected for cracks



A corner of the machine shop, with plenty of light and working room in evidence



For bus maintenance only—new P. R. T. plant at Third Street and Hunting Park Avenue, Philadelphia

Digitized by Google

or distortion. Front axles are checked for misalignment and new bushings and king pins fitted. Worn spindles and bearings are replaced. Production of front axles totals twelve a week with a similar number of complete rear axles and worn carrier assemblies.

The sheet metal department is equipped with shearing machines as well as tools and devices for bending, rolling, forming and crimping sheet steel and aluminum. Its duties include the cutting and shaping of hoods and body panels, also the manufacture of metal trays and countless other things used about the garage. In addition to taking care of all repairs, the upholstery shop turns out tpproximately five sets of seats per week. The sash department not only reglazes windshields, doors and windows but also manufactures for replacement five complete sets of sash weekly.

Stock Inventory $150,000

Material worth approximately $150,000 is carried in the main stock room, which also supplies materials for the subsidiary stock rooms located at various operating garages. A system of card tags showing unit inventory costs has been worked out, one of these cards being attached to each storage bin or compartment. In this way it is possible for the stockkeeper and foremen issuing an article to know the actual cost of that particular item, simply by referring to the card on the bin. The psychology of this practice is to give individual employees a better understanding of the dollars and cents value of the repair and replacement parts used.

Adjoining the stock room in the extreme rear of the building is the salvage and reclamation department, where units sent in from the various operating locations are examined, tagged for repairs or stored for salvage purposes. Both this department and the stock room face on a broad concrete loading platform which is served by a railroad spur track and is also available for truck loading. An inclined concrete ramp from the lower ground level gives access to the building.

To the west of the shop but in a different building is the experimental laboratory where standard practices for the machine shops and garages are set up and new maintenance and operating developments worked out. It will accommodate one double-deck bus, two single-deck buses or four taxicabs. It possesses every facility for the widely varied range of work contemplated by company engineers. An example of the results which have been obtained from this work in the experimental laboratory is the increase by 33⅓ per cent in horsepower output of bus engines used on P.R.T. vehicles.

An experimental paint shop also has been set up adjoining the bus shop, and exhaustive research in the problem of spray painting is to be carried on at this point, while construction work on the main paint shop is under way. The methods which will be followed as standard practice in the new paint shop will depend largely on the outcome of research work to be done in the interim.

Personnel Training Proves Valuable

The instruction room ranks among the most important departments in the plant. Here, by means of moving pictures, illustrated lectures and practical working demonstrations, the company expounds its theory that there is all the difference in the world between telling a man to do a job and explaining the reasons why. Training classes are carried on in the evening and all employees are given an opportunity to attend. During these classes many problems of the day are brought up and ensuing discussions very often result in suggestions that are valuable to both company and employees. As a result of constructive suggestion, the men are ever on the alert for new ideas and better ways of doing their job.

5,400-HP. Electric Locomotives for French Railroad

FOUR d.c. electric locomotives recently ordered by the Paris, Lyons & Mediterranean Railway, France, will, it is claimed, rank as the most powerful single locomotives so far built. The contract for the electrical equipment of the engines, which are to have a one-hour rating of 5,400 hp., has been placed with the Société Oerlikon, Paris, while the mechanical part is being constructed by the Société de Construction des Batignolles in Paris.

Four years ago the P.L.M. Railway started a trial service on a section of the Mont Cenis tunnel line, with a view to collecting data regarding the most suitable type of express locomotive. Four different trial locomotives were ordered. The results obtained in these tests with an Oerlikon individual-drive engine proved most satisfactory. Investigation showed, however, that it was advisable to have a considerably higher output than that of the trial locomotive; in view of which the number and output of the driving axles had to be increased.

The locomotives now in course of construction are of the 2CoCo2 type with close-coupled trucks and an overall length of body of 78 ft. They have the Oerlikon individual drive, each of the six driving axles being driven by a twin motor. With a pressure of 1,350 volts at the contact line, these motors each develop 800 hp. at 45 m.p.h., while with the full pressure of 1,500 volts the one-hour rating is 900 hp. per motor or 5,400 hp. for the locomotive, outputs being measured at the wheel treads. The permissible axle load is 18 tons and the maximum speed 80 m.p.h. The locomotive weighs 153 tons, so that the weight per horsepower at the one-hour rating is 63.5 lb.

Glasgow Modernizing
Gets Fine Start

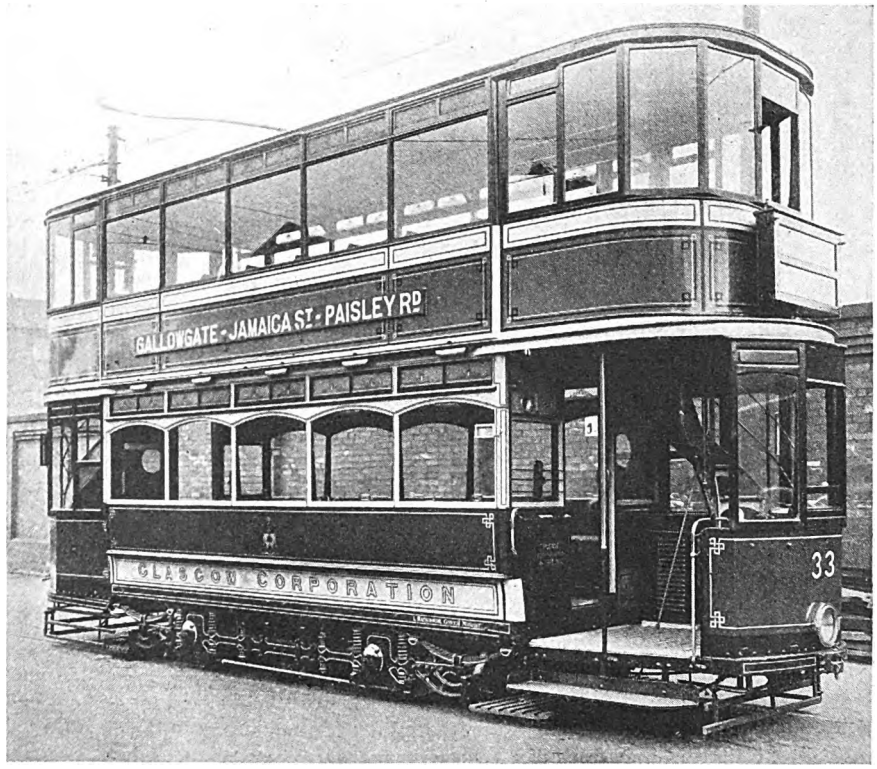
Concentration of rehabilitated and modernized cars on Uddingston route increases earnings 1.6 cents per mile within the first four weeks. The Tramways schedule speed was increased to 10 m.p.h.

By Walter Jackson
Fare and Motor Bus Consultant

FOR many years the Glasgow Corporation Tramways has stood out as a conspicuously successful example of street railway operation. The fares were the lowest in Great Britain and headways were so short that walking was an almost unknown form of outdoor sport.

This undertaking was one of the last to succumb to the need for a higher scale of fares, due partly to the heavy traffic and partly because the greater part of the investment had been paid off, in addition to setting aside funds for depreciation and renewals. At the present time, in fact, only 44 per cent of the investment remains outstanding on the books.

During 1925, or about the time a healthy financial condition had been restored, the motor bus made its appearance as a competitor. These buses could be regulated only with the greatest difficulty because their ostensible purpose was to pick up passengers outside the Glasgow area and deposit them within Glasgow. Actually, many of them did pick up city riders at considerable loss to the Tramways.



Glasgow cars are being reconditioned both for better technical performance and greater passenger comfort

Since the Parliamentary regulation of services of this kind is still in a nebulous state, the Glasgow management had to find some quick means of helping itself out of this situation. At that time the scale of fares ranged from 1d. to 10d. Most of the bus pick-ups were longer-ride passengers. Upon recommendation of the general manager, on July 1, 1926, the maximum fare was reduced to 2d. (4 cents).

This had the immediate effect of bringing back much of the lost business and creating some new traffic in addition. However, at no time did Lachlan Mackinnon, general manager, believe that so low a fare as 2d. should remain permanently.

The 2d. all-the-way rate was simply a dramatic way of letting the unregulated competitor know that he would have a fight on his hands and was a "hands-off" warning to possible newcomers. Meanwhile, the management was making plans along two lines that would maintain the priority of the Glasgow Corporation Tramways. The first of these lines was the inauguration of motor-bus services. The second was the replacement of the oldest cars and the modernization of the remainder.

The 2d. all-the-way fare having achieved its purpose, the management suggested July 10, 1928, an increase to 3d., which would still be 7d. under the old maximum fare. At the same time Mr. Mackinnon suggested the abolition of the minimum fare of ½d. which was reinstituted July 1, 1927, following its first abolition on June 1, 1920. The new scale as recommended to the corporation is as follows:

NEW SCALE OF FARES IN GLASGOW

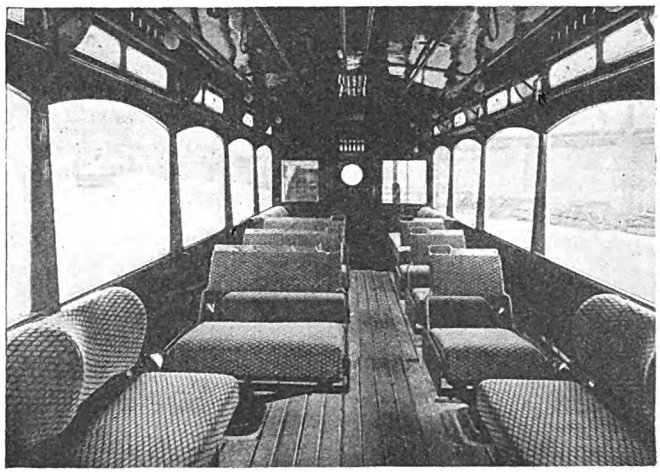
	Stages	Average Distance (Miles)
1d.	2	1.14
1½d.	4	2.28
2d.	8	4.64
2½d.	12	6.96
3d.	Over 12	....

Digitized by Google

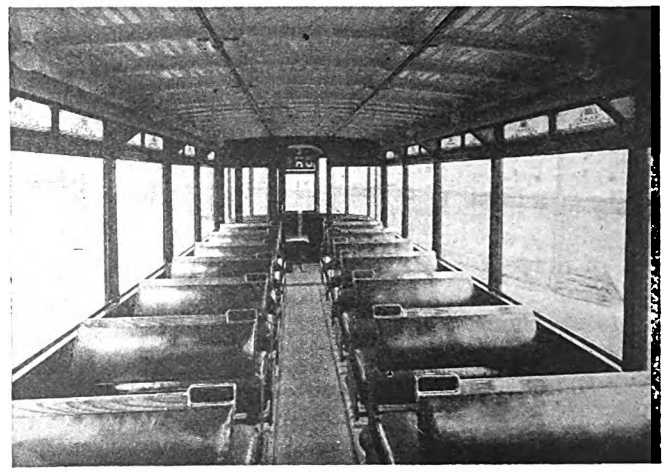
With the foregoing scale in vogue, the management believes that it will earn revenues sufficient to carry out an extensive modernization program. It is already operating 45 motor buses and has 100 more on order. Of the buses, fifteen are double-deckers seating 51.

Fifty New Cars Ordered—150 Cars Modernized

As can be said of many American street cars, Glasgow's tramcars have been built and maintained altogether too well. If it hurts to scrap a car in America, what shall be said about doing the same thing in Scotland? However, like causes bring like results. So long as the Glasgow public knew only the hard-seat tramcar, it was content to glory in the cheapness of the ride; but when personal cars were reinforced by a flood of soft-seated motor buses, the "good old trolley" looked more old than good. The cut to 2d. "all-the-way" was just the thing for a temporary measure. In the end, the really permanent policy was to build up a higher quality of service at a higher scale of fares.



Glasgow lower-deck passengers are now literally riding on velvet. Only the corner seats are longitudinal



Glasgow upper-deck passengers now ride on leather seats and smoke if they like

In America, ideas like these have to be sold to boards of directors; in Glasgow to a City Council of differing political and economic outlooks. For very many years the tramways had been such a handsome source of revenue to the common good that more than one councilor was aghast at the thought that profits had better be turned into moderization outlays if there were to be such contributions in the future. Other councilors less interested in tax reduction might object on the grounds of low-fare policy favoring the working-class riders. It will be seen, therefore, that the management had to be content with a slice of modernization in the hope that the rest of the loaf would be granted later.

But in April, 1927, the Council voted funds for the purchase of 50 new cars and the modernization of 150 cars, as will be told hereinafter. The system operates altogether some 1,100 cars, of which 500 have been in use since the electrification of the tramways in 1900! Modernization treatment is considered feasible for about 330 cars in all.

On April 26, 1928, the Council also decided to purchase 100 double-deck buses.

The modernization program, as will be seen, is not confined to the refitting of the cars but also to speeding them up. The average schedule speed of the Glasgow system is 9.3 m.p.h. The modernized cars have been remotored to give 10 m.p.h. The first few of these cars received were put in service about the system, more or less as an advertisement, but this did not give the desired opportunity of learning what the improvements could be made to mean in economy and higher earnings. Hence the required number were concentrated to care for all the Monday-Friday needs of the Uddingston route. Because of the higher schedule speed, it was found that 32 cars would do the work of 33. The riding public soon discovered that the cars were not only more luxurious, but saved six minutes running time. This discovery was prompt indeed, as proved by the jump in earnings from 15.84d. to 16.63d. per car mile, an increase of 0.79d. (1.6 cents) in the four weeks of June, 1928, compared with the preceding four weeks. Here is the way work was done.

The cars were carried on Brill 21-E trucks of 7 ft. wheelbase. These trucks were lengthened to 8 ft. wheelbase and equipped with one of three types of roller bearings—Hoffman sleeve, S.K.F. or British Bock (tapered rollers). These anti-friction bearings were installed without regard to possible saving of energy but solely to attain smoother riding. The lengthening of the truck and the installation of these bearings has stopped nosing or side play to such an extent that these double-deck cars can be operated up to 30 m.p.h. running speed with no such discomfort as was formerly experienced at much lower speeds.

To reduce noise, there was inserted a rubber strip $\frac{3}{4}$ in. thick by about $3\frac{1}{2}$ in. wide between the top of the truck frame and the side sills.

The substitution of high-speed, light-weight motors made it possible to lower the floor level, since 27 in. wheels now replace $31\frac{3}{4}$-in. wheels. The old motors were two Westinghouse 49-B rated 35 to 40 hp. Higher speed is now given by two MV-101 DR Metropolitan-Vickers

SCALE OF FARES FOR BUSES

	Stages	Average Distance (Miles)
1d.	2	1.12
1½d.	3	1.66
2d.	4	2.22
2½d.	6	3.28
3d.	8	4.22
3½d.	10	5.41
4d.	12	6.62
4½d.	14	8.03
5d.	16	9.08

Digitized by Google

motors rated 50 to 60 hp. each. The higher horsepower is approximated in practice because the average line potential is 575 volts. The gear ratio is 13:62.

Twenty of these cars have also been fitted with contactor controllers including field control, whereby up to 40 per cent of the current can be shunted to permit a speed on the level of 28 m.p.h. instead of 22 m.p.h. The controller used is designated as the Metropolitan-Vickers OK-23B. The field shunt switch is brought into use only on the last parallel position. A relay prevents overloading of the motors.

The higher running speed of these cars is balanced by improvements in braking. For the first time, a group of Glasgow cars has been equipped with air brakes instead of depending on hand and short-circuiting brakes alone. These air brakes are used for all service stops except occasional trial stops with the hand brake. Still better emergency stops than before have been secured by the use of two sets of magnetic brakes instead of one. The brakes are reinforced by two sets each of pedal-operated and pneumatic sanders.

In past years car heating was unknown in Glasgow. The installation of various types of electric heaters is another novelty.

In line with this tendency is the complete inclosure of the upper deck. The canopy has been extended at each end and a pleasing glazed vestibule installed. Through the removal of superfluous gadgets elsewhere, the overhung weight has not been increased.

The change most apparent to the public is, of course, the reupholstering of the seats. The longitudinal seats on the lower deck have been replaced by a combination of cross-seats and short benches in the corners upholstered in moquette. As the Glasgow cars have a 6 ft. 10½ in. outside width and 6 ft. inside width, the transverse seats are double on one side and single on the other side. The cushion width of a double seat is 30 in. but the actual seat space is 35 in. The clear width of the aisle between the double and single seats is 15½ in. In the rearrangement of the lower deck, the number of seats was cut from 24 to 21.

The upper deck has fourteen cross-seats, seating 28 passengers, and longitudinal seats on the canopies for ten passengers. These have been retained through the simple substitution of genuine leather upholstering. It will be seen from an illustration that the seat-backs are not full, as is customary in American practice. In this way it is possible to avoid lengthening the seat spacing, which remains at 26 in. center to center.

The practice of designating each route by cars of certain color combinations has been retained, but for the benefit of strangers and of residents unfamiliar with a given route an improved form of roller destination sign has been adopted in place of the less conspicuous markers formerly used.

The foregoing improvements plus a number of constructional changes were made at an average cost of £1,000 per car. The job has been done on a maintenance basis with an average time of three cars per week.

Since the foregoing was written, the Tramways Committee has recommended (October, 1928) the acceptance of bids covering £183,215 ($890,425) of electrical equipment, brakes, roller bearings and upholstered seats for 300 re-conditioned cars.

Who Will Receive the

$200 Maintenance Prize?

AT A RECENT MEETING of the executive committee of the American Electric Railway Engineering Association it was decided that the awarding of the $200 individual prize in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest and the presentation of the company trophy and departmental certificates of merit will form part of the program at the general session of the engineers during next year's convention at Atlantic City. This will focus attention on the improved methods and equipment that are being originated by electric railway maintenance forces, resulting in better and faster work and decreased costs.

Send in your items for ELECTRIC RAILWAY JOURNAL'S Maintenance Contest. You are sure of $5, as that amount is paid for each item published, whether it wins a prize or not.

There are twelve $25 departmental prizes to be awarded to individuals sending in winning maintenance ideas. These will be divided equally between the following four maintenance divisions: (1) Rolling stock and shops; (2) way and structures; (3) electrical and line; (4) buses and garages, including shop equipment for bus maintenance.

The most sought after prize of all will be the $200 individual prize to be awarded at next year's annual convention to the person submitting the best maintenance idea during the contest.

Don't delay in getting started! There is no limit on the number of items that may be sent in by one person. The more you submit the better chance you have of winning one or more of the big prizes. Some companies are organizing all maintenance departments to go after these awards. Look up the announcement in the Oct. 20 issue of the JOURNAL, or send for copies of the instruction folder!

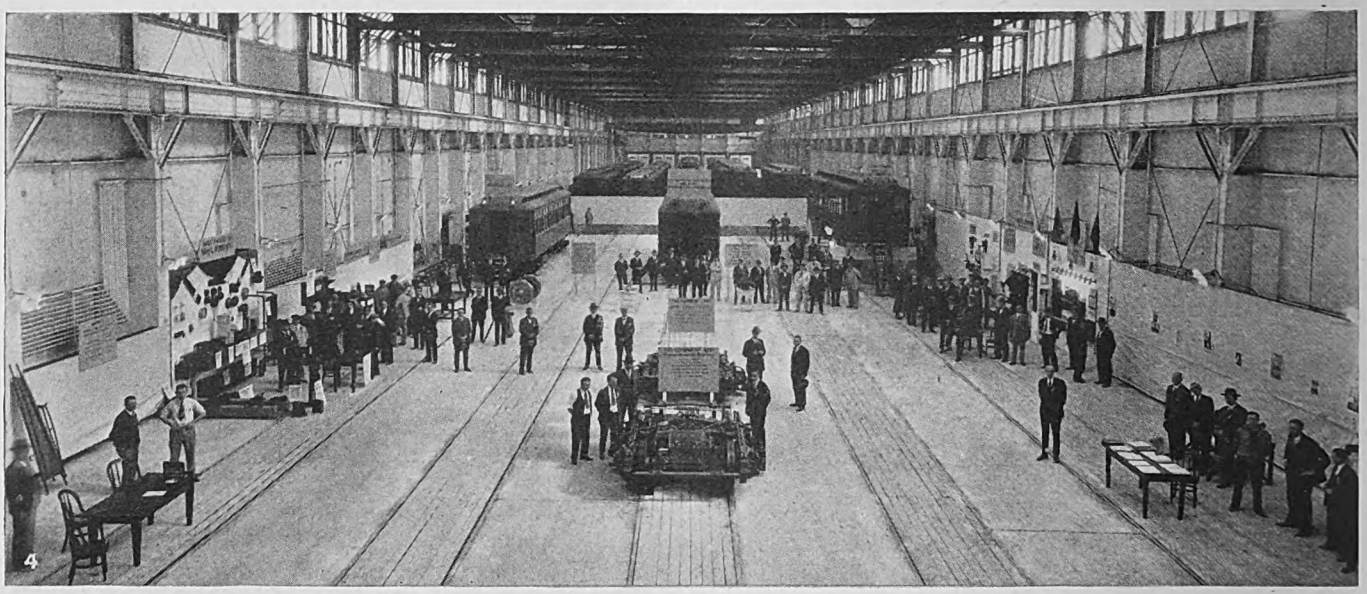
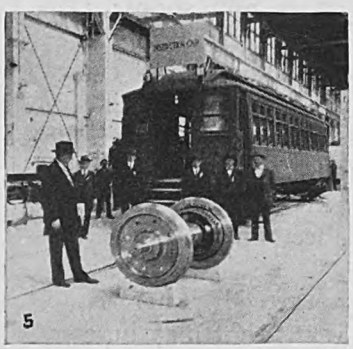
Interborough Rapid Transit Holds Public Exhibit of Its Safety Devices and Methods





1. Chief engineer's exhibit of feeder layouts, remote control circuit breakers, etc.
2. The signal department showed a great variety of equipment including automatic stops, track relays and signal lights.
3. The medical department showed its charts, forms, records and physical helps such as crutches and braces.
4. This is a general view of the exhibit held in a recently completed bay of the 147th Street shops.
5. The instruction car and the car equipment department's exhibit.
6. First all steel passenger car constructed.
7. The standard motor and trailer truck. There is one motor truck under every motor car and seven motor trucks under every ten-car train.
8. The final exhibit was of the transportation department.

Interborough Exhibits Its Safety Equipment

Devotes bay of its 147th Street shop to show features of car and track equipment— More than 4,000 persons attended during 22 days in October

DURING October the New York public had an opportunity to study subway construction and operating methods first hand, particularly the precautions used to insure the safety of passengers.

Shortly prior to the Safety Convention, held in New York during the early part of October, the Interborough Rapid Transit Company was asked to co-operate by making an exhibit of its safety appliances. To do so it set aside one of the recently completed bays in its shops at Seventh Avenue and 147th Street, whitewashed the walls and staged an exhibit of which some views accompany this article. A large delegation from the Safety Congress was taken from the Pennsylvania Hotel, on 33rd Street, to the shops by buses on Oct. 5. The delegates were met by James S. Doyle, assistant to the general manager, and conducted around the exhibit, while representatives from the different departments explained the features shown. Later, the delegates were taken to the yards, where a demonstration was made on a train of some of the most important safety features of the equipment, particularly the automatic multi-side-door, the signal and automatic trip system and the dead man's button. A pamphlet, especially printed, explained and illustrated these and other fundamental features and gave some striking facts about subway safety. Thus, the statement was made that it is 22 times safer to be an I.R.T. passenger than to be on the streets of New York and six times safer than to stay at home. It has been calculated also that the average New Yorker, if he should travel continuously in the subway and should die only by accident, would live for 11,728 years.

The exhibit was so successful that the company decided to keep it open for very much longer than the period of the Safety Congress, and it remained open until Oct. 27. During that time it was visited by 4,349 people including several delegations from civic organizations, like boards of trade. The individuals included representatives from the police and fire departments of the city as well as company employees, many of whom visited the exhibit on Sunday, and all on their own time. Indeed, it was the first opportunity which most of them, particularly those in the clerical departments, had of obtaining a close view of subway equipment. Even some of the trainmen had never before seen the underside of a subway car with all the equipment mounted in place. This was possible at the exhibit because a standard car was raised high enough above the floor so that persons could pass under it, and the bottom was well illuminated with lights.

The Exhibit Was Comprehensive

Space will not permit here of an account of all or even much of the apparatus displayed. A list of the different departments represented, with mention of a few of the things shown, will give an idea of the representative character of the exhibit.

The first exhibit on the right to greet the visitor was a full-sized model of the multiple-unit type of remote door control. All parts were distinctly marked, and a separate display showed the various relays and other of the larger parts employed. Next came a display of the safety posters used through the shops, then an exhibit of the purchasing department, with samples of its specifications and inspection reports and some of the articles purchased in which safety is a dominant feature, such as treads of subway stairs. A placard declared that the value of materials purchased yearly by the company amounts to $9,685,000 and that 22,000 orders are issued per annum.

The next exhibit was one of the lighting system used in the subway, and the next the safety features of the chief engineer's department. These latter related principally to the employment of remote control for power, on which articles have been published in these columns. This exhibit included views of the emergency and other equipment of a ticket agent's booth.

First Steel Car Exhibited

At the end of the exhibit were three cars. One was a standard car, raised from the floor to a sufficient height to allow an inspection of its equipment. The second car was the first steel car put into use on the railroad. This car was built in 1903 and is now used as a pay and collection car. It is said to be the first steel passenger car ever to be put in regular service, as well as the first to be equipped with anti-climbing buffers. The third car on exhibit was the school car of the system.

On the left-hand side of the exhibit, adjoining the construction car, was a standard automatic tight-lock coupler and a pair of brightly polished wheels with axle and gear attached. Farther on were exhibits of the car equipment department, signal department, medical department and transportation department. In the center of the hall were a standard trailer truck and a standard motor truck.

During October the exhibit was open daily between 10 a.m. and 6 p.m. When advance information was received of the visit of an important delegation, arrangements were made whereby the visitors were received at the entrance of the administration building, and conducted through the shops to the exhibit room. Here the various exhibits were explained either by the heads of the several departments of their assistants. Then the delegates were taken to the demonstration track, where they were shown the operation of the track switch and dead man's button in regular subway operation.

Southern Equipment Men Complete Convention Plans

ARRANGEMENTS have been completed to make the Rice Hotel, Houston, Tex., headquarters for the joint meeting of the Electric Railway Association of Equipment Men, Southern Properties, and the mechanical division of the Southwestern Public Service Association, to be held on Jan. 23-25, 1929, in Houston. Hotel rates for a single room with bath will be from $3.50 to $5 per day, and for a double room with bath, from $6 to $8 per day.

Due to the interest in bus operations, Robert M. O'Brien, president of the Association of Equipment Men, has requested that questions regarding bus operating difficulties be submitted for discussion at the convention, in addition to the questions on general railway operations.

Convention Plans Discussed by A.E.R.A. Executive Committee

EXCELLENT facilities for an exhibit of street cars, buses and other local transportation equipment are to be provided for the next annual convention of the American Electric Railway Association. As announced in last week's issue of ELECTRIC RAILWAY JOURNAL, this will be held in Atlantic City, N. J., Sept. 28 to Oct. 4, 1929. A. H. Skean, manager of the Atlantic City Convention and Publicity Bureau, and L. G. Dickey, manager of the new Atlantic City Auditorium, explained in detail the facilities to be provided in the new auditorium, in connection with the statement of the convention location committee, headed by W. H. Sawyer, which made its report to the executive committee favorable to taking the 1929 convention to the New Jersey resort city.

IDEAL FACILITIES FOR SUCCESSFUL CAR EXHIBIT

One problem which had given considerable concern to the location committee was that of providing suitable space for a representative exhibit of street cars at Atlantic City. This question involved not only the completion of arrangements for suitable space that would encourage manufacturers to send a representative exhibit of cars to the next convention, but also the matter of cost of such exhibits, which always was one that gave grave concern at Atlantic City. The arrangements completed by Mr. Skean and Mr. Dickey offered a very satisfactory solution to both of these problems.

The car exhibit will be arranged upon a great open plaza which is under construction on the beach in front of the boardwalk across the entire width of the new Auditorium building. Temporary tracks arranged in semicircular form across the ocean half of the plaza will provide space for approximately twenty cars in a location and setting highly advantageous to a successful exhibit. Special ramps from the tracks in the streets adjoining the Auditorium will permit the cars to be placed in position and removed after the convention with a minimum of labor. Arrangements have been made with A. J. Purinton, vice-president of the Atlantic City and Shore Railroad Company to assume the work of handling street cars from freight cars to the plaza and reloading them after the convention at a flat total price of $130 per unit, which would make the total cost of exhibiting cars in Atlantic City closely comparable with what it has been in Cleveland.

Within the Auditorium there will be space for housing the entire convention exhibit on one floor and in one room, with ample facilities for holding all meetings of the American and affiliated associations in conveniently located and comfortably equipped meeting rooms. After going over these facilities carefully it seemed to be the opinion of most of the members of the executive committee that the 1929 convention in going to Atlantic City will be held under almost ideal conditions.

Officers of the association were authorized to execute the contract which was prepared under the auspices of the location committee and which had already been signed by the proper representatives of Atlantic City. The dates for the convention provided in the contract are Sept. 28 to Oct. 4, inclusive, which is approximately one week later than the dates in Cleveland last year. Discussions which have ensued regarding objections to opening the exhibits on the Saturday preceding convention week had been reviewed by the locations committee, and were called to the attention of the executive committee. It was considered advisable to include the Saturday date in the contract, and the final determination of whether the convention will actually open on Saturday, Sept. 28, or on Monday, Sept. 30, will be referred to the convention program and exhibit committees. The locations committee likewise recommended that the program committee give consideration to the advisability of setting aside Monday afternoon and Wednesday mornings for the inspection of exhibits instead of the whole of Tuesday, as was done last year. In doing this it was felt that an inspection of exhibits on Monday afternoon, the first day of the convention, would be advantageous and do away with the need for opening the exhibit on Saturday. Furthermore, it was felt that by splitting exhibit day between a morning and an afternoon on different days, there would be a better opportunity for delegates with only a limited time at the convention, to go over the exhibits carefully and at the same time participate in the meetings of those associations in which they are particularly interested. Still another reason advanced in favor of this arrangement was that it would reduce the temptation to be absent from the convention which exists when an entire day is set aside free of meetings. By arranging the exhibit inspection on Monday afternoon and Wednesday morning, it was pointed out also that affiliated association meetings, starting on Tuesday afternoon, would run continuously for each of the three afternoons of convention week.

NEW COMMITTEES TO MAKE BROAD ECONOMIC STUDIES

In addition to the discussion of convention plans and the discharge of routine business which occupied most of the time of the executive committee meeting, President Barnes announced the appointment of several important American Association committees to study broad phases of local transportation economics, somewhat along the lines of the work done by the rapid transit committee and that being carried out by the committee on street traffic economics. These new committees include a committee on the economics of interurbans, a committee on fare schedules and a committee on the co-ordination of public transportation facilities. In addition, there is to be a committee on co-operation with the industry in Canada. This program was approved by the executive committee. The thought behind the work of these new committees is that of a basic economic study of the several phases of community transportation in its broadest aspects.

E. F. Wickwire, sponsor of the manufacturers' luncheon during the last Cleveland convention, read a letter to President Barnes transmitting the suggestion made by resolution at the manufacturers' luncheon, for the appointment of a special committee of manufacturers to consider special manufacturing and trade problems within the industry. The executive committee passed a motion authorizing the president to appoint such a committee.

Those present at the executive committee meeting included President J. P. Barnes, J. H. Hanna, G. A. Richardson, L. S. Storrs, Barron Collier, R. P. Stevens, O. H. Bernd, L. F. Wynne, F. H. Miller, W. H. Boyce, A. S. Grenier, T. W. Casey, E. B. Meissner, E. F. Wickwire, D. W. Snyder, Jr., S. W. Shugg representing J. G. Barry, H. B. Potter, S. J. Cotsworth representing

Virginians Discuss Utility Problems

MORE than 400 delegates representing almost every utility in the state of Virginia attended the annual meeting of the Public Utilities Association of Virginia, held at Roanoke on Nov. 21 and 22. Many interesting papers on utility relations with the public, investment banking views, urban transportation problems and rates were presented. Group luncheon meetings were held for the first time at this meeting of the association and, according to reports, proved very profitable. Another innovation was the formation of a woman's committee to assist and co-operate in all activities of the association.

Hon. William Meade Fletcher, commissioner of the State Corporation Commission, addressing the delegates at the opening session, spoke at some length on securing good public relations. He said in part:

Public utilities by high efficiency, better service and more progressive policies should make their commodities useful and necessary to the public and thus win its confidence and good will, for good public relations are of the utmost importance to the successful operation of public utility properties. The dissatisfaction which arises from poor service by the public utility is one of the most frequent causes of an unfriendly public attitude.

Commissioner Fletcher voiced his opinion with regard to public and private ownership by saying:

I am satisfied that as a general rule neither public ownership nor public operation is for the public's good nor desirable, and that private ownership and operation under proper regulation is the best system for conducting the business of public utilities.

The speaker stressed the need of proper employee attitude toward the patrons in establishing satisfactory friendly relations. He also mentioned the desirability of the utility securing more confidence on the part of the people in its good intentions and its desire to render good service. In support of this he said:

Instead of a policy of concealment there should be the policy of honest revealment, and when this course is pursued honestly, fairly and with no misleading propaganda, no distortion of facts, no concealments or evasions, and the public is fully taken into the confidence of the utility and made to understand the nature of its business, the cost of conducting it, the effect of restrictions placed upon it, the part it plays in the life of the community and its needs and necessities, then the utility has gone far to establish better relations between it and the public and the way has been paved for a sympathetic attitude on the part of the public to its necessary requirements.

Views of an Investment Banker

Some aspects of the public utility business which are of major concern to investment bankers were reviewed by Henry R. Hayes, vice-president of Stone & Webster and Blodget, Inc., and former president of the Investment Bankers' Association of America. Mr. Hayes credited much of the stability of the public utilities to the efficient statewide regulations that have been responsible for the elimination of needless and destructive competition and that have prevented exorbitant rates. Supported by very uniform court decisions, he continued, this wise public policy of state regulation has afforded investors stability to such an extent that securities of the industry rank high among conservative investments. The speaker denounced those who were against state regulation and pointed out that their criticisms were general and without foundation. Mr. Hayes stated that more uniformity in commission regulation is essential to enable the operating companies to command a freer flow of money into the business for expansion.

The unfairness of charging only those who ride the cars and buses for the entire cost of financing and operating the transportation systems was pointed out by Tom P. Walker, vice-president Virginia Electric & Power Company. To use Mr. Walker's own words:

Public transportation for people in mass is an absolute necessity for any city grown beyond the "one-horse" class. The butcher, the merchant, the manufacturer, the home owner and the worker are dependent on it directly. As a necessity this service is found to be supported, and we therefore have before us the definite problem of how to assess against each element of the population the cost of the service which that particular element enjoys. Under the theory established by many years usage, and at present in vogue, he who actually rides the cars and buses is expected to carry the entire cost. Franchises to operate transportation systems now require expensive hard surfaced streets which car riders are forced to pay for and which are of no direct benefit to them.

The speaker analyzed in part some of the traffic ordinances and suggested that provision be made for the speeding up of transportation vehicles. On this subject he said:

If we are to halt the tremendous expenditures for widening streets to causeways and subways, we must certainly contrive to encourage the use of the more efficient bus or street car by allowing it to operate at an average speed, comparable with that of the automobile.

Other addresses delivered before the association included "The State Conservation and Development Commission," by Hon. William E. Carson, chairman of the State Conservation and Development Commission; "Your City and Your Business," by Colvin Brown, manager Commerical Organization Department of the United States Chamber of Commerce; "Fundamental Rate Base," by N. M. Argabrite, vice-president of the American Gas & Electric Company; "Industrial Development in the New Virginia," by J. P. Fishburn, president Virginia State Chamber of Commerce, and "Whither Public Utilities?" by Alexander Forward, managing director American Gas Association.

Three group luncheons were held during the noon hour of the first day. The groups were divided as electric light, power and telephone; transportation; and gas and water. Much interest was shown in a demonstration of "Televox," the Westinghouse mechanical man.

Women Form Auxiliary

The ladies in attendance at the convention met and formed an organization to work in conjunction with the association. Officers were elected and a definite program outlined. Several entertainment features were planned for the ladies in attendance, including a sightseeing tour, a luncheon, a bridge tournament and a buffet supper and dance.

A. W. Higgins, executive vice-president of the Virginia Public Service Company, Charlottesville, Va., was elected president of the association for the coming year. The vice-presidents named were C. B. Short, manager Roanoke Railway & Electric Company; T. Justin Moore, vice-president and general manager Virginia Electric and Power Company, and Herbert Markell, division manager Appalachian Electric Power Company.

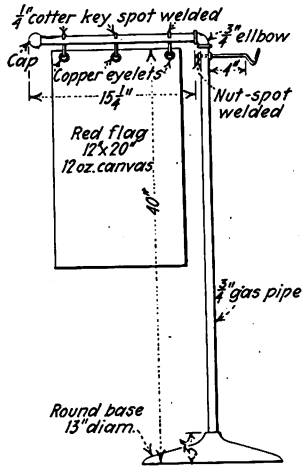
Short Cuts to BETTER

Sign Boards and Standards Improve Public Relations

AS A PART of its program to improve public relations the Northern States Power Company, Fargo, N. D., uses an attractive type of flag and lantern standard and a distinctive sign board. The flag and lantern standards are used at all



Type of standard used for red flag and red lantern display by the Northern States Power Company, Fargo, N. D.

obstructions in the streets. They are a distinct improvement over the red flag as displayed on a staff. With the new type of standard the flag is plainly visible at all times. A hook is provided for the lantern so that this is displayed much better. The neat arrangement of the standard also makes a better display of the work under way.

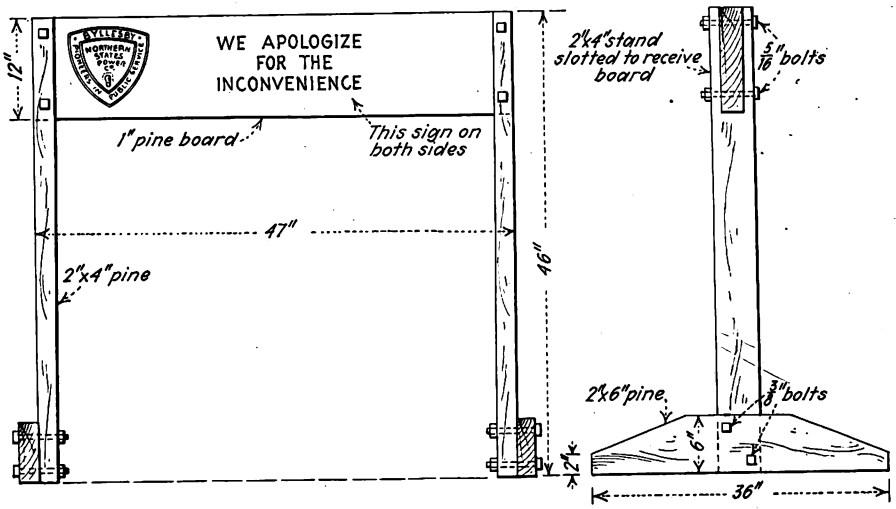
Sign boards are used on all work which in any manner may inconvenience the public. The top reads "We Apologize for the Inconvenience." The sign also bears the seal of the Byllesby organization. Many favorable comments have been received in regard to their use.

Painting Notes from Vienna

PLANS of the Vienna Tramways include the building of a cabinet for painting two cars at a time with nitro-cellulose paints. Compressed air will be introduced at the top of the enclosure with ample suction at the bottom so that the rapid carrying off of gases will make it unnecessary for the spray painters to use masks. The experimental cars will be treated in part with Duco and in part with a German product called "Glasurit," made by the Glasuritwerke of Hamburg.

For wooden surfaces, the management has under consideration a lacquer oil paint which will permit a car to go through the shops in six days instead of twenty-one, a very considerable saving.

Spray painting has already been applied on signs with stencil lettering. The stencil pattern is magnetized to stick on the plate during the spraying. After drying, the lettering can be brought up to enamel polish.

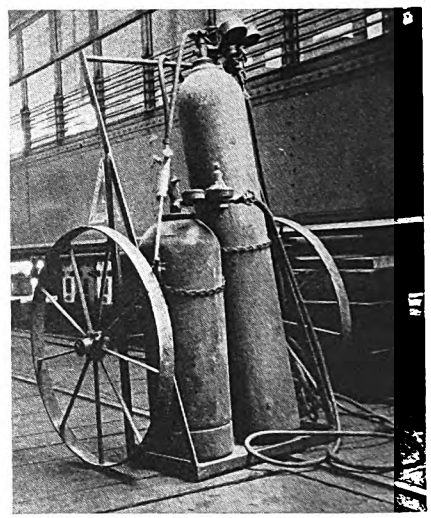


Sign board used on work which may inconvenience public

Large Wheels on Welding Truck

WHEELS of 10-in. diameter and 2-in. face were used originally on the acetylene outfit truck in the shop of the Richmond Railways, Inc., Staten Island, N. Y. When this outfit was taken about the shop as well as about the yard and inspection shop, trouble was experienced continually in moving it over small floor imperfections, rails, etc. In consequence, the services of two men were very often required to transport it. As this was expensive the truck shown in the accompanying engraving was designed and constructed.

The novel feature of this truck is in the diameter of the wheels used



Large wheels on this truck make it easy to roll over obstructions

and the fact that the wheels are raised from the floor when the tanks are in a vertical position. The platform is 24x14 in. and is made with a ¼x2-in. angle framework and ⅛-in. floor plate. The joints of the plate and angles are welded. Two ¼x1¼-in. vertical angles 39 in. high are welded to the back corners of the platform. Two ¼x1⅛-in. flat bars welded to each front corner of the platform extend backward to meet and project beyond the two rear vertical angles. A ¾-in. round rod, welded to the upper end

Digitized by Google

MAINTENANCE

of these flat bars, provides a handle for moving the truck. Each front flat bar and back angle is welded at the meeting joint.

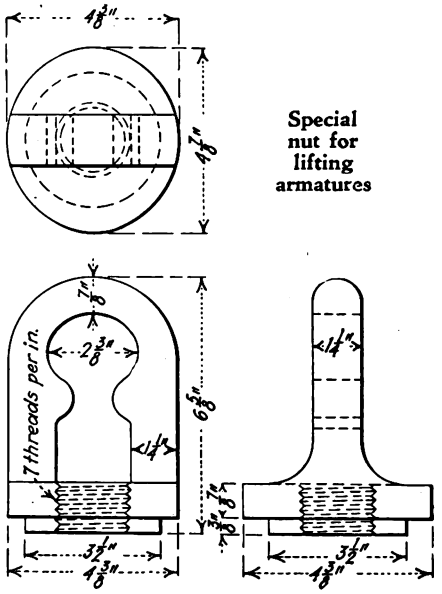
A 1¼-in. square axle is welded to the vertical angles 15¼ in. from the bottom of the platform. These axles are fitted with iron wheels of 30-in. diameter and have rims ¼ in. thick and 2 in. wide. The wheels are spaced 40 in. apart. When the truck is resting on the platform the wheels are ¼ in. off the floor. This prevents movement of the truck when unattended. A ¼x1¼-in. angle welded to the vertical angles strengthens the framework and provides a support for fastening the tanks.

This truck can be moved by one man and has thereby increased welding production and decreased labor.

Lifting Armatures with Pinion Nut Thread

THERE is always a possibility of an armature being damaged during its installation or removal from a field frame. Unless the utmost care is exercised, maintenance expense will be increased. The cars of the Staten Island Rapid Transit Railway, Staten Island, N. Y., are equipped with G-E, 282-A box frame motors. Several methods were tried for applying and removing the armatures from the field frames, and it was finally decided to perform this work with the frame in a vertical position. Motors are placed on the floor with the pinion end up, and the armatures are applied to or removed from the frame while in this position. The armatures are lifted by a special lifting nut designed and made in the shop.

This nut is screwed on to the shaft pinion nut thread. It is a steel forging with an oval base 4⅜x4⅞ in. and an over-all height of 6⅝ in. The base is ⅞ in. thick and the diameter of the eye is 2⅜ in. The base is designed with a projection ⅜ in. thick and with a 3½-in. diameter. The thickness of the eye material at the top is ⅞x1¼ in. and at the base 1¼ in. The oval base



Special nut for lifting armatures

and its projection are drilled and tapped to fit the pinion nut thread.

This method has been in use for some time and although the armatures weigh 1,650 lb. not a single accident has occurred.

Convenient Route Number Sign

By A. M. Lindsay

Superintendent of Rolling Stock
Montreal Tramways, Montreal, Canada

SEVERAL advantages are claimed for an inexpensive, adjustable type of route number sign used by the Montreal Tramways and shown in the accompanying illustrations. The principal features of this sign are:

1. Each curtain can be adjusted separately for position, giving a wide range of numbers. A coil spring on the curtain rollers keeps the face of the curtain tight and in the position where it is placed.

2. The back of the holder is of glass, so the route number is illuminated at night from the general car lighting.

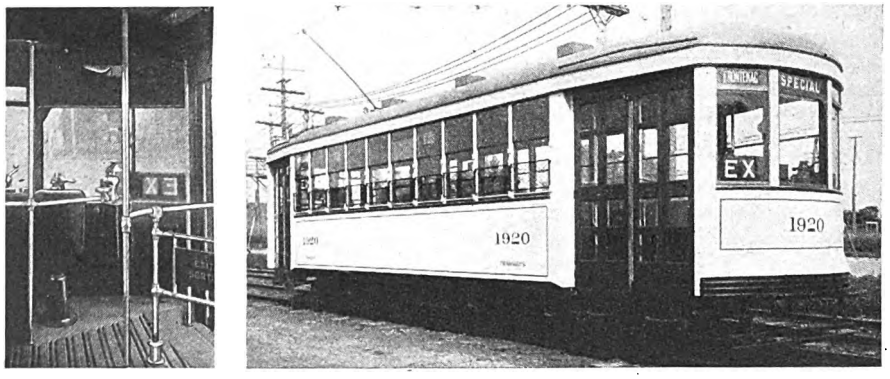
3. A self-locking spring catch keeps the back cover tight and prevents rattling.

4. Curtains are inclosed completely and are kept clean and free from dust.

5. Slots in the ends of the case enable it to be placed in or removed quickly from suitable brackets on the window posts when repairs are necessary.

The cost of a complete sign is small, being approximately as follows:

Sign case	$3.00
Sign brackets and application	.25
Sign curtains	1.00
Total	$4.25



At left—View of the sign from the interior of the car.
At right—Exterior view of the sign

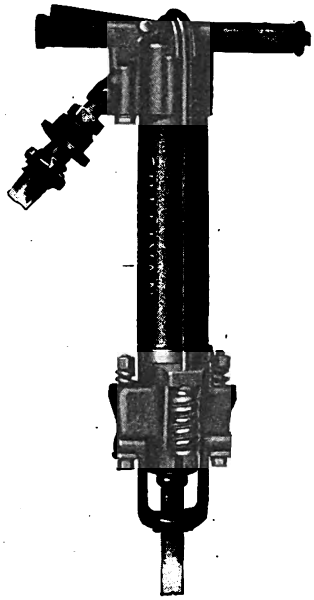
Helpful Equipment Suggestions

Powerful Type Concrete Breaker

FOR BREAKING concrete of heavy and difficult construction, a new type Sullivan K-3 concrete breaker is announced by the Sullivan Machinery Company, Chicago, Ill. This compressed air tool weighs 84 lb. and employs a cylindrical hollow valve for imparting the impulses of air to the piston. In the usual type



New type of concrete breaker

of service, air economy and excellent stand-up qualities are claimed for this machine as well as great power and penetrafion.

New Solder for Railway Motors

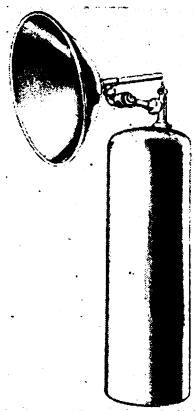
By James Silberstein
Chicago, Ill.

SOLDERS for electrical apparatus generally consist of lead and tin and start to melt at a temperature of 183 deg. C. A solder of higher melting point is desired for apparatus where the service is severe and high temperatures are encountered. Pure tin, which has a melting point of 232 deg. C. has therefore been used. The advantage of using pure tin is, however, not very marked and it has the disadvantage of being difficult to solder on account of its fluidity and tendency of "running through" joints.

Attempts have been made to develop new solders, standing higher temperatures, but they have so far been unsuccessful because of the rather severe requirements which have to be met by solders for electrical apparatus. Recently, however, an alloy has been developed which has proved its usefulness as a solder under very severe conditions. This alloy consists of lead as a base metal with additions of silver and copper, and starts to melt at a temperature of 302 deg. C. The alloy can be used in soldering with the non-corrosive fluxes, ordinarily employed in the soldering of electrical apparatus, and can be worked with a common soldering iron, which, of course, has to be heated to a higher temperature than when soldering with the ordinary lead-tin solders.

The new solder was put in service, and used successfully, on the electric motors of the locomotives of the Virginian Railroad. It was developed by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

Floodlight Attachment



Floodlighting unit attached to tank

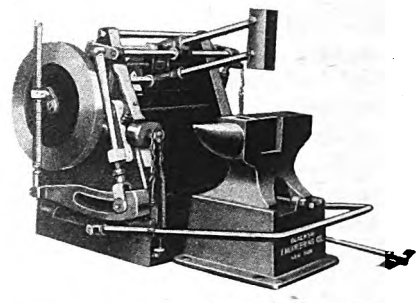
FOR USE with small tanks of dissolved acetylene the Prest-O-Lite Company, Inc., New York, N. Y., announces a floodlight attachment of new design. By the connection of the attachment a convenient, portable, powerful floodlighting unit is obtained which can be used for illumination in dark places and for facilitating night work of all kinds.

The improved attachment is of simple, strong, rigid and compact construction. Universal adjustment is obtained with only one swing joint, thus minimizing the possibility of leakage. Because of the substantial construction of the new part and because of its position near the center line of the tank, the attachment itself can be used as a handle in carrying the entire unit.

The reflector, which is of 10-in. diameter, can be taken off by removing a single knurled nut. A new type of burner is used which will not "carbon up." This burner is placed at a fixed focal point and requires no adjustment.

Improved Smithing Hammer

SEVERAL improvements are incorporated in the new Blacker "B" blacksmith hammer, recently placed on the market by the Blacker Engineering Company, New York, N. Y. While retaining the features



Improved type of blacksmith's helper

of preceding models, it is a larger and heavier machine throughout. Along with numerous dimension changes, thrust bearings are fitted to ease up the control mechanism, and a complete rearrangement of the motor drive gives a neat and compact unit.

A smith working at an anvil equipped with the improved hammer has directly under his control a sturdy, tireless helper swinging a sledge that can strike a blow three or four times as heavy as that of the hand swung sledge it replaces. He no longer has to signal with a small hand hammer to his strikers, and all confusion and misunderstanding are eliminated. The smith merely presses down the treadle with his foot and the sledge swings up and down exactly at the spot on the anvil that the smith selects and with his foot control he regulates the blow.

The control of the blow is positive. It passes from the treadle and chain through reduction gearing to the worm and quadrant action moving the quadrant arm. This is the same principle as the automobile steering gear and motion and shock from the working parts cannot carry back to the operator. The slipper in the link-motion drive is at dead center, or neutral, while the link itself rocks up and down with the eccentric action of the fly-wheel. Exactly like the locomotive drive, any movement of this slipper through the link results in a proportionate up and down motion of the driving rod, which in turn sets in motion the carriage and its hammer arms and head.

News of the Industry

May Have to Increase Its Fare

An increase in street car fare in Cleveland, Ohio, is considered probable as a result of a drop in the interest fund of the Cleveland Railway below $500,000 during the months of September and October.

The Tayler grant states that a drop in the interest fund below $500,000 shall be considered as *prima facie* evidence of the necessity for an increase. The present rate in the city is 7 cents cash, eight tickets for 50 cents, with a 2-cent differential in East Cleveland and similar differential about to be enacted for Cleveland Heights.

The interest fund stood at $468,397 on Sept. 30. Officials of the railway expected that the seasonal increase in riding would build up the fund during October, but on Oct. 31 the balance was $468,139, according to reports made to the directors at their monthly meeting on Nov. 22.

The directors, however, made no move to bring about an increase in the rate of fare, believing that there will be a recovery in the interest fund during the winter.

Forward Step in Traffic Solution in New York

Mayor Walker, of New York City, has suggested that the Board of Estimate engage the professional services of Day & Zimmermann, engineers, to make a survey of the city's traffic conditions. Such was the central recommendation of the report of Mayor Walker's citizens' committee, and the Mayor himself has recently taken steps to carry it out. This commission would deal with all matters connected with the city's growth, and would naturally have much to say about the causes of congestion and its remedy. Distribution of population, balance of industry, recreational facilities, bridges, by-passes, arterial highways would be studied thoroughly.

Ordinance for Electric Power in Atlanta Abandoned

The attempt of the city of Atlanta, Ga., to compel railroads in its downtown district to use electricity as a source of power has been abandoned, at leat, for the time being. This became certain when the proposed ordinance, which would have made it a misdemeanor for any locomotive to "emit coal smoke or cinders" within the fire limits of the city, and compelled all railroads operating in the city to use electric locomotives, was withdrawn by its author, Alderman W. Guy Dobbs.

In withdrawing his ordinance, which already had the approval of a majority of the City council, Mr. Dobbs stated that it provided for the electrification of the railroads by Jan. 1, 1929, and that this was now a physical impossibility, due to delays in holding hearings and getting definite action on the proposition.

One hearing was held, after which the bridge committee, to which the ordinance was referred, asked that a special committee be appointed to study all phases of the city's smoke problem. The committee was appointed, and an ordinance had to be introduced giving it legal authority. Thus far the authority measure has not been presented to the Council.

After the special smoke committee makes its report it is probable that a new ordinance will be drawn up following its recommendations.

Telling Them How and Why in Nebraska

Management and employees of Omaha and Council Bluffs Street Railway show what a well-knit organization with perseverance and purpose can do for the common weal

DEEP gratitude has been acknowledged by the management of the Omaha & Council Bluffs Street Railway and the employees to the people of Omaha, Neb., for their award of the franchise which has been regarded as not only a vote for the franchise but "as a vote of confidence in the company and its employees." Through *Street Car Topics,* published by the company, the railway promises to prove worthy of the confidence.

The expiring franchise in Omaha was one of the problems which faced John N. Shannahan when he went to Omaha a year ago to re-establish the credit of a sick railway organization. In the emergency a large bond issue had either to be retired or extended. Arrangements were made with the bondholders whereby the expiration date was extended, pending an effort to secure a new franchise, and the management set about preparing the way to consummate that object.

An unusual means of taking his message to the public was conceived by President Shannahan in enlisting the aid of his platform men. From the ranks of the train service ten representatives were selected during August, and were given a course in public speaking under the direction of a competent instructor. The men were supplied with a prepared speech, setting forth their own and the company's position with regard to the proposed franchise and were required to memorize it, with such changes as would fit in best with their own command of the English language. Within a few weeks the speakers felt competent to make their first appearances.

The ten trainmen during the preliminary training period worked only part time on their cars and were compensated for all time lost. After the campaign got well under way they were relieved from their duties on the cars entirely, were furnished with brand new uniforms, which they were required to keep in first-class condition, were paid something more than their regular wages and were supplied with liberal expense accounts. They were now ready for an assault upon the luncheon clubs, the various local group meetings and any and every place where a suitable audience could be prevailed upon to listen to their argument.

After the regular list of luncheon clubs had been subjected to their oratorical fire the field of operations was broadened to include lodges, trades unions, business colleges and the like. One of the men appeared before the Omaha Women's Club, where he was well received and made a decided hit. Afternoon and evening card clubs were invaded.

To the People of Omaha

ON ELECTION day by a vote of 60,600 to 17,348, you gave us a franchise to continue to do business in the streets of Omaha.

The franchise was necessary for us to continue in business. The company's 1,100 employees, and the company itself, wish to acknowledge through *Car Topics* their deep gratitude to the people of Omaha.

However, we regard the fine vote as more than a vote for the franchise. We regard it as a vote of confidence in the company and its employees.

It is and will be our purpose to prove ourselves worthy of this confidence. We have been and are, to the best of our ability, giving efficient and courteous transportation service. Our purpose is to make this service constantly better. We welcome suggestions from the people of Omaha.—*Street Car Topics,* published by the Omaha & Council Bluffs Street Railway.

Digitized by Google

During the final month of the campaign the scope of the meetings was broadened so as to cover many of the city's leading industrial establishments, department stores and factories. On one occasion the Union Pacific Railroad gathered 1,300 of its employees during working hours and allowed the trolley company's representatives twenty minutes in which to talk to them. Some of the trainmen made as many as four speeches a day. On Friday and Saturday immediately preceding the election two men went on the radio with their talk and in this manner reached hundreds who had not previously been addressed. In all, this group of trainmen addressed over 200 gatherings and spoke to an estimated total of 18,000 people.

WOMEN NOT OVERLOOKED

On election day, in addition to two men in uniform at each of the 176 precincts in Omaha and Council Bluffs. there was one woman, the wife, sister, mother or sweetheart of some male employee, each wearing a ribbon labeled "Street Railway Employee."

In spite of active opposition, led by United States Senator R. B. Howell and supported by a considerable and active element in both cities, the franchise carried by a vote of 60,600 in favor as opposed to about 17,000 against. The motion for the proposed free bridge over the Missouri River was defeated, but by a vote somewhat less decisive.

As the result of the election and of the spirit which was aroused among its employees the Omaha & Council Bluffs Street Railway finds itself with a 30-year franchise, with its credit restored, and with the way cleared for the sale of its toll bridge to the city, instead of a threat to build a free bridge in competition. The company can now proceed to carry out its long delayed plans for securing new rolling stock, constructing new substations and rehabilitating certain of its cars. Immediate results have been the engaging of experts to conduct a traffic survey, which is expected to result in a number of changes for the better in the routing of its cars, and a group insurance arrangement whereby each employee is given a life insurance policy for $1,000, the premium of which is carried by the company.

Above everything else that the company counted as gain as the result of its campaign for the franchise, was the strengthening of the morale of its entire force of employees. This was especially true of the train force. Not only did they take a new pride in themselves and in their vocation but they raised themselves in the estimation of the general public. In the eyes of the business community the trainmen are something more than mere automatons; their entire status has been improved. As one observer sees it they have won for themselves a new prestige. They have shown the people of Omaha and of Council Bluffs that they are a power to be reckoned with in the community. By their efforts they have established the company upon a new and improved basis. It is now in position to go forward and do its full part in the development of these growing cities. It is freely admitted that without the whole-hearted support of the employees this happy result could never have been accomplished.

Snag in Decatur's Argument

Five of the six judges on the Supreme Court of Georgia have declared themselves disqualified for consideration of litigation between the city of Decatur and the Georgia Power Company over Decatur's 5-cent fare contract, and argument has been postponed. Judge Marcus W. Beck was the only member of the court who declared that he was qualified to hear the case. Both sides were willing to waive the disqualifications set up by the other justices, the reason for which was announced as ownership of stock in the company by near relatives, which operates as a bar under the law, but the judges themselves refused to sit in the case.

The case involves a franchise entered into by the city of Decatur and the Georgia Power Company in 1903 for the taking over of the Decatur street car line. It has been the center of litigation for a number of years. A clause in the contract provided that Decatur should never be charged more than a 5-cent fare. Abrogration has been sought in vain through both court channels and legislative enactment, and on two occasions the case has come before the United States Supreme Court.

The present litigation originated in 1925, when the company notified the city of Decatur that it had surrendered it franchise and would remove its tracks. The city then secured and injunction in the De Kalb Superior Court, and this decision is before the Supreme Court of the state for review.

Akron Set to Negotiate New Franchise

Committee turns in report in which it finds 7.7-cent are necessary. Present average fare is 6.51 cents. Buses and cars each carry about 20,000,000 a year

THE Citizens' Fact Finding Committee at Akron, Ohio, selected to study the city's transportation system, has presented its report to Council, after several months' work. The committee finds that a fare of 7.77 cents is necessary if the Northern Ohio Power & Light Company is to receive a rate sufficiently high to pay operating expenses, maintenance, depreciation and taxes, and a 7 per cent return upon the valuation of the property.

Filing of the report with Council marks the first step in the negotiations between the city and the company for a franchise to take the place of the temporary franchise which expires in February.

Under the present franchise the company is getting an average fare of 6.51 cents, the reports shows. The present fare is 7 cents cash, four tickets for 25 cents, and seventeen tickets for $1. The committee does not recommend an increase in fare to the figure named in the report, upon the theory that a heavy decrease in riding would follow to a point which would give the company only a 3 per cent increase in actual fare. The increase necessary to pay all charges is 18 per cent.

The committee made a study of 25 cities throughout the United States. In cities where the fare has been increased steadily over a period of years, the gross revenue of the company, the report declares, has remained almost stationary instead of increasing. In other words, as the fare went up, the number of riders went down.

The report presents to Council six valuations. These valuations range from $6.262,364, arrived at by the historical cost less depreciation reserve method, to $8,643,207 valuation arrived at by the reproduction cost less retirement only method.

That the automobile has provided the most relentless kind of competition for transportation companies is shown in figures on auto ownership for Akron. The report discloses that there were 13,600 automobiles in the city of Akron for 1918, or one for each 13.75 persons. In 1928 there were 63,566, or one auto for each 4.75 persons.

REMARKABLE GROWTH OF BUS BUSINESS

Other outstanding points in the report show that on the basis of present fare, net revenue of the company is showing marked improvement for 1928. The bus system, started in 1922, will carry more passengers in 1928 than the street car system. The first year the company operated buses it carried 2,004,297 passengers as against 33,894,113 on the street cars. In 1927 the buses carried 19,038,134 persons while street cars carried 20,519,101. By the close of 1928, the buses will have carried several hundred thousand more passengers than the street cars for the year. The street car system is shown to be on a sound economic basis, but losses pile up on bus operation. Drastic economies on the bus system are suggested to aid in solving the transportation problem. In striking an average, the committee finds that the reasonable net revenue for the year should reach $3,230,992 to pay operating costs, taxes, interest on bonds, dividends and provide fair depreciation reserve.

The report shows that there was $187,014 applicable to depreciation and return in 1927, and that in 1928 the figure will reach $224,654. This amount should be $723,393, to put the trans-

Digitized by Google

portation property on a justified earning basis.

The report contains 150 pages and goes into the transportation system in an exhaustive manner. Besides the summary, written by Harold McGee, director of the bureau of municipal research, the report includes a section on court decisions on valuation and rate of return of electric railways by Edwin W. Brouse, attorney. Mr. Brouse is secretary of the committee. The report also contains an analysis of franchises by legal members of the committee. It contains an accounting study, by H. C. Miller, L. W. Dalton, and William L. Post; an analysis of prior appraisals, by Post; the physical appraisal of the company, by Prof. Henry Riggs, appraisal expert of Ann Arbor, Mich.; a historical cost of the system, by Post; capital securities, by H. C. Miller; an analysis of operating incomes and expense, by Mr. Dalton, and a section on the economics of car and bus fares, by H. L. Newhall. It is expected that negotiations for the new franchise will begin during the week beginning Dec. 2.

The Northern Ohio Power & Light Company, the city officials, the committee of citizens, and the newspapers are urging an early settlement.

Small Town Problems to Be Studied

Difficulties of electric railways in small towns and what can be done to alleviate them will be the subject of study by a committee of the American Electric Railway Association during the coming year. This committee on "small town operation," of which A. C. Spurr, general manager Wheeling Traction Company, is chairman, met at association headquarters on Nov. 26. The subjects to which particular attention will be paid are method of financing new car purchases, relief from paving burdens, possibilities of reducing the cost of purchase power and the conditions which may make it desirable to substitute buses in place of cars on small systems. Members present at this meeting were: A. C. Spurr, chairman; J. S. Bleecker, L. F. Gillett, A. H. Gossard, L. W. Heath, William M. B. Lord, C. A. Meyer, F. A. Persons, C. W. Stocks, representing R. E. Plimpton and J. H. Pritchard.

Chicago Honors Fallen Heroes

Electric transportation companies serving Chicago and the entire metropolitan area joined in paying tribute to the nation's fallen heroes on Nov. 12, when the tenth anniversary of the signing of the Armistice was generally observed. Traffic came to a complete halt for one minute at 11 a.m., on the Rapid Transit Lines, the Chicago North Shore & Milwaukee Railroad, the Chicago South Shore & South Bend Railroad and the Chicago, Aurora & Elgin Railroad while the employees of the four companies faced east in silent tribute to the dead.

Buglers from Chicago Elevated Post No. 184, American Legion, sounded taps from four "L" transfer bridges in the Loop just as traffic came to a halt at 11 o'clock. All rapid transit cars and the transfer bridges on which the buglers are stationed were decorated in the national colors.

Midwest Association Meeting Scheduled

Plans have been made to hold the midwinter meeting of the Midwest Electric Railway Association at the Robideaux Hotel, St. Joseph, Mo., on Feb. 7 and 8.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Dec. 3-7 — **American Society of Mechanical Engineers, 49th annual meeting, 29 West 39th St., New York, N. Y.**

Dec. 7 — **Metropolitan Section, American Electric Railway Association and Metropolitan Section, Society of Automotive Engineers, joint meeting, 33 W. 39th St., New York, N. Y.**

Dec. 10-12 — **National Highway Traffic Association, annual meeting, Automobile Club of America, New York, N. Y.**

Jan. 14-18, 1929—**American Road Builders' Association, convention and road show, Cleveland, Ohio.**

Jan. 22—**New York Electric Railway Association, mid-winter meeting and dinner, Hotel Commodore, New York, N. Y.**

Jan. 23-25—**Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.**

Jan. 24-25—**Central Electric Railway Association, Claypool Hotel, Indianapolis, Ind.**

Jan. 25-26—**Central Electric Railway Accountants' Association, Claypool Hotel, Indianapolis, Ind.**

Jan. 28-Feb. 1—**American Institute of Electrical Engineers, annual convention, 33 W. 39th St., New York, N. Y.**

Feb. 7-8—**Midwest Electric Railway Association, Midwinter meeting, Robideaux Hotel, St. Joseph, Mo.**

Feb. 14—**Central Electric Railway Master Mechanics' Association, Youngstown, Ohio.**

Sept. 28-Oct. 4—**American Electric Railway Association, 48th annual convention, New Public Auditorium, Atlantic City, N. J.**

Engineering Executive Committee Meets in New York

Completion of the personnel of all standing and special committees of the American Electric Railway Engineering Association, with the exception of one or two committees in the Purchases and Stores Division, which are expected to be completed in the near future, was announced by President F. H. Miller at a meeting of the Engineering executive committee held at association headquarters in New York on Nov. 22.

Progress in the work of the committee on revision of committee rules was reported by W. W. Wysor. The secretary reported approval by letters ballot of the following committee reports: way and structures—committee No. 4, track ballast and drainage; committee No. 5, wood preservation; committee No. 6, arc welding; committee No. 7, alloy steels for special trackwork; power—committee No. 5, catenary specifications; committee No. 7, radio interference; committee No. 12, ferrous versus non-ferrous materials for overhead lines; rolling stock— committee No. 1, engineering manual; committee No. 5, bearings; committee No. 6, lubrication; committee No. 9, noise reduction. In addition to these, the reports of way and structures committee No. 11 on track construction, No. 14 on rail markings, and No. 16 on special trackwork foundations, were approved at this meeting of the executive committee. The reports of way and structures committee No. 2 on special trackwork and No. 8 on track pavement were referred back to these special committees.

Time limits for the completion of all special and standing committee reports were established. Progress in co-ordinating the work of the several associations engaged in the study of the various phases of heavy electric traction was reported. A recommendation by the committee of judges in the ELECTRIC RAILWAY JOURNAL Maintenance Contest, that the annual company award, the individual capital prize and the departmental certificates of merit be made a part of the general engineering sessions at the convention was approved. P. V. C. See was appointed to represent the association in a proposed conference on a uniform motor bus specification code. A report was made that negotiations are still under way for a conference with representatives of the National Machine Tool Builders' Association looking to a study of the economies to be obtained by application of modern shop machinery in the electric railway industry.

Those in attendance at the meeting included President F. H. Miller, presiding; F. McVittie, C. H. Jones, P. V. C. See, W. W. Wysor, H. H. George, E. M. T. Ryder, H. F. Brown, A. T. Clark, C. R. Harte, Charles Gordon, C. L. Van Auken, A. W. Baker and G. C. Hecker. President J. P. Barnes of the American Association visited the meeting for a brief period to explain proposed changes in the convention program designed to facilitate the work of the affiliated associations.

Detailed Traffic Survey Planned

Executive committee of Philadelphia Chamber of Commerce endorses suggestion of Mitten Management to go thoroughly into matter

MITTEN MANAGEMENT'S offer to make a detailed survey of traffic conditions in Philadelphia and to prepare a complete city traffic plan, was accepted on Nov. 27 by the executive committee of the Philadelphia Chamber of Commerce. The offer of the management, which operates the Philadelphia Rapid Transit Company, to undertake a study of local conditions was made several days earlier by Joseph A. Queeney, vice-president of Mitten Management in charge of operation.

Need for treatment of this kind for the traffic problem has long been felt in Philadelphia and there have been periodic agitations for a comprehensive engineering survey of street conditions and requirements throughout the metropolitan area. Mr. Queeney, in presenting the plan of Mitten Management to the executive committee of the Chamber of Commerce, pointed out that his organization has had fifteen years of experience in giving transportation service over the city streets and that no group of engineers could come into Philadelphia and secure the facts or acquire the knowledge possessed by the transportation management, without long and intensive study.

It was proposed that this wealth of information be gathered together, supplemented by studies of the immediate conditions, shaped into a practical plan and subjected to the comment and criticism of every individual or organization that may be in the slightest way affected.

The plan will embrace city-wide traffic control, including the operation of all public vehicles; a parking plan; a scientific signal light system; the construction of new streets or the widening of others if found necessary and practical; the elimination of grade crossings; the study of accidents; and everything else that in any way involves the right of the citizens to obtain the safest and most convenient use of the streets. Among other things Mr. Queeney said:

Our plans have been developed to the point where we now need the co-operation of the business men of our city. We want, for example, to have several merchants conduct checks at their stores and places of business, so as to develop just how their customers reach their places of business. Do they come by private automobile, leaving their cars parked at the curb, or do they park in some nearby garage; or do they come by subway, surface car, bus, or taxicab, or do they walk? Once these facts are determined to the satisfaction of the merchants, we will have no difficulty in deciding whether it is necessary to have our valuable street space occupied by parked cars. If it is true that parking cars on our public streets is necessary, or desirable, then we will provide for such parking in our plans of traffic control.

When this plan of ours is completed we suggest that you call in the representatives of every interest affected, and let them measure it by their own problem. That goes for the motorist organizations, the trucking companies, the steam railroads, the city highway department, the utilities which have conduits in the city streets, the merchants, the manufacturers, etc. Traffic relief means so much to all of these people that a comprehensive plan, satisfactory to all, should quickly be arrived at as a substitute for the chaos existing today. Then, with your endorsement (the endorsement of the executive committee of the Chamber of Commerce) the plan will be submitted to the Mayor's traffic commission.

At the time that the Chamber of Commerce group approved the suggested plan of Mitten Management, it also recommended that members of the City Council should investigate traffic conditions in other cities at first hand. The resolution approved by the committee was as follows:

The traffic committee of the Philadelphia Chamber of Commerce has repeatedly urged that a comprehensive survey of the traffic conditions in Philadelphia should be made by an independent traffic expert, to be employed by the city. However, as the city has failed to provide the funds to employ such an expert, we approve the offer on the part of Mitten Management, Inc., to make a survey and, when completed, will give it careful attention."

Denver Employees Pay Election Bets

SOME of the employees of the Denver Tramway, Denver, Col., who voted for Governor Al Smith, were forced to wait until the first snow storm to pay their losing bets. Accordingly, on Nov. 17, attired in straw hats and with corn cob pipes in their mouths, they straddled broom sticks and raced down Sixteenth Street waving banners which explained what it was all about. They insisted that "We are still for Al."

Would Restrict Parking in Chicago

In an effort to speed up traffic during morning and evening rush hours an ordinance has been drawn for presentation to the City Council of Chicago which would restrict parking to only one side of the street on all thoroughfares where there are street car lines. In the morning peak period, parking would not be permitted on the right side of the street carrying city-bound traffic; and in the evening parking would be prohibited on the right side of streets bearing outbound traffic. The ordinance would apply only to those streets having car lines.

City traffic experts agree with Alderman A. K. Mose, who is sponsoring the measure, that the ordinance would be a great benefit to the many thousands of downtown workers who use the trolleys in traveling to and from their homes. They also point out that neighborhood stores are often closed during the morning rush hours and that they do little business during the homeward rush at night. Alderman Mose believes that the ordinance would not only speed up street traffic but would materially decrease the number of accidents.

Developments in Cuyahoga Subway Project

The mysterious Cuyahoga Subway Company, which is seeking franchise rights in Cleveland, Ohio, has placed in circulation a new set of petitions for an initiated ordinance, revealing some of the details of the company's plans which heretofore have been carefully guarded. The company is asking a 50-year franchise for the operation of underground, surface or elevated lines on practically every main thoroughfare in the city.

Sponsors of the franchise said that every conceivable route was described in the proposed ordinance, with the idea of allowing the City Council ample room for selection.

No announcement was made as to the amount of money the company is prepared to spend. Banking connections are not known and, with the exception of M. F. Bramley, wealthy paving contractor and amusement park owner, identity of the officers of the company has not been disclosed.

The supposition that the Bramley project is apparently to be hooked up in some way with the Pennsylvania Railroad is backed by the stipulation in the grant that the first route is to be built in Superior Avenue, East Fourteenth Street and a point 1,000 ft. west of the Pennsylvania Railroad bridge, near Superior and East 40th Street. The ordinance also states that the Superior subway is to be the only one having four tracks. All other routes are limited to two. The ordinance provides:

Fare definitely fixed at 10 cents within the city for the first ten years, after which either the city or company could appeal to a board of arbitration or the Ohio Public Utilities Commission.

Free transfers.

Excise tax to be paid annually to the city after 1940, based on ten per cent of the gross passenger revenue less taxes.

Construction to start one year from effective date of the ordinance.

Overhead construction to require the approval of the director of public service. In streets now occupied by Cleveland Railway Company tracks, the approval of the railway also to be required.

Superior route and 4 miles additional of routes to be in operation within three years after construction starts.

Trains to be operated over not less than 5 miles additional of routes in each succeeding four-year period.

Failure to provide service within time limits to give Council the right to revoke franchises on routes not started, "but the company shall have the right to maintain and operate the then existing routes during the life of the grant."

Subway commissioner to be appointed by the city manager.

Proposed New York Legislation To Affect Transit Board

Bills to reorganize the New York Transit Commission to make it really a division of the Public Service Department will be introduced at the next session of the Legislature under Democratic auspices. The proposed legislation will reserve to the Transit Commission, now legal and then to be actually the metropolitan division of the Public Service Department, only the regulation of capitalization, rates, service, equipment and operation of common carriers within New York City, except baggage and express companies.

It will transfer to the City Board of Transportation, according to the terms now proposed, elimination of grade crossings within New York City, the carrying out of the proposed plan of unification or readjustment of the city's transit lines, which has been prepared by the present Transit Commission and Samuel Untermyer, its special counsel, and the administration of the dual contracts with the Brooklyn-Manhattan Transit Company and the Interborough Rapid Transit Company.

The city administration also will have a transit legislative program, and the bill to create a Transit Authority to carry out the readjustment plan also will be introduced again.

New Rapid Transit Line in New Jersey Will Need 11-Cent Fare

An average fare of 11 cents will pay operating charges and retire construction costs on the proposed Newark-Paterson-Hackensack rapid transit line, according to an announcement made by the North Jersey Transit Commission Nov. 27, following the compilation of operating costs details by the commission's engineers. The average fare necessary to make the line self-sustaining at the end of the fifth year of operation is estimated at slightly more than 7½ cents. It is estimated that traffic will total 25,000,000 passengers for the first year of operation, which it is said could be 1933, and will have increased to 50,000,000 passengers at the end of the fifth year of operation.

Ten-Cent Cash Fare in Baltimore

The United Railways & Electric Company, Baltimore, Md., has been granted a fare increase by the Maryland Public Service Commission to 8¼ cents, when tickets or tokens are purchased, with 10 cents for single cash fares. The new rates became effective on Dec. 1 and are an increase from 9 cents cash or three tokens for 25 cents. Officials of the United sought a flat 10-cent fare but this has been denied. Whether the company will again take the case into the courts in an effort to obtain the straight 10-cent fare has not been determined.

This latest action by the Public Service Commission was a result of a ruling by the courts, which remanded the case for further consideration. In fixing the rate of fare the court ruled that the commission should have based its depreciation allowance on present value instead of cost of depreciable property.

Discussion Goes on in Chicago

Elevated, surface lines and city's opinions aired on rate of return. Will consider legislation for a fixed return

ALTHOUGH much progress has been made in recent weeks toward arriving at an agreement on the proposed unification ordinances and new franchises, representatives of the Chicago elevated and surface lines and members of the City Council local transportation sub-committee are still far apart on the question of how much the rate of return to the new company should be. At a joint discussion held on Nov. 26, the companies insisted upon their original proposition of a return of 6½ per cent on the initial capital invested plus one mill per revenue passenger carried, while the committee proposes to allow only a 5½ per cent return plus the compensation feature. A compromise figure of 6 per cent on initial capital value, with all new money to go in at cost (estimated at 5½ per cent) plus the one mill per revenue passenger, was suggested by City Engineer R. F. Kelker, Jr., but it was received by the company representative without comment.

Leonard A. Busby, president of the Chicago City Railway, declared that he could see no reason for modifying the original proposal, considering the fact that the courts and utility commissions have granted to utilities rates of return higher than 7 per cent.

Rate of Return an Issue

It is the city's contention, however, that the 6½ per cent return asked by the companies plus the compensation feature is about 2 per cent more than they have obtained in the last twenty years. "On the capital account the surface lines have earned an average of about 6.2 per cent for the period, and the elevated lines much less," asserted Mr. Kelker. "As an average they have earned about 5 per cent, while now they ask a total of nearly 7 per cent.

The city engineer questioned the logic of allowing a return of 7 per cent on new capital when the money would cost probably only 5 or 5½ per cent. In addition to agreeing to a return of 5½ per cent on all money now invested, plus one mill per passenger, the city proposes to pay the entire cost of new capital.

Mr. Kelker further pointed out that the companies seek the privilege through the local commission of changing the fares to meet the rate of return. "This means a perpetual franchise under the guise of an intermediate period," he explained. He met the companies' objection to a fixed rate of return by asserting that the 1907 surface lines ordinance provided for a fixed rate, as did also the 1918 and 1925 ordinances.

The companies and the Aldermen were also in disagreement as to whether interest shall be paid upon the city's $53,000,000 traction fund if it is invested in the bands of the new unified company. In support of their contention that such an investment should draw no interest, attorneys for the companies point out that the fund was created by the car riders under the 1907 ordinance and if interest is to be paid the car riders will be paying for the use of their own money. The city, on the other hand, maintains that the interest should be paid, insisting that if it is not the stockholders will be receiving free use of the money. In addition, the city argues, whatever interest is earned will be used for the benefit of the car riders in the construction of subways, extensions or the reduction of fares.

Instead of investing the traction fund in bonds of the new company, P. J. Lucey, attorney for the Chicago Rapid Transit Line, suggested that it be used for the construction of downtown subways, pointing out that unless additional terminal facilities are provided in the Loop district, the entire traction settlement plan will be worthless. Mr. Kelker took the position, however, that it would be futile to build subways until the elevated lines have entered into a contract to use them.

Members of the sub-committee decided to hold a special meeting to determine whether they will try to obtain legislation authorizing a contract ordinance with a fixed rate of return. Attorney Lucey contended that no such contract legally could be made.

Agitation of Rapid Transit in Detroit

At the spring election the Detroit Rapid Transit Commission will submit to voters a plan for a four-line subway system costing $280,000,000. Mayor John C. Lodge has also declared steps to oust the Detroit Motor Bus Company from streets will be taken after holidays, the city taking over the lines. The Rapid Transit Commission asked to plan downtown subway dips for trolleys, available later, as part of the subway system. This plan would be submitted as alternative to the subway system.

Payment for Suggestions in Fort Wayne

Suggestions are being sought from all employees of the Indiana Service Corporation, Fort Wayne, Ind., which would improve the workings of any department of the company. They are to be written out, identified by number only and dropped into a suggestion box. Awards will be made to all except heads of departments. The committee, including Robert M. Feustel, president, will judge the submitted suggestions and determine the awards to be made.

Survey in San Francisco

City experts to complete by Jan. 1 presentation upon which it plans to base Market Street purchase

THE recent campaign in San Francisco in which the question of granting an indeterminate permit to the Market Street Railway was an issue was one of the most stoutly contended in San Francisco for a long time. Proponents painted a gloomy picture of chaotic transportation conditions should the measure be defeated. To offset any alarm that may have been caused by the discussion, Samuel Kahn, president of the Market Street Railway, has issued this statement:

We will continue to do our best to serve San Francisco even though we are somewhat handicapped.

Further than that he declined to discuss the company's plans.

In reviewing the defeat of the measure Major Charles H. Kendrick, chairman of the Citizens' Committee against amendment 24, urges the establishment of an understanding between the Market Street Railway and the city government. He is quoted as follows:

Now that the campaign is over, city officials should reach an understanding with the railway looking toward a solution of the transportation problem that faces San Francisco. The Market Street Railway deserves a fair deal from the city and an adjustment of the difficulties between it and the city should be arrived at with the thought uppermost of a square deal for all concerned.

Supervisor Havenner, chairman of the finance committee of the board and one of the leaders in the fight against the measure, said:

There is being made by the force of City Attorney O'Shaughnessy a survey and valuation of such properties of the Market Street Railway as will be of utility to the city in its ownership of the entire street car system within its limits. This survey should be completed by the first of the year.

Meantime the Public Utilities Committee of the board is considering the situation with relation to the action the city shall take when this valuation is before it. Just what plan will be decided upon has not been determined. I have no authority to speak for the committee, but I believe that, as the problem seems to be one of finance, the voters will be asked to approve a bond issue enabling the city to purchase the privately owned street car systems.

Another solution would be to make arrangements to purchases the properties on the pay-as-you-go plan. This, should it prove acceptable to the owners, probably would mean the paying of a higher price than were the purchase outright.

Should no plan be arrived at when the franchises begin to expire, I feel certain that the companies would be willing to continue operation on a sufferance agreement until such time as is necessary. This arrangement also would be in effect, I believe, in case a bond issue were defeated, and the pay-as-you-go plan should not meet approval.

The Supervisors have been accused in the campaign just ended of neglecting their duty in the railway situation. I feel that such accusation was unjustified. The bond issue of first consideration was that providing for the purchase of Spring Valley. At that election it was deemed inadvisable to place another major issue on the ballot, and it was deemed inadvisable to place it on the ballot at the election just ended. This would have been the case had there been a purchase price agreement.

I believe the survey and valuation of the railway properties now under way will establish a reasonable price for the California Street Cable Railway and also for the Market Street line. I see no cause for any alarm in the situation.

Seattle Moves Toward Settlement

Every possible economy being put into effect on municipal railway pending the development of a real program. Leasing of the railway for private operation being advocated

AT LEAST two far-reaching rival programs for the solution of Seattle's involved transportation problem probably will be submitted to a vote of the people next March, unless the combined ingenuity of the City Council, Mayor Frank Edwards and George B. Avery, superintendent of city utilities, with the aid of leading citizens, is able meantime to cope with the situation with facilities already at hand.

One of the proposed plans involves public refinancing with a bond issue for the rehabilitation of the railway and its reorganization and development along modern rapid transit lines.

The other plan advocates the leasing of the railway and the granting of an exclusive long-term taxicab franchise to go with the lease to private operators who will merge the two services into one transportation system. An arrangement of this kind is now being sought by private capital, represented by Karl H. Kaye, whose proposal is being considered by the Mayor and Council.

Under the refinancing and bonding plan, it is stated, a program designed to anticipate Seattle's development for many years would be outlined, with a view to speeding service to and from the downtown district by the aid of elevated tracks, subways and other innovations. It would provide for lighter, more comfortable cars, lower operating and maintenance costs and further economies by cutting out unprofitable car routes and bus lines, city officials declare.

The leasing plan would contemplate the payment of the present railway debt, rebuilding of many of the present car lines, equipment of the system with new cars, and extension and improvement of service for the city as a whole at private expense. Further proposals are expected shortly from Mr. Kaye, applicant for the street railway system lease and taxicab franchise. Mr. Kaye said:

Acceptance of our proposal will mean the rapid rehabilitation of the entire railway system, at private expense, so that it will give the adequate and efficient service demanded of it, and without which the growth and progress of Seattle is being retarded. It will remove, probably for all time, danger of laws being so amended that resort may be made to a general property tax to support the operation of the municipal railway, and it would accomplish this without the sacrifice of the municipal ownership principle, for the city would still own and control the system under our plan.

We have asked for a taxicab franchise along with the railway lease, because the railway cannot be made profitable without control of the taxicab competition and because taxicab service profits are needed to compensate for losses on parts of the present system, and on new extensions that may be necessary in different sections of the city.

In the meantime G. B. Avery has been proceeding with the overhaul of the municipal railway. This involves sharp reductions in personnel and extensive rerouting of car lines designed to effect an annual saving of $350,000 in operating costs. Initial steps taken involved the release of three veteran subordinate officials: Edward E. Mitchell, supervisor of traffic; S. E. Goodwin, supervisor of power; and Robert Nesbitt, assistant supervisor of power. Other dismissals, including at least seven of the fourteen railway inspectors, are expected to follow. Before starting his reorganization program, Mr. Avery took the precaution to assure himself of Mayor Edwards' backing and of a policy of non-interference on the part of the City Council utilities committee.

Establishment of a new uptown street car loop around one block, perhaps two blocks, near the center of the retail district, with transfer points at all corners; curtailment of left-hand street car turns, and use of more one-man cars are other probable developments of the near future. Adoption of these features would effect greater economy and speedier service in the railway department and bring about relief for the growing congestion of traffic in general through the downtown business district, it is declared. Parking of automobiles probably would be forbidden in the blocks forming the new loop, but through automobile traffic would be speeded on all four streets, with street car patrons protected by a well-guarded safety zone extending completely around the loop.

Another feature being considered is the resumption of the skip-stop system abandoned during the administration of former Mayor Bertha K. Landes. More split routes and shorter runs are also favored. A return to the skip-stop system would reduce by nearly one-half the street car stops in the more thickly settled residence districts, it is declared, allowing traffic to move along with correspondingly less interruption, and would be a move toward relieving motor traffic, which is becoming increasingly

Digitized by Google

congested and exceedingly complicated.

In the meantime, Seattle taxicab men have been granted a respite in a projected campaign by the city utilities department to compel the use of taximeters on all taxicabs, in place of zone systems and special rate plans under which many of them are operating. This announcement is in harmony with the decision of the City Council franchise committee to hold in abeyance rival negotiations of Sam V. Taggart for an exclusive taxicab service franchise, for the same reason.

While the various problems are being considered, the residents of Beacon Hill must also wait for their proposed extension from the present terminus at Spokane Street and Beacon Avenue to Beacon Avenue and Columbian Way, although the petitioners have presented to the utilities committee a written guarantee to make up to the city any discount which might be exacted on street railway bonds necessary to finance such an extension.

Claims Executive Committee Meets

For the purpose of discussing arrangements for the 1929 convention the Claims executive committee met at association headquarters on Nov. 21, with President L. F. Wynne in the chair. Decision was made to designate the special committee which had been appointed to study Mr. Kubu's suggestion as the "committee on uniform negligence law." It was tentatively agreed that the Claims Association meet at 2 o'clock on Monday afternoon of convention week; that an informal luncheon be held either Tuesday or Wednesday, depending upon which day was reserved to inspection of exhibits, and that final session be held at 2 p.m. Thursday.

The sub-committee on subjects reported no progress, but was instructed to include among its scheduled papers one on the advantage of attendance of claims adjusters at the convention on account of the value of personal contacts made there. A sub-committee reported that copy for the Proceedings had been edited and passed for publication. The committee will meet again Jan. 24-25 at Indianapolis, upon the occasion of the mid-winter meeting of the C.E.R.A. Those present were L. F. Wynne, president; C. A. Redfern, J. W. Giltner, Seth Baldwin, W. E. Robinson, Trevor Nielson, W. F. Weh, W. A. Foley and Wallace Muir.

New Franchise Ordinance in Bluefield Proposed

A proposed ordinance which would give to the Tri-City Traction Company a new franchise and declare null and void three other grants now held by the company in Bluefield, W. Va., has been submitted to the board of directors. It was explained that one of the three franchises held by the company expires in 1933. The purpose is to enact a blanket franchise covering all the lines that will materially benefit the company.

Safe Operation Rewarded in Illinois

Fifteen motormen and bus operators of the Champaign-Urbana railway and bus line division of the Illinois Power & Light Corporation recently received bonuses of $5 each for completing 270 hours operation without accident of any nature.

The Copper Country Sticks to Its Street Cars

In the copper country of Michigan, where the snow piles high in the winter, making walking anything but a pleasure, citizens are not inclined to think lightly of the service provided by street cars, says the Duluth (Minn.) *Herald,* in commenting on the fact that every city in the district has voted to renew a franchise to the Houghton County Traction Company permitting it to operate on a 30-year writ. Here is the account from the *Herald:*

An attempt has been made for the last three years to keep state highways open to wheeled traffic in the winter season and remarkable success has been attained. There are times, however, when all the snow-fighting equipment in the Upper Peninsula would be unable to keep the highways between Copper country towns open.

When a 40-mile wind sweeps out of the Northwest, carrying snow so thick it blocks visibility like a heavy fog, the snow piles up faster than it can be moved aside. Five minutes after a tractor plow snorts its way through drifts to open a lane the road is blocked again. In cases of this kind Copper country people have one way of getting around their country and that is by street car. Street cars in the Copper country run constantly and are ready for all kinds of weather.

In the depression which swept this district a few years ago when thousands moved to other industrial centers of the Middle West the business slumped and the Houghton County Traction Company went into the hands of a receiver. Conditions are on the uptrend again and business is picking up with the carrier. The enthusiastic approval given at the polls recently instills new ambition and confidence in the firm.

Fact-Finding Committee for Omaha Bridge Proposal

Mayor Dahlman of Omaha and Mayor Greene of Council Bluffs have named committees of business men to meet with President Shannahan, of the Omaha & Council Bluffs Street Railway, for the purpose of determining what is a fair price for the bridge across the Missouri River. The bondholders have told Mr. Shannahan that they are prepared to sacrifice private ownership of the bridge for the public good, but that in return they expect a fair price.

The joint committee is first instructed to inquire as to the price and conditions upon which the present bridge can be purchased, as well as the terms by which the railway lease upon it can be bought; to collect information as to the cost and present purchase value of the bridge, together with information as to cost of maintenance and operation. It is also to find out what revenues may properly be expected after purchase, and from what source. It is also to determine the kind and cost of a bridge between the two communities, if it develops that a new one must be erected to serve as a free bridge.

The Omaha newspapers are backing the proposal for purchase of the old bridge, and say the people are willing to pay a sum slightly more than a new bridge would cost, but that the people are not buying an investment, hence the present owners should not take any possible profits into consideration. Mr. Shannahan is said not to anticipate any particular trouble in getting an agreement as to that price when all the facts are made known.

Christmas for Atlanta's Children

Youngsters of the Georgia Power Company, Atlanta, Ga., will receive a Christmas present through *Snap Shots,* the official paper of the company, if they are under twelve years old and write a letter telling Santa what their happiest Christmas was. Pictures of the letter writers are being solicited by *Snap Shots* for early publication.

Placing the Burden Where It Belongs

Richard Palmer, a student in the law school of Denver University, has been awarded first prize in a national contest conducted by the Phi Delta Phi legal fraternity, for his essay, "Stop, Look, Listen." Among the salient points of that essay are:

There was a time when liability for grade crossing accidents rested almost entirely on the railroads, and the courts imposed heavy damages on them when a train struck a carriage or one of the early one-lunged "gas buggies." With the development of the automobile it became apparent that arbitrarily to blame the railroad was not just. Gradually the judicial view of such accidents has changed and the trend of recent decisions is to hold the motorist accountable for his own mishap.

In developing this view, the courts have taken account of the difficulty of stopping trains quickly and of the fact that motorists now approach grade crossing with full knowledge that they should "Stop, Look, Listen."

Half Fare Plan for Worcester Children Abandoned

Although officials of the Worcester Consolidated Street Railway, Worcester, Mass., at one time considered adopting a half-fare strip ticket for children during the vacation months similar to that tried in Springfield, Mass., the past summer, it was decided that the children's transportation problem at Worcester in the summer was not comparable to that in the sister city. Between 70,000 and 80,000 tickets were sold to children during the summer in Springfield, but officials there are not yet certain if the plan has been a financial success.

Recent Bus Developments

De Luxe Service Proposed in Jacksonville

Permission is to be sought by the Jacksonville Traction Company, Jacksonville, Fla., to operate a de luxe express bus service from Murray Hill and Avondale, into the downtown district. A petition detailing how the company will operate the buses is now being prepared and will be sent to the Council.

Four new buses, the very latest in the city type, will be purchased immediately after Council authorizes the operation of such service.

As indicated in a recent issue of ELECTRIC RAILWAY JOURNAL, negotiations between the city and the company looking toward a new franchise are expected to be resumed shortly.

The bus fare will be 10 cents cash. Transfers will be issued to the car lines, and passengers paying the 10-cent cash street car fare will be transferred to the bus line. Murray Hill passengers who desire to use the reduced rate of 7 cents or the weekly pass will be transferred to and from the Murray Hill car line at the Murray Hill terminal. The buses now used as a feeder to the present end of the Murray Hill car line will be withdrawn.

The buses will operate express between Park and King Streets and the downtown section, with stops only at Five Points, the union depot and Broad and Adams Streets. The downtown terminus would be at Forsyth and Laura Streets. The buses would run "local" beyond King and Park Streets.

The buses will operate every twenty minutes, from 6 a.m., until 10 a.m., and from 4 p.m., until 9 p.m., and every 30 minutes from 10 a.m., until 4 p.m., and from 9 p.m., until 1 a.m., except on Saturday and Sunday. A regular twenty-minute schedule will be maintained all day on Saturday, from 6 a.m., until 1 a.m. A 30-minute schedule will be maintained on Sunday, from 7 a.m., until 8 p.m., and an hourly schedule, from 8 p.m., until 1 a.m.

Canton-Youngstown Rights Sought

Petitions and protests are keeping the Ohio Public Utilities Commission busy these days since the Youngstown & Suburban Transportation Company abandoned part of its bus route between Canton and Youngstown on Nov. 1.

It was with permission of the state board that the Youngstown & Suburban withdrew its buses between Canton and Salem, a run of 33 miles, and joined the Stark Electric Railroad in furnishing double service over this line. At Salem, cars which leave Canton on the hour connect with Youngstown & Suburban buses for Youngstown. Formerly, there was only two-hour service between Salem and Canton.

Hardly had the buses stopped running before the Warren-Salem Coach Line and the Salem-Akron Transit Company applied to operate over part of the abandoned line. These petitions were followed by the Michele Transportation Company asking a permit to operate between Youngstown and Canton.

Both the Stark Electric and the Youngstown & Suburban lines are protesting the issuance of new certificates. No definite action has yet been taken by the state board on any of the petitions or protests.

Taxes and Insurance Matters of Moment in Iowa

Attorneys for Iowa bus lines, which have been waging a long legal battle against the ton-mile tax recently upheld by the Iowa Supreme Court have filed a petition for a rehearing, which is scheduled for Dec. 12. The high court ruled on Sept. 28 that Judge W. G. Bonner, of the Polk County District Court, was right in his decision that the law does not discriminate against the motor carriers with fixed terminals and routes.

The petition attacks the constitutionality of the law. It raises the question of whether the measure does not discriminate between motor carriers by turning over the highways to one class of users for profit, with immunity from taxation, while denying the same immunity to others using similar types of vehicles. It is contended by the petitioners that, unless the court can find an actual distinction in the "wear and tear" on the Iowa highways, the motor carriers operating between fixed terminals should not be charged a ton-mile tax, while other motor carriers, operating for profit without definite routings, are allowed to use the roads free of tax.

Indications are that the Legislature will take up the whole question again at the coming session in an attempt to levy a general tax on all privately owned buses and trucks operating over the highways for profit. The amount of back taxes involved in the court proceeding is $66,000. Approximately $52,000 of this sum is assessed against Mrs. Helen Schultz Brewer, head of the Red Ball Transportation Company of Mason City, long known as the "Iowa Bus Queen."

Another matter, which is likely to go before the Iowa legislature at Des Moines this winter, is a request to change the motor vehicle law, so as to define more clearly the liability of insurance companies writing liability insurance bonds on the motor carriers which come under the provisions of the law. This question was brought to the attention of motor vehicle owners and insurance men of Iowa recently, when the Black Hawk County District Court interpreted the motor vehicle law as assuming unlimited liability on the part of insurance companies, in cases where riders on passenger buses are injured.

This interpretation, it was pointed out, would make the insurance companies writing the bonds, responsible for any amount of damages which a jury might see fit to award in a personal damage case against a bus transportation concern. For a time, the companies holding the major portion of the bonds on Iowa's motor carrier companies threatened cancellation of the policies. W. A. Lawrenson, state agent for the Underwriters Service Company, declared no company could afford to take the added risk at the amount of the present premium. However, after consideration, it was decided to leave the situation in *status quo* and await possible action by the Legislature or the appeal of a case to the Iowa Supreme Court. The insurance companies can still cancel upon ten days' notice, it was said.

Failure of the Iowa bus companies to get bonds would automatically put a stop to motor vehicle transportation of passengers, as filing of a bond is a prerequisite to operation in this state.

Proposal of Knoxville Company Still Pending

The City Council of Knoxville, Tenn., will oppose before the Railroad & Public Utilities Commission any petition filed by Knoxville Power & Light Company to increase its token fare charge from 6 to 7 cents.

Agreement to this effect was reached in an adjourned session of the Council held to consider the most recent proposal of the company relative to instituting bus service in areas not now served by railway lines and the relinquishing of its private right-of-way in Kingston Pike west of the Louisville & Nashville Railroad overpass.

To represent the Council in any proceedings the Power & Light Company may bring for the purpose of increasing its present token fare. Mayor James A. Fowler has appointed Messrs. Wright, Monday and Fretz.

Schenectady to Scotia by Bus

Abandonment of the electric railway to Scotia, N. Y., from Schenectady is expected to bring about a bus service to the village, application for which has already been filed with the Scotia Village Board by the Schenectady Railway Bus Lines, Inc., a subsidiary company of the Schenectady Railway. A similar application has been filed with the Schenectady Common Council, asking the city's permission to operate the bus service to Scotia from the railway's waiting room on State Street and from the General Electric Company terminal.

Bus Service to Replace Detroit's Jitney's

General Manager Del A. Smith has proposed a system that makes faster time, he claims, and will be cleaner, more comfortable and more dependable than the old jitneys

NINE routes have been designated by the Detroit Department of Street Railways to be traversed by the new de luxe motor coaches which the department has ordered to replace the jitneys, ruled off the streets under the recent decision of the Michigan Supreme Court. It is the intention of the Department of Street Railways to have 160 sixteen-passenger de luxe buses in operation by Dec. 15.

Four of the lines planned will replace the former jitney lines while others will run into new territory not previously served by jitneys. The lines first mentioned will be operated on or parallel to Woodward, Grand River, Jefferson Avenues and Fort Street. Two of these lines the general manager expects will be in complete operation by Dec. 1.

Eighteen of the new coaches have arrived and were placed in operation on Woodward Avenue line on Nov. 25. The fare announced is comparable to that of the former jitneys: 10 cents from downtown to Webb Avenue; 15 cents from downtown to Highland Park; and 20 cents from downtown to the Six Mile Road.

The Woodward Avenue line will extend from Palmer Woods, its outer terminus, to downtown, operating part of the way over Cass and Second Avenues. The Jefferson Avenue and Fort Street lines will operate over those thoroughfares. The outer extremity of the Jefferson line will be at Wayburn Avenue and of the Fort Street line at Woodmere Cemetery.

The Grand River Avenue line will run for a part of the distance over Ash Street, West Grand Boulevard, Milford, Beechwood and Woodside Avenues, hitting Grand River Avenue at a point south of Livernois Avenue. This will increase the distance by ¾ mile, but it is believed that better time will be possible because of the lighter traffic to be encountered.

The other routes planned have not been served by jitneys. They will include the following lines: out Grand River Avenue to Linwood Avenue, following Linwood Avenue to the Six Mile Road; out Brush Street and Oakland Avenue to the Eight Mile Rd.; from Gratiot Avenue and the Seven Mile Road to Gratiot and East Grand Boulevard, thence downtown via the Boulevard, Verner Highway, McDougall Avenue and Macomb Street; out Lafayette Avenue east, Van Dyke Avenue and Warren Avenue; out Congress Street, Mt. Elliott and Mack Avenues.

The line to operate from the downtown section out Porter Street and across the new Ambassador bridge to Windsor, Ontario, will not be started immediately over any part of the route but will depend upon the date of completion of the new international bridge.

While the Department of Street Railways is proceeding with the purchase of new buses and street cars to care for all the traffic handled by the jitneys, some of the downtown merchants advocate that the jitneys be permitted to return to the streets to operate on a day-to-day agreement. Edward N. Barnard, attorney for the jitney organizations, has submitted to the City Council the following propositions:

1. That the jitneys operate as they did in the past under a day-to-day agreement, the city having power to put them off at any time.
2. That the city rent the jitneys for 12 cents a mile, providing the city agrees to pay for a minimum of 100 miles a day of operation.
3. That the jitneys operate under any other plan the city proposes.

The Council is to hold a hearing within the next few days to consider Mr. Barnard's proposal.

An Observer's Idea of the Situation

The personal opinion of an observer in Detroit is that the way the city put the jitneys out of business as soon as it had authority is the best and most creditable thing it has done for a long time. Of course, there have been many protests, but a good many of them appear to have been inspired by the former jitney operators. Perhaps the railway department was not as well prepared as it should have been to handle the increased load from the jitney riders, but had there been any temporizing, the jitney men might have, by some hook or crook, sought to continue to operate indefinitely. The best thing was to get rid of them as soon as possible. That is what happened.

So far as the newspapers are concerned there is nothing consistent about their policy and they appear to go from one side of the fence to the other very easily and frequently. Aside from the competitive situation among them, they appear to adhere to the policy of criticizing anything done by the city department when there is half a chance. There now appear to be two other important reasons, other than the withdrawal of the jitneys, for the concern of the downtown stores about the ability of people to do their Christmas shopping. It is intended that stores recently erected by the great mail order houses in outlying sections shall carry the complete catalog items as sold by mail. The policy is to place them at the halfway point, that is far enough downtown so that there will be a considerable urban population beyond the stores. Still the stores are far enough out so that they can have space to park 800 cars at the back of the store building. As a matter of fact, the downtown merchants admit their selfish interest in seeking to make it easy for people to get downtown. They have no figures, no definite information, only a general idea that the demand has greatly increased. If there is any possible way in which the merchants can secure more transportation downtown, they want it, regardless of the difficulty of handling the peak due to a combination of shoppers and workers, regardless of any effect that the added service will have on the financial conditions of the street railway department, and almost regardless of who furnishes the service, except that no one seems to want the Barnard crowd after its six years of fighting the city.

To the mind of the observers on the ground it is not so much the trolley as the Detroit City Administration that deserves criticism. The city has grown so tremendously in recent years that a subway system is sadly needed to handle the heavy transportation downtown. This is out of the question for several years to come, and longer unless the city administration bestirs itself, so the job must be done by cars and buses. In this connection a representative of the Retail Merchants' Association appears to have got at the heart of the difficulty when he said that the nine members of the City Council had been in politics for a number of years and think they are experts on any problem that may come up before them. Instead of taking the advice of experts, the members of the Council are accustomed to use their own small knowledge. Hence, when Dell Smith, manager of the Municipal Railway System, wanted to order several hundred more buses two or three months ago, and put on a de luxe service that would really compete with the jitneys, his suggestions were frowned upon and nothing was done until the jitneys were actually removed. Still the size of the jitney traffic appears to have been over-rated. If the jitneys averaged 80,000 a day, during September and October, they were doing pretty well. But Detroit is booming, the Employers' Association reporting 285,000 men at work on Nov. 1, compared with 200,000 at the similar period last year. The figures cover only the members of the association, but it is said that, by adding 50 per cent, a good picture is presented of the total employment in Detroit.

At first no one could believe that the

Digitized by Google

jitneys would stop operation. For six years they had weathered every legal storm, with the city always winning in court and always being prevented by appeal or other legal maneuvers from capitalizing on its victory. The jitney men had submitted their case to the voters at a city election in the fall of 1926, but their proposal to repeal the regulatory ordinance was defeated by a considerable majority.

Rumors of last-minute jitney coups were abroad. The cars were to be used as taxicabs, or no fares were to be collected, the patrons being permitted to make voluntary contributions. But the city went ahead promptly and decisively. On Friday, Oct. 26, the Supreme Court decision had been recorded and was presented to the Circuit Court, which thereupon dismissed its injunction.

A few of the jitney men threatened to continue running even after the injunction was lifted, but most of them took the order seriously, in fact, very seriously, the announcement of the city authorities that no more tickets would be handed out, but that jitneys violating the ordinance would be seized and towed to the city pound. This action was actually taken by the police authorities in the case of three jitneys operating to one of the suburbs. Their owners defied the ordinance in the belief that it did not cover the suburban operators. The service to the suburbs involves a distinct problem, which is considered later in this article.

At the time the Supreme Court decision was put into effect, about 1,000 jitneys were being operated on the city streets. Only about 500 of these were involved in the six-year legal proceedings. The others were newcomers, usually referred to as "wild cats," that began to appear during June and July of the present year. The general scheme was to follow a route that led into some important downtown point where regular loading points with starters were established. Starters were also maintained at the outlying terminals to control the drivers, establish spacings, and exercise general supervision. Parking space was available at the outlying terminals, but downtown the jitneys would often be making a circuit on nearby streets and waiting their turn to get into the stand and pick up passengers.

Just what caused the influx last summer is difficult to explain. A number of reasons have been advanced by those familiar with the situation. It was known even in the spring that the Supreme Court would hand down its decision in October. Most people believed that it would be in favor of the city. Perhaps this suggested the idea of making hay while the sun was shining. Another factor, possibly, was the increased activity in the automobile factories. These were employing about 40 per cent more than last year, thus greatly increasing the load on all the transportation facilities and suggesting a field for other services, no matter how small or humble.

Now that the forces of law and order reign triumphant, what is going to happen? The way is clear, it appears, for the city to administer the ordinance. While excluding jitneys from certain main thoroughfares, parks and boulevards, this gives the Mayor authority to issue or revoke jitney licenses on the other streets of the city. The Supreme Court decision said that the Mayor had the right to grant or withhold licenses for proper cause. This cause is not defined in the ordinance, which merely makes it discretionary on the part of the Mayor to issue or revoke the licenses. Obviously, he has complete control of the situation. In exercising this control the corporation counsel, the police department and the Department of Street Railways have already been called upon for their advice and consent.

Because they had taken steps to obey the ordinance, thirty jitneys were granted permits early in October. These are still running on Hamilton Avenue, from Library Square downtown to the southern limits of Highland Park. The route parallels to a large extent one of the D.S.R. trolley lines. Under the ordinance not more than one passenger can use the seat beside the driver. Stops to load or unload must be made at the far side of street intersections, and within two feet of the right hand curb. The jitneys are forbidden to cut ahead of "any other driver, motor bus or any vehicle for hire, in order to pick up a passenger when both vehicles are within 100 feet of that passenger."

Once the jitneys were removed, additional service was put on by the Department of Street Railways. It rented 40 trolleys from the Eastern Michigan Trolley System (formerly of the Detroit United Railways) and 24 from the Cleveland Railway. New trolleys are being purchased, but the trouble is that the tracks in the downtown district have almost reached their capacity during rush hours. More transportation is clearly required, with fair consideration given the many riders who honestly believed the jitneys provided the fastest, cheapest and, in many respects, the most comfortable transportation in the city of Detroit.

In enforcing the jitney ordinance the police made no distinction between the city and suburban variety. Before the fateful Oct. 26, 100 or more jitneys were thriving on the cream of shopper and commuter traffic. Like the city jitneys they were depending on parallel bus and car lines to furnish the regular service and to carry the greater part of the traffic.

Financial *and* Corporate

Review of Von Herberg Suit Denied

The United States Supreme Court has denied the Puget Sound Power & Light Company review of a suit against J. G. Von Herberg and the city of Seattle, in which the Circuit Court of Appeals ruled against the company on a jurisdictional point. Mr. Von Herberg, owner of $100,000 in city warrants, sold to pay for operation of the municipal street cars, claimed priority in the gross revenues of the street car system, and the Puget Sound company brought suit to insure its claims for payment from the revenues. In effect, the decision upholds that of the Circuit Court of Appeals at San Francisco, which on Sept. 19 held that the matter was not a proper one for the federal court, but must be tried in state court.

This decision means that Mr. Von Herberg is now free to press his litigation in the Superior Court, and his attorney, Robert P. Oldham, announces that the suit will be pressed to trial at the earliest possible date.

Would Suspend Service in Santa Barbara

The Santa Barbara & Suburban Railway has applied to the Railroad Commission for authority to discontinue operation of its street railway service in the city of Santa Barbara, Cal. The company sets forth in its application that despite the action of the Railroad Commission last January in granting it an increase in fares to 10 cents, with a weekly ticket selling at 25 cents that entitled the holder to ride for an additional 5 cents, the revenues of the lines have been insufficient to warrant their continuance. Two lines in the city of Santa Barbara cover a total mileage of 11.5 miles.

Improvements in Toledo Affairs

Following a gain of $30,000 in revenue in September the Community Traction Company, Toledo, Ohio, increased this to $45,000 gain in October compared with the previous year and kept its record of turning in a surplus from operations every month this year so far. These facts are disclosed in the report submitted by Commissioner E. L. Graumlich to the street railway board of control at its meeting on Nov. 14. October revenue was $324,341 compared with $277,923 for a similar month in 1927. There were 4,173,447 revenue-passengers carried. Operating expenses were $219,680 including $42,796 for maintenance. Taxes were $17,205 and after depreciation, interest, and adjustments for power refund there was a net surplus of $25,249 for the stabilizing fund, bringing the deficit to $1,151,624 and the fund reserve for purpose of fare regulation to $60,625. No downward revision of fare will be possible until this fund reaches a $500,000 level. This is possible in about eighteen months under the present rate of progress.

Digitized by Google

Railway operation produced $265,615 in revenue while the coach operations brought in $57,249. Coach operations now show a slight profit.

The ten months of 1928 show a gain of more than 2,000,000 car riders over a similar period in 1927.

Elimination of independent bus competition, better employment conditions, more economical operation, and relief from sinking fund charges all contributed to the better showing.

New Third Avenue Director

At the annual meeting of the Third Avenue Railway, New York, N. Y., Nathan L. Ottinger was elected a director to take the place of Alexander S. Webb, resigned.

Puget Sound Passes to Engineers Public Service

Charles W. Kellogg, president of the Engineers Public Service Company, states sufficient common stock of Puget Sound Power & Light Company has been deposited or pledged and sufficient preferred stock and proxies are on file with Puget Sound company to effect consummation of plans for acquisition of control of the Puget Sound company by the Engineers Public Service. The deposit period expired on Nov. 16.

Loss by Schenectady Railway on Quarter's Operation

The Schenectady Railway, Schenectady, N. Y., reports to the New York State Public Service Commission for the quarter ended Sept. 30, 1928, net loss of $61,401 after charges, compared with net loss of $36,688 in the corresponding quarter of 1927.

Fewer Passengers in Kansas City

The Kansas City Public Service Company, Kansas City, Mo., reports a loss of 84,694 car fares and 20,643 bus fares for the week ended Nov. 4, compared to the corresponding period last year. The total loss in revenue was $8,027, a decrease of 4.65 per cent. The total decrease reported since Jan. 1 now totals 3.94 per cent for a total of $300,632. Since Jan. 1, 1928, 3,302,067 fewer persons have ridden the street cars and buses than during the first ten months of 1927.

Net Income Lower on Brooklyn City

For the four months' period ended Oct. 31, 1928, passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $3,676,522, as against $3,694,735 for a similar period ended Oct. 31, 1927. Operating expenses and taxes advanced from $3,249,352 to $3,296,095 for this year. After income deductions the net corporate income for the four months' period of this year was $309,684, compared to $351,593 for the four months ended Oct. 31, 1927.

Legal Notes

CALIFORNIA—*Injury to Alighting Passenger by Sudden Start of the Car.*

The act of a conductor, although done while in service, cannot bind the street railway if it does not fall within the scope of his duties. A street car was stopped in front of an approaching railroad train because of a motor truck stalled in front of it. The conductor called "everybody off." At the same time the motorman started the car, and a passenger attempting to alight was injured. It was held that the conductor acted within the scope of his employment, and there was concurrent negligence on the part of the conductor and motorman, which was the approximate cause of the passenger's injury. [Little vs. Los Angeles Ry. Corp., 121 P., 134.]

ILLINOIS—*Right of Elevated Railway to Allow Use of its Tracks to Another Company.*

By virtue of their charter and the assent of the city and abutting property owners, the elevated railroads in Chicago became vested with property rights in their right-of-way as completely as though the grant had been made directly by the state. Consent of the city and abutting owners is not necessary to the validity of an operating agreement by which the company permitted another railroad to use its tracks for passengers and freight traffic, in view of the provisions of the Public Utility Act. Such use did not constitute an additional burden on the streets where no additional obstructions were placed in or over them, and no limitation existed on the number of cars to be run on the track. [Chicago N. S. & M. R. Co. vs. City of Chicago, 163 N.E., 141.]

IOWA—*Motor Vehicle Tax Upheld.*

The 1927 Legislature passed a motor vehicle tax by which commercial vehicles, whether freight or passenger, were taxed one-fourth of 1 cent per ton mile if equipped with pneumatic tires, and one-half of 1 cent per ton mile if equipped with solid tires. The law explained the method of determining the tonnage. The tax was attacked as unreasonable and discriminatory, but was upheld by the Supreme Court of Iowa. [Iowa Motor Vehicle Association vs. Board of R.R. Com., 221 N.W., 365.]

MISSOURI—*Duty of Automobile Passenger To Warn Driver.*

An automobile passenger's negligence in permitting the driver to cross the track ahead of an approaching street car without protest is proper for submission to the jury, though the instructions of the trial court that such a passenger could not recover from the railway if the collision was caused solely by the driver's negligence was held to be erroneous. [Shumate vs. Wells, 9 S.W. (2d), 632.]

MISSOURI—*Skidding of Bus Is Prima Facie Evidence of Negligence.*

When a bus skidded and hit the curb and a passenger was thrown out of her seat and injured, a *prima facie* case of presumptive negligence arose under the *res ipsa loquitur* rule and was aided by the defendent's evidence, so that the case was properly submitted to the jury. It would be most unfortunate, in view of the extent of modern motor bus transportation, if a motor bus carrier, in the event of injury to a passenger by the overturning or wrecking of a bus, or by collision, deprived the passenger of the benefit of this rule by showing that the accident was occasioned through the skidding of the motor bus and thereby escaped liability for injury. [Heidt vs. Peoples M. Co. of St. Louis, 9 S.W. (2d), 650.]

MICHIGAN—*Pedestrian Should Know That Rear of Street Car Will Overhang When Car Rounds a Curve.*

Pedestrians are presumed to know that a street car will overhang at its rear end when rounding a curve. Hence, the motorman of a car is not bound to keep watch of the overhang, but may discharge his duty by looking ahead. [Hering vs. City of Detroit, 221 N.W., 278.]

OHIO—*Collision With Automobile Without Tail Light.*

Although an automobile driver was negligent in leaving his automobile on a highway without a tail light, he can recover damages to his car when struck by a street car, unless his negligence was the approximate cause of the injury. [Columbus R. P. & L. Co. vs. Pickles, 162 N.E., 614.]

SOUTH DAKOTA—*Mandamus Legal Remedy to Compel Companies to Pave.*

A company's franchise required it to do certain paving, and the city received judgment for a writ of mandamus. This was held proper, though if the defendant was entirely unable to defray the cost of the paving, a procedure in the nature of a *quo warranto* might be the proper remedy. The plea of the company that the city should pave, then bring suit to recover cost was rejected. [City of Sioux Falls vs. S. F. Traction Co., 221 N.W., 84.]

VIRGINIA.—*Right to eject an invalid transfer upheld.*

A passenger received from the conductor of the car on which he paid his fare a transfer punched for 5:45 p.m. instead of 3:25 p.m. When he attempted to use the transfer on another car, it was rejected because it was improperly punched, and he was ejected. His suit for damages for ejectment was not allowed. [Virginia E. & P. Co. vs. Brown, 144 S.E., 708.]

Personal Items

E. J. Pearson Resigns from New Haven

Edward J. Pearson has resigned as president of the New York, New Haven & Hartford Railroad. Ill health is given as the cause of the resignation, which will be effective on Dec. 31.

Mr. Pearson became head of the system on April 24, 1917, succeeding Howard Elliott. He had been with the New Haven only about a year when he became its president.

He was born in Rockville, Ill., in 1863, of New England ancestors. After his graduation from Cornell University, Mr. Pearson served with several Western railroads. While in the West he developed the first "hump" freight yard on the Pacific coast. Later, when he came to the New Haven, one of his achievements was the building of the large railroad classification yards at Cedar Hill, Conn.

Mr. Pearson came to the New Haven as vice-president, having been called from the Texas & Pacific, of which he was vice-president. A year later he became president. During the war he was federal manager of the road when the system was taken over by the government. Since 1920 the road has shown a steady increase in net earnings and dividends were resumed on the common stock, the first payment of the kind made since 1913.

During his career in the West, Mr. Pearson was connected with the St. Paul, the Missouri Pacific and the Texas & Pacific railroads. He constructed terminals in St. Louis, Kansas City, New Orleans and Chicago.

With regard to the probable successor of Mr. Pearson, Edward G. Buckland, vice-president of the road, has been mentioned as the most likely candidate.

E. M. Bassett to Plan New York City's Zoning

Edward M. Bassett has been appointed to the city planning post by Mayor Walker of New York City. The new appointee has a long record of public service activities. In 1922 he was appointed by Secretary Hoover as a member of the advisory committee on zoning. His term of office as a member of the Public Service Commission of the first district of New York expired in February, 1911. His greatest service to the commission, the ELECTRIC RAILWAY JOURNAL said some time ago, was in connection with framing the new rapid transit law and in pushing the elimination of dangerous grade crossings. Since 1902 Mr. Bassett has been connected with the law firm of Bassett, Thompson & Gilpatrick

In announcing the acquisition of the services of this zoning expert, Mayor Walker said it was a step toward the foundation of a permanent planning commission for the city. He added that the new commission when organized would study the present situation regarding zoning of all boroughs, and attempt to work out a plan for the future development of the city.

F. J. Gannon Assumes New Duties in El Paso

F. J. Gannon has assumed his duties as manager of the El Paso Electric Company, El Paso, Tex. He succeeds Joseph Bowes, who, as noted previously in ELECTRIC RAILWAY JOURNAL, goes to the Virginia Electric & Power Company.

Mr. Gannon was formerly at Davis Island, at Tampa, Fla., where he held the position of vice-president of Davis Islands, Inc., a firm organized for the development of the islands of Tampa Bay. He has been in the public utility field for the past 26 years and has an exceptional record to his credit.

After completing school in 1902, he started out in the general offices of Stone & Webster, Inc., and since that time has been continually with companies under that firm's management.

After four years of training he was sent to Dallas where he became connected with the Light, Power & Railway Company, later being connected with the Pawtucket Electric Company, Pawtucket, R. I. His first step to an executive position occurred in 1910 when he was sent to Brockton, Mass., as assistant treasurer of the Edison Electric Illuminating Company, and a year later to Reno, Nev., as assistant treasurer of the Reno Power, Light & Water Company and Truckee River Power Company, serving gas, electric light, power and water.

By this time Mr. Gannon had so well established himself in the utility field and demonstrated such rare executive ability that in 1916 he was selected to fill the position of assistant treasurer with the Northern Texas Traction Company at Fort Worth. While he was in Fort Worth, so marked was his broad experience and unusual ability as an executive that when Stone & Webster took over the development of the Davis Island project Mr. Gannon was selected to serve as assistant treasurer, since a man of unusual financial and executive experience was needed. He served only one year in that capacity, and was then made vice-president of the undertaking.

When Mr. Gannon went to Davis Island the construction program was in its infancy and he served in his usual efficient manner. Davis Island is now considered one of the most beautiful residential sections of Tampa and Mr. Gannon deserves great credit for the part that he played in its development.

Burt Hamerstrom Promoted in San Francisco

Burt Hamerstrom, in charge of the commercial department of the Market Street Railway, San Francisco, Cal., has also been made head of the transportation department. Accordingly, his title has been changed from vice-president in charge of commercial department to vice-president in charge of service. When the commercial department was established by the Market Street Railway two years ago, Mr. Hamerstrom was chosen to be the one to work directly under Samuel Kahn, executive vice-president.

As a former newspaper man, well versed in the business of customer-ownership and public relations, the choice of Mr. Hamerstrom to establish close relations with the public was considered a fortunate one. Mr. Hamerstrom spent about ten years as a reporter and feature writer in San Francisco, Chicago and Seattle. For more than ten years he was associated with public utilities, including the United Gas Improvement Company, American Light & Power Company and the Illinois Power & Light Corporation.

J. P. Daratt to Go to Havana

Joseph P. Daratt, for more than four years manager of the Frankford, Ind., plant of the Northern Indiana Public Service Company, has accepted a position with the Compania Cubana De Electricidad of Havana, a subsidiary of the Electric Bond & Share company of New York City. The corporation operates the power, electric railway and gas utilities of Havana.

Mr. Daratt will sever his connections with the Frankford branch on Dec. 15 and will begin his new duties Jan. 1. He went to Frankford from Fort Wayne on July 16, 1924, succeeding M. P. Royal, who was transferred to Kokomo.

SAM HALEY, assistant general counsel for the Missouri Public Service Commission, has resigned from that post. He accepted the post Oct. 16, but did not resign as Federal Prohibition Director at St. Louis for Missouri and Arkansas. He will continue to fill the federal post.

WILLIAM F. CROWE was appointed assistant to the president of the Springfield Street Railway and Worcester Consolidated Street Railway of Springfield and Worcester, Mass. This appointment was effective on Nov. 22.

S. A. MORRISON, formerly superintendent of freight service of the Chicago, South Shore & South Bend Railroad, Michigan City, Ind., has been promoted to the position of assistant general superintendent. Mr. Morrison has had many years of supervisory operating experience, particularly with the Chicago & Northwestern line besides his term of service with the South Shore line.

Thomas Fortune Ryan

Last of the group of financiers which included Messrs. Whitney, Widener, Elkins and others died in New York on Nov. 23

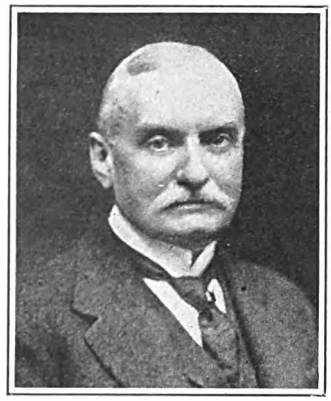
THOMAS FORTUNE RYAN, the last of the group of financiers and railway promoters that included, among others, Messrs. Whitney, Widener, Elkins, Dolan and Yerkes, died in New York on Nov. 23. He was 77 years old. For many years before his death Mr. Ryan had not been active in business, but his interests during his active life had been manifold. He had a hand in the financing of electric railways, steam railroads, public utilities as exemplified in the electric light and power industry, in gas, and in tobacco and other manufacturing concerns. In the field of philanthropy he did his part in his later years. In politics he was both prominent and powerful.

Mr. Ryan is a subject for an analyst with the capacity of a Gamaliel Bradford. In business he was distinguished by wide vision and native shrewdness. He was a product of the age that was portrayed in the "Lion and the Mouse," and of the day that supplied the background for the "Titan" and "The Financier." For that very reason much that Mr. Ryan did must remain an enigma to the present generation, since most of his active career closed before the new conception of big business made headway against habit and conservatism.

Among his achievements were the saving of the Equitable Life Assurance Society in 1905, and his participation in the organization of the American Tobacco Company, acquisition of the Broadway street railway franchise in New York as the keystone for the Metropolitan Street Railway, acquisition of the Third Avenue Railroad in New York, after its former owners had been forced to the wall, and the formation of the Metropolitan Securities Company to hold securities in which Mr. Ryan and his associates were interested.

The stakes in New York were big. Mr. Ryan and his associates saw their surface lines threatened by the new subways with Mr. Belmont at their head. In such circumstances the astute managers of the Metropolitan Street Railway conceived the bold plan of seeking rights for competitive rapid transit lines for themselves. It was Mr. Ryan's move. Only a few years before Mr. Belmont alone had been prepared to leap into the deep waters of rapid transit, but now Mr. Ryan was apparently prepared to follow. Perhaps he was, but as a matter of fact Mr. Ryan's proved only to be a gesture after all. As James Blaine Walker says in "Fifty Years of Rapid Transit," it was not long until the cat was let out of the bag and the financial district rang with the story of how Mr. Ryan had forced Mr. Belmont into a merger by the threat of constructing a new subway to be operated in competition with the underground road into which Mr. Belmont had put his millions. This virtually marked the exit of Mr. Ryan from the transit scene in New York.

It could never be said of Mr. Ryan as it was of Jim Fisk and others that he was one of the playboys of "The Gilded Age." Mr. Ryan stuck sturdily to his last. In all of his many guises he kept the public at a distance—as stock broker, street railway promoter, pilot of the New York traction combinations of the period just before the turn of the century, adventurer at intervals into Western and Southern railroading, reorganizer of gas and electric companies, head of the tobacco trust,



Wide World Photo

Thomas Fortune Ryan

absorber of banks, pioneer in the development of the Congo, buyer of the powerful Equitable Life Assurance Society in the day of its trouble, astute politician, and occasional lavish contributor to charity and art.

When all is said and done, probably Mr. Ryan's most important public benefaction was the purchase of the Equitable Life Assurance Society. After the Armstrong legislative investigation of life insurance companies in New York State and its revelations of extravagance and scandal and the passage of remedial legislation, Mr. Ryan was one of the leaders in a movement to protect the interests of the policyholders. At his request, Grover Cleveland, former president of the United States, Morgan J. O'Brien and George Westinghouse consented to act as trustees and straighten out the affairs of the society. Mr. Ryan regarded this work as a public trust and from his brief control of the society derived no personal profit.

Mr. Ryan was born in Virginia on Oct. 17, 1851, and, as he could get no schooling beyond that afforded by occasional sessions under uncertain hill-country pedagogues, he determined as a small boy to do a lot of studying on his own account. At the age of seventeen he left home to start business life in a city. That was in 1868. He got a clerkship in the Baltimore store of John D. Barry, whose daughter, Ida M., he married in 1873. But Baltimore was too small for him; it has been related that he broke his customary silence to say as much to a fellow store employee. He moved to New York in 1874, became a curb broker, and, within a year, bought a seat on the Stock Exchange. The start on his meteoric career had been made.

"Dan" Smith

"Dan" Smith of Detroit, Mich., soldier, politician, business man, and municipal-ownership advocate, died on Nov. 25. Thus ended a career short in years but extensive in its range of pursuit and intensive in purpose. Known to the electric railway industry at first through his connection with the Peter Smith Heater Company, he was in the public eye in 1921 when as mayoralty candidate opposing Mayor Couzens for re-election he flayed the policies of the municipal street railway chiefs and characterized the plan as "a program which was conceived in ignorance and executed in extravagance." He stood for municipal ownership when operated on economic lines. Nevertheless, for all his disclosures of waste and secretive handling of the Detroit municipal railway project the citizens of Detroit at the polls on Nov. 8 of that year showed their approval of Mayor Couzen's administration and indorsed his re-election.

Dan Smith was born in Detroit, 53 years ago, the son of Peter Smith, the inventor of the well-known heating appliances. In 1907 he became president of the Peter Smith Heater Company and more recently president of the Sattley Coin Counting Machine Company, in both of which enterprises he remained interested until his death. But they were only a part of the man's interests. Mr. Smith had long taken an active part in the various military organizations of the state of Michigan and of the country. First as private he was later to do honor as quartermaster-sergant, captain, adjutant and adjutant-general, seeing active service in Cuba and Mexico and in intention, though not in actuality, in France—for he was on the high seas when the armistice terminating the World War was signed. He never lost contact with soldiers of fortune or rather soldiers of misfortune, for he had made numerous bequests to retired needy soldiers.

In railway association activities Mr. Smith served as chairman of the exhibit committee in 1916 when the American Electric Railway Association had its first exhibit under its own auspices. Nor did he ever actually dissever his connection with transportation. For it is recalled that of late years he has been traveling around in a Lucullian palace on wheels—a bus built for himself which he used for business purposes and as a delectable pastime. It was exhibited at a recent annual convention of the association. He is also recalled by many for his becoming yearly a "newsboy," selling papers on the streets of Detroit for needy families.

Activity of Equipment Market Continues

Cleveland Railway plans to rehabilitate 750 cars. St. Louis Public Service contemplates new tracks. Several large orders for track and line materials

DESPITE the seasonal decrease in orders of material and supplies, large projects and purchases continue to be made. Estimates on the cost of equipping 750 old-type street cars with Timken axles, individual leather seats, electric heaters, modern lighting and ventilation, and the newest safety devices are being obtained by the Cleveland Railway, Cleveland, Ohio. According to Joseph H. Alexander, president, the popularity of the 100 new street cars put into service on the Cleveland lines recently, as evidenced by the increased riding, was sufficient indication that increased riding on all of the lines can be expected if all of the cars are modernized. When the estimates are obtained for each type of car in use, a study will be made to determine whether the cost will be warranted, taking into consideration the probable life of each car.

Catenary for Cleveland Terminal

The Fort Pitt Bridge Works Company, Pittsburgh, Pa., has been awarded the contract for the fabrication and erection of the structural steel catenary bridges to be used in the electrification of the approaches to the Cleveland Union Terminal, Cleveland, Ohio. The contract specifies that the work is to be completed by June 1, 1929. The catenary bridges are to be built along the right-of-way of the Nickel Plate, New York Central and Belt Line Railroads, between Collinwood and the Union Terminal Station on the east, and along the right-of-way of the Big Four between Linndale, and the terminal station on the west.

Improvement of Poplar Avenue from Third to Dunlap Streets, Memphis, Tenn., has just been started. Permits have been obtained by the Memphis Street Railway allowing it to replace old track and repave the street. The project will cost $90,000.

Plans for a new loop at the end of the Grand Avenue division of the St. Louis Public Service Company, St. Louis, Mo., and Virginia Avenue and Meramec Street, are being considered by that company and the St. Louis Board of Aldermen. Under the new plan the Grand Avenue cars would turn north at Meramec Street and Louisiana Street for about a block, and then over private property of the car company to Virginia Avenue, and south to Meramec Street. The extension of the natural bridge line westward to Pine Lawn has been delayed until the city is ready to proceed with the widening of Natural Bridge Avenue.

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has placed orders for 48,000 ft. of rail, 20,100 paving bricks and 81,600 lb. of asphalt. Other equipment ordered by this company includes 2,896 tie plates and 534 ties.

The Twin City Rapid Transit Company, Minneapolis, Minn., has placed orders for 50,000 paving bricks, three left-hand 200-ft. C. R. mates, 15 ft. long, of 7-in. construction, six left-hand 75-ft. standard mates, 12 ft. long, of 7-in. construction, and six right-hand 75-ft. standard switches 12 ft. long of 7-in. construction. The Gary Railways, Gary, Ind., has just completed its track rehabilitation program on South Broadway, between Little Calumet and 40th Avenue, over the line of the Gary & Southern Traction Company. The pavement between 35th Street and 40th Avenue is of 9-in. crushed stone with tar product penetration.

The Memphis Street Railway, Memphis, Tenn., has just completed its Jackson Avenue extension to University Place. The new section is 1⅛ miles long and costs $70,000. Double tracks have been laid as far as McLean Boulevard, and single tracks from there to University Place terminus.

The Worcester Consolidated Street Railway, Worcester, Mass., has completed the relocation of its tracks on Chandler Street, which was made necessary by the widening of the street. This construction costs approximately $40,000. This company has also renewed five frogs and one switch at the corner of Pleasant and West Streets, at an approximate cost of $1,600. $6,000 was spent for double-track renewals at Billings Square.

Line Materials

Twenty-five miles of No. 00 grooved trolley wire, 5,475 ft. of 1,000,000 circ.mil, paper-insulated, lead-covered 600-volt cable, and one two-section blue Vermont feeder panel top section has been ordered by the Twin City Rapid Transit Company, Minneapolis, Minn. Ten cars of poles, one car of weatherproof wire, and one car of cable have been ordered by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. Cape Breton Electric Company, Sydney, N. S., contemplates the purchase of track and line material for maintenance use.

Fifty General Electric 213 railway motor gear blanks, 12,000 ft. of 1-in. Magnolia lumber, and 12,000 ft. of 1x6-in. white and red oak have been ordered by the Twin City Rapid Transit Company for the remodeling of cars. The Milwaukee Electric Railway & Light Company has purchased five second-hand passenger cars and is remodeling 40 cars into one-man safety cars. The Cape Breton Electric Company has ordered five used Birney single-truck cars and is remodeling three two-man double truck cars to one-man operation. This company has ordered three sets of safety car equipment including air brakes and electrical automatic equipment and 48 cross seats for three cars. Power equipment ordered by this company includes five new 150-hp. boilers and 75,000 firebrick. The Milwaukee Electric Railway & Light Company is building a second floor addition to its Broadway garage.

New Birney Car Tested in East St. Louis

The new Birney car was given its first official test on Nov. 8, over the lines of the East St. Louis Railway, East St. Louis, Ill., in the presence of prominent Mid-West representatives, officials of the local railway systems, electric railway and manufacturers' representatives.

This is the latest invention of C. O. Birney, superintendent of car construction for Stone & Webster, Inc., known throughout the industry as the "Father of the Safety Car," and who for the last fifteen years has offered numerous improvements in street railway practice and design.

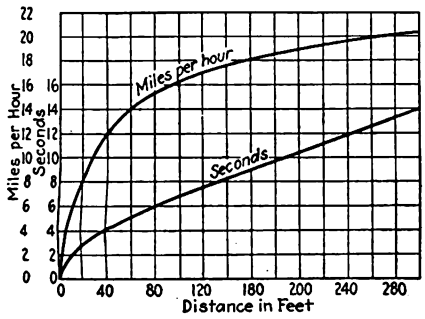
The new Birney car was built by the St. Louis Car Company and its trial in East St. Louis offered the visitors the opportunity to study its performances before it is shipped to Houston, Tex., to be placed in regular service. The local demonstration was made from Third and Broadway over the Lansdowne division and back to the local carhouse at Twentieth and State Streets.

Opportunity was afforded all those attending to inspect the trucks and underneath construction of the car from a pit in the East St. Louis shops.

Within the new Birney, which seats 39 passengers, there is an air of luxury. All interior finish is mahogany. Sheet rubber with a mosaic pattern covers the floor, and all seats in the car are of the deep spring design, covered with hand-buffed leather. The car is the one-man type and has full safety equipment. Automobile type visors and bumpers and the low roof give the car a striking resemblance to a large motor coach.

The car accelerated from a standing point to 20 m.p.h. in five seconds and

Digitized by Google



Speed attained and time required by Birney car during acceleration for a given distance

deceleration rated up to 4 miles per second.

The tests show a maximum accelerating rate of 2.4 m.p.h.p.s. for conditions where there is a severe drop in voltage. This is about what might be expected on properties where the voltage conditions are not good. Where the voltage is good throughout the system, accelerating rates of 4 to 5 m.p.h.p.s. may be attained if every condition for acceleration is at its best.

Braking rates up to 4.0 m.p.h.p.s. may be attained with sand on wet rails. Emergency rates of 2.5 m.p.h.p.s. from the "dead man" handle and 3.0 from the brake valve were obtained with bad rail conditions in the rain, aided by sand.

In giving his opinion of the new car to the group on the trial run, G. W. Welsh, vice-president and general manager of the East St. Louis Affiliated Railway System, pointed out that both the driving mechanism and the design represented radical departures from the standard street car as it is now known to the public.

"More than ten years ago," he said, "Mr. Birney invented what is known as the safety car, which is now being used extensively on small city properties all over the country. The new Birney car is designed to find its place in the transportation field between Birney's safety car and the larger double-truck cars now in use in St. Louis and East St. Louis. Its quick acceleration, light weight and attractive appearance will undoubtedly appeal to operators who see in these qualities something with which to compete with present day transportation agencies."

Those who attended the demonstration were entertained at luncheon by the St. Louis Car Company at the Missouri Athletic Club, presided over by Mr. Meissner, president. After the luncheon an interesting discussion followed, during which Mr. Birney mentioned that this car was built in less than 30 working days in order to show it at the A.E.R.A. convention at Cleveland. He took occasion to thank the various manufacturers, particularly, Westinghouse Electric & Manufacturing Company, Westinghouse Air Brake Company, National Pneumatic Company, Johnson Fare Box Company and the St. Louis Car Company for their co-operation.

The following attended the demonstration:

Kansas City Railway, Kansas City, Mo., D. L. Fennell, general superintendent transportation, R. W. Bailey, general superintendent power and labor, R. S. Neal, superintendent of equipment, D. E. Druen, superintendent bus maintenance.

St. Joseph Light & Power Company, C. A. Semrad, vice-president and general manager, F. E. Henderson, superintendent of railway, Theodore Riesemme, master mechanic, Mr. Johnson.

Louisville Railway, Louisville, Ky., Samuel Riddle, vice-president.

Illinois Power & Light Company, Decatur, Ill., M. L. Harry, general manager.

Illinois Power & Light Corporation, Peoria, Ill., R. F. Palmblade, manager, A. T. Leech, master mechanic.

Illinois Power Company, Springfield, Ill., A. D. Mackie, vice-president.

Milwaukee Railway & Light Company, Milwaukee, Wis., John Lucas, superintendent rolling stock.

Kentucky Traction & Terminal Company, Lexington, Ky., D. M. Carr, superintendent equipment, H. Busch, superintendent transportation.

Chicago Rapid Transit Company, Chicago, Ill., D. E. Brittan, engineer.

St. Louis Public Service Railway Company, St. Louis, Mo., Samuel Greenland, general manager, Major Lockwood, assistant general manager, M. O'Brien, master mechanic, A. Finck, transportation engineer, Mr. Jones, Mr. Wright.

Springfield Traction Company, Springfield, Mo., A. E. Reynolds, vice-president and general manager.

East St. Louis Railway, East St. Louis, Ill., G. W. Welsh, vice-president, W. C. Myers, general superintendent, L. W. Jacques, master mechanic, E. H. Slater, assistant engineer, H. P. MacDonald, superintendent automotive equipment, H. Niemoeller, assistant engineer, N. J. Albright, advertising manager, L. G. Leake, general storekeeper, F. O. Whiteman, superintendent service.

Stone & Webster, Inc., C. O. Birney, superintendent car construction.

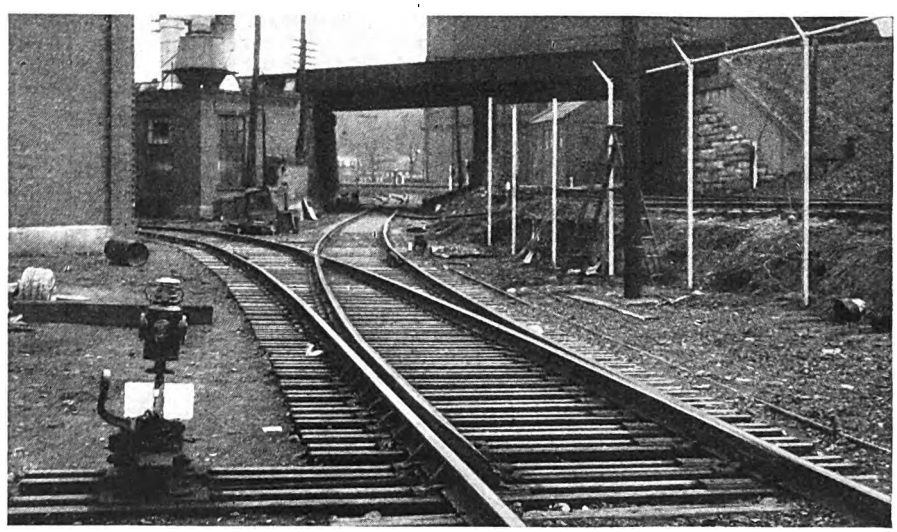
J. Grause, Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., L. W. Stemrich, Westinghouse Electric & Manufacturing Company, St. Louis, Mo., O. A. Broten, National Pneumatic Company, Chicago, Ill., Otis Turner, General Electric Company, E. Davis, Westinghouse Traction Brake Company, Joseph Dapron, Westinghouse Traction Brake Company, Clarence Brown, Westinghouse Traction Brake Company, J. E. Lytle, *Electric Traction*, Donald Heinly, ELECTRIC RAILWAY JOURNAL, F. H. Ingalls, St. Louis *Times*, Edwin B. Meissner, president St. Louis Car Company, L. F. Seelar, chief engineer St. Louis Car Company, L. W. Richards, St. Louis Car Company, H. R. Cass, St. Louis Car Company, M. J. Oswald, St. Louis Car Company, Frank Grayson, Grayson Supply Company, William Grayson, Grayson Supply Company.

Welded Metal Ties Used on Switches

A recently completed spur connecting the General Electric plant at Schenectady, N. Y., with the Delaware & Hudson Railroad has wooden ties replaced with those of metal.

The feasibility of metal ties was suggested by the General Electric Company, early in 1927, when it announced that it had designed automatic welding machinery which could produce metal ties. The Delaware metal tie fabricating shop at Colonie, N. Y., which produced the ties used in this installation is built around an automatic arc welding machine designed and built by the General Electric Company. Its present output is about 20,000 ties per year. Not only were the switches and cross-overs mounted on metal ties, but the switch stands themselves were mounted on extra long metal ties. By a simple arrangement the base on which a switch stand is fastened is welded to the ties, resulting in a firmly fastened stand, but allowing its easy removal for replacement or repair if necessary.

For this special construction, scrap rails, cut to the proper lengths, were delivered on the spot and there welded by hand and installed under the track. The railroad crew foreman in charge of the installation claimed that not only was the work simplified with the metal tie, but that he could do a much better job with more permanent, beneficial results.



Metal ties of greater length are used where one track leaves another at a switch, being common to both sets of track

Digitized by Google

A particularly advantageous consideration, it was found, developed in connection with the installation of the cross-overs. Where one track left another at a switch, metal ties of greater length were used, a single tie being common to both sets of track for quite a distance from the switch.

Secretary of Commerce Makes Annual Report

According to the annual report of the Secretary of Commerce the fiscal year ending June 30 continued the high economic activity which has been characteristic of American industry during recent years. There was a slight recession during the latter part of the calendar year 1927, but this was fully recovered during the first six months of 1928. As a result of this temporary reduction in activity, however, several of the indicators of business conditions show for the fiscal year 1927-28, as a whole, an average a little below the peak levels of 1926-27, although almost every one of them stood materially higher than during such prosperous years as 1923-24 and 1924-25. The slackening of business in the earlier months of the fiscal year just closed was due to special and temporary causes, among others the damage caused by the great Mississippi flood, the prolongation of the effect of the low price of cotton of the crop of 1926, and the temporary shutdown of certain large motor-vehicle plants for readjustment of models. At the close of the fiscal year 1927-28 business in nearly all branches was on a level rarely, if ever, before attained. The volume of production and consumption for the year, as a whole, and the physical quantity of exports and imports were very large, unemployment was relatively unimportant, and the rate of real wages and the standard of living of the masses of the people remained higher than anywhere else in the world.

The general index of manufacturing production, perhaps the most comprehensive measure of business conditions, average 2 per cent lower than the year before and 1 per cent lower than in 1926. It was, however, higher than in any fiscal year before 1926. The relatively slight degree to which industrial activity had been temporarily cut down is indicated by the fact that the index of production of manufactured goods in November, at the lowest point reached, was only 2 per cent below the average for the three years 1923 to 1925. By January, 1928, the index had already been restored to its normal and progressing level, output being 9 per cent greater than in November. Indeed, the first half of the calendar year 1928, taken as a whole, showed greater production in our factories than any corresponding period theretofore.

Mineral production in 1926-27 was abnormally great, partly because of the demand for coal, caused by the British mining strike, and partly by reason of an unduly rapid expansion of petroleum output which was generally considered contrary to the public interest. The falling off in aggregate mineral production during the fiscal year just closed was therefore entirely to be expected; output, nevertheless, remained greater than in any year before 1926-27. The decline in railway traffic last year was in considerable part due to this smaller movement of coal.

The indexes of electric-power production, of building construction, and of the sales of department stores, chain stores, and mail-order houses all showed increases in the last fiscal year as compared with that preceding and most of them were the highest ever recorded.

The foreign trade of the United States in the fiscal year 1927-28 has continued that expansion in the export of manufactured goods which has been a conspicuous feature in the economic life of the United States during the past seven years.

Further progress in the elimination of waste has resulted from continued co-operation among the many branches of industry and commerce. The department has participated, when requested, in this general effort by assembling and distributing economic information, investigating economic and scientific problems, and otherwise assisting the several groups to reach common understanding and solution of their difficulties.

METAL, COAL AND MATERIAL PRICES F.O.B. REFINERY

	Nov. 27, 1928
Metals—New York	
Copper electrolytic, cents per lb.	15.775
Copper wire, cents per lb.	17.875

Miller Schorn Incorporates

Incorporation of the Miller Schorn Rapid Transit System, Detroit, Mich., developer of the rapid transit plan on which the East Jefferson Avenue express service in Detroit is based, was announced recently. Capitalization was announced at 1,000 shares, no par value, and offices of the concern were given as 338 Lafayette Boulevard.

Officers are: Harry R. Miller and Nicholas J. Schorn, inventors of the plan, and H. M. Gould, former general manager of the Detroit Municipal Railway, who completed the D. S. R. traffic survey a year ago.

Additional Safety Gates for North Shore

A new type of automatic electrically-operated safety gate, which has proved highly successful in practical tests at three locations on the Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., will be installed at 26 grade crossings along the railroad between Niles Center, Ill., and Racine, Wis., according to an announcement by John R. Blackhall, general manager.

TRADE NOTES

ELECTRIC STORAGE BATTERY COMPANY, Philadelphia, Pa., recently announced the appointment of Albert N. Dingee as advertising manager to succeed the late Alfred B. Kreitzburg. Mr. Dingee has been in the sales department of the company for the past eighteen years.

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., announces the removal of its Los Angeles branch office and service station to 1220 South Hope Street. The removal involves all local departments.

BARNEY G. TANG, assistant general superintendent of the Schenectady Works of the General Electric Company, has been made general superintendent to succeed James A. Smith, who died Oct. 25. John D. Harnden, former superintendent of the testing department, has been appointed assistant to the works manager, F. L. Kemp succeeding him as superintendent of the testing department, and Leroy Beers has been made plant engineer, a newly created position under the works manager.

WAGNER ELECTRIC CORPORATION, St. Louis, Mo., announces that H. N. Felton, branch manager of the Milwaukee office since 1927, has been made branch manager of the New York office.

ADVERTISING LITERATURE

I-T-E CIRCUIT BREAKER COMPANY, Philadelphia, Pa., has just published a new bulletin, No. 220, covering a new type of electrical protective equipment, the U-Re-Lite All-Steel Distribution Groups.

HYDRAULIC SOCIETY, New York, N. Y., has published the fifth edition of the Standards of the Hydraulic Society. The principal changes from the preceding edition are a revision of the extracts taken from the A.S.M.E. test code for centrifugal and rotary pumps and changes in materials recommended for the construction of special service pumps, in line with the latest accepted practice.

Seeing Chicago's Need, but Doing Nothing About It

NEW records for the number of passengers carried and for gross receipts continue to be made by the Chicago Surface Lines. The total number of rides, including revenue, transfer and free passengers, during October exceeded 142,000,000 and was 2,880,000 greater than in March of this year, the previous high month. The gross income rose to $5,475,000. This was $58,000 larger than in December, 1926, when the old record was established.

In 1907 there were 372,000,000 revenue passengers on the surface cars. That was at the rate of 182 for each of the 2,039,000 residents of Chicago at that time. Last year the population had grown to 3,100,000, but the rate of passenger growth was far more rapid than the rate of growth of the population. There were 882,000,000 revenue rides in 1927, or 284 per inhabitant, in contrast to the 182 per inhabitant twenty years ago. This was an increase of 137 per cent in revenue passengers on surface cars. In the same 20-year period the increase in passengers on local elevated lines was 54 per cent.

According to the Chicago *Tribune* the value to Chicago of an improvement in transit facilities is likewise suggested by the report of the New York Transit Commission. In substantiation that paper quotes the fact that in 1906 the use per inhabitant of all local transportation facilities in the five boroughs of Greater New York was 301, contrasted with the Chicago figure of 182 for 1907. By 1923 the rides per inhabitant in New York had increased to 439, but meanwhile subways had been built. The figure for 1927 for the surface and rapid transit lines in New York was 461. As the *Tribune* sees it, these figures point to the probable advantage to be derived from the modernizing of Chicago's transportation facilities and leave many persons wondering why investment bankers are not falling over each other for the opportunity to underwrite the reorganization.

For the benefit of the *Tribune* and the people of Chicago, it should be said that the bankers are not falling over one another to do this because of the policy of bickering and procrastination followed by the city during the past decade. It may be well to recall here that Chicago has, on two different occasions, turned down by popular vote comprehensive plans proposed for the coordination and extension of its transportation facilities—once in 1918 and again in 1925. It is interesting to note also, that those who were so vociferous in opposing previous proposals as being "steals by the bankers and grasping corporations" have been content to lapse into silence while the situation continued to drift and the former franchises to expire. In the meantime these corporations, with inadequate credit and no assurance of future operating rights, have continued to meet with available facilities the public need for transportation service in a way that has established an outstanding record of operating efficiency.

Were it not for the previous failure of Chicago to meet its transportation problem intelligently the situation would not exist as it is in that city today with the Surface Lines operating by grace of grants extended temporarily and with one of the systems in receivership if not in default. A settlement is needed in Chicago, but it can be made only "by close co-operation among the city authorities, the citizens, the railways and the various agencies which create public opinion." The *Tribune* is only partially correct. The opportunity is there. The companies have made the most of it under the limitations imposed upon them. It is a shame that the possibilities in the Western metropolis are not being fully realized, but that shame is Chicago's. So far as transportation is concerned, the slogan of the city appears to have been changed from "I will" to "I won't."

Approaching the Fare Question on a New Basis

KANSAS CITY has a problem. That has been evident for many months from the earning statements of the recently reorganized Kansas City Public Service Company. Serious decreases in revenue have produced a deficiency in earnings which has for some time been causing grave concern to the railway management. Not only has the company failed by a wide margin to earn the amount allowed in the ordinance, as a return upon the outstanding securities and the $6,600,000 of new money put into the improvement of the property since the reorganization, but it finds itself unable to finance additional improvements demanded by the public, and even threatened with inability to meet its fixed obligations and operating costs.

This is not alone a problem of the railway company. It concerns the city itself, for upon the ability of its public transportation system to maintain a high standard of operating efficiency and to keep up with the growing needs of the community, depends in large measure Kansas City's future development. With that conception of the city's interest in the affairs of its transportation company, the management of the latter has approached the present problem in a laudable way. The railway is convinced that a higher fare is necessary and that nothing less than 10 cents will suffice. But it has made no formal application for an increase. Instead, it has prepared a comprehensive report, clearly presenting the facts of the present situation and outlining the causes of the difficulty and the various alternatives that are open for meeting the situation. This it has submitted to the franchise committee of the Kansas City Council on the assumption that the city has a vital interest in the problem that has arisen, and that any formal move to relieve the difficulty should first be discussed frankly between the company and the representatives of the city which it serves.

In its report, the company openly urges the need for a

Digitized by Google

10-cent fare. But it discusses in turn, the several other steps that might be proposed and carefully points out the reasons why it considers the higher fare necessary. Throughout the report it is assumed that the city has a vital interest in maintaining its transportation system in a high state of operating efficiency. "No half-starved horse ever pulled a heavy load. A half-starved transportation system never helped the growth, prosperity or credit of a city," says this illuminating document on its first page.

In view of this unusual procedure in approaching the question of street railway fares, it will be interesting to observe the action which will be taken by the City Council. Final supervision of fares is lodged in the Public Service Commission of Missouri, and an examination of the report just made substantiates the fact that the company has ample evidence to support a formal application for a higher fare before the commission. But it prefers to put its problems before the representatives of the city in an effort to avoid the usual proceeding in a rate case. It takes the position that the city should be as much interested as is the company itself in meeting a situation which threatens the efficiency of its transportation service. Will the city recognize the spirit in which this report is thus presented? Will the city officials be willing to face the issue squarely and recognize that preservation of a progressive transportation service is more in the public interest than is the maintenance of the minimum possible rate of fare? That remains to be seen.

Popularity Enlists Consideration

STREET car patrons are less able than any other class of citizens to pay more than the legitimate cost of their urban transportation. If the street railway industry is to survive and to develop along economically sound lines, it must convince the butcher, the baker, the merchant and the manufacturer, along with city officials and the general public, that a reallocation of taxes and, even more important than that, a changed point of view regarding the taxation of transportation service, are imperative. The merchant, the manufacturer and the property owner are real beneficiaries of urban transportation, although they contribute little patronage directly to the street car or bus. Aside from public officials themselves, city transportation managements represent the only group in the modern community which is in position to speak with knowledge and authority in the interest of the street car or bus rider.

This in effect was the declaration of T. P. Walker, vice-president of the Virginia Electric & Power Company, in an address delivered recently at the annual convention of the Public Utilities Association of Virginia. Mr. Walker emphasized the need for removing unjustified paving and other special taxes imposed upon transportation properties above the usual ad valorem and income taxes assessed against other forms of business. The justice of this plea needs little argument, since it is obvious that these taxes are borne by the car rider for the benefit of property owners, business and auto drivers. The service rendered by a public transportation system is of such value to property, business and the community at large, that the present-day practice of taxing transportation facilities in favor of property and business, might justifiably be reversed, when necessary, to insure maintenance of these facilities which contribute so much in the form of community values.

But to bring about a reversal in the public attitude toward transportation the public must first be made to understand what it might expect in the way of improved transportation service if this important utility were put upon a proper economic basis in relation to the community. This cannot be accomplished by expecting the "pretty good" rolling stock of yesterday to hold its own with the present highly developed private automobile. To win real public co-operation, the possibilities of improved transportation must be demonstrated in any given community, sometimes to the extent of investing good money to show what could be done if proper support were available. The public favors the private automobile today, even in the matter of traffic regulation and parking privileges, despite its relative unimportance in terms of passengers carried. Only by making public transportation popular as well as necessary can its sponsors win that degree of public consideration which its economic importance in the community justifies.

A Railway Offers to Sponsor and Direct Traffic Planning

DOUBTLESS the Philadelphia Rapid Transit Company would have preferred that some agency other that Mitten Management should conduct a traffic survey of Philadelphia, but when it became apparent that there was little likelihood anything would be done about the matter in the immediate future, the company did not hesitate to indorse the Mitten Management plan for carrying out the work, as outlined in last week's issue of ELECTRIC RAILWAY JOURNAL. All the Philadelphia papers are agreed that a traffic survey is needed in that city. The traffic committee of the Chamber of Commerce has repeatedly urged a comprehensive survey of traffic conditions by an independent expert employed by the city. It was on the score of the inactivity on the part of the city that the Chamber of Commerce acted in approving the Mitten proposal.

After all, the proposal is eminently sound. Who has a broader interest in traffic improvement than the street railway management which is alert to its obligations? The point made in advocating the plan was a strong one —namely, that the management organization had fifteen years of actual experience in furnishing transportation over the city streets and that no group of engineers could come into Philadelphia and secure the facts or acquire the knowledge possessed by the transit management, without long and intensive study.

For years the Philadelphia management has insisted that the rights of the 80 per cent who use the streets for transportation via public vehicles should be respected. It proposes now to get at all the facts regarding street use and traffic movement. The survey is intended to develop a plan for city-wide traffic control, including the operation of all public vehicles; a parking plan; a scientific signal light system; the construction of new streets or the widening of others if found necessary and practical; the elimination of grade crossings; the study of accidents, and every other factor that in any way involves the right of the citizens to obtain the safest and most convenient use of the streets. Surely this is comprehensive. The *Philadelphia Record* has voiced the sentiment of those who have recognized the proposal as sound by stating editorially that no makeshift measures are going to relieve business of the ultimate consequences of traffic overgrowth.

Digitized by Google

The transit company admits that since it operates the street cars, the buses and the taxicabs, it has a selfish interest to serve, but it points out that its selfish interest is the interest of every man, woman and child who uses its service and that means the great majority of Philadelphia's citizens and taxpayers. It points out, further, that merchants and manufacturers must recognize that the smoother flow of traffic is to their interest, too, even as it is likewise to the interest of the motorists who use the streets.

This is a frank statement of the situation and of the motives of the railway management. Favorable reaction to the Mitten proposal indicates that its very frankness has inspired public confidence. It is promised that only after every interest affected has had an opportunity to be heard will a plan be submitted to the Mayor's traffic committee, and not even then, until after the executive committee of the Chamber of Commerce has approved the recommendations. As the *Record* again so aptly says, whatever the cost of bringing relief to congested Philadelphia streets, it will be less than the cost of letting things drift or of merely tinkering. Either of these courses must ultimately result in enormous losses. It is too bad that this point of view is not more generally accepted. So great is the preponderance of evidence indicating the opportunity for developing an intelligent traffic policy that it is difficult to understand the disposition in many cities to permit business to be choked by traffic that has degenerated into congestion.

Boston, Revere Beach & Lynn Electrification Merits Attention

PLANNED 56 years ago to develop East Boston and Revere, the Boston, Revere Beach & Lynn Railroad, by the recent electrification of its lines, has taken a long step forward in improving its service to these and other communities. Quicker, more frequent and more reliable transportation is the objective of the present management. Even during the actual installation of electrical equipment schedules were maintained. The demonstrated efficiency of the new electric service is winning friends for this railroad.

Because of the cost of steam operation and minimum crew requirements, large capacity trains formerly were necessary. To load these larger units only infrequent headways could be operated. Therefore, the character of the service suffered. Careful study indicated that electrification of the road would improve transportation facilities and at the same time would lower the cost of operation. With electric power small unit trains are run on shorter headways, giving faster service at decreased cost.

In carrying out the work of electrification an effort was made to keep the total expenditure to a minimum consistent with reliable service and ultimate operating economy. The existing road and equipment was adapted as far as possible to the new motive power. Less than two-thirds of the old cars have been motor equipped, the existing track was altered for electric operation, a feeder-messenger type of catenary overhead was used, and contracts to purchase central station power were made.

The desire for economy in first cost, however, was balanced by a policy of far-sightedness in selecting equipment and materials. Only highest quality apparatus was considered compatible with maximum efficiency. Electropneumatic brakes replaced the antiquated vacuum brakes used in the steam operation. This change is considered by the management as a major factor in making possible increased schedule speeds. In the line and catenary installation non-corrosive materials and fittings were used to insure long life and low maintenance. Considering the cost, time and quality of the installation and the unusual conditions encountered and mastered, the electrification of the Boston, Revere Beach & Lynn Railroad stands out as an example of far-sighted and conservative management.

Agitation for Unification Revived in New York

MOST anything may come out of the medley called transit in New York City. Both the Interborough Rapid Transit Company and the Brooklyn-Manhattan Transit Company, operating the rapid transit lines, are doing the best they can under adverse circumstances, with the various surface lines trailing along. The Equitable Coach matter still is unsettled, that enterprise being in the position of having secured from the city certain rights to operate buses, but not having secured the sanction of the state regulatory authority. The Equitable matter is involved in all sorts of rumors, even to one that its control has passed to interests identified with the present operating companies.

Meanwhile comes the statement that negotiations are to be resumed looking toward unification of the present lines, and the further announcement that the subway lines now being built by the city itself will probably be ready to be placed in service early in 1930. This may be a full municipal enterprise both as to its ownership and its operation in the event that the unification negotiations fail, but even then there would remain the possibility of private operation under a management contract. In any case, the city's system if run as a municipal enterprise must be operated at a 5-cent fare for the first three years, after which a rate must be charged sufficient to make the enterprise self-sustaining.

But the way is not all dark and cloudy. Those entrusted with the prosecution of the municipal enterprise have indicated that there is no intention on the part of the city to build its own power house, and matters have been helped by the disposition of the engineers of the city subway and others to fashion the rolling stock intended for use on the new lines in a manner that will make it possible to interchange service with at least one of the present operating systems, without carrying out major changes in physical structure. There are to be seven connections with existing lines for the interchange of passengers. This also is a good omen since it will help in the event that a plan for unification is devised.

It would, of course, be saying too much to indicate that New York is well taken care of so far as the number of available transit lines is concerned, but it is not saying too much to register the opinion that New York could be much better served than it now is if the existing lines were unified. No amount of ingenuity in the operation of the individual systems can offset the needless waste imposed under a system that does not permit the various systems to articulate their services. The lines now under construction by the city are a legacy from the Hylan administration. It is not too late to overcome some of the defects of their conception, but the value of the new system can best be realized only under an arrangement for co-ordination of operation with the existing roads.

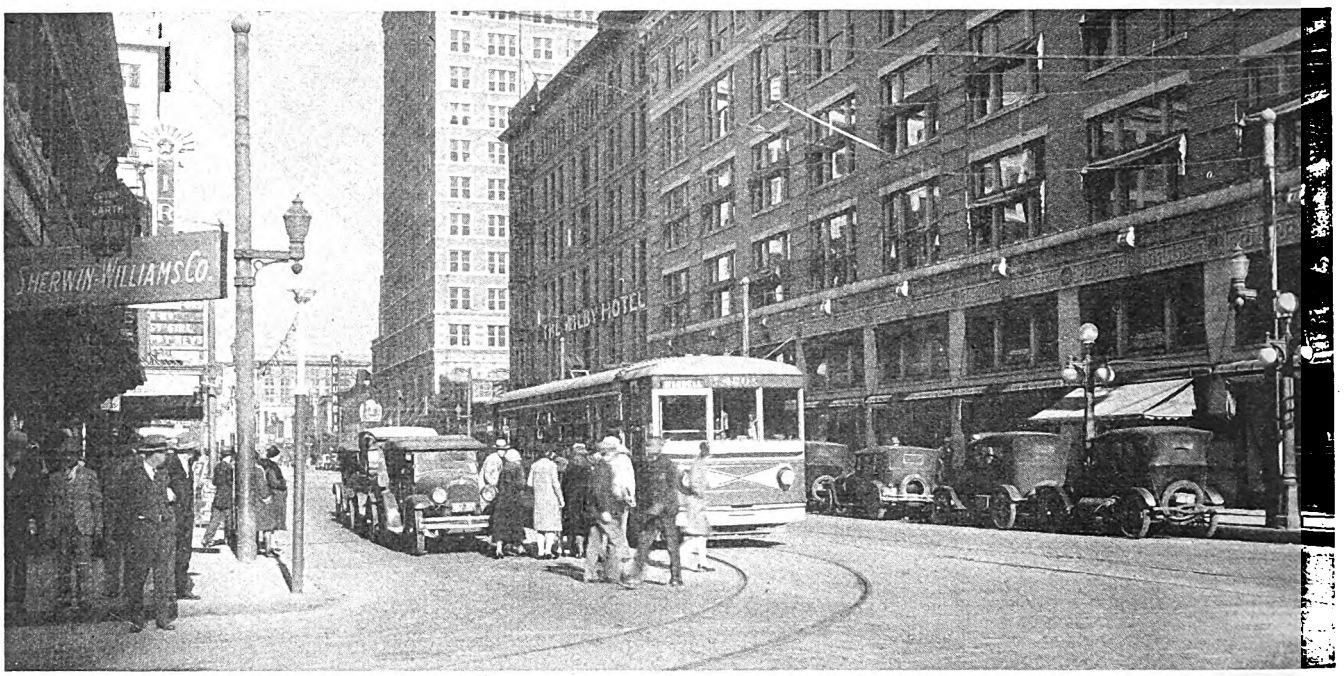
Express Buses

to Supplement Rail Service in Houston

Beeler Organization suggests several methods of providing high-speed service to growing district. Advantages over earlier plans. Functions of buses and electric railway in city transportation are outlined



High buildings being erected in downtown Houston are bringing new problems in local transportation

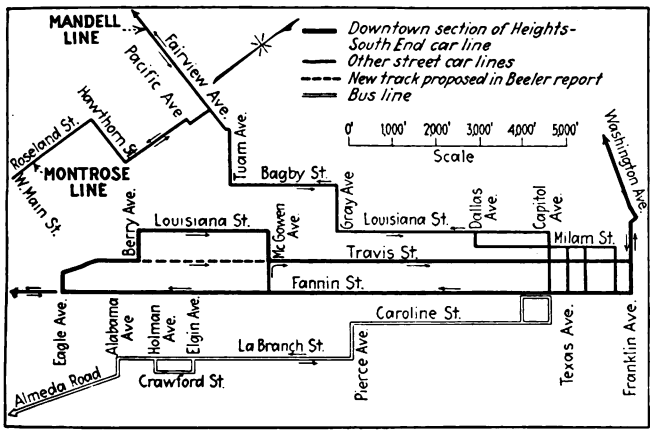
TRANSPORTATION problems in Houston, Tex., have recently been the subject of study by the Beeler Organization. This was done at the request of the city, following agitation for the removal of car tracks from certain streets. Rather than the suggested abandonment of car service the Beeler report proposes changes in routing and the establishment of express bus service.

The business district of Houston lies nearly in the geographical center of the city, but the recent rapid growth of the city to the southwest demanded faster service than was supplied by existing means. Main Street, a wide and long boulevard, which passes through the principal shopping district reaches this growing section of the city. Except for two reasons it would form an ideal thoroughfare for a transportation line between the two sections. One is that diagonal parking is permitted, and this has so narrowed its available width for traffic in the downtown section as to leave insufficient room for a line of buses or cars each way, together with such other traffic as naturally would have to be accommodated. Another objection to its use for railway cars is that some time ago a car line was removed from Main Street, and some of the citizens in Houston have acquired the impression that the popularity of the street for retail trade is due in part to the absence of tracks.

The means of transportation in this district at present are shown in an accompanying map, the downtown district being at the right. Main Street is not shown, but lies between Travis Street and Fannin Street. The cars on the Heights-South End car route from the north end of the city which serve this district, come down Washington Avenue, pass through the business district, and then go southwest on Fannin Street as far as Eagle Avenue. Here the line turns northwest for two blocks, and returns via Travis Street, except for a short detour on Louisiana Avenue.

This car line is the most important in Houston. The cars operate on a headway averaging six to seven minutes throughout the middle of the day, four minutes in the morning rush, and five minutes during the evening rush. as far as Eagle Avenue. In addition, eighteen more trips are made during the evening rush hour as far as McGowen Avenue, thereby affording a 2½-minute headway for the section north of McGowen Avenue. During 1927, this line carried 6,953,444 revenue passengers, which is more by 60 per cent than all of the bus lines in the city combined. Persons desiring to travel out Fannin

Digitized by Google



Present transportation routing in down-town Houston

Street beyond Eagle Avenue transfer to a shuttle car at Eagle Avenue.

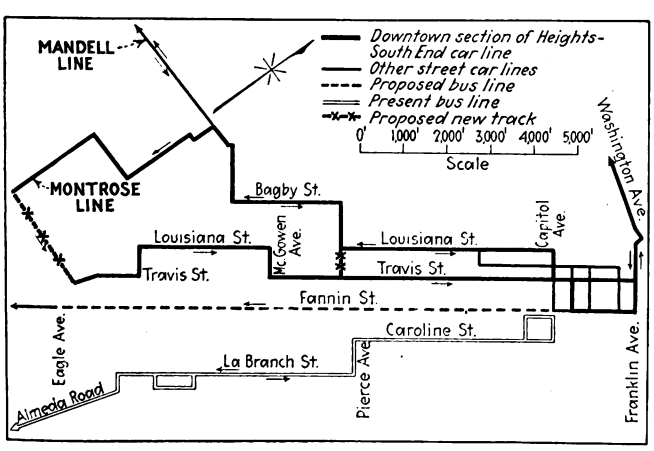
A short time ago the Fannin Street Improvement Committee petitioned the city to order the substitution of buses for electric cars on that street, alleging street railways are now considered obsolete and noisy, that they block traffic, retard the movement of vehicular traffic and are hazardous to pedestrians crossing the street. The abandonment of track on Main Street and its pre-eminence as a business thoroughfare were offered as further arguments for the abandonment of trolley service on Fannin Street.

At the request of the city, the Public Service Commissioner, together with his engineer, suggested some plans for carrying out this request. Plans were also submitted by an engineer for the Fannin Street Improvement Committee. One is illustrated in the second map. By it the Heights-South End cars were to be routed out Louisiana Street around the loop shown and then back to Travis Street, while Fannin Street was to be given up to a bus line. The other plans were slight modifications of this general idea. All involved the abandonment of track on Fannin Street and called for some new track construction to provide the necessary rail connections.

With eight buses, the plan illustrated would require an investment of $126,700 and an increase in total operating costs of $80,488. A second plan also with eight buses called for an investment of $196,975 and increased operating expenses of $81,469. Other plans were prepared calling for 7, 11 and 17 buses. They differed only slightly from that shown.

ESTIMATE OF COST OF BEELER PLAN NO. 1

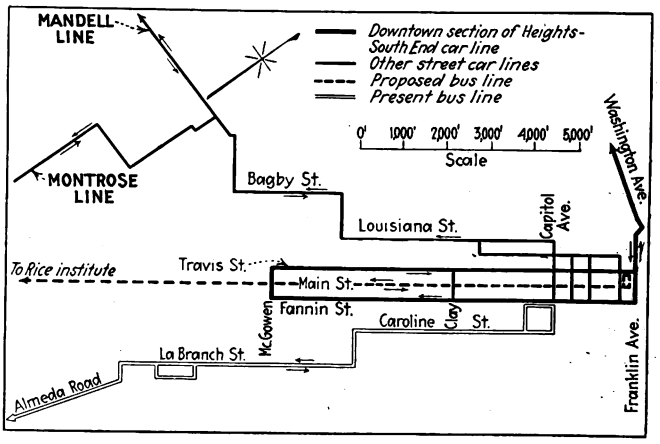
Investment:		
Ten buses at $12,000	$120,000	
Auxiliary equipment at $2,500 per bus	25,000	
Track on Clay Avenue	11,250	
	$156,250	
Cost of bus operation:		
406,063 bus-miles at 16.66 cents		$67,650
40,150 bus-hours at 54 cents		21,681
20 per cent renewal and retirements on $120,000		24,000
5 per cent renewal and retirements on $25,000		1,250
Vehicle tax 10 × $321		3,210
Property tax 2.27 per cent on $145,000		3,292
8 per cent interest on $145,000		11,600
Total bus costs		$132,683
Reduction in Car Operating Expense:		
274,042 car-miles at 14.93 cents		$40,914
30,792 car-hours at 54 cents		16,628
Tax reduction 2.27 per cent on $97,600		2,216
Total		$59,758
Less 14.77 per cent on $11,250 for new track on Clay Avenue (8 per cent interest, 4½ per cent renewal and retirement, 2.27 per cent taxes)		1,662
Saving in rail costs		$58,096
Net increased costs		$74,587
Increased revenue from 2,685,537 passengers using express bus service		64,453
Loss in net earnings		$10,134



One suggested plan was to take up the track in Fannin Street and reroute the cars as shown

The Beeler Plan

After being called into consultation by the city, the Beeler Organization suggested three plans. That preferred is shown in the third map. By it the Heights-South End car line would continue to operate on Fannin Street as far as McGowen Avenue, then loop back on Travis Street, and an express bus line would be put on Main Street, to operate non-stop from the business district to McGowen Avenue. Then the buses would run, with stops arranged to permit fast service, to Eagle Avenue and beyond. This plan calls for the removal of the tracks beyond McGowen Avenue, as well as those used by the shuttle car beyond Eagle Avenue, but the shuttle track was to have been abandoned in any event because the cost of new track and paving beyond Eagle Avenue would have been prohibitive. A track connection at Clay Avenue was to be installed for turning short line and emergency cars. The cost of this change is estimated as shown in the accompanying table. The report points out that in this case diagonal parking would have to be given up on Main Street, in favor of parking parallel with the curb, and sufficient curb space would have to be left for bus stops.



The first choice of the Beeler Organization is to retain most of the track and install an express bus service on Main Street

The car lines in Houston now operate over 88 miles of track and 59 miles of streets. There are also six local bus lines, three of which reach the business district and three which operate as feeders to car lines. In addition,

TRAFFIC DATA IN HOUSTON, TEX.

Total in 1927		Percent Increase Since 1924 1924	1925	1926	1927
259,000	population	100.0	109.8	120.4	132.2
$3,003,365	passenger revenue	100.0	104.4	111.4	122.6
41,264,223	revenue passengers	100.0	104.9	111.0	108.6
35.7	car- and bus-miles per inhabitant	100.0	95.7	91.2	90.0
7.28	average fare in cents	100.0	99.8	100.2	112.9
$11.59	passenger revenue per inhabitant	100.0	95.1	92.3	92.5
51,824	automobile registration	100.0	115.2	130.3	142.8
200	automobiles per 1,000 inhabitants	100.0	105.2	108.2	108.2

there are ten express bus routes. Altogether, the bus routes cover 46 miles of street. The inauguration of express, or non-stop, bus service to serve districts beyond the zone of car or local bus service has met with success and apparently enjoys the unqualified approval of the patrons. The fast express service has been largely a development since 1925. It may have been a factor in checking the rapid growth of the automobile, as automobile registration per 1,000 inhabitants shows no increase in 1927 over 1926.

The tendency in Houston is to serve the district near the center of the city by car and those farther from the center by bus. Of the nineteen car lines radiating from the center of the city, eleven terminate near the 2-mile limit. Only eight go beyond, and of these only one operates any appreciable distance beyond the 4-mile circle. One of the three local bus lines terminates within the 2-mile circle, and the other two extend out about 2½ miles. Of the eight city express bus lines, only one terminates at a distance less than 3 miles out and three operate beyond the 4-mile circle.

The present rates of fare, effective June 12, 1927, are as follows:

On street cars and local bus lines, 10 cents cash with four tokens for 30 cents; the purchase of a 25-cent weekly pass enables the holder to ride on any local line for 5 cents each time; children and students may ride for 4 cents cash.

On express bus lines the fares are: 10 cents straight; children and students for 5 cents; free transfers connecting from express bus lines to all other lines. Passengers may receive transfers from local to express bus lines on payment of a 10-cent cash fare, or the payment of 2 cents in addition to any token, or a nickel cash fare. The charge for a transfer to children is 1 cent.

In 1928 the express buses will carry, in round figures, four million riders. These buses now average 2.7 passengers per bus-mile. As the total cost of this service, including interest on the investment, is 30 cents per bus-mile, it will be seen that the cost per passenger is 11 cents. In other words, the service is being conducted at present at a loss of 10 per cent. However, the territory served is newly developed and this handicap of a 1 cent loss per revenue passenger should speedily be overcome. An advantage of the express bus service is that it satisfactorily solves the rapid transit problem for years to come in an efficient and economical manner.

Bus Progress in China

BUS operation is making progress in China, though somewhat slowly, according to a foreign contemporary. The principal reason is the lack of good roads. Nevertheless, where fairly good roads exist, the automobile and bus are found in growing numbers. At the end of 1926, there were 26 omnibus companies in China, mostly in the northern part.

The first bus company in Shanghai was established in 1924 with a capital of about $500,000 and with buses purchased in England. Operation was begun on the basis of a fairly high fare and a seat for every passenger. But little business was done, however, until the fare was put down to about 1¼ cents per mile, and a standing load was carried. Then the company began to make money. The buses now owned number 52, and the routes operated vary from 2 to 7½ miles in length. The company employees about 450 men.

Shreveport Railway Pushes Ahead

By purchasing new equipment the company has overcome jitney competition and has increased its earnings and income

SHREVEPORT, La., has 80,000 inhabitants and the Shreveport Railways furnishes transportation there with 35 miles of track and 52 passenger cars. The company has overcome both jitney competition and the handicap of an inadequate fare, and during 1927 both its earnings and income were higher than in any twelve months period during the past five years. It tells its story modestly but clearly in its Coffin award brief prepared for the 1928 contest.

When the company first sought a higher fare in 1920 the increase was granted promptly by popular vote. Unfortunately for the company, a change in the state constitution made soon after required ratification of any fare change by a state commission and this was not granted. Finally, by appeal to the United States courts, an increase in fare from 5 to 7 cents was obtained, and was accepted without complaint by the citizens of Shreveport. Jitney competition was met by a steady policy of fair dealing and full publicity of the problems of the company through the newspapers and other available media.

During the past year the Shreveport Railways installed three 500-kw. automatic substations, which, with one already built, have permitted it to abandon its power station in favor of purchased power. The estimated saving in money is $500 per month. During the past year also it has built a new paint shop 200x30 ft. and installed a system of spray painting. By its means, one painter and helper do as much as was formerly accomplished by two painters and two helpers. The company has also purchased during the year two 52-passenger cars, equipped with treadle doors and suitable for one-man or two-man operation.

Its safety campaign is based on the plan adopted in 1924, by which any motorman or conductor who is in continuous service and for a period of a year has no accident, receives a gold star. Two such stars entitle the motorman, and three stars a conductor, to a new uniform. A new uniform is also given for each succeeding year of similar service. Under this arrangement during 1927, out of a total of 133 motormen and conductors, 100 earned a star, and 34 motormen and 31 conductors earned a uniform.

The amount of money paid by the company during 1927 for damages, including in this payment cost of the new uniforms given to the motormen and conductors, for yearly no-accident records, was $5,999. This is less than 1 per cent of the gross revenue.

Catenary type overhead with feeder-messenger is suspended from steel bridges

"Narrow Gage" Electrified

for Economy

Quicker, quieter and cleaner service now being given by Boston, Revere Beach & Lynn Railroad. Three-foot gage retained. Special motor constructed. Messenger feeder used in catenary type overhead

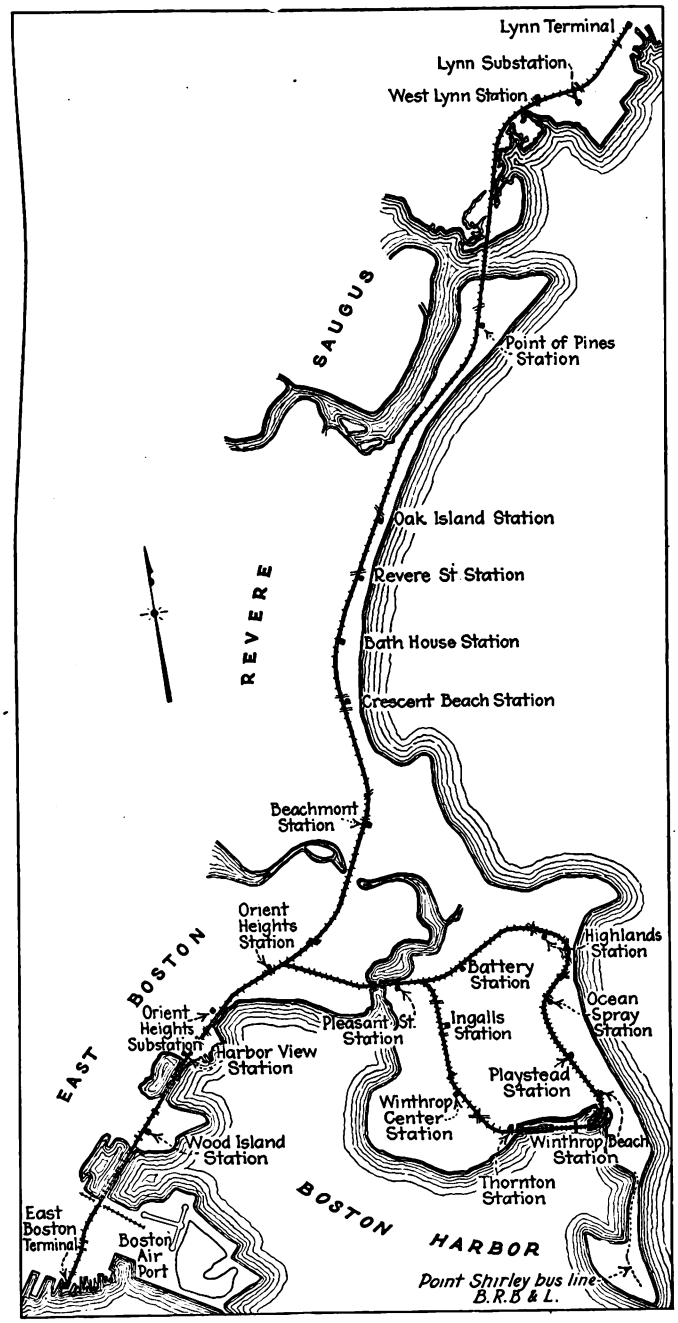
ECONOMY was the paramount consideration in the electrification of the Boston, Revere Beach & Lynn Railroad, Boston, Mass. At the same time the service has been made quicker, quieter and cleaner. As the electric trains move smoothly over the line, murmurs of satisfaction are heard from the passengers on every hand. To make possible this improvement in service, an expenditure of $1,400,000 was required which was divided in the following manner:

Car equipment	$610,000
Substations	152,000
Overhead structures, lines and feeders	277,000
Signal changes	90,000
Miscellaneous construction including engineering, interest charges, etc.	271,000

During rush hours, six-car units and express trains have been inaugurated. Throughout the day trains operate at an increased schedule speed and greatly decreased headway. The running time between Boston and Lynn has been reduced about one-third and the comfort and safety of passengers has been materially improved. At the same time, the number of cars in operation has been reduced from 96 to 67 and the 26 steam locomotives have been discarded. The essential principles of steam and electric operation are fundamentally opposite. In steam operation, on account of the cost of locomotives and minimum crews, the whole tendency is toward heavier trains and greater headway. In passenger transportation, shorter headways mean more passengers. With electric operation the trains can be broken up into smaller units running on shorter headways, thus giving faster service with less expense.

The Boston, Revere Beach & Lynn Railroad was planned 56 years ago, primarily to develop the land which now comprises the municipalities of East Boston and Revere. Service was inaugurated in 1875. What is now the Winthrop branch was originally the Boston, Winthrop & Shore Railroad, started in 1877, and merged with the Revere Beach Road in 1891. In November, 1927, the railroad was purchased by the Eastern Railway

Digitized by Google



The Boston, Revere Beach & Lynn Railroad electrified its entire system from the East Boston terminal, which is connected to Boston by ferries, to Lynn including the double-track loop to Winthrop. Substations are located at Orient Heights and Lynn

Associates, controlled by Hemphill & Wells, and American Equities Company.

Immediately upon acquisition of the property by the new owners, steps were taken toward electrification. There was an outstanding capital stock of $850,000 and 4¾ per cent first mortgage bonds amounting to $1,000,000. To finance the electrical program, the Massachusetts Department of Public Utilities authorized an issue of additional capital stock in the amount of 1,700 shares with a par value of $170,000 and $1,000,000 in 6 per cent, general mortgage bonds. Additional short-term notes were necessary to complete the financing.

As shown in the accompanying map the railway operates between Boston and Lynn with a branch line forming a loop through Winthrop. To connect Boston with the terminal in East Boston, three ferries are operated across

Slack adjuster	Form J

the harbor. The entire system is double track. Last year 13,350,000 passengers were carried. A total of 60 electric cars, seven trailer cars, and two electric service cars are operated over 13.12 miles of line having 34.48 miles of electrified track. The running time between Boston and Lynn has been reduced about ten or fifteen minutes, which is a saving of one-third of the time formerly required by the steam trains.

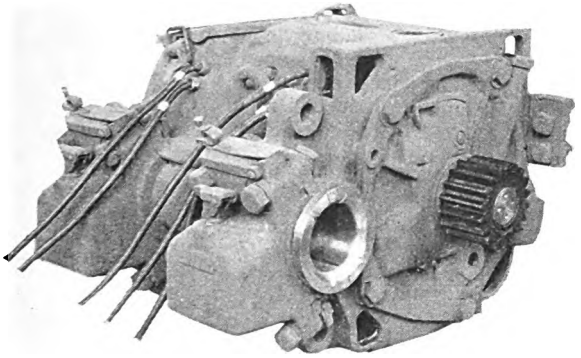
No new cars have been purchased. Sixty of the 96 passenger cars used in steam service have been remodeled and electrically equipped. Seven additional cars have been remodeled as trailers. The interior of each car has been refinished and small operating cabs built in each end. Each car has been equipped with 30 Consolidated 500-watt truss plank heaters connected fifteen in series on a circuit. The heating circuits are controlled by a Consolidated No. 213 switch mounted at the motor end of the car. Wiring has been installed for a thermostat to be placed in the center of the car. The lighting fixtures furnished by the Electric Service Supplies Company are the 1022 dome type, with short-circuiting sockets. Twenty of these dome fixtures with 32-volt lamps are connected in series in each car. A General Electric J-63 headlight can be attached to the front of each car by means of brackets arranged on the handrail. These headlights are equipped with 250-watt incandescent lamps controlled by a three-way switch located in the cab through a tapped resistance permitting dimming.

Motive power has been provided by replacing one of the old trucks with a new Brill 177-E2 truck equipped with two General Electric 295-A 600-volt railway motors. Because of the narrow gage these motors were especially designed for this installation. They are the four-pole, direct current, commutating pole railway motors for operation with tapped field on 600 volts. The weight of the motor complete with gear, pinion, gear cover, and axle bearing linings, is approximately 2,770 lb.

The frame of the motor is the box type with bar suspension. Longitudinal ventilating ducts are provided in the armature, which is keyed to the spider. The shaft can be replaced without disturbing windings or the commutator. The commutator is unusually narrow for a railway motor and its diameter is 14½ in. The depth of

Digitized by Google

the segments is approximately $\frac{3}{4}$ in., the segments being mica-insulated and grooved $\frac{3}{64}$ in. There are four brush-holders per motor, which are adjustable radially. Steel clock spring pressure fingers are centrally located by recessed adjusting sleeves which are clamped by the first turn of the spring. The carbon ways are renewable and each brush-holder is equipped with a $1\frac{3}{4}$-in.x$\frac{5}{8}$-in. brush. Because of lack of space, the commutator overrides the bearing on that end of the motor. Ventilation is produced by a multiple fan integral with the pinion end

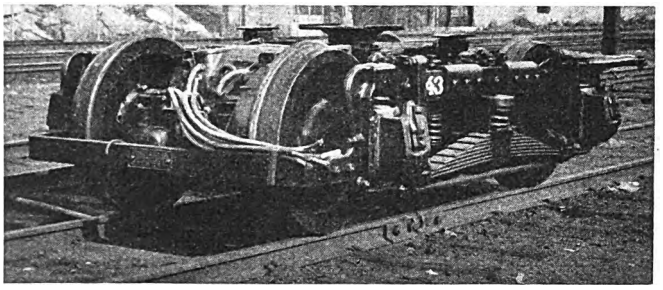


Because of the 36-in. gage the motors were specially designed by the General Electric Company

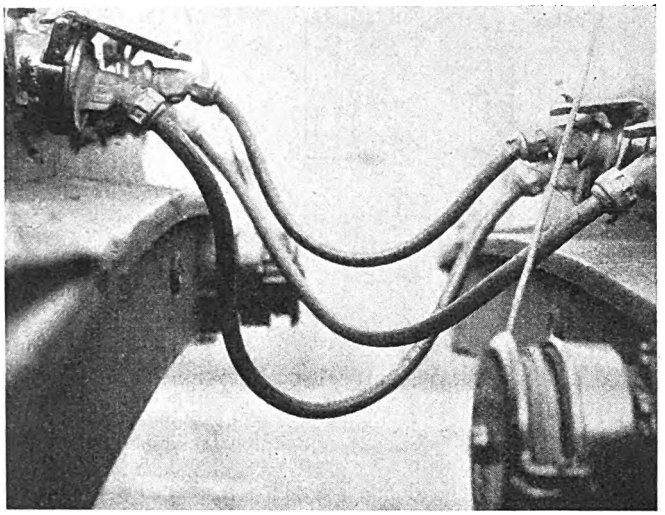
of the armature head. The air intake is through protected openings in the top of the commutator cover.

The cars are equipped with type M control for multiple-unit operation. Current is collected from the trolley by a Nuttal 11 ft. 4 in. pole. Current is carried down the car at the left-hand corner post on the motor end, to a main switch and a fuse box located underneath the car. This, in turn, is connected to a contactor box which is operated by a C-503-A master-controller located in the cab at each end of the car. A type ML form E-3 master governor is mounted under a longitudinal seat in the front end of the car and connected to a snap switch in the operator's cab.

Cables from the connection boxes mounted under the cars are carried up through the car framing to the roof and all electrical connections between cars are made overhead by means of coupler sockets located in the ends of the car roof. A No. 00 bus line runs from end to end of each car, connecting the trolleys and DA-35G bus line coupler sockets, located in the ends of the cars. With the exception of the heater circuits, no metal conduit is



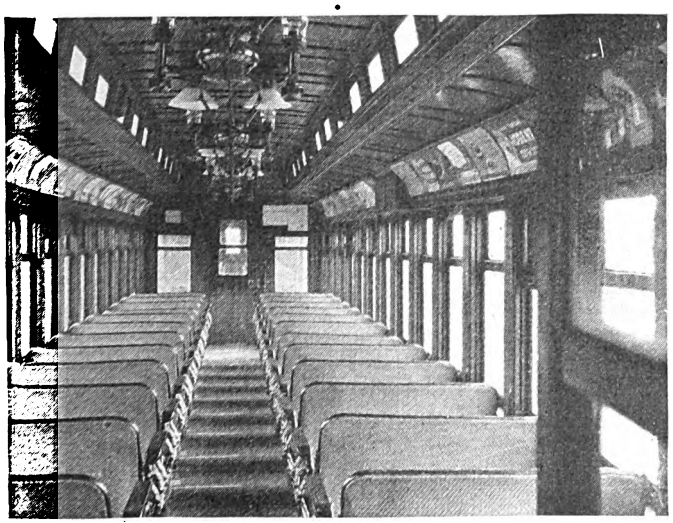
A two-motor Brill truck is provided for on each car

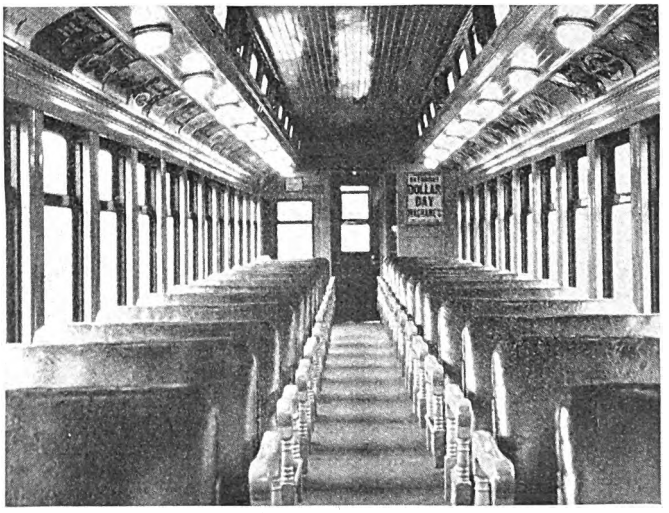


All electrical connections between cars are made by means of coupler sockets located in the ends of the car roofs

used in these cars. The control cables were grouped, taped and covered with a weather-resisting mulehide. The lighting circuits were run in wood moldings on the interior of the car mounted in the cove of the ceiling. The advertising signs are snapped in place over this molding, completely concealing it.

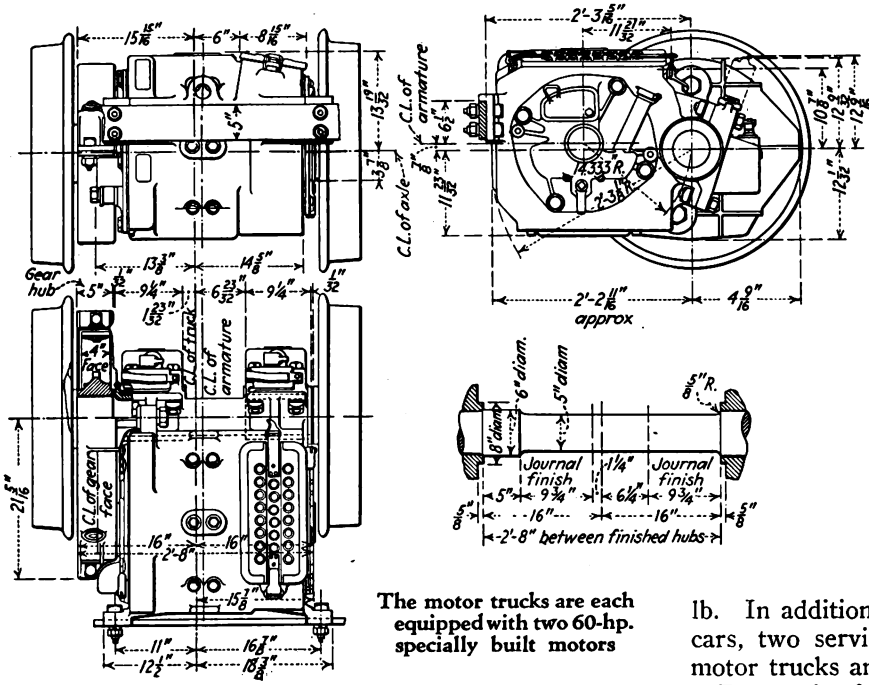
General Electric electro-pneumatic brakes are installed on each car. This equipment uses a brake valve, having an equalizing piston which functions to give a pneumatic service application if, for any reason, the electric brake is inoperative. There are five positions on the brake valve from left to right as follows: release, holding, lap, service, and emergency. In conjunction with this brake





At left, the old cars before electrification. At right, the same type of car refinished and electrified

Digitized by Google



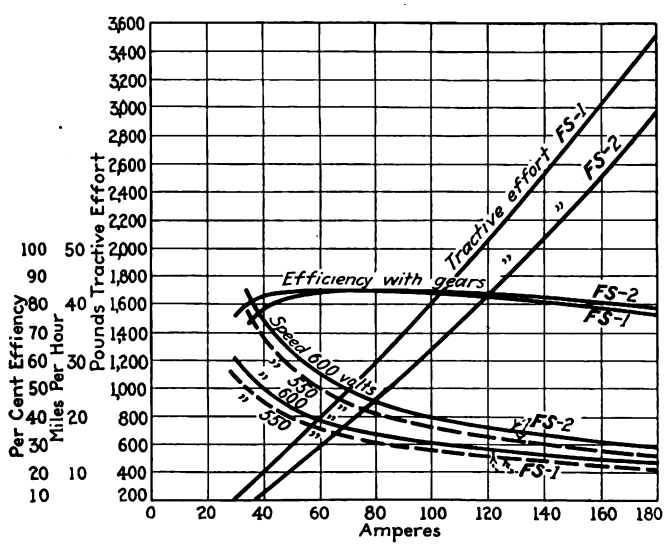
The motor trucks are each equipped with two 60-hp. specially built motors

valve is used a pneumatic duplex contactor. In release position of the brake valve the contactor is in neutral position. In holding position it is moved to the right and energizes the holding magnet. In lap, it is again in neutral position and in service or emergency position it is moved to the left and energizes the application magnet, causing the brake pipe reduction to take place at the application valve in service position, and at both the brake valve and application valve in emergency position.

In electric operation of the brakes, a service application is made in the regular way, and after the proper brake pipe reduction is made, the handle is returned to the holding position. In this position of the brake valve handle, the triple valve goes to release position, but the release or holding wire is energized by the contactor which, in turn, energizes the holding magnet and retains in the brake cylinder any air that has been admitted. The brake may then be graduated off by moving the brake valve handle between the holding and release position. The graduating actually being accomplished by energizing and de-energizing the holding magnet, which in turn seats and unseats the release valve in the magnet bracket.

In making an electric service application, the equalizing piston does not move as brake pipe air is being taken from the under side of the piston, past the application magnet valve, as rapidly as the equalizing reservoir air is being taken from the top of the piston. In making a pneumatic service application, no brake pipe air is taken from the underside of the equalizing piston, while equalizing reservoir air is depleting to atmosphere and consequently the higher brake pipe pressure raises the equalizing system, allowing the brake pipe air to escape to atmosphere at the brake valve. Brill brake rods and brake beams are used.

The cars, completely electrically equipped, weigh approximately 52,000 lb. In addition to the 60 electric cars and seven trailer cars, two service cars were equipped with two double motor trucks and using the type K-35-JJ control.



Characteristic curves of the motor operating with a gear reduction of 3.77 and 30 in. wheels. FS-1, full field and FS-2, tapped field

Power is furnished through two substations, one located at Orient Heights and the other at Lynn. The Orient Heights station is supplied by the Edison Electric Illuminating Company and the Lynn station by the Lynn Gas & Electric Company. The Orient Heights station furnishes power to all lines. The two 600-volt trolley wires from this station to East Boston are furnished with power by this station only, when under normal operation. The two trolleys from the Orient Heights station to Lynn are furnished power by both stations. The two trolleys on each of these sections are bonded about every ½ mile. The Winthrop loop is furnished power by the Orient Heights station and each trolley wire is completely insulated from the other. Any section of the line may be supplied by either station or a portable station. A 2,300-volt line parallels the track furnishing power to the signal system and other power apparatus.

The substation at Orient Heights is of the automatic type and contains two synchronous railway converter sets, of 650-volt, 1,000-kw. capacity. This station has four d.c. stub multiple-feed reclosing feeders, 650 volts, 2,000 amp., and one d.c. stub feed reclosing feeder 650 volt, 2,000 amp.

The two a.c. 13,800-volt incoming lines are provided with manually operated breakers which are tripped only on reverse current overload, indicating a line fault or a severe overload on the 13,800-volt bus or transformers.

An unusual feature in this substation is the system of ventilation. A steel housing is constructed over each machine, similar in shape to a blower housing. The rotation of the converter causes a draft of air to flow through this housing into a cavity in the floor. The air passes from this to a funnel leading to the ceiling. The warm air from the converter freely rises through the funnel and is expelled through the roof. A damper regulates the degree of temperature maintained. These housings are built in sections and bolted together so that they can be dismantled easily without disturbing the machine. The framework is built up of angles and covered with No. 8 sheet steel. The stack is covered with No. 18 sheet steel.

The substation at Lynn consists of a 1,000-kw., 650-volt converter set which is housed in the power house of the Lynn Gas & Electric Company. This substation is

Digitized by Google

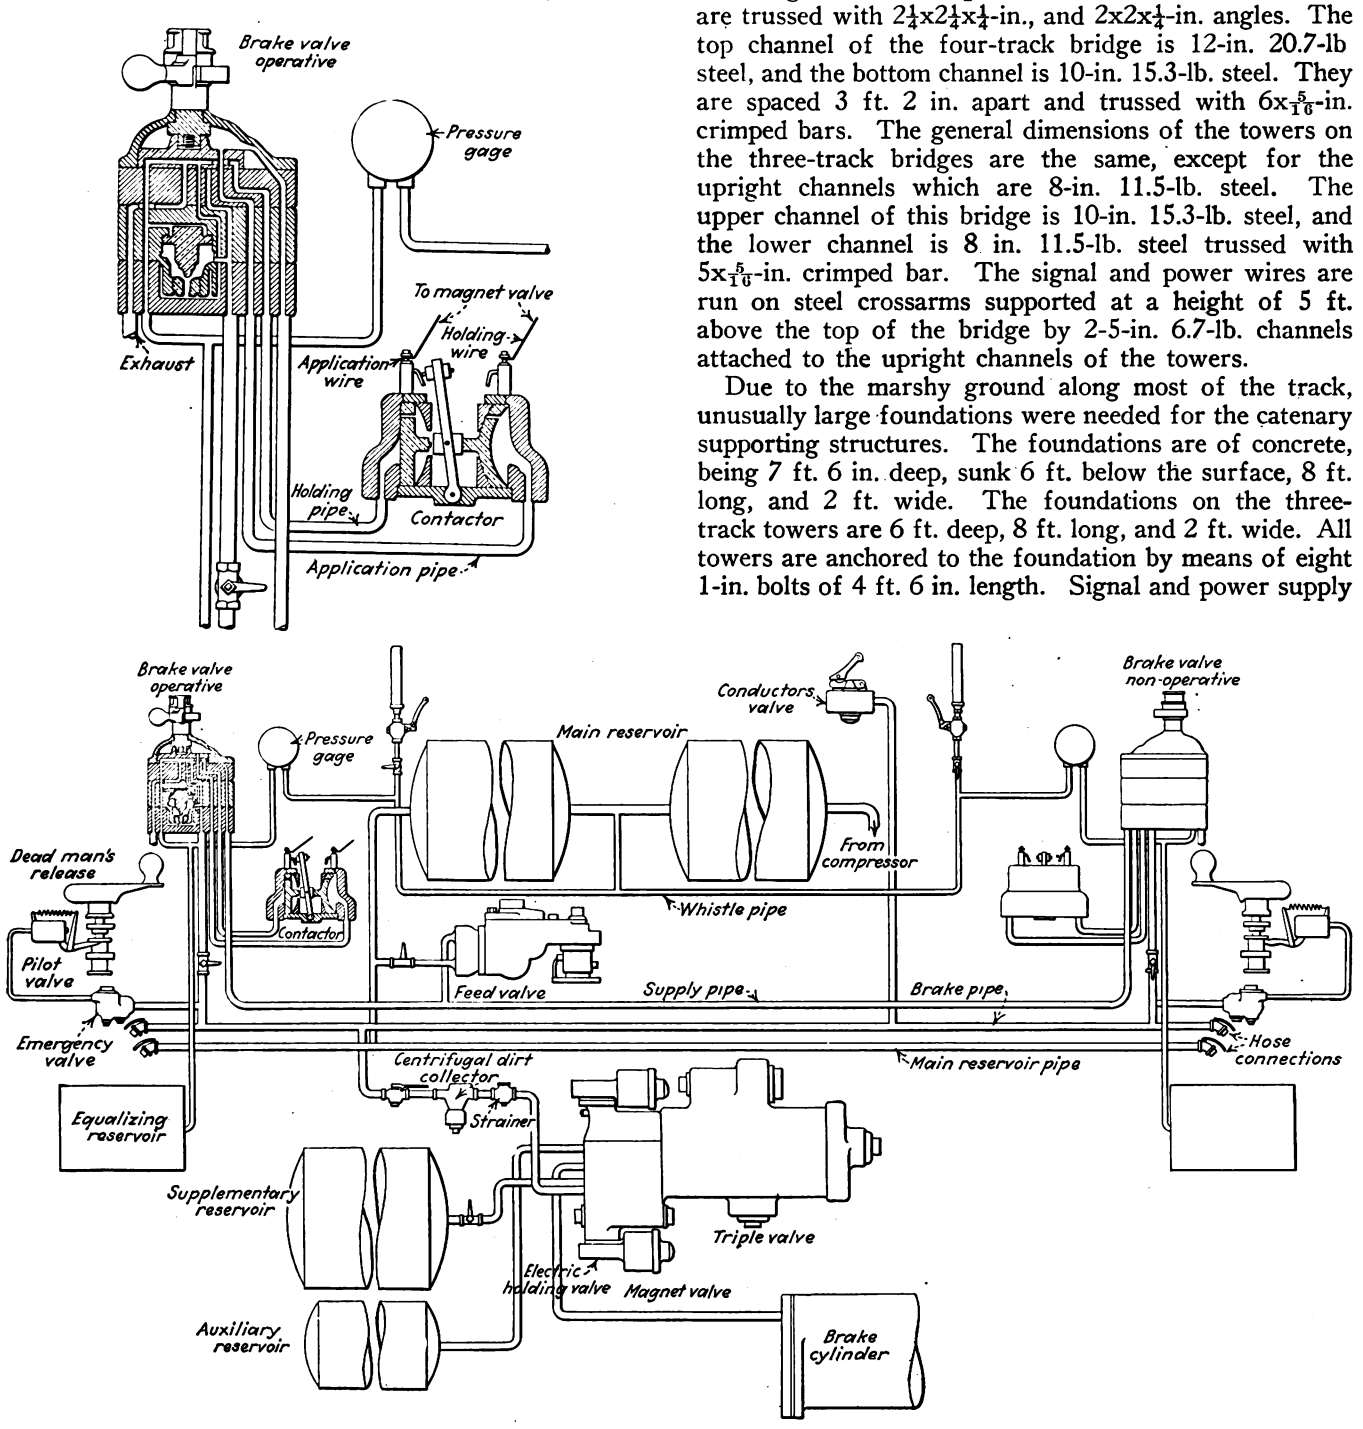
arranged for manual operation only, and is operated by the electric company's forces at a fixed charge.

A portable substation is arranged to be connected to the line at either Orient Heights or the Lynn substation, as the 13,800 feed is available at these points. This substation consists of a 1,000-kw. unit of the manually operated type mounted in a cab on a steel car. The transformer and oil circuit breakers are mounted on the car outside of the cab, making it a complete portable unit. The estimated power consumption per year for the line is about 10,000,000 kw.-hr. The Lynn Gas & Electric Company will furnish 2,500,000 kw.-hr. of this and 7,500,000 kw.-hr. will come from the Edison Electric Illuminating Company.

The line installation presents a number of unusual features. The actual construction work performed under many handicaps and in record time without seriously interfering with the normal flow of traffic. Throughout the day trains operated on a fifteen-minute schedule, and during the morning and evening rush hours, work was interrupted by passing trains every ten minutes. For this reason, a large part of the construction program was carried on at night. Between the hours of midnight and 6 a.m. the trains operate on an hourly schedule, thus permitting the delivery of materials and equipment by a special night work train.

The catenary supporting structure consists of 262 corrosion-proof steel bridges, spaced at a maximum distance of 300 ft. The towers of the four-track bridges consist of 10 in. channel, 15.3 lb., tapering from 6 ft. centers at the base to the center of the top bridge channel at a height of 22 ft. 6½ in. above the rail. The towers are trussed with 2¼x2¼x¼-in., and 2x2x¼-in. angles. The top channel of the four-track bridge is 12-in. 20.7-lb steel, and the bottom channel is 10-in. 15.3-lb. steel. They are spaced 3 ft. 2 in. apart and trussed with 6x$\frac{5}{16}$-in. crimped bars. The general dimensions of the towers on the three-track bridges are the same, except for the upright channels which are 8-in. 11.5-lb. steel. The upper channel of this bridge is 10-in. 15.3-lb. steel, and the lower channel is 8 in. 11.5-lb. steel trussed with 5x$\frac{5}{16}$-in. crimped bar. The signal and power wires are run on steel crossarms supported at a height of 5 ft. above the top of the bridge by 2-5-in. 6.7-lb. channels attached to the upright channels of the towers.

Due to the marshy ground along most of the track, unusually large foundations were needed for the catenary supporting structures. The foundations are of concrete, being 7 ft. 6 in. deep, sunk 6 ft. below the surface, 8 ft. long, and 2 ft. wide. The foundations on the three-track towers are 6 ft. deep, 8 ft. long, and 2 ft. wide. All towers are anchored to the foundation by means of eight 1-in. bolts of 4 ft. 6 in. length. Signal and power supply



In conjunction with the brake valve of the electro-magnetic brakes a pneumatic duplex contactor is used which energizes the holding or application magnets

This portable substation may be connected to feed any section of the line

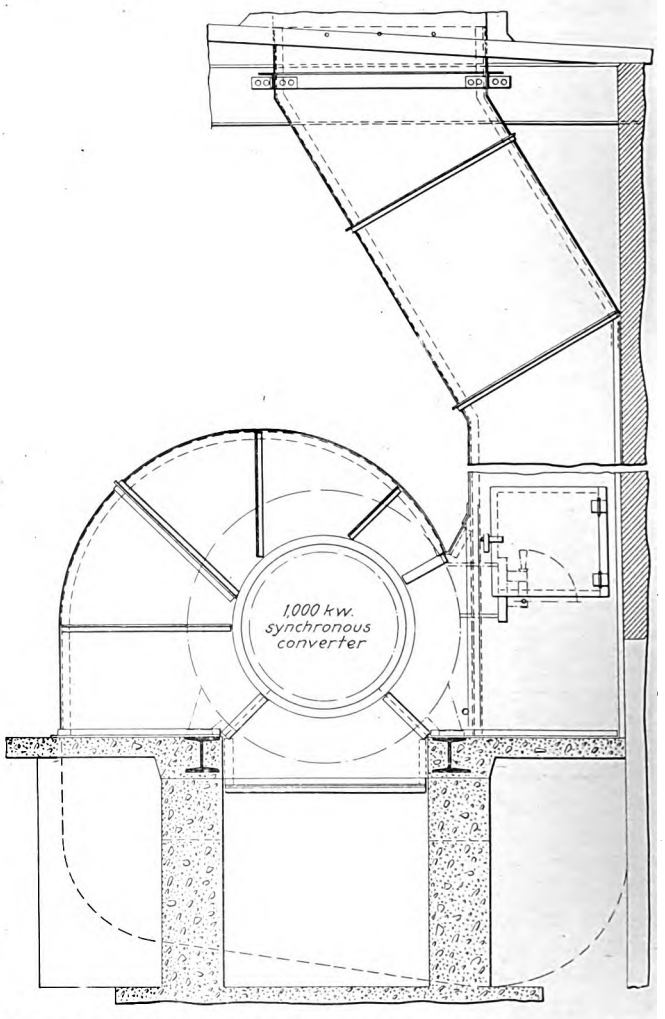
wires are carried on crossarms supported at a height of 5 ft. above the top of the bridge by two 5-in. 6.7-lb. channels attached to the upright channels of the tower.

To hold the trolley wire over the track on curves, steel pull-off poles were installed. These were set on concrete foundations at an angle, and laterally braced, no back-bracing being used. In all, 161 of these poles were used ranging in height from 18 ft. to 23 ft. 6 in.

For the reason that the required feeder cable had sufficient strength to support the No. 0000 grooved trolley wire, a 500,000 c.m. copper cable was used as both messenger and feeder for the entire system. Hitenso trolley wire was used, consisting of 99½ per cent bronze and ½ per cent cadmium. The messenger and trolley wire are bonded about every 600 ft. All hangers and castings are of non-ferrous material.

In the yards and siding, the overhead is direct suspension type. To prevent corrosion, all span wires are of red brass. No copper ground return is used on the system, the track being depended upon for the return. This is possible because all of the tracks are on a private right-of-way and there are few paralleling pipe lines to cause electrolysis.

The insulators supporting the messenger are G-E No. 294698, consisting of General Electric metal parts cemented to Locke insulators. The insulators supporting the short feeders running from the Orient Heights substation to the Winthrop branch lines are supported on this same type of insulator. The span wire insulators are Locke guy strain insulators No. 7664. The 2,300-volt signal and power supply line is carried on Locke 8,000-volt pin-type insulators No. 12. Due to the large number of overhead highway bridges crossing the track, about ½ mile of wood troughs for the trolley wire had to be installed.



A housing is built over each rotary converter in the Orient Heights substation, making possible proper control of ventilation and temperature

Cars and Buses Dispatched by Telephone

A number of advantages follow the use of the telephone for dispatching in city service, as employed in San Antonio, Tex.

IN THE issue of Nov. 3, a brief reference was made to the practice in San Antonio, Tex., of dispatching cars and buses by telephone. This is an important feature of car and bus operation in that city. In fact the whole plan of service, according to the company's Coffin prize brief this year, is built around the company's telephone dispatching system. Particulars were given in these pages several years ago, but so much stress is laid by the company in its brief on the advantages of the plan that a more extended account will be published.

The dispatcher's office is located in the main office building near the superintendent of transportation, chief dispatcher, claim department and other offices. One P.B.X. board here is provided with direct connections to telephone stations at the end of each car and bus line, at main points along the route and at points of advantage downtown. This furnishes a network of direct channels of communication from the dispatcher's office to the train crews and to the supervisors on the entire system.

Train crews and bus operators are required to report to the dispatcher whenever they reach either end of each line. The dispatcher then makes a daily record of all such arrivals, so that he has a complete record of all car and bus operations on his "dispatcher's train sheet." On this sheet he shows the exact time that each car or bus reports at the ends of their respective lines throughout the day, as well as the time they are scheduled to be there. In case a car or bus is cut back short of the end of its route, the point on the line that the car was cut back is shown on the train sheet. Line set-backs, extra service, car changes, etc., are also recorded on this sheet, so that at the end of a day it shows not only the scheduled operation as planned, but the actual operation as to car spacing, delayed cars, extra service used, car failures and the effects of any interruption to service.

All dispatching orders are written, whenever possible. Owing to the nature of the business done, however, as the cars are in city service and the buses are not confined to a track, the dispatching procedure followed does not have to be as rigid as on a steam railroad or interurban line. Trainmen are encouraged to think for themselves and use their judgment in case of an emergency, even turning back, if necessary, though if this is done they are expected to notify the dispatcher of their action as soon as possible.

A necessary change in the service can be ordered by an inspector in emergencies, or he can request telephone authority for such a change from the dispatcher, who has authority to order the change first and then write the confirming order.

Telephone Has Other Uses as Well

The telephone system is not used exclusively for dispatching. All reports and all messages from the supervisor and trainmen regarding daily operation, such as car trouble, track and overhead trouble, accidents and blockades, come to the telephone dispatcher, who notifies the proper department. When doing so he gives the location and nature of the trouble and follows up this message with a written order. The dispatcher also keeps in contact with the tower wagons and track crews which are out working on the line, so that in case of trouble he can get in touch with them immediately.

As already explained, it is a rule that messages and orders regarding service or changes in service, or any message pertaining to the operation of cars, must go through the telephone dispatcher's office. In other words, the dispatcher's office acts as a message center and headquarters of operation.

The dispatching system also plays a large part in the system of checking up on what each man is doing. The fact that each trainman calls up at the end of the line not only serves as a check on his operation, but it encourages him to make every effort to reach his terminus and telephone in on time. Trainmen's times are also checked by road supervisors from time to time at different points along the line.

Advantages of Telephone Dispatching

The company lists eleven advantages of the company's system of telephone dispatching. Briefly, they are as follows:

1. The fact that each operator or motorman comes in direct contact with the main office once each trip stimulates his desire to run his car on time.

2. The system is popular with the trainmen because each knows that the man ahead of him cannot leave the end of the line ahead of time and so require him to carry an overload.

3. Knowledge of conditions permits the dispatcher to anticipate delays in time to prevent them. Thus, if a car is late, the dispatcher can get in touch with an inspector, who will help the operator get his car back on time before it gets completely out of schedule. Mechanical troubles with cars are reported by trainmen while they are calling in to the dispatcher. These troubles can then be fixed before they cause a delay. The same is true of track conditions and broken span wires.

4. Quick communication gives prompt knowledge of delays. Supervisors do not have to wait until they discover an exceptionally late car to surmise that there is trouble.

5. The means at hand permit quick rectification. The inspector can quickly summon car wagons, track crews, inspectors or an emergency trouble car and can order cars out of the barn to fill open spaces immediately.

6. The plan allows higher speed, because very little allowance need be made for delays, since the dispatcher can anticipate the delay in service or immediately install service after the delay. It is believed that over-all schedule speed, at least 10 per cent faster than would otherwise be possible, may be obtained by the use of telephone dispatching.

7. The system relieves lines inspectors of a great deal of their routine work of schedule supervision and permits a smaller number who can devote a greater amount of their time to instruction work and giving special attention to any men who are having difficulty.

8. Constant contact with the inspectors permits the dispatcher to get in touch with several of them more promptly to handle critical situations, and in emergencies concentrates them where they can do the most good.

9. Emergency crews may be kept constantly in production work yet be available for emergencies. The company believes that the saving in this factor alone more than pays for the entire cost of operation of the dispatching system.

10. Reports of accidents are transmitted immediately to the claim department because the train dispatcher can connect the trainmen directly with that department. This gives the claim department the advantage of immediate information.

11. The dispatcher's train sheet gives a complete record of the operation, both as to the movement of cars and of trouble.

Study of these train sheets on the causes of delay have been the means of greatly reducing the number and time of delays, as well as the number of late cars.

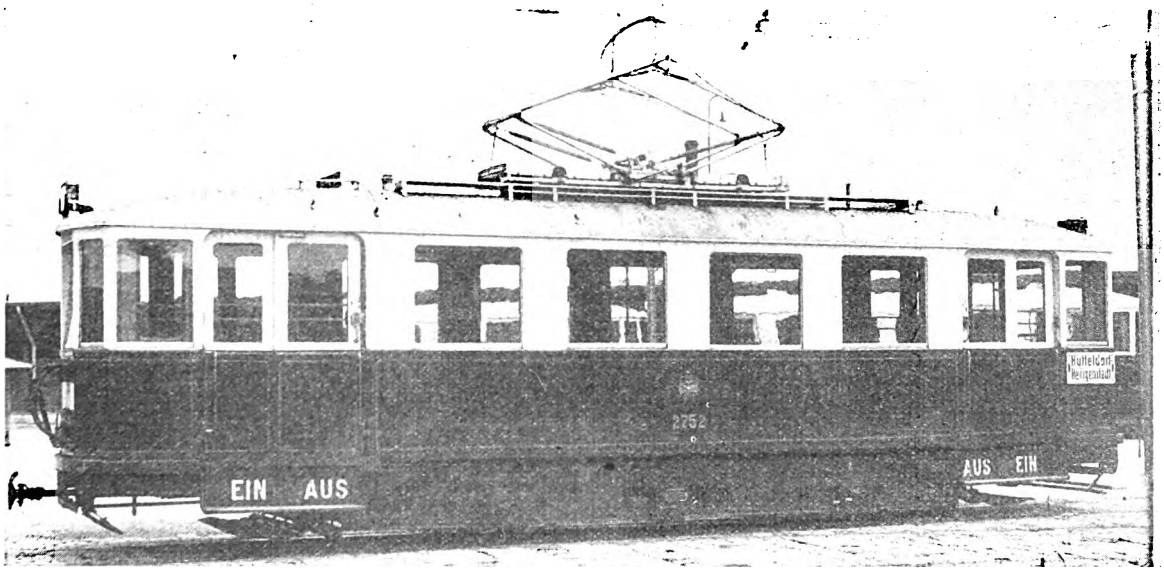
How Vienna Tramways

Handled the Schubert Festival

Transportation of an extra 100,000 persons to concert hall proved easier than moving a smaller football crowd. A review of Vienna's present facilities and traffic is included

By Walter Jackson
Fare and Bus Consultant



Standard motor car for surface lines in Vienna

ONE OF the mightiest musical gatherings of modern times occurred at Vienna during July, 1928. It was held to honor the centenary of Franz Schubert, who died 100 years ago at the early age of 31 years with a most astounding number of famous compositions to his credit. German singing societies came from all over the world to his native city for the event.

The concerts were given in a temporary hall holding 80,000 people. This hall was built on a meadow in the famous "Prater." This is a great chain of public parks, including a host of amusements, similar to those at Coney Island. The site was a fortunate one for the Vienna Municipal Tramways, which had provided station and storage facilities here in past years for handling amusement crowds. The storage capacity of the main terminal alone, known as the Hauptallee, was equivalent to 48,000 passengers.

The estimated number of visitors to the city was from 150,000 to 200,000, including 34,000 to 40,000 singers! During the peak of the festivities July 19-22, more than 100,000 persons had to be transported to and from the "Saengerhalle." To prevent interference with free car movement on the Hauptallee line, an underpass was constructed for pedestrians, and all cross travel over the tracks was forbidden by the police. The station was lengthened to 750 m. (2,445 ft.). As a result, it was possible to handle 120 three-car trains each way in an hour. Most of Vienna's cars seat only 24, but the regulations permit a maximum of 75 standees, 25 on each platform and 25 within the car body. The actual load per train varied from 160 to 180, and the traffic amounted to about 23,000 passengers per hour.

At one Praterstern terminal, five minutes' walk distant, 114 trains with 274 cars an hour carried another 16,000 people. At a second Praterstern terminal, 40 trains made up of 100 cars were available for another 6,000 patrons. A single route at Schüttelstrasse ran 24 trains with 48 cars to carry 3,000 passengers.

Thus it was possible to move 48,000 passengers an hour, of whom 34,000 were brought within easy reach of the concert hall.

Although this business, including general amusement riding, meant an addition of 500,000 rides a day to an average of 2,000,000, it was handled with remarkably little extra cost because most of it came outside the industrial peaks. No new trackwork was required, although a bridge was strengthened and the main station was enlarged. The chief item of expenditure was 10,000

Personal pass with symbols on the picture side to show sections and areas in which the pass is valid. The names of these areas are written out on the side of the pass carrying the owner's name, address and signature

schillings ($1,400) for additional ticket-selling facilities. Shortage of transportation personnel was avoided by suspending all vacations between July 15 and 22. On their own account, also, the men volunteered to work more than the customary hours so that the visitors would feel that even under stress Vienna's transportation system was as efficient as it always has been courteous.

A gratifying feature of the traffic on the music festival days at the Prater was the absence of the sharp peaks that characterize such mass handling as a football crowd. The singers themselves began to arrive for rehearsal early in the morning and they would stay through to the night since there were plenty of restaurants near.

Many concert auditors also came an hour or two ahead of time to amuse themselves on the Ferris wheel, merry-go-round and miniature railway. The end of the concert did not see the Viennese rushing homeward with one mad impulse. Many preferred to stroll through the woods or to enjoy themselves on the various amusements before returning.

Specially marked dash signs in green paint were placed on all cars bound for the concert area. To aid the visitors further, two leaflets were distributed wherever visitors were likely to be. One leaflet dealt entirely with the routing and "last car" data during the five days July 18-22 when night services were extended 2½ hours. The second leaflet was prepared to speed the parting guests in helping to learn just what routes served the different steam railway stations and gave particu'ar care to night-train connections.

During the choral period, the Vienna Municipal Tram-

ways also operated 230 special trains so that groups of singers could be transported en masse between their living quarters and the concert hall.

One fare novelty inaugurated early in 1928 was the sale of three-day, unlimited-ride, transferable passes for the special accommodation of tourists. For many years, the Vienna Municipal Tramways has sold non-transferable passes at a cost well under two ordinary fares a day. This was the first time, so far as the writer recalls, that Vienna passes were sold on the American basis of charging more than two full fares a day. This pass proved popular with the visitors because it relieved them from bothering with transfer regulations and the annoyance of paying extra fares for mistakes. Most Vienna fare receipts, serving also as transfers, have more or less arbitrary number markings that are a mystery to all but the regular rider over a given route.

Vienna Rolling Stock and Services

It has been mentioned that the extra business incident to the Schubert Festival was not allowed to disrupt the customary transportation of a city of 1,860,000 inhabitants. Although the average age of Vienna motor cars is nearly twenty years and only 50 motor cars (two 70-hp. motors) were new, the peak period found 97 per cent of the equipment on the job as against a normal ratio of 87 per cent.

For the city surface lines, which comprise 288 km. (179 miles) of route or 600 km. (372 miles) measured as single track, there were on hand 1,498 motor cars and 1,827 trailers. These are operated in two-car and three-car trains with one car reserved for smokers. There are 76 routes designated by letters or numbers. The average schedule speed is 9.9 m.p.h. with stops spaced 400 m. (1,312 ft.) apart.

TABLE SHOWING PASSENGERS CARRIED AND CAR-KILOMETERS RUN BY VIENNA MUNICIPAL TRAMWAYS

	Passengers Carried in Millions	Car Kilometers in Millions
1919 (a)	560.713	88.759
1920 (a)	481.495	86.556
1921 (a)	494.902	99.783
1921 (b)	272.985	54.166
1922 (c)	440.754	104.133
1923 (c)	458.475	108.412
1924 (c)	567.384	124.287
1925 (c)	601.510 (d)	141.006
1926 (c)	615.065 (d)	152.738

(a) Year ended June 30. (b) Six months ended Dec. 31. (c) Year ended Dec. 31. (d) Includes Stadtbahn.

The rolling stock of the system has shown a continuous, though slow, increase during the past fifteen years. This increase has been due in part, of course, to the co-ordinated operation of the electrified Stadtbahn. Thus at the end of 1913 the system comprised 1,451 motor cars and 1,550 trail cars.

The city cars are 11.6 m. (38 ft.) long over all, 6.1 m. (20 ft.) long over the seating compartment, 3.6 m. (11.8 ft.) wheelbase and 2.24 m. (7.34 ft.) wide. Their average weight is 29,370 lb. Bow collectors are used with a line potential of 600 volts.

For the Stadtbahn, which is an electrified belt and suburban railway with 26.5 km. (16.4 miles) route or 61 km. (37.8 miles) single-track measurement, there were on hand 180 motor cars and 230 trailers. These cars are operated in trains of five to nine cars at running speeds up to 40 km. (24.8 miles) per hour and schedule speeds up to 24 km. (14.9 miles) per hour. Pantograph collectors are used for the line potential of 750 volts.

During the summer of 1928, the motorbus operation of the Vienna Tramways was still confined to the trackless center of Vienna, "The Inner City," except for a single motor bus line in the northern portion of the city and a short trackless trolley line connecting with this suburban bus line. In 1927, 34 buses were operated over 26 km. (16.1 miles) of route. Some of these routes were only 800 m. to 1,000 m. (2,624 ft.—3,280 ft.) long, yet the two-minute to four-minute headways and extremely low fares of 9—10 groschen (1.26 cents —1.40 cents) produced 22 passengers per bus-mile! Before the end of 1928, the Vienna Tramways expected greatly to enlarge its bus operation through the development of a series of express and pleasure routes to suburban areas.

In round numbers, the relative importance of each class of traffic during 1927 was as follows:

Street railways, 630,000,000 passengers with 138,000,000 car-km. (85,560,000 car-miles) or 7.3 passengers per car-mile.
Electrified stadtbahn, 100,000,000 passengers with 21,000,000 car-km. (13,020,000 car-miles) or 7.7 passengers per car-mile.
Motorbuses, 11,400,000 passengers with 837,000 car-km. (518,940 car-miles) or 22 passengers per bus-mile.

A peculiar feature of the Stadtbahn is the fact that but 10,000,000 to 12,000,000 of the 100,000,000 riders did not use surface line transfers. At the height of its pre-war business, when operated as part of the State Railways, the Stadtbahn carried only 40,000,000 riders a year. It is apparent, therefore, that operation of this line, in conjunction with the surface lines, has greatly increased the value of the Stadtbahn through permitting travelers to make combinations that will save time.

The Stadtbahn is leased for 30 years from 1924, though with the right of the Government to cancel the lease after ten years. Under this lease the Vienna Municipal Tramways supplied rolling stock that can be used on the surface lines should this become necessary.

Rail Replacement in Hawaii

Honolulu Rapid Transit replaces 5,000 ft. of 70-lb. A.S.C.E. T-rail track with 122-lb. Trilby rail

By E. de Harne
Roadmaster Honolulu Rapid Transit Company

NOT LONG AGO the Honolulu Rapid Transit Company decided to renew the rail on about 5,000 ft. of track in paved street. The old track built in 1917 consists of 4⅝-in. 70-lb. A.S.C.E. T-rail, laid on wood ties. The original ballast was set deep enough to permit re-railing this section of line with a 7-in. rail. The old paving between the tracks was of concrete with a line of wood blocks inside each rail. Wood blocks were used outside both rails.

The new track, which the company decided to lay, consisted of 7-in. 122-lb. grooved rail of the Trilby section, laid on creosoted redwood ties. To this rail the fish plates were seam-welded and the nuts of the bolts were spot-welded to the plates. No bonds were used. Concrete paving 7 in. deep was installed, carried to additional depth of 4 in. under the rails and between the ties. An asphalt squeegee surface was applied.

Since the grade had to be lowered, 2⅜ in. re-railing had to be done at night while the cars were not running. This was accomplished by removing the old rail and installing the new rail for 500 ft. of track each night by a force of twenty men and a 1-ton Fordson tractor crane. The Fordson crane, used for the first time for handling all rails, resulted in a big saving in track and roadway labor. The rails were hauled to the job with a flat motor car. Six weeks were required to complete the job, and the cost was found to average $6.94 per linear foot. Track and roadway labor averaged $0.86 per linear foot, and total labor $2.28 per linear foot.

Freight Is Principal Subject at Coming C.E.R.A. Meeting

SEVERAL men prominent in the industry, headed by J. P. Barnes, president of the American Electric Railway Association, have been secured to address the Central Electric Railway Association, which convenes in Indianapolis, Ind., on Jan. 24-25, 1929. Addresses will be delivered on the opening morning by Mr. Barnes, L. Ert Slack, Mayor of Indianapolis, W. S. Rodger, general traffic manager Eastern Michigan Railways, and R. N. Van Doren, vice-president and general counsel, Chicago & Northwestern Railway.

The afternoon of the first day has been set aside for the general subject of freight. Following a report of the committee on pick-up and delivery of freight, a paper will be read on "The Trend in the Development of Pick-Up and Delivery Freight Service," by L. G. Tighe, assistant general manager Northern Ohio Power & Light Company. D. R. Thomas, president of the Electric Railways Freight Company, will present a paper on "Advantages of Freight Consolidation."

Papers to be presented at the second day's session include "Traffic and Schedule Making," by J. R. Ong, transportation engineer Cincinnati Street Railway; "Interurban Operation, Possible Economies and New Methods," by C. T. Dehore, president Indianapolis & Southeastern Railroad, and "Personnel," by W. P. McCarter, supervisor of instruction Milwaukee Electric Railway & Light Company. These will be followed by the reports of committees and affiliated associations, and election of officers. The association dinner and dance are to be held on the evening of the first day.

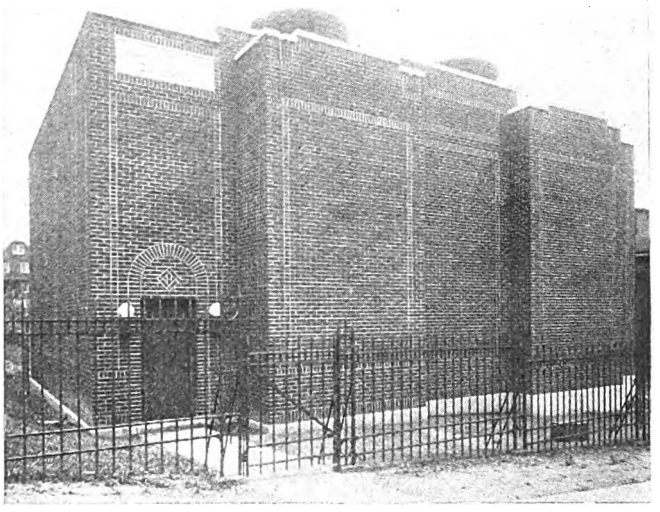
The executive committee of the association will hold two meetings at Indianapolis, one preceding the opening session of the convention and another after adjournment of the final session on the second day.

Attractive Substation Serves Four Pittsburgh Lines

By M. R. Sumner
General Superintendent of Construction
Byllesby Engineering & Management Corporation, Pittsburgh, Pa.

NO SACRIFICE of attractiveness was made by the Duquesne Light Company in constructing its new Maple automatic substation, even though the structure was built economically. It was erected in a residential section but is a distinct asset to the neighborhood. The building itself is well designed, but to add to the appearance an ornamental iron fence was erected along the front of the lot.

Located in Wilmerding, Pa., about 12 miles from Pittsburgh, this railway substation supplies current to



An ornamental iron fence adds to the attractive appearance of the new building

TABLE I—EQUIPMENT OF THE MAPLE SUBSTATION OF THE DUQUESNE LIGHT COMPANY

Starting and running oil circuit breakers, type B-2, three-pole, single throw, complete with contactors and operating mechanism.
Load limiting resistors 0.030 ohms, 4 units.
Field discharge resistor, 2 units.
Synchronous converter, six-phase, shunt-wound.
Potential transformer, outdoor, three-phase, 22,000-11,000/110 volt.
Air break switch, three-pole, single throw, motor operated, type PM.
Air break switch, three-pole, single throw, gang operated, with grounding blade, type PM.
Air break switch, three-pole, single throw, gang operated, type PM.
Switchboard complete for control of two 1,000-kw. synchronous converters.
Storage battery, 60-cell, type OG-13.
Battery charging set, one-phase, 60-cycle, 220-volt motor and 140-volt d.c. generator.
Air compressor.

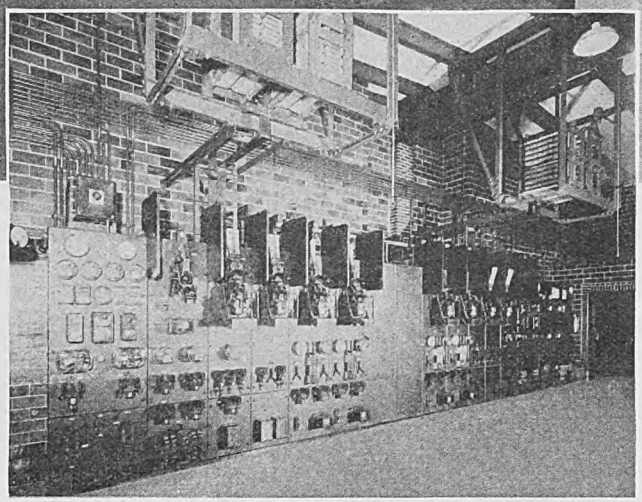
Four outlying lines of the Pittsburgh Railways are supplied with current from the two 1,000-kw. synchronous converters

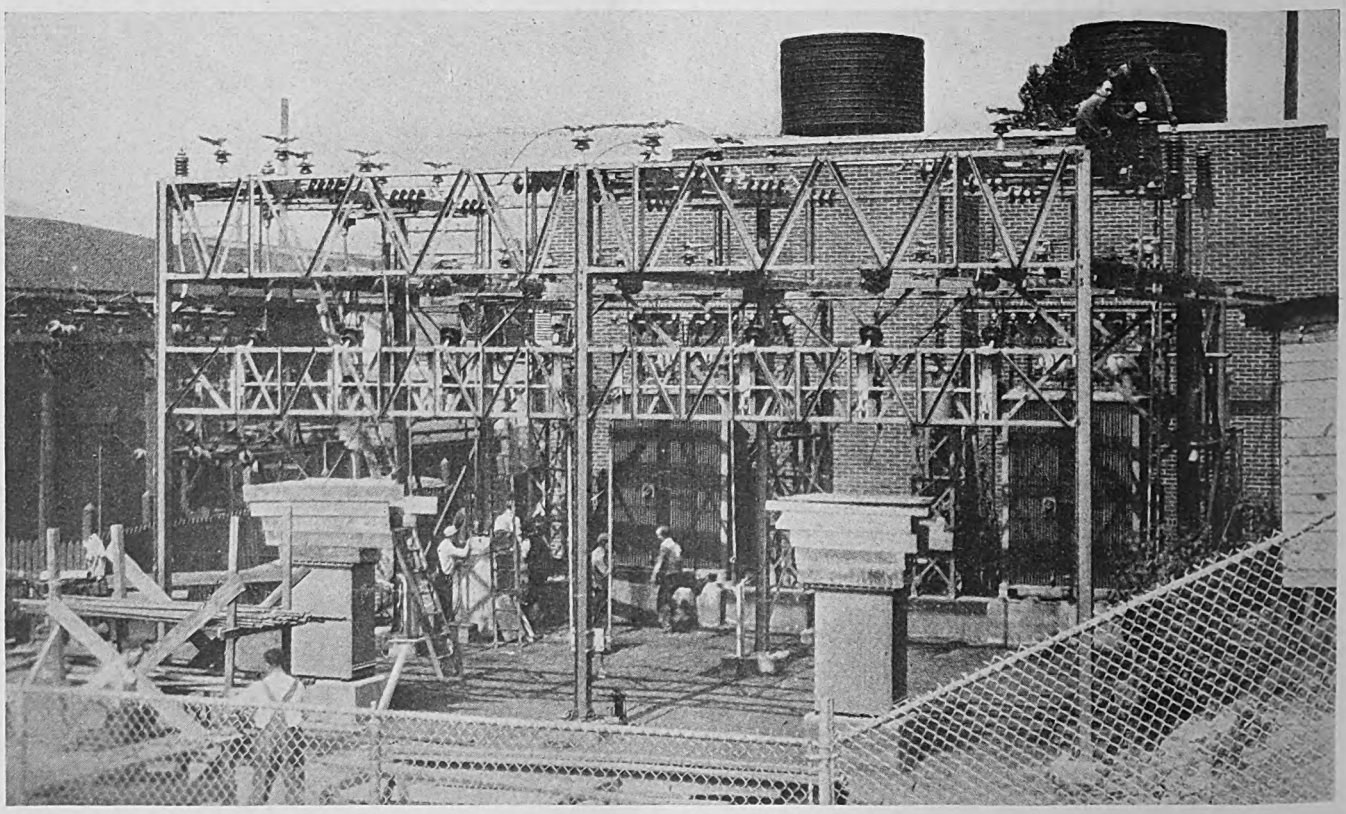


This switchboard is complete for the automatic control of the two 1,000-kw. synchronous converters in the substation

four lines of the Pittsburgh Railways, approximating a total length of 16 miles. These lines are (1) the Trafford City line from Wilmerding to Trafford City; (2) the McKeesport line from Wilmerding to East McKeesport; (3) the lines in East Pittsburgh and the Turtle Creek district, and (4) the Ardmore line from East Pittsburgh to Edgewood Acres.

Electrical equipment of the station consists of two 1,000-kw., 600-volt, shunt-wound synchronous converters and four 600-volt feeder panels housed inside a permanent brick building. The high-tension bus structure and the bank of transformers are located out of doors at the rear of the station. The equipment is summarized in the accompanying table. To date the average load on the station has been 800 kw. with a peak demand approximating 1,000 kw., well within the capacity of one converter unit.

The building, including foundations and lighting, cost $34,000; the electrical equipment, outdoor and indoor,



The substation was in service eight months after its construction was authorized

including telephone lines, cost $95,000; land improvements, grading, seeding and fences added $4,000; outdoor switching structure, exclusive of equipment, cost $3,000, and poles, fixtures, overhead and underground conduit lines, engineering, insurance, etc., amounted to $17,000, making a total cost of $153,000. Construction of the station from authorization of the work to the official opening occupied just eight months.

Utility Association Secretaries Meet in New York City

CLOSER co-operation between regional organizations and the national headquarters of the various public utility associations was the principal topic of discussion at the seventh annual conference of Utility Association Secretaries which met in New York City on Dec. 3-4-5, 1928. The delegates were the guests of the A.E.R.A. during the first day of their conference. The meeting at association headquarters was opened with an address of welcome by General Secretary J. W. Welsh. Managing Director Storrs spoke briefly on the present status of the electric railways of the country, and was followed by Frank R. Coates, chairman of the committee for co-operation with state and sectional associations, who made a plea for closer relationship between the various regional associations, through their secretaries, and the national headquarters organization in New York City. Labert St. Clair, of headquarters staff, read a letter from President J. P. Barnes, expressing his regret at his inability to be present, and commending the regional secretaries for the work which they were doing for the utilities in their respective spheres. The morning session concluded with an inspection of the A.E.R.A. offices under the auspices of Mr. Welsh and members of the staff.

Reconvening in the afternoon, the conference was addressed by George B. Cortelyou, chairman of the joint committee of the national utility associations. Members of headquarters staff then spoke briefly, outlining the duties of their respective departments.

On the second day of the conference the delegates were the guests of the American Gas Association, and on the third day of their stay were entertained at the headquarters of the National Electric Light Association, the program in both cases being under the direction of the secretaries of the associations named. President E. F. McKay presided over the sessions, with O. E. Weller as secretary. At the concluding session, Mr. Weller, who is secretary of the Rocky Mountain Division of the N.E.L.A., with headquarters in Denver, was chosen as president for the ensuing year, with Harold A. Buck, Harrisburg, Pa., as secretary. The date and place for the next meeting was fixed for the first week in December, 1929, at Chicago.

Kentucky Utilities Meeting

THE annual meeting of the Kentucky Association of Public Utilities will be held at the Brown Hotel, Louisville, Ky., on Jan. 15 and 16, according to an announcement which has just been made by the secretary, Edward F. Kelley.

On the afternoon of Jan. 15 and the morning of Jan. 16 business sessions will be held in the Roof Garden. The annual dinner will be in the Crystal Ball Room on the night of Jan. 15.

Two Hundred Dollars for a Single Idea

PERHAPS the very job that you were doing this morning has prize-winning possibilities. Are you familiar with the opportunities offered in ELECTRIC RAILWAY JOURNAL'S maintenance contest? Read about the prizes that can be won and the rules and conditions of the contest as given in the Oct. 20 issue of the JOURNAL, or send for copies of an instruction folder giving full information.

Progressive maintenance men always keep their eyes open and their minds alert for new ideas. They look ahead. They want to know what is going on not only in their own field of work but in the industry as a whole. The maintenance contest offers opportunities not only for obtaining new ideas for your own work, but also for creating interest and co-operation in the work of your department. At the present time much rehabilitation and improvement in equipment and methods is going on among electric railways. Results have been most gratifying both as to the performance obtained and the savings effected. It is with the thought of giving increased stimulus to such programs, and of bringing to light further commendable accomplishments, that the various prizes have been offered in ELECTRIC RAILWAY JOURNAL'S contest.

There are twelve $25 departmental prizes to be awarded to individuals sending in winning maintenance ideas. These will be divided equally between the following four maintenance divisions:

1. Rolling stock and shops
2. Way and structures
3. Electrical and line
4. Buses and garages, including shop equipment for bus maintenance.

The most attractive prize of all will be the $200 individual prize, to be awarded at next year's anual convention to the person submitting the best maintenance idea during the contest.

Company and departmental recognition are features of the new contest. A company trophy will be presented, and departmental certificates of merit will focus attention on the improved methods and equipment that are being originated by electric railway maintenance forces. For each item published $5 will be paid, whether it wins a prize or not.

Now is the time to start sending in your material. The more you submit, the bettter chance you have of winning one or more of the big prizes. Look up the announcement in the Oct. 20 issue of the JOURNAL or send for copies of the instruction folder.

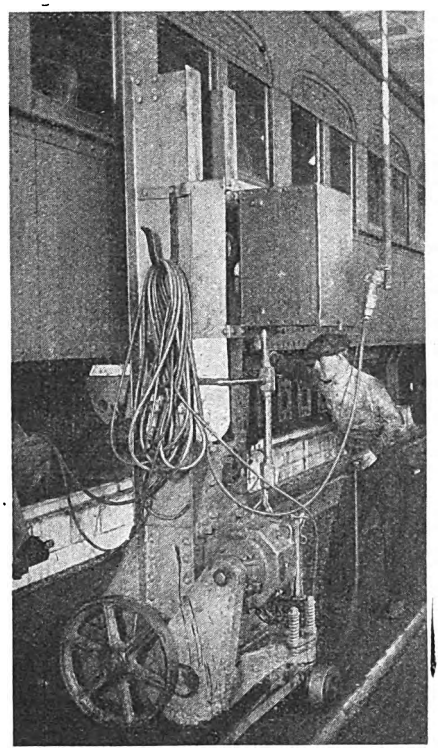
BETTER MAINTENANCE Through Improved

Raising Car Bodies for Oiling Bearings*

By Harvey L. Bullock
General Foreman of Electrical Equipment New York Central Railroad, White Plains, N. Y.

FOR oiling the center and side bearings of its cars, the New York Central Railroad, at its White Plains, N. Y., shops, uses two standard Whiting electrically-operated jacks to raise the car bodies. With this equipment the oiling crew can grease all of the center and side bearings on a train of cars, as it comes into the shop for inspection, in a very short time.



Raising a car body with a standard car jack to oil the center and side bearings

Jacks are placed near one end of each side of the car to be greased, and are both raised simultaneously. Current for operating the jacks is supplied from the overhead trolley through a pole with a contact. One man controls the operation of both jacks. In the accompanying illustration showing the raising of a car body, the control button is in the hand of the operator.

A long length of cable reaches from the contact pole to the jack, and is then looped over a hook. Connection between the jacks is by a lead with plugs, and standard receptacles on each jack are provided so the lead can be removed when not in use. With this arrangement one man raises the car body, while the crew does the oiling. The jack is then rolled to the next position, and the operation repeated until the entire train has been greased.

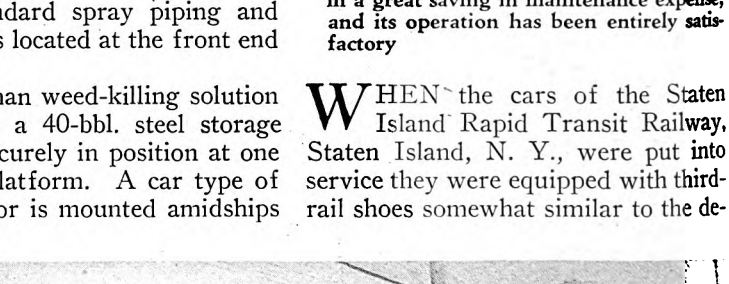
Special Car for Weed Killing

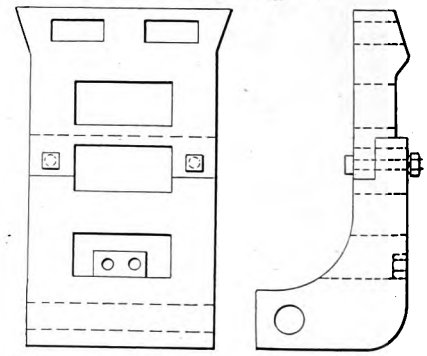
TO FACILITATE the killing of weeds along its right-of-way the Steubenville, East Liverpool & Beaver Valley Traction Company, East Liverpool, Ohio, installed a complete weed-killing outfit on one of its flat cars. Inasmuch as such a car is used only two or three times in a year on a small property, a large outlay is not warranted. The car is 35 ft. long, is mounted on 24-in. wheels, and has standard spray piping and control valves located at the front end of the unit.

The Chipman weed-killing solution is carried in a 40-bbl. steel storage tank fixed securely in position at one end of the platform. A car type of air compressor is mounted amidships of the car together with an air reservoir for maintaining 12 lb. pressure in the large solution tank. The car is equipped with hand brakes and is ordinarily operated in conjunction with a company work car at an average speed of 12 m.p.h. A regulation headlamp plug provides the means of conveying electrical energy to the air compressor of the weed car from the trolley circuit of the motor car.



This special car for weed-killing equipment forms a useful working unit of the railway

Renewable Third-Rail Shoe Tip



Adoption of this contact shoe has resulted in a great saving in maintenance expense, and its operation has been entirely satisfactory

WHEN the cars of the Staten Island Rapid Transit Railway, Staten Island, N. Y., were put into service they were equipped with third-rail shoes somewhat similar to the de-

Digitized by Google

Methods

sign shown in the sketch, but of one piece. It was soon found, however, that the expense of shoe maintenance was very high, because, when the contact surface became worn or the tip broken it was necessary to replace the entire shoe from the fulcrum to the top. The cost of the casting plus the cost of the replacement labor amounted to a large sum.

The shoe shown in the sketch was designed and installed to decrease this cost. This shoe is made in two parts, a fulcrum casting and a tip casting. The joining points are machined accurately to assume perfect contact when bolted together. In case the tip becomes worn or broken, it can be replaced in a few minutes by removal of the bolts.

Preventing Signal Relays from Sweating

IN A REPORT of the Signal Section of the American Railway Association which was presented at the section's annual convention there are some recommendations which should prove of value in maintaining signals for electric railways. A section on the prevention of sweating of relays is as follows:

1. Relay housings, including the door, shall be non-metallic, or metallic, with non-metallic lining.

2. Non-metallic housings and non-metallic lining of metal housings shall be constructed so as to close as near airtight as practicable. The outside metal housing shall be ventilated by openings near the bottom and the top of the housing, the openings covered with wire gauze to exclude dirt and insects, and hooded to exclude rain.

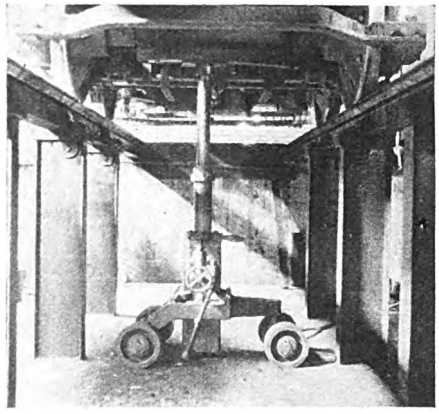
3. The voids between and around the wires at the point where they enter the relay housing shall be filled with a compound that will seal the opening and exclude moist air from the conduit leading to the housing. Where housings with open bottoms are mounted on concrete foundations, the surface of the concrete shall be covered with material that will prevent the entrance of moisture into the housing.

4. Glycerine in a small open container placed inside the relay housing has been found to be beneficial. Moisture-absorbing chemicals, except glycerine, shall not be used on account of injurious corrosive action.

5. Relays should be sealed as nearly airtight as practicable.

Trackless Lift Convenient for Handling Equipment*

By C. B. Hall
Chief Clerk Mechanical Department Virginia Electric & Power Company, Norfolk, Va.



Portable lift in place for removing a pair of 34-in. steel wheels

USE of a portable lift in the shops of the Virginia Electric & Power Company, Norfolk, Va., has resulted in better maintenance of equipment by simplifying the labor of handling. The machine is a self-contained type designed to remove and replace car motors, wheels, etc. It has a telescopic ram and does not require a sub-pit. It is mounted on flat, broad wheels so that it can be moved easily. The ram and cylinder are steel, and pump valves and pump pistons are bronze. There is a side adjustment of the cylinder of 2 in. The weight of the machine is 700 lb. and it has a lifting capacity of 3,000 lb. The length is 37 in., and the over-all height, with ram closed, is 32 in. Use of this lift has resulted in a considerable saving in the time and labor of removing and replacing equipment under cars without jacking up the car body.

Chemical Fire Extinguishers Centralized

STUDY of the fire fighting apparatus in the shops of the Richmond Railways, Inc., Staten Island, N. Y., led to a new arrangement of the chemical extinguishers. Heretofore they were placed around various parts of the shop but it was found when an emergency arose that confusion developed, resulting in a loss of time in procuring the necessary extinguishers. All extinguishers are now centralized on a common rack in one location in each department and are accessible from all directions. The accompanying picture shows a typical arrangement of the extinguishers installed in the paint shop. In addition, a multiplicity of water and sand pails are located conveniently throughout the shop.

With the new arrangement every man knows exactly where the extinguishers can be found, and confusion and delay are prevented when an emergency arises.

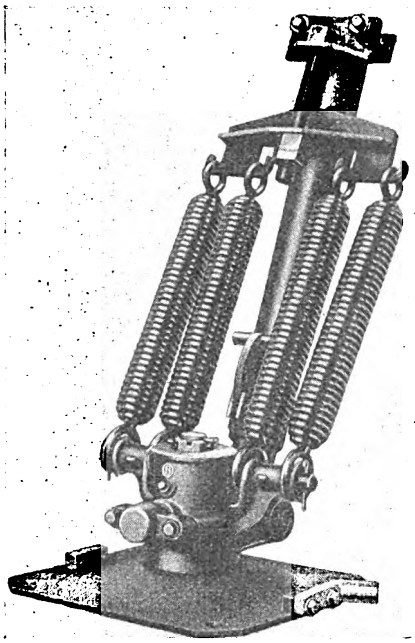
Helpful Equipment *from the* Manufacturers

Light Weight Trolley Base

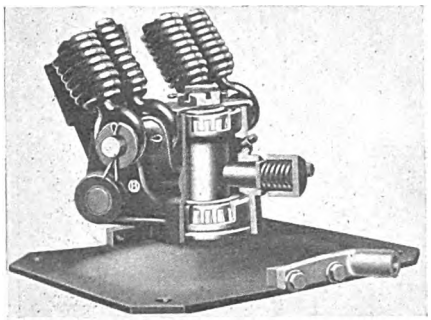
A TROLLEY base of all steel construction weighing 73 lb. has just been announced by the Ohio Brass Company, Mansfield, Ohio. It is claimed that this new base, while eliminating much of the weight, has not sacrificed strength, pole tension nor current carrying ability. This is due to the use of a rolled-steel assembly with a cast steel turret.



Light weight trolley base

The new base is equipped with Timken roller bearings, and a current shunt protects the bearings from pitting and assures a constant current flow from turret to base. Bases can be procured with light, medium or heavy springs to meet various service requirements.

Ease of lubrication and accessibility are also embodied in this design. The removal of one nut is all that is required to remove turret for inspection or adjustment.

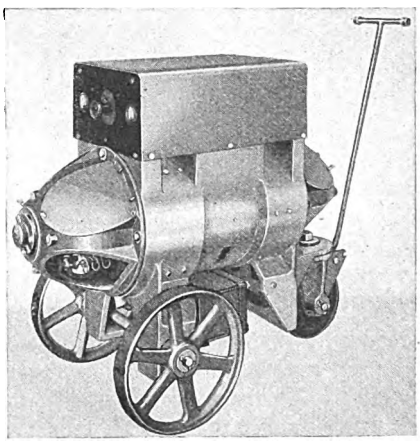


Sectional view of turret of new trolley base

Service trials have shown that due to the lighter oscillating weight, the spring tension can be decreased materially thus causing less wire wear, less hammering of ears and fittings, and less crystallization of parts with which the wheel comes in contact.

Heavy-Duty 300 Amp. D.C. Welder

SIMPLICITY, sturdiness and compactness are combined in a 300 amp. d.c. arc welder, a recent development of the Westinghouse Electric & Manufacturing Company. The welding unit was designed and constructed for heavy duty work and continuous economical service, in the shops and field where only direct current is available for the driving motor. This set is particularly applicable where the all-day load exceeds 200 amp.



Heavy-duty arc welder using direct current

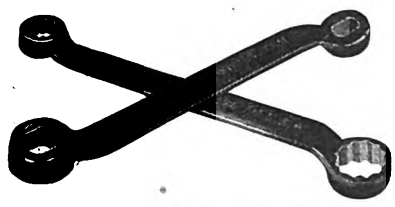
The driving motor and the generator are enclosed in the same frame, while the control is mounted on top, being in a part of the frame and protected by a sheet steel cabinet. A common shaft with a ball bearing at each end is used for the generator and driving motor. The unique construction of this welder gives it small overall dimensions and a low center of gravity. Three roller bearing wheels may be attached to the frame if it is to be portable. If intended for stationary use, the running gear parts are omitted.

The driving motor is designed so that it can be used on either a 230 volt or a 550 volt line, being of a special constant speed type S.K., compound wound. The motor control, mounted in the control cabinet, is a starting rheostat providing low voltage protection. The generator, a single operator, constant current, differentially compound wound type, is separately excited from the motor supply and has a welding range from 75 to 400 amp. Simple welding control is secured by a one-dial rheostat. Any desired welding current, over the entire range, can be obtained readily by the proper dial setting. A 690-amp. meter and a 0 to 125-volt meter are mounted on the control panel.

The rating of this heavy-duty arc welder is 300 amp. for one hour, with a 50 deg. C. rise on a resistance load at 25 volts, which conforms to the N.E.M.A. standard practice.

Valve Stem Wrenches

DESIGNED especially to set valve stem nuts firmly, Stevens Walden-Worcester, Inc., have placed a new valve stem wrench set on the market. Wrench No. 481 is $\frac{5}{8}$ in. and $\frac{1}{2}$ in. Doublehex box type. It passes easily over the valve stem and one end fits the $\frac{5}{8}$ in. nut on large diameter stems, while the other fits the $\frac{1}{2}$ in. on smaller stems. The companion wrench No. 482 is $\frac{7}{16}$ in. and $\frac{1}{2}$ in. oval box type to grip the oval shape of all standard diameter straight stems, thus holding it firmly in place while the nut is set or loosened. These wrenches are drop forged.



New pair of valve stem wrenches

News of the Industry

Philadelphia Men Sworn in as Special Officers to Speed Traffic

Thirty-seven men picked from the personnel of the Philadelphia Rapid Transit Company, Philadelphia, Pa., for their experience in expediting traffic, have been sworn in as special officers and assigned to the central city area to co-operate with the city's traffic police in measures calculated to relieve congestion.

The P.R.T. supervisory force, according to an announcement made by Ralph T. Senter, president of the company, will assume responsibility for all public transportation in the district between Spring Garden and South Streets, 34th Street and the Delaware River. They will wear a distinctive uniform of military gray.

"The company evolved this plan," said Mr. Senter, "as a logical phase of co-ordinated operation of all forms of surface transportation.

"Our men will in no way attempt to usurp the authority of the city traffic personnel."

In commenting on this move the Philadelphia *Ledger* said:

The installation of this special force is unique and anomalous. Since the city is unable to provide the needed numbers of traffic police to cope with conditions where the congestion is greatest, it should be glad to accept the assistance of men who have a direct interest in doing their job efficiently and for the benefit of the greatest number. They will be on the streets to answer the question, "how to speed up traffic for the 80 per cent," and as the interests of the P.R.T. and the large majority of the users of the streets are identical, they will have great opportunities for usefulness.

Daily Meetings on Chicago's Ordinance

Representatives of the Chicago transit companies and members of the City Council sub-committee on local transportation have decided to consider the proposed traction ordinance at once, and to meet every day until they have agreed upon the draft of the new ordinance, or until they definitely have reached an insurmountable obstacle.

The draft as it now stands has been approved by the Council sub-committee. It provides for a rate of return of 5½ per cent on the $257,000,000 investment represented by the present elevated and surface lines and that additional capital shall be put in at cost. The companies have been asking a 6½ per cent return on the present capital account, plus one mill per revenue passenger and a compromise of this must be effected.

Attorneys for the companies insist that the 6½ per cent return, plus the compensation feature, is imperative at the present time, and that future rates could be determined by the proposed local transit commission. Some of the Aldermen, however, desire a fixed contract so that the rate of return will never be higher than the amount finally agreed upon. This point will be put aside temporarily until all other negotiations have been completed, both groups agreed.

The city is also asking that interest be paid on its $53,000,000 traction fund, which is to be invested in the bonds of the new unified company. Objections originally raised on this point by company representatives have been withdrawn. The question of length of time the franchise should run has been tentatively agreed upon as that specified in the ordinance draft, which provides for termination upon purchase. It is estimated that the city can purchase the consolidated system within 40 years out of its share of the company's profits.

Both groups are now confident that the ordinance will be in shape to submit to the City Council after Jan. 1. If approved by the Council, bills authorizing the city to call a special public referendum on the ordinance could then be submitted to the State Legislature, which convenes in January.

New Fares in Effect in Baltimore

Rejecting 10-cent flat rate, commission authorizes 8¾-cent ticket rate. Supplemental opinion reviews depreciation contention. Company contests return rate

BALTIMORE car riders are now paying 10 cents for single cash fares and 8¾ cents when tickets or tokens are purchased. The new rates authorized by the commission and announced in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 30, are an increase from 9 cents cash or three tokens for 25 cents.

In handing down its latest order the commission accompanied it with a supplemental opinion in part as follows:

In obedience to the mandate of Circuit Court No. 2 of Baltimore entered Aug. 31, 1928, in accordance with an opinion of the Court of Appeals, in the case of Harold E. West, et al., versus the United Railways & Electric Company of Baltimore, filed July 16, 1928, this commission on Monday, Nov. 19, 1928, entered upon a rehearing of Case No. 2648, in so far as it concerned the annual allowance for depreciation on the property of The United Railways & Electric Company of Baltimore made in the opinion and Order No. 12639 of the commission, filed Feb. 10, 1928.

The order of Circuit Court No. 2 of Baltimore directed the commission to further consider the question of depreciation, determine the proper allowance for depreciation in accordance with the opinion of the Court of Appeals, and make any change in the rate schedule which may be necessary and requisite.

In its opinion and Order No. 12639, this commission allowed 5 per cent of gross revenue as a proper amount to be set aside for depreciation upon the company's depreciable property. The amount so estimated for the year 1928 was $883,544. This allowance of 5 per cent of the company's gross annual revenues was made first in 1912, the year in which a depreciation reserve was set up by the company, and it has continued since. It has provided for current retirements of the company's property at cost, and permitted the building up of a reserve, at the beginning of the year 1928, of $1,413,739. The plan of providing for retirements at cost is that followed by the Interstate Commerce Commission and the utility regulatory commissions of most of the states, and by all other utilities under the jurisdiction of this commission.

The commission, therefore, did not feel justified, in the circumstances, in departing from the generally observed rule of allowing depreciation on a basis of cost.

The company's contention that value, and not cost, is the proper basis upon which to calculate depreciation was sustained both by Circuit Court No. 2 of Baltimore and by the Court of Appeals.

In its opinion the Court of Appeals asserted that while there is authority for calculating depreciation on the basis of cost, "in our opinion it is artificial, illogical and unsound, and ought not to be approved." The court continues:

"Since we cannot say that proper methods would not have produced a result which would have affected the rate schedule adopted, the case should be remanded to the commission in order that it may consider and determine the proper allowance for depreciation in accordance with rules hereinafter stated, and if necessary readjust the rate schedule to cover any changes it may make in that allowance."

Later the court declares:

"In such a case as this we are . . . dealing . . . with substantive rights protected by constitutional guaranties, and there seems to be no logical reason why the depreciation should not be based upon the actual value of the property itself, rather than upon vague and conjectural inference drawn from the money the property earns. . . . But even so, if the conclusion actually reached was proper, the fact that it was reached by improper methods, would not justify us in disturbing it, so that the more important question is whether the base of the calculations by which it was tested was itself lawful. And that depends upon whether the commission should have based its allowance for depreciation upon the original cost of the prop-

Digitized by Google

erty, or upon its present value. It actually did use cost and not present value as the basis of its conclusion, and here again it must be said that there is authority for its procedure. But in our opinion it is justified by neither law nor right reason."

Inspection and Investigation of Property

The court directed the commission to make a physical inspection of the property and an investigation of the probable useful life of the property as shown by the experience of this company and other companies using similar properties in a similar way and to make an estimate, based in part at least upon such an investigation of the probable annual depreciation. This the commission has done.

The annual amount claimed by the company for depreciation was $2,200,000. This, however, in the opinion of the commission, provided for certain extraordinary obsolescence, which the Court of Appeals declares the commission does not have to allow, and which it does not allow. H. Carl Wolf, chief engineer of the commission, under whose direction the commission's investigation and physical inspection of the property were made, testified that the fair amount to be allowed for depreciation, based upon the fair value of the property, is $1,687,068. Charles Nodder, chief auditor of the commission, approaching the problem from another angle, that revealed by the experience of the company as shown by its books, testified that the amount required for depreciation, based on present fair value, is $1,269,565.25.

The commission carefully has considered all the testimony and exhibits before it in this case bearing upon the problem of depreciation, and finds that $1,638,660 is the proper amount to be allowed the company for depreciation. This allowance is based upon the present value of the company's depreciable property, in accordance with the court's order, and equates to 3.6 per cent of the amount testified to as being the value of the company's depreciable property, $45,518,344.

In determining this allowance it is assumed that the existing practice, with respect to the division between charges for maintenance and charges to the depreciation reserve, will be continued.

The allowance of $1,638,660 is an increase of $755,116 over the allowance previously found, which was based upon the cost of the company's property, and necessitates an increase in the rate of fare from 9 cents cash or three tokens for 25 cents to 10 cents cash or four tokens for 35 cents. Other fares will remain as established by Order No. 12639.

The commission will pass an order in accordance with the findings herein stated.

Amended Order Defines Fare

In the order passed by the commission on Nov. 28, it amended its order of May 26, of this year, to read in part:

That from and after midnight on Nov. 30, 1928, and until the further order of the commission, The United Railways & Electric Company of Baltimore shall be permitted to charge and collect for the transportation of persons over its several street railway lines in Baltimore and vicinity, a base rate fare of 8⅓ cents when tickets or fare checks are purchased, or 10 cents cash, for the conveyance of each passenger over twelve years of age, and 5 cents for each child between the ages of four and twelve years, between any of the points designated in the schedule of the said company or between intermediate points, in either direction, on any of such lines, except in so far as the zones on any of the said lines are hereinafter modified or changed.

Rate of Return Made An Issue

The United Railways & Electric Company has decided to appeal from the action of the Maryland Public Service Commission. The case is to be taken to the United States Supreme Court. President Emmons said that the United is being discriminated against and that refusal to permit the company to receive an adequate return has caused it a loss of $15,000,000 in the last two years through depreciation of securities. This is a point that has been reiterated previously. He said:

It has been decided to proceed with an appeal to the courts so that the question of the sufficiency of the rate of return, as previously fixed by the Public Service Commission at 6.25 per cent, should be decided as promptly as possible by the Supreme Court of the United States in order that this problem, of so much importance to the entire public of Baltimore and the future of the street railway system, the investors of Baltimore and elsewhere who hold securities of the United Railways, as well as the company itself, may be finally settled.

Not only do we feel that the 6.25 per cent return is confiscatory, but it stands as an economical barricade in front of the company and as a menace to the future railway transportation in Baltimore. When other Maryland utilities are allowed a 7½ per cent return, and the railway is confined to 6.25 per cent return, the investor naturally will lend his money to the company which the state treats more liberally.

The public will need new cars in the future of a more convenient type and more perhaps in line with the comforts of buses, and also better facilities generally for transporting passengers quickly and comfortably. All of this requires money on a very large scale.

If it cannot be obtained the future of transportation in Baltimore is in a bad way, indeed, and it cannot be obtained until the background of credit given the company by public authorities is sufficient to attract investors.

We feel it is understood by the general public that the recent increase allowed by the commission is for the purpose of maintaining the property itself, and does not include any item at all for increased service or facilities.

Another Railway Problem

SEVENTY citizens of Hudson, N. H., have appealed to the Public Service Commission to take action that will relieve them of annoyance in the way of interrupted radio reception. The petitioners believe that the trouble is caused by operation of electric cars from Hudson bridge to Hudson center and they point to confirmation of their opinion in the fact that it does not exist when the cars are not running. They ask the commission to take such action as may be necessary to remedy an "exasperating condition."

Report of Rolling Stock Committee

Outlining of work and discussion of best methods of getting information for reports occupied the attention of the general rolling stock committee at a meeting held at association headquarters, New York City, on Dec. 5. Those present were A. T. Clark, chairman; W. S. Adams, C. Bethel, J. M. Bosenbury, J. A. Brooks, R. S. Bull, M. R. Hanna, G. C. Hecker, E. J. Jonas, J. S. McWhirter, A. D. McWhorter, T. H. Nicholl, H. A. Otis, M. W. Rew, H. Savage, R. B. Smyth, C. W. Squier and W. T. Vivian.

Changes in the procedure for making reports and the dates at which they must be presented were outlined by Mr. Clark. The committee on revision of the manual will undertake to add several standard axles to those already available, and the rating of others will be increased. The progress being made in testing of various drives under the direction of the committee on car design was outlined. The Westinghouse drive is now under test. The General Electric drive is being set up for testing, and the Timken drive is on the way.

In addition to further studies of lighting the subcommittee on this subject will devote added attention to headlights for city cars. The committee on noise reduction will devote special attention to track construction that bids promise of providing quiet operation.

There was considerable discussion on the work being done by committee No. 10 on welding of wheel flanges. The amount of work of this character being done by electric railways is increasing very rapidly, and this has led to a preference for grinding wheels instead of turning them in a wheel lathe, as in many cases the amount of metal necessary to be removed for truing up the contour is very small. Present grinding equipment for this use, however, is very costly, and railways hesitate to make such a large investment.

The committee agreed that wood preservation in car and bus construction is a worth-while subject for study by the wood preservation committee. The next meeting of the committee will be held at Cincinnati about the middle of March. At this meeting all committees of the rolling stock division will be expected to get their reports in shape. All members of rolling stock special committees are invited to attend this meeting, and others interested in rolling stock will also be invited.

Mayor Wants New Operating Agreement with P. R. T.

The City Council's transportation committee will meet shortly to act on Mayor Mackey's request for authority to negotiate a new operating agreement with the Philadelphia Rapid Transit Company for the Broad Street subway in Philadelphia, Pa.

The Mayor sent a special message to

Digitized by Google

Council on Dec. 3 pointing out that the three-month lease expired Nov. 30, that the P. R. T. had discontinued its payments of $200,000 a month for operating privileges, and that a new contract would have to be executed pending the completion of the South Broad Street unit.

On a day-to-day basis the company is now operating the city-owned line. The new agreement will be made retroactive to Dec. 1.

More Militant Moves in Detroit

Recent developments in Detroit include moves on the part of Mayor John C. Lodge to banish jitney service of any kind from Detroit streets unless the jitneys are municipally owned and operated; to evict the Detroit Motor Bus Company's buses from the streets; to have two subway plans placed upon the ballot at the April election so that the voters may take their choice. One of the subway propositions would be the comprehensive subway plan of the Rapid Transit Commission, estimated to cost $280,000,000. The other would be a subway dip plan with an estimate of cost, for the relief of traffic congestion in the downtown streets.

It is believed that the Mayor's suggestion relative to the eviction of the Detroit Motor Bus Company will be taken up shortly after the holidays. Just what the Mayor's plan will be has not been announced. The bus company is operating in Detroit without a franchise. The one objective strived for, Mr. Lodge stated, is absolute control of the city's transportation facilities, in order that the transportation system be made all exclusive and under the sole authority of the municipal government.

The Mayor stated that it is very evident that the people want an opportunity to express their views as to whether the city should proceed with the so-called dip system or go ahead with the comprehensive subway idea.

Three Measures for Transit in St. Louis to Be Presented

The Transportation Survey Commission of St. Louis, Mo., on Nov. 21 indorsed three measures to be presented to the Missouri General Assembly when it convenes at Jefferson City, Mo., on Jan. 2. The bills are intended to secure for St. Louis the necessary powers to establish a rapid transit system.

One measure will confer the right to construct subways and elevated tracks for rapid transit and to assess part of the cost against property found to be benefited by the improvements. Another would give the city the right of excess condemnation of property affected by public improvements. Such a measure would speed up the preliminary arrangements for the rapid transit system. A third measure is designed to increase from 20 years to 50 years the limit for which the city may issue bonds. To attain this the Missouri constitution must be amended by popular vote. There is to be a state-wide referendum on this subject.

Franchise Negotiations Started

City and company at Akron begin discussions on which to base new grant. Riders interested in quality of service

NEGOTIATIONS between the city of Akron and the Northern Ohio Power & Light Company for a new franchise based upon the recent report of the citizens' fact-finding committee were begun during the week ended Dec. 8. It is understood that the company will suggest an initial fare of 10 cents with a ticket rate of fare in line with that now existing. The present rate of fare in Akron now is 7 cents cash, four tickets for 25 cents, seventeen tickets for $1.

The company is operating under a temporary franchise which expires on Feb. 15. It is generally recognized that some increase in fare is justified, but the question to be determined is just how much advance should be made with the interests of the city and the company joined. One of the local newspapers, *The Beacon Journal*, suggests that the present cash rate of fare should be continued. *The Times-Press* has refrained from suggesting a rate of fare.

In a statement made public by A. C. Blinn, vice-president and general manager of the company, attention is called to the fact that the company has upon several occasions endeavored to bring about economies suggested by the citizens' fact-finding committee, and the suggestion is made "that it must be borne in mind that the service to the car riders is of first consideration and car riders do not want anything done that will affect the quality of service."

As Mr. Blinn sees it, "there is very little duplication of service, if any, that can be avoided. Where all transportation lines come into the business district, there must be certain duplication on the main thoroughfare or at the point of concentration." He continues:

It should be understood that a reasonable increase in fare does not always result in decreased riding. Akron is one of the very best examples of this fact. In 1925 there was an increase in the number of car riders over 1924, notwithstanding an increase in fare. The constant increase in the popularity of the 10-cent bus lines in Akron is another evidence that a reasonable increase in fare does not decrease the number of riders. Requests have been continually made for additional 10-cent bus lines. Our experience is that the public is primarily interested in good service and is willing to pay for it.

If the fare increases had not helped transportation companies of this country, most of them would be in receivers' hands today.

The report of the fact-finding committee contains a complete survey of the transportation situation in Akron and it certainly removes the subject from demagogic debate, reducing it to a point where the problem may be discussed upon a practical, common sense and business basis.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Dec. 10-12 — National Highway Traffic Association, annual meeting, Automobile Club of America, New York, N. Y.

Jan. 14-18, 1929—American Road Builders' Association, convention and road show, Cleveland, Ohio.

Jan. 15-16—Kentucky Association of Public Utilities, annual meeting, Brown Hotel, Louisville, Ky.

Jan. 22—New York Electric Railway Association, mid-winter meeting and dinner, Hotel Commodore, New York, N. Y.

Jan. 23-25—Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.

Jan. 24-25—Central Electric Railway Association, Claypool Hotel, Indianapolis, Ind.

Jan. 25-26—Central Electric Railway Accountants' Association, Claypool Hotel, Indianapolis, Ind.

Successors to Detroit Jitneys Popular

The de luxe bus system established on Woodward Avegnue on Nov. 25 has proved very popular and the Department of Street Railways has expressed confidence that these buses are more than filling the needs for transportation formerly met by the jitneys. The number of buses has been increased on the Woodward line and on Dec. 1 operation was started on the Grand River Avenue line. More buses are being added to the Grand River line as they are delivered by the manufacturers.

Rerouting in New Orleans

Important changes in the routes of eight street car lines of the New Orleans Public Service Company are proposed in maps and plans now in the hands of Public Utilities Commissioner William T. Hall, and will be submitted to the Commission Council at the next meeting. The changes were agreed upon after conferences attended by experts of the city and planning and zoning commission, Commissioner Hall, and engineers of Public Service.

Special Rates on Fredonia Line

A new tariff of the Buffalo & Erie Railway, Fredonia, N. Y., has been approved by the Public Service Commission effective Dec. 26. It provides special car rates between stations on its lines and for round trip transportation of not more than 50 persons per car. The person designated as being in charge of the party will be required to purchase a special car ticket naming the station to and the station from, the rate and the number of persons in party. Such tickets will be good for round trips on the special car.

Plans for Freight Service Being Perfected

Final arrangements are fast being made for divisions of the Texas Electric Railway between Dallas and Waco, Dallas and Corsicana, and Dallas and Denison to handle freight shipments, of carload and less than carload lots, in interchange with steam railroads with which the three divisions intersect. An hourly schedule of movement and delivery of freight will be observed in the service, in which the latest type of 50-ton electric locomotives will be employed.

The major portion of freight in and out of Dallas will be handled at night by the company. Cars loaded along the lines outside of Dallas, for destination in any section of the United States, will be hauled to the nearest junction point and turned over to the steam road.

More than 230 miles of track belonging to the Texas Electric Railway have been brought under this electrification of freight service, which is the first service of its kind to Texas shippers.

Another Branch of Pennsylvania Operates Electric Trains

The Pennsylvania Railroad added a link on Dec. 2 to its extensive electrification project when the 6:42 a.m. train from West Chester, Pa., arrived in Broad Street Station under electrical power. The Octoraro branch, the latest to be electrified, follows the tracks of the Wilmington branch as far as Woodlands Cemetery in West Philadelphia, then branches off to Wawa and West Chester. It comes a distance of 27½ miles. Service from Wawa to Oxford and Perryville is being supplied by gas-electric cars, with the exception of one mail steam train daily. The Wilmington branch began electric operation Sept. 29. From three to eight minutes have been cut from the running time.

St. Louis to Have Services of R. F. Kelker

Rudolph F. Kelker, Jr., senior member of the engineering firm of Kelker, De Leuw & Company, Chicago, has been selected by the Transportation Survey Commission of St. Louis, Mo., to act as its engineer and aid in planning a rapid transit system for the city and its environs. It is believed that the survey will cost approximately $35,000 and that it will take about eight months time for the study to be completed.

Mr. Kelker will examine all previous reports on the transportation and traffic problems of St. Louis and make such additional investigations which may be found necessary. Reports with recommendations will be submitted to the Transportation Survey Commission from time to time. His studies will include street car and bus routing, with recommendations to provide the most efficient routing and co-ordination with the St. Louis plan.

Growth of One-Man Car System in Indianapolis

Service with one-man cars has just been introduced on the Northwestern Avenue line of the Indianapolis Street Railway, Indianapolis, Ind., bringing the total of subordinate lines thus served in that way to eighteen. With the exception of service on four important trunk lines of the company and three shorter lines, one-man operated cars gradually have been put into use in the last two or three years. Joseph A. McGowan, secretary and acting president of the company, said the one-man cars were being introduced on lines where service had decreased as a matter of economy, so that the character of the service should not be permitted to decline.

Rerouting of street cars will be the next phase of traffic congestion relief to be attacked by the City Council in Indianapolis, Ind. A change in routes of cars of the Indianapolis Street Railway to keep as many as possible off the main thoroughfares and two minor ones are being contemplated with a view to eliminating right turns at congested corners.

Electrification Saves Small Texas Road

A short electric line in West Texas has been made a paying proposition. This line, the Roby & Northern, now handles passengers, freight, express and mail on regular schedule and according to the last report made by company officials is earning a fair return on the investment.

Yet six years ago the old steam line was about to abandon. Its 5 miles of track were in bad condition and its meager equipment was no better. Citizens petitioned the West Texas Utilities Company, which had built its transmission lines into Roby and was serving the community with light and power, to purchase the line. The purchase was effected and in 1923 a rebuilding program was started, which has resulted in replacements in track, equipment and terminal facilities and, from accounts, successful operation.

Opinion Recommends Niagara Bridge Investigation

A report has been received by the Niagara Falls, Ontario, City Council from a special committee appointed to investigate the alleged swaying of the Falls View Bridge of the International Railway across the Niagara Gorge at Niagara Falls. The committee recommends an investigation of the span by the Dominion Board of Railway Commissioners, the Queen Victoria Park Commission, the railway and representatives of the state of New York. "We are of the opinion that this swaying is sufficiently pronounced to indicate that the bridge lacks stability in a lateral direction," says the report. It was accompanied by signed and sworn statements from fourteen persons giving their personal experiences in which it was claimed the bridge on occasions had a lateral sway from 18 to 24 in. and that during such periods the railway had deemed it wise to take precautions in regulating the volume of trolley, vehicular and pedestrian traffic.

Dismissal of Protest Against Philadelphia Fare

The United States Supreme Court dismissed a taxpayer's suit against the Philadelphia Rapid Transit Company, Philadelphia, Pa., on Dec. 4, for want of a substantial federal question. The suit was brought by George Sambor when the company advanced its fare to 8 cents.

The suit was instituted against the railway on behalf of the taxpayers of Philadelphia to enforce the contract of 1907 restricting the fare to 5 cents for 50 years. The refusal of the federal Supreme Court to intervene makes final the action of the United States Court in Pennsylvania in dismissing the case.

Rapid Transit Issue Revived in Pittsburgh

Some years ago the people of Pittsburgh, Pa., expressed themselves as favoring a start toward a subway system when they approved a bond issue of $6,000,000 for that purpose. But the issue had not been passed before it was realized that $6,000,000 would not even pay for a good beginning. As a result nothing definite has been done. The disposition was to mark time and this attitude continued until the fate of the constitutional amendment to permit the assessment of benefits upon a whole district was known. To the disappointment of advocates of the subway, the vote throughout the state was adverse, and that plan will have to be abandoned for some years to come at least.

As the *Post-Gazette* sees it, this result should stimulate those not in sympathy with the subway to advance their proposals more energetically. In fact, F. L. Duggan, vice-chairman of the Pittsburgh Better Traffic Committee, said the subway suggestion should be abandoned and work started on the widening

Digitized by Google

of Fifth Avenue as a substitute. In support of his view Mr. Duggan said that "the bus is here to stay while the subway is a thing of the past. Give Pittsburgh a few more wide thoroughfares and we will surpass our sister cities in traffic progressiveness." The *Post-Gazette* says:

There will be no denial that buses have come to stay, but whether they will replace other forms of transportation or merely serve as an auxiliary to them has not been demonstrated.

The subway may be ruled out as too expensive for Pittsburgh, particularly in view of the defeat of the district assessment plan, but widening of the arteries leading to the triangle, without doing anything for the latter, would simply aggravate the downtown situation. To that conclusion every discussion of the subject has pointed for the past twenty years. Possibly it will be found expedient to take some of the surface cars to a subway level within the triangle only and abandon the longer subway proposals linking East End and Northside in favor of widened streets. The important thing at the moment, however, is to bring the subject up again for prompt action—with a view always towards permanent relief, not a mere makeshift that will hardly be completed before it is found to be hopelessly inadequate and unsatisfactory.

One-Man Car Line Suspends

Service on the Evans Avenue, McKeesport route, of the Pittsburgh Railways, operated at a 3-cent fare, was suspended on Nov. 27. This action followed the adoption of a resolution by the McKeesport Council condemning operation of one-man cars on the route. Thomas Fitzgerald, vice-president of the railway, suggested to the Mayor that the matter be threshed out before the Traction Conference Board. Mr. Fitzgerald stated that the operation of one-man cars was started "only after the most careful consideration of all elements involved in the situation, including that of safety." Only three cars have been withdrawn from service. They provided fourteen-minute service on the Evans Avenue route with a "tripper" car operated during the peak of traffic, giving eleven-minute service. The route they covered is approximately 2½ miles long, and cars are heavily loaded only at noon, when many people take advantage of the 3-cent fare to go home to lunch, and during the rush hours at night.

Another Festivity in Cleveland

The Cleveland Railway, Cleveland, Ohio, will hold its first annual Christmas party for employees and their families in the Cleveland Public Auditorium on Dec. 19. In addition to everything customarily associated with Christmas parties, there will be an indoor circus.

A few days prior to this activity the railway chorus will sing for inmates of the Soldiers and Sailors Home at Sandusky, Ohio. The chorus is directed by Charles G. Dawe, director of the Orpheus Male Choir, which won first prize in the Welsh National Eisteddfod in 1925.

Foreign News

Traffic Co-ordination in London Seemingly Nearer

Co-ordination of all transportation in London has become seemingly nearer through a resolution adopted by the London County Council at an all night session on Nov. 6-7. At present, most of the buses and rapid transit lines in London, with some of the tramways in the outskirts of the city, are in what is known as the "underground group," while the tramways in the County of London are municipally owned. The resolution adopted by the County Council was that steps be taken to enable it to enter into agreement with the Underground Electric Railways and others, for a common management and a common fund. What these arrangements are to be will have to be determined in the future. It is expected that the plan will not involve a change of ownership of the London County Council Tramways as was made to appear in press dispatches to the United States, but simply a direction of the property and a pooling of its earnings. On March 31, 1928, the debt of the London County Council with respect to its tramways was £8,692,987.

An Idea from Japan

"KIND WEEK" has just been celebrated on the Japanese railways. The Tokio Railway Bureau decided that all porters and other station employees should "wear permanent smiles, put luggage down gently, and bow every time they are addressed." In addition, some 200,000 leaflets were distributed among passengers asking them not to be hard on the railway employees.—*New York World.*

Guatemala Railway Suspends

Electric railway traffic on the Los Altos Railway, between San Felipe and Santa Maria de Jesus, in Guatemala, has been suspended indefinitely until connection is made at Quezaltenango. There have been numerous accidents on this railway and very little passenger traffic.

Argentina Tramway Strike Settled

After having been in progress for 33 days, the tramway strike in Rosario, Argentina, has been settled and service resumed. According to the terms of settlement, both sides have made more liberal concessions than they were disposed to consider at the beginning of the controversy. The settlement came as a surprise to many, as serious consideration was being given by the Mayor to commandeering the company's plant and vehicles.

Presentation to Alfred Baker

The members of Tramways Committee at Birmingham, England, and the chief officials of the department on Oct. 25 entertained at dinner Alfred Baker, formerly general manager of the city tramways, who retired from his post recently on account of ill health. Various complimentary speeches were made, and Mr. Baker was presented with an illuminated copy of a resolution passed by the Tramways Committee bearing testimony to his eminent services. He also received a handsome grandfather chiming clock.

Wage Reductions in England

Nearly all sections of British railway employees recently submitted to a reduction of 2½ per cent in wages and salaries, in view of depressed traffic. An exception was the case of the staff in railway generating stations and substations and those engaged on high-tension cable work. The railway companies applied to the industrial court to sanction a corresponding reduction in such cases, and the court has decided that the reduction shall be made.

Proposed Tramway Line in Java

Plans are now under consideration by the West-Java Tramway Syndicate to connect the isolated region lying to the east of the railway, Meester-Cornelis-Buitenzorg, by means of a tramway which would give direct connection with Batavia, Buitenzorg and Krawang.

TRAFFIC DEVELOPMENTS IN ITALY.—The Italian government has decided to electrify the most important railways serving the port of Trieste, with a view to development of traffic. These lines are the Trieste-Campo Marzio-Opicina, the Trieste-Aurisina Opicina, and the Trieste-Centrale Monfalcome.

SUBWAY PLANNED FOR MOSCOW.—Decision has been made by the Soviet to begin construction on Moscow's first subway. The cost is estimated at £2,000,000 and it is expected that the work will be completed in three years with the aid of German and American firms.

RADIO INTERFERENCE IN SWITZERLAND.—Some of the street cars in Berne were equipped recently with a special device to alleviate present interference with radio reception. If these tests prove satisfactory, all cars will eventually be equipped in this way.

Recent Bus Developments

Substitution in Poughkeepsie Defined

The Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., under a Dec. 3 order of the Public Service Commission, has been authorized to operate buses in place of cars on its tracks on Market Street, South Avenue and South Road in Poughkeepsie to the city line, in Montgomery Street, in Hooker Avenue and in Southeast Avenue.

Approval was also given by the commission for discontinuance of trolley operation between Poughkeepsie and Wappingers Falls. The railway, under an agreement with the board of supervisors, is to sell to Dutchess County for state highway purposes all its rights to the use of land now occupied by its tracks between Poughkeepsie and Wappingers Falls for $150,000.

Seeks to Discontinue Line in Los Angeles

Application of the Pacific Electric Railway, Los Angeles, Cal., to discontinue its bus service on what is known as the Hyperion Avenue, Silver Lake, Glendale Boulevard Motor Coach Line has been taken under advisement by the Board of Public Utilities. A protest has been filed with the board against discontinuance of the service.

The company sought to discontinue the service May 12, 1926, setting forth that although $5,000 was paid as a subsidy during the first year, it was operated at a loss. People in the district agreed to subsidize the line for two more years. The service was continued over a slightly different route.

J. O. Marsh, general manager of the utilities department, said it was hoped that the district would have filled up so that the patronage would justify further operation of the line without further bonus. The Pacific Electric Railway contends that the line continues to operate at a loss, even with the bonus.

Buses Succeed Trolleys in Glens Falls

The Hudson Valley Railway lines radiating out of Glens Falls, N. Y., were abandoned on Dec. 1 and were replaced by 24 buses operated by the Hudson Transportation Company. Substitution by bus terminates railway operation which began 38 years ago.

Abandonment of the trolley service leaves about 50 miles of railway to be scrapped, between Glens Falls and Saratoga, in Glens Falls, between Troy, Mechanicville and Stillwater, Lake George and Glens Falls, and Glens Falls through Hudson Falls to Fort Edward.

The successor company will retain about 40 of the 125 employees of the Hudson Valley, a subsidiary of the Delaware & Hudson Company. Several men, in the employ of the railway company for more than 25 years, will retire, while others may be employed by the transportation company later.

Two-Mile Route in Buffalo Up to Commission

The Buffalo City Council has granted a one-year franchise to the International Bus Corporation, a subsidiary of the International Railway, Buffalo, N. Y., to operate buses in Kensington Avenue from Bailey Avenue to the city line, a distance of almost 2 miles. A 10-cent fare will be charged and the company is required to issue free transfers to other bus and car lines. The route, on which the company will operate single-deck, gas-electric buses, serves a new residential development in the northeast section of the city. The new service will start as soon as the necessary authority is obtained from the Public Service Commission.

Move to Put Louisville Taxis Under Regulation

The taxicab situation in Louisville, Ky., has not changed in the past two months, other than an ordinance which has passed the lower board of the City Council placing cabs under regulation. It provides for insurance or bond in acceptable concerns, with the $5,000 for one, or $10,000 for two persons hurt in an accident; for carrying on under a $30,000 blanket bond; maximum fare rates of 30 cents for the first quarter of a mile, as against the present 25 cents for two miles or under. The ordinance also provides for meters on all cabs, issuance of receipts and that drivers will have to pass examinations and receive permits from the Board of Safety before they can take out a cab. The latter provisions would block the migration of outside cabs and drivers to the city of Louisville to capitalize on the crowds at the race meets.

There are now about six concerns in the taxi business with two or more cars. One company is now operating Whippet cabs at 8⅓ cents per mile, or 3 miles for 25 cents, but more than 3 miles puts the rate up to 10 cents a mile for additional mileage. Most of the others are operating at 2 miles for 25 cents, or 12½ cents a mile.

The Louisville Taxicab & Transfer Company increased its number of cabs from about 75 in active service and 150 in all, to more than 250 in active service, plus a reserve supply, and all at 12½ cents a mile, having met the price.

Action on Buses in Kansas City Will Wait Fare Outcome

The Kansas City Public Service Company, Kansas City, Mo., will not ask for a renewal of its bus franchise. Its action on buses will depend on the outcome of the request, before the City Council at this time in which a 10-cent fare is suggested. In the recommendation to the Council, the company promises continuation of the bus service if the new fare is put into effect. Officials plan to ask for a day-to-day agreement with the Council to operate the buses until the increased fare question is settled. The trial agreement with the buses expired on Dec. 1.

In the report presented recently to the City Council by the company, there is little reference to the buses except to say that they are losing money. It stated, however, that if the 10-cent fare is accepted, the bus service will continue.

According to President Groner, bus service is still in the experimental stage and no long-term contract will be made by the company. The situation is further complicated by the fact that much of the equipment will probably have to be replaced within the next year. This applies particularly to the double-deck buses and the heavy coaches which were bought to run on a de luxe route at a 25-cent fare. The company says that the double-deck buses will not be replaced as they have not proved satisfactory.

Although the company reduced the bus fare from 15 cents straight to two fares for 25 cents, the buses are still losing money. They are losing less money than they did at the 15-cent fare, but more than at 10 cents, and under the 10-cent fare they lost money constantly.

Service by Bus Between Jackson and Kalamazoo

United States District Judge Charles C. Simons has authorized John F. Collins, receiver of the Michigan Electric Railway, to discontinue interurban service on its southern division, Jackson to Kalamazoo. Loss of more than $10,000 on this line from June 19 to Oct. 31 was cited as the basis for the order. Freight service will be continued, and buses will take care of passengers.

Syracuse Fare Agitated

Tentative plans have been laid to raise the bus fare in Syracuse, N. Y., to 10 cents cash with six tickets for 45 cents, corresponding with the rate of the New York State Railways on trolleys. The program also provides for issuance of a five-year permit for bus operation to the Syracuse Coordinated Railways Corporation, subsidiary of the New York State Railways. In return for the five-year permit and the higher fare, the bus corporation and railway agreed to ex-

Digitized by Google

tend the bus lines and make other improvements.

The program has been tentatively approved by the aldermanic franchise committee and representatives of the bus and railways as a compromise. The bus company had asked for a franchise for its bus lines. In the past it has been operating under a permit which had to be renewed by the aldermanic body annually. The aldermen as a whole were opposed to the franchise proposition. Railway officials said they would extend the bus lines only on condition that they receive a franchise or long-term permit, which would serve to protect their investment. They contended that it was inconsistent to have the buses operate at a 7-cent fare and the trolleys at a 7½-cent ticket or 10-cent cash fare, particularly in view of the fact that it was possible to transfer from one to the other.

Geneva-Waterloo-Seneca Falls Route Sought

The Geneva Railway Bus Lines, Inc., applied, on Dec. 4, to the Public Service Commission for a certificate for the operation of a bus line from Seneca and Linden Streets in Geneva, to Main Street in Waterloo town, thence to Seneca Falls. The petitioner also asks for a certificate to operate along Lake Street in Geneva and the continuing highway in Waterloo town to the junction with North Street. In the petition it is stated that the schedules of operation and fares, including round trip commuters and school tickets and transfer privileges, are to be the same as the existing operating schedules and fares of the Geneva, Seneca Falls & Auburn Railroad Company, Inc. The bus line has been operating in Geneva, N. Y., since 1925.

Equalizes Rail and Bus Fares in Binghamton

An amended tariff of the Binghamton Railway Bus Lines, Inc., has been approved by the Public Service Commission in accordance with an ordinance adopted by the Common Council of Binghamton, N. Y. It authorizes the Binghamton Bus Lines, Inc., to charge the same fare for transportation over its lines within the city of Binghamton as is charged by the Binghamton Railway over its car lines within said city, with universal transfer privileges between buses and street cars. Cash fare is 10 cents with four tickets or tokens sold for 30 cents. The new tariff is effective on Dec. 20, 1928.

East St. Louis Petition Denied

The application of the East St. Louis & Suburban Railway to substitute buses for street cars between Edgemont and Lebanon, Ill., was dismissed by the Illinois Commerce Commission on Nov. 27.

Financial and Corporate

North American Company Centralizes St. Louis Operation

The Missouri Public Service Commission on Nov. 28 granted the application of the Union Electric Light & Power Company, St. Louis, for authority to acquire by purchase from its parent, the North American Company, the stock of all the public utilities in the East St. Louis and Alton districts controlled by that company. A total of $18,100,000 is involved in the sale, which simply means that the North American Company is centralizing the operation of all its utilities in the Greater St. Louis district in the Union Electric Company.

The Union Electric Company will pay the North American Company $8,000,000 in cash and $10,100,000 of its common stock. It was stated in the application and testified to at the hearing that the Union Electric is simply paying the North American Company just what it cost that concern to acquire these utilities.

Corporations affected are the East St. Louis Light & Power Company, East St. Louis Railway, Alton & St. Louis Railway, Alton Gas Company, the Alton Railway and the Union Electric Light & Power Company of Illinois, which operates the Cahokia power plant south of East St. Louis.

Revenue and Traffic Fall Off in Philadelphia

For the nine months ended Sept. 30, 1928, the deficit of the Philadelphia Rapid Transit System, Philadelphia, Pa., was $409,832, for the three months' period ended Sept. 30, 1928, $440,421, and in September, 1928, the deficit was $411,294.

The company in its report states that this deficit represents largely the added expense to P.R.T. system from operation of Broad Street subway. September was the first of three months during which P.R.T. agreed to operate the subway for the city. Terms generous to the city were agreed upon because the management recognized that in no other way could the true financial effect of this city-built subway be shown so as to be accepted and understood by everybody. This understanding has now been secured, the cost will be met out of P.R.T. surplus without affecting dividends, and the city has been notified that a new agreement must be provided for after Nov. 30.

Investigation Planned of Grays Harbor Holdings

Legal proceedings leading to the acquisition by the city of Aberdeen, Wash., of the Grays Harbor Railway, Light & Power Company have been authorized in a communication from the City Council. This grants Mayor H. E. Bailey the power to employ special counsel and to proceed with the necessary steps to procure the facilities. Whether the property will be acquired through purchase without condemnation was not known today. The Mayor said that it was planned by the city to conduct a complete survey of the holdings of the company, as soon as a definite price was placed on it by company officials.

Approval Sought for Declaration of Abandonment

The International Railway, Buffalo, N. Y., has applied to the Public Service Commission at Albany for approval of a declaration of abandonment of its double track line in Carolina Street, starting from Niagara Street, alleging that this part of its system is no longer necessary for the successful operation of its lines and has been non-operative for more than five years. Further, the company states the lines using the portion of the route have been rerouted for more than five years past to give more direct and efficient service in the district.

Puget Sound Sale Postponed

Fixing of the time and place of the sale of the property of the Puget Sound Electric Railway, Tacoma, Wash., used in its operation of the Seattle-Tacoma interurban line, has been delayed for two weeks. Date of sale was to have been set in Federal Judge Cushman's Court on Nov. 25, but he continued the hearing until after Dec. 10, upon request of the receiver's attorney.

Records in Rides and Receipts Registered in Chicago

Street car riding in Chicago, which has shown a remarkable growth throughout the year, reached the highest peak in the history of the city last month, according to the October report of the Chicago Surface Lines, just issued. Both in total rides and in gross receipts the company set a new record.

The total number of rides during the month was 142,063,299, an increase of 2,884,207 over the previous highest month—last March. The gross receipts were $5,406,144, an increase of $58,915 over the previous high of December, 1926. Guy A. Richardson, vice-president, said:

We are timing overhauling schedules in such a way as to have every car available during rush-hour periods throughout the heaviest part of the Christmas shopping season.

Company officials declare that there has been no unusual condition this year to account for the tremendous increase in riding, and they credit the growing business almost entirely to the greater popularity of street car service. In this connection Mr. Richardson said:

People are learning more and more that the common carrier has a distinct advantage over the private automobile for city transportation. Surface Lines cars make almost as good time as automobiles in congested sections, and when the time consumed in parking the automobile is taken into consideration, the street car is faster. So far as economy is concerned, of course, there is no comparison. Short-haul riding has been increasing rapidly of late also, due to the increased regularity of cars through the Loop and other congested sections.

Preferred Stock of Interurban Publicly Offered

Public offering of $1,500,000 of 6½ per cent cumulative Class A preferred stock of the Chicago, South Shore & South Bend Railroad was made on Dec. 1, at $96.50 a share. This is the first stock of the railroad ever offered to the public. It will be sold by employees of the railroad and by the Utility Securities Company, Chicago.

The road is more generally known as the South Shore Line. It is controlled by the Midland Utilities Company, which also controls a number of other utility companies in northern Indiana. The railroad came under the present management on July 14, 1925. Since that time an extensive rehabilitation program has been carried on and service improved.

Under the new management there has been a steady increase in business. Passengers carried on the main line increased from 1,552,308 in 1925 to 2,806,855 for the year ended Sept. 30, 1928, an increase of 80.8 per cent. Passenger revenue rose from $599,236 in 1925 to $1,772,918 for the year ended Sept. 30, 1928, an increase of 195.9 per cent. Freight revenue rose in the same period from $189,263 to $1,129,856, an increase of 497 per cent. Total operating revenue in the same period increased from $858,265 to $2,972,888, or 246.4 per cent.

Sale of Spartanburg Property Arranged

All the property of the South Carolina Gas & Electric Company will be sold at the Spartanburg County Court House on Dec. 10, under an order by Judge H. H. Watkins of the United States Court of the Western District of that state. The order also named an upset price of $4,200,000. Action which terminated in this order grew out of a suit brought last June and the federal judge upholds a report of the case made by Solicitor J. C. Blackwood, of the Seventh Judicial District, who was appointed special master.

According to the order, the purchaser will "satisfy and discharge any unpaid indebtedness and obligations or liabilities which have been duly contracted or incurred by the company for the necessary operating expenses in due and ordinary course of the said company subsequent to the commencement of this suit."

The South Carolina Gas & Electric Company defaulted on payment of interest on bonds and action followed. The Merchants & Farmers Bank, as trustee for their bondholders, brought action in the United States courts against the gas company to foreclose third mortgages. The New York Trust Company, as trustee for first bondholders, and the American Exchange Irving Trust Company, as trustee for second mortgage bondholders, were made parties to the action and asked that their mortgages be foreclosed in the same proceedings.

Mr. Blackwood was appointed special master to take testimony and determine all points of law and fact, and to pass on all claims against the company and report his findings to the court. He filed a report and recommended the foreclosure of all mortgages and the sale of the property of the company. As said above, this report by the master was upheld by the court.

Traffic, Fare and Wage Figures

The number of revenue passengers, including bus passengers, reported by 228 companies to the American Electric Railway Association for the month of October, 1928, compared with October, 1927, is as follows:

October, 1928	839,377,637
October, 1927	833,954,392
Increase, per cent	0.65

This is the first month that has shown an increase in traffic since March, 1927, with the exception of February, 1928, when the increase was due to the extra day occurring in Leap Year. While this increase is encouraging it is too soon to say that it is due to any fundamental improvement in traffic conditions, since there were two more full working days in October, 1928, than there were in October, 1927, and it is quite possible that this difference in the calendar may have accounted for the increased traffic in 1928.

Average cash fare in cities of 25,000 population and over:

	Cents
Nov. 1, 1928	8.2358
Oct. 1, 1928	8.2241
Nov. 1, 1927	8.0723

The increase in the average fare between Oct. 1 and Nov. 1 was due to an increase in Los Angeles from 5 cents straight to 7 cents with four tokens for 25 cents and an increase in Shreveport, La., from 7 cents straight to 8 cents with eight tickets for 60 cents.

The correction in the average for Oct. 1, 1928, and that shown in last month's service letter is due to the fact that street railway service in Marion, Ohio, with a population of about 28,000, has been discontinued and the city therefore has had to be taken out of the average.

	Average Hourly Rate, Cents	Index Number 1913 = 100 Per Cent
Nov. 1, 1928	57.52	211.08
Oct. 1, 1928	57.52	211.08
Nov. 1, 1927	57.29	210.24

New Director in Boston

Bernard J. Rothwell, president of the Bay State Milling Company, has been elected a director of the Boston Elevated Railway, Boston, Mass. Mr. Rothwell's appointment comes as the result of the directors' decision to increase their number by one. Mr. Rothwell was president of the Boston Chamber of Commerce from 1908 to 1910, and in 1913 served as chairman of the Massachusetts Commission on Immigration. He is prominently connected with many enterprises.

David F. Houston Elected to Brooklyn Board

David F. Houston, former Secretary of Agriculture and of the Treasury and now president of the Mutual Life Insurance Company, New York, has been elected a director and member of the executive committee of the Brooklyn City Railroad, Brooklyn, N. Y., to succeed the late James Simpson.

Bringing the Force Together in Baltimore

The United Railways & Electric Company, Baltimore, has leased six entire floors in the new Court Square Building and will move its offices from the Continental Building about March 1. At the present time the offices of the Baltimore company are scattered over a number of floors of the Continental Building, some on every floor from the eighth to the fifteenth. In addition to these the company uses one complete floor.

Book Reviews

Stay Alive!

Marcus Dow. Published by Marcus Dow, Inc., New York, 209 pages. Price $2.

Kicks enough to go around for all walking and riding humanity are contained in Marcus Dow's message "Stay Alive!" Through his spokesman, Jim the truckman, observant and experienced, many harrowing tales are recounted with such vividness and conviction that the reader can't help but agree with this burly recorder that the question of accidents is all a matter "of usin' the noodle." To prove his contentions Jim recites one instance after another—backing without looking behind, rushing past intersections and piloting with one arm—where results might very evidently have been different.

The three or four line admonitions at the end of each chapter epitomize the substance of the kick in that particular chapter. Corner Cutters, for instance (Kick No. 20), points this moral: "Turnin' a corner faster than anybody can walk in givin' them that walks a kind of a tough break." Another, called Black Cats, suitably listed as Kick No. 13, ends thus: "Don't try to hug the car in front o' you. Wait till you get home and hug your wife."

Nor is Jim biased in favor of the pedestrian. He often finds the walking human a more perverse goat-getter. In language that certainly is not euphemistic he scores the jay-walker who steps unwittingly, of course, in front of a touring car, taxi or truck and the fellow who for a capricious reason decides to cross the avenue green lights or otherwise. Besides, Jim believes that this hurry business is an illusion.

Again, Jim claims many drivin' fools really think "they is good engineers," but he knows better. For he had a career shunting box cars in the main yard of a terminal on one of the big transportation lines of the country and there he learned his lesson on the how, why and wherefore of care and safety.

Mr. Dow, the author, is one of the leaders of safety in this country with activities in the field of public service that cover fifteen years and embrace the writing of valuable pamphlets, making public addresses and moving pictures and otherwise giving his time and energy to the business of saving life.

Jim's cracks on the shortcomings of "drivin' fools and walkin' yaps" and the drawings of H. S. Zoll might be examined with profit by all drivers.

Law and Practice

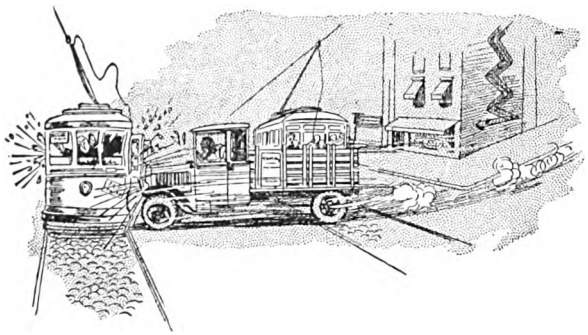
Oscar A. Gier. Published by Richards & Gier, patent attorneys, New York. No charge.

This is a summary of United States patent law, relating to the prospective patentees, what may be patented, methods of applying for a patent, procedure in the patent office and infringement suits. The appendix gives the rates charged for foreign patents, term of patent and other similar information.

Public Utility Rate Making

Taylor E. Groninger, Bobbs-Merrill Company, Indianapolis. 381 pages. Price $7.50.

The author was formerly corporation counsel for the city of Indianapolis and special counsel for the Indiana Public Service Commission. He was also one of the attorneys in the Indianapolis Water Case, before the Public Service Commission of Indiana, before the United States District Court, and finally, before the United States Supreme Court, where he made one of the oral arguments. This experience qualifies him for a discussion of the subject. In his introduction he says frankly that though he would prefer that the rate base should be measured by "prudent investments," he discusses all the methods approved by the courts. Besides treating the points usually considered in volumes on this subject, the author adds several appendices, giving many details of recent cases, revised rules of the Supreme Court of the United States and other pertinent matters.



Drivin' with bum brakes is a cruel crime against humanity.

Mundy's Earning Power of Railroads

Compiled and edited by Floyd W. Mundy, James H. Oliphant & Company, New York, N. Y.

In this 23rd issue are found important statistics and other facts relating to the earning power and to the securities of railroads, arranged in convenient form for ready reference. Such subjects as stocks, funded debt, mileage, revenues, rentals, guarantees, investments, valuations and others are covered so that the investor can inform himself on the value of the stocks and bonds of any important railroad in the United Sates. Official annual railroad reports have been used almost exclusively in the preparation of this book.

Whither Mankind

Edited by Charles A. Beard—Longmans, Green & Company, New York, N. Y. 408 pages, Price $3.

Not so much to defend the machine age as to urge an impartial and dispassionate view of its accomplishments and possible future, "Whither Mankind"—a panorama of modern civilization—will give the inquiring mind some pertinent facts on life as it is lived today. Dr. Beard and his collaborators have dissected and analyzed the machine age and have tried to answer its assailers and critics on the esthetic, religious and humanitarian sides.

Certain contributions to this symposium are not connected with electric railway enterprises. However, the discussion on business by Julius Klein, director of the U. S. Bureau of Foreign and Domestic Commerce, is not too far afield to win the attention of the progressive transportation man. To Dr. Klein it would appear that after passing through its successive stages, "machinery and its directive force, modern business," have made an impressive contribution in "easing the burdens of drudgery, in sharing the costs of countless tasks, and in making available a larger leisure for the enjoyment of those finer comforts which in earlier ages were the exclusive prerogatives of a few." He sees business, too, with a grave responsibility in the drama of restoring order out of post-war chaos.

A particularly provocative chapter on education has been written by Everett Dean Martin, containing generous excerpts from his "The Meaning of a Liberal Education." Just as the latter work is worth the time of every railway manager and operator, now vitally interested in the problem of educating the rank and file, so, too, might this addenda be read with profit by all in and out of the railway field who are floundering about in an effort to know and apply the aim of education to modern conditions.

The New Way to Net Profits

Fred W. Shibley, New York. Harper & Brothers. 206 pages. Price, $3.

This book on the science of business is a practical treatise dealing with the making of net profits in business and industry. The appeal of the book's contents should be a wide one. Manufacturers, merchants and bankers will find information of great value in the solution of their special problems.

The opening chapter on "Why the New Way Was Found Necessary," establishes the fact that the present is the day of the thinker, the philosopher in industry. Modern business has become highly complex and must be conducted on scientific principles. In consequence the business man today must possess the intellectual qualifications and the practical wisdom of a philosopher if he expects to attain pre-eminence.

Personal Items

George B. Avery Takes Over the Reins in Seattle

The appointment of George B. Avery as superintendent of public utilities of Seattle, Wash., by Mayor Frank Edwards, on Aug. 15, last, was followed on Nov. 13, by the City Council passing an ordinance giving Mr. Avery full charge of the Seattle Municipal Street Railway department and abolishing the position of general superintendent, held by David W. Henderson, who died on Oct. 27. Mr. Avery, as superintendent of public utilities, succeeds Clark B. Jackson. In line with his expressed policy of operating the system as a corporation would operate it, he has appointed the following heads of departments for the railway:

George B. Avery

Roy E. Furse, superintendent of transportation; R. E. Pierce, superintendent of maintenance; A. D. Campbell, superintendent of equipment and A. C. Hiatt, accountant.

Prior to his appointment, Mr. Avery was employed by the State Department of Labor and Industries at Olympia, having charge of six counties, including King County, the largest of the 39 comprising the state. He also has been identified with the Internal Revenue Department, operating in Seattle and for about eight years served the government as an electrical engineer, supervising electrical installations in hospital construction programs in South Dakota and elsewhere.

Mr. Avery was born in Chariton, Lucas County, Iowa, on March 19, 1884. He went to Seattle in 1916 and has been active in civic affairs.

Mr. Avery signalized his advent into full power over the municipal railway by launching energetic steps on his program, which promises improvement in service as well as heavy reduction in operating costs. He declared that hereafter "efficiency, service, economy and courtesy" would be the rule of the railway department.

As the first step in this program, Mr. Avery plans to speed up service in the congested downtown district during the afternoon "peak" traffic rush. To this end, police department has started strict enforcement of a ban on parking of automobiles. Further, to expedite movement of cars in the downtown district, fares will be collected at both front and rear doors, that loading may be more quickly accomplished.

After Jan. 1, the feeder buses will be retained and one-man cars will be operated on all lines, except that two-man cars will be in service on certain of the more heavily traveled lines during the late afternoon rush period. Carrying out instructions, Roy E. Furse, superintendent of transportation, has issued a bulletin to the 1,100 train men on two-man cars warning them of the impending change to a one-man car basis, and advising them to familiarize themselves with the one-man car operation before Dec. 15. After that date, selection based on efficiency will be made of the 1,000 who are to be retained as one-man car operators.

M. R. Beaman Honored in Philadelphia

Maurice Regan Beaman has been appointed secretary of the Bureau of Transportation and Commerce, recently established by the Philadelphia Chamber of Commerce. For more than a year the holder of this new post has been general manager of the Camden Marine Terminals and traffic manager of the South Jersey Port Commission. He has spent more than a score of years in handling transportation problems, half of the time in the service of the carriers and the rest either with the shippers or in port executive positions in various cities.

For twelve years until 1915 Mr. Beaman was with the traffic department of the Southern Railway. He developed into a rate expert, appearing frequently before the Interstate Commerce Commission. In Camden he organized the Traffic Club and reorganized and headed without compensation the traffic committee of the Camden Chamber of Commerce.

Mr. Beaman was born in Raleigh, N. C., 41 years ago. He was graduated from the old Columbia Law School in Washington. In his new post he will combine into one bureau the work formerly handled by the transportation bureau and the foreign trade bureau of the chamber. P. H. Gadsden, president of the chamber and a former president of the American Electric Railway Association, in announcing it said that Mr. Beaman's appointment was the first of a number of important developments intended to increase the militancy of the Chamber of Commerce.

Additional Duties for D. W. Dodge of Brill

Douglas W. Dodge, who has represented the automotive car division of the J. G. Brill Company since 1923, has also been appointed Pacific Coast representative of its electric car and truck division. Therefore, in addition to self-propelled gas-rail and gas-electric cars for steam railroads, Mr. Dodge will also handle the sale of electric cars, trucks, seats, specialties and renewal parts in the states of Washington, Oregon, California, Idaho, Utah, Arizona, Montana, Wyoming and Nevada. His office will continue to be in the Rialto Building, San Francisco.

A broad engineering experience was acquired by Mr. Dodge with the Ocean Shore and the Western Pacific Railroads, as well as the Pacific Portland Cement Company. From 1907 to 1917 he was engaged in sales work for the Orenstein Arthur Koppel Company. Then for two years he served in the Engineers Corps, U. S. Army.

D. W. Dodge

Subsequently, he was Pacific Coast manager of the Lakewood Engineering Company and manager of the Engineering Products Company, representing the latter until his recent appointment.

Mr. Dodge, who has always lived on the Pacific Coast, is a member of the Engineers, Transportation and Commercial clubs and of the Menlo Country Club.

Messrs. Kidd and Murrin in New Rôles

George Kidd has resigned as president of the British Columbia Electric Railway, Vancouver, B. C., and has accepted the chairmanship of the board of directors of the British Columbia Power Corporation, the holding company. W. G. Murrin, vice-president, will take over the office of chief executive.

Mr. Kidd thus completes a period of fifteen years as head of the British Columbia utility. He was educated as a chartered accountant and was ap-

Digitized by Google

pointed (London, England) secretary of the British Columbia Electric Railway in 1907. Four years later he went to British Columbia and acted as comptroller until May, 1914, when he was appointed general manager. The office of general manager was changed to that of president in August, 1923.

Mr. Murrin began his public utility career in the City of London Electric Lighting Company in 1903. Later he became works manager and electrical engineer of the London United Tramways, which concern he left in 1913, going to British Columbia as mechanical superintendent of his present company. From general superintendent he became assistant general manager in November, 1916, and was appointed vice-president in August, 1923. The president-elect, as is his predecessor, is well-known in social circles in Vancouver.

G. W. Schwaner Succeeds R. V. Prather

George W. Schwaner, former Sangamon County treasurer and at one time internal revenue collector, has been appointed secretary of the three Illinois state utility associations, succeeding the late R. V. Prather of Springfield, Ill. This selection was made by executive committees of the three organizations: the Illinois Electric Association, Illinois Gas Association and Illinois Street Railways Association. His office will be in Springfield.

C. F. Terrell Succeeds E. S. Fitz at Beaumont

E. S. Fitz, operating manager of the Eastern Texas Electric Company, Beaumont, Tex., since December, 1924, has accepted a position with the Virginia Electric & Power Company with office in Richmond, Va. His business connection with Stone & Webster began in 1911 with his employment in the meter department of the Blackstone Gas & Electric Company, Pawtucket, R. I. He has served with the Houghton Electric Light Company and the Houghton County Traction Company. Mr. Fitz was graduated from Brown University, Providence, R. I., as an electrical engineer. Except for the period when he was in the Army Air service overseas, he has been connected with Stone & Webster since 1911.

Mr. Fitz's successor, Charles F. Terrell, has already assumed his new duties as operating manager of the properties. He was formerly general superintendent of the light and power department of the Tampa Electric Company. Beginning work with the Stone & Webster interests in Seattle and later being affiliated with the properties in Bellingham and El Paso, his record of twenty-five years service with the organization is one of steady promotion. Mr. Terrell was born in Illinois in 1885, and he was graduated from the University of Washington as an electrical engineer in 1910.

A. W. Thompson Away on Leave from U.G.I.

Granting of a six-month leave of absence was voted on Dec. 5 by the United Gas Improvement to its president, Arthur W. Thompson, for reasons of health, and John E. Zimmermann, president of Day & Zimmermann, engineers, received full executive powers temporarily. In the light of the action of Dec. 5 the reason for the addition of five members to the executive committee last month with its implication of a pending consolidation, was said to be clearer. Several New York and New Jersey men were added to the committee.

The new members named were Thomas N. McCarter, president of the Public Service Corporation of New Jersey; William C. Dickerman, operating vice-president of the American Car & Foundry Company; Landon K. Thorne, president of Bonbright & Company, Inc.; Harold Stanley, a member of J. P. Morgan & Company, and Mr. Zimmermann.

The official statement of the change said that Mr. Zimmermann had agreed to accept such a temporary assignment of duty, upon condition that he is not committing himself, nor is the company committing itself by reason of such appointment, to any permanent use of his services as an executive officer, he being unwilling to accept any such obligation.

Mr. Thompson has had a varied and conspicuously successful career in railroad and public utilities fields. He has been president of the United Gas Improvement Company since 1922 and for seven years previously was president of the Philadelphia Company, Pittsburgh. To accept that post he resigned as vice-president of the Baltimore & Ohio Railroad in charge of operations, traffic, engineering and commercial development. He was born in Erie, Pa., in 1875, is a graduate of Allegheny College, and is now president of its Board of Trustees. He is a director of many companies, among them the Pennsylvania Railroad, Missouri-Kansas-Texas Railroad, Philadelphia National Bank, Pittsburgh Hotels Company, Public Service Corporation of New Jersey, Union Trust Company of Pittsburgh, The Pennsylvania Company and the P. C. C. & St. L. Railroad, and is a manager of the Girard Trust Company, Philadelphia.

C. B. Melton, assistant treasurer of the Eastern Texas Electric Company, Beaumont, Tex., has resigned. He has gone to Greensboro, N. C., to take charge of the accounting work connected with the extensive ice properties of the Southern Public Service Company in Virginia, South Carolina and Georgia. He has been a member of the Stone & Webster organization for about a dozen years, serving in Pensacola, Houston and Beaumont.

J. R. Groves has resigned as general manager of the Barrow, England, Tramways on account of ill health. He has had a wide tramway experience during the past 40 years, holding important positions in Edinburg, Cardiff, Yarmouth, Peterborough, Worcester, Gravesend and Barrow. The Barrow Town Council has granted Mr. Groves a pension.

R. B. Stearns Retires

Robert B. Stearns, vice-president, general manager and treasurer of the Eastern Massachusetts Street Railway, Boston, Mass., who for more than eleven years has been the chief executive officer of the road, has resigned to take effect Jan. 15, 1929. He will continue as a director of the company. The effective date of his resignation coincides with the date of expiration of the ten-year public trusteeship.

OBITUARY

One of the leading figures of the South, a banker and public utilities projector—E. W. Robertson—died in New York on Nov. 21, after coming to the city to attend a meeting of the directors of the Equitable Life Assurance Society. The former chairman of the board of directors and treasurer of the Columbia Railway, Gas & Electric Company, Columbia, S. C., and the Parr Shoals Power Company and president of the Columbia Gas Light Company severed his connection with these utility enterprises in 1924 at the age of 61. He had obtained control of the Columbia Electric Street Railway, Light & Power Company in 1903 and the name was subsequently changed to the Columbia Railway, Gas & Electric Company. Mr. Robertson was graduated from Yale University and from the law department of the University of South Carolina in 1887. He has been an outstanding figure in banking in the South.

Frederick Kent Copeland, president of the Sullivan Machinery Company since 1892, died at Claremont, N. H., on Nov. 10. After several years spent in Iowa and Colorado in mining engineering work he helped to organize the Diamond Prospecting Company in 1884 and became its president. This company engaged in contracting with the Diamond Core Drills made at Claremont, N. H., by the Sullivan Machine Company. In 1892 the two companies were merged with Mr. Copeland as president. Under his leadership Sullivan products were developed for a wide range of purposes serving the mining, quarrying, constructing and manufacturing industries, being manufactured at plants at Claremont, N. H., and Michigan City, Ind., and marketed through world-wide sales organization. Mr. Copeland was born in Lexington, Mass. He was graduated from Massachusetts Institute of Technology in 1876 and was a member of many engineering societies.

Additional Improvements Projected

Pacific Electric may make extensive track changes. Chicago Rapid Transit to improve Westchester line. Tacoma to ask for bids on cars. Seattle and Milwaukee plan improvements

PERHAPS the outstanding plan among the numerous improvement projects announced this week is that of lowering the tracks of the Pacific Electric Railway, Los Angeles, Cal., that bisect the entire city of Beverly Hills. These tracks, which are at a considerable elevation, will be reduced to street level and many of the wig-wag bell signals will be disposed of, if the Chamber of Commerce and the City Council succeed in an engineering survey that will present an equitable bond issue for the approval of the voters. The railway at its present elevation rises from the surrounding level at the eastern end of Beverly Hills and returns to this level a little beyond the junction of Wilshire and Santa Monica Boulevard, thus making Santa Monica Boulevard an imaginary barrier between the northern and southern sections of the city.

Chicago Improvements

The Chicago Rapid Transit Company, Chicago, Ill., will make extensive improvements at the present terminus of the Westchester line in connection with the widening and paving of Roosevelt Road. To eliminate the danger of a grade crossing the plans provide for the raising of the highway to a height of 8½ ft. above the present grade and the depression of the tracks of the Westchester line to a depth of 14 ft. The depression of the tracks will be below the sewer level at the lowest point, which will necessitate the installation of a pumping station.

The open cut for the tracks will be 2,300 ft. in length, and a total of 3,800 cu.yd. of dirt will have to be excavated. The present station will be moved south and east and an island platform built in the open cut between the tracks. The work will be done simultaneously with the widening of Roosevelt Road so that the dirt can be taken out of the cut and used for raising the level of the highway across the viaduct.

To Ask Bids on Cars

The plan for purchasing seven new street cars for the Tacoma Municipal Railway, Tacoma, Wash., has been changed. Instead of buying the cars from an Eastern concern direct, the board of contracts and awards will issue a call for bids for this equipment. The date for calling these bids has not been set. This equipment will be used in place of rented cars, which have been in service since the fire last June that destroyed the carhouse and the rolling stock. The plan for financing this new rolling stock and a new carhouse by a $140,000 utility bond issue was announced in the Aug. 25 issue of the JOURNAL.

The Seattle Municipal Railway has authorized the remodeling of 72 two-man cars to permit one-man operation. Plans for rehabilitating its line and restoring adequate service have been made. These plans involve refinancing, the purchasing of new rolling stock, the rebuilding of the existing system and the construction of needed extensions. The details have not been made public.

New Station for Milwaukee

A contemplated improvement costing more than $100,000 has been announced by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. It is planned to erect a sheltered loading station for interurban cars near the Broadway ticket station of the company at Waukesha, Wis. The plans provide for the widening of Broadway from 66 ft. to 102 ft., the erection of a sheltered station of concrete and steel foundation, glass inclosed, over the double tracks and a 22-ft. subway leading to both sides of the street so passengers will not have to cross in traffic. Paving the street and widening the bridge across the Fox River will also be included in the project, at the expense of the railway.

The orders for equipment have dropped considerably. The Washington Railway & Electric Company, Washington, D. C., has purchased during the past month 200 pairs of joint plates, section 114-480; 100 pairs of joint plates, section 104-396; 470 cast-iron manholes, frames and covers and 10,500 track bolts. This company also has purchased three Champion snow plows from the John T. Lewis Company, and among its shop equipment ordered is one Argyle Titan electric drill and one Feregen three-way wheel aligner. The Denver Tramway Corporation has placed orders for 100 30-ft. Western red cedar poles, 41 marathon trolley ears 12 in. long for No. 00 round trolley wire.

Rolling Stock Ordered

The Northwestern Pacific Railroad, San Francisco, Cal., has ordered five motor cars and five trail cars from the St. Louis Car Company. Mention of the inquiry for these cars was made in the Oct. 27 issue of the JOURNAL.

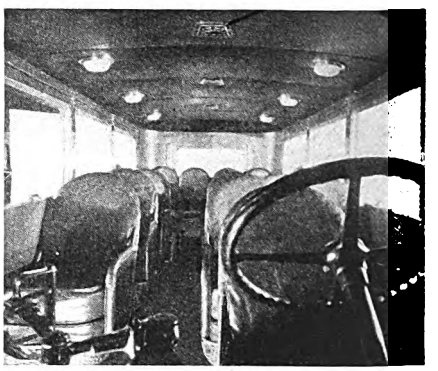
One interurban car valued at $12,500 was destroyed and a second interurban and four city cars were damaged in a fire in the carhouse of the Kentucky Traction & Terminal Company, Lexington, Ky. The damage to the second interurban car was estimated at $4,000. The damage to the four city cars will approach from $3,000 to $4,000.

The Detroit Street Railway, Detroit, Mich., has purchased fifteen urban-type Twin Coaches from the Twin Coach Corporation at Kent, Ohio. The United Electric Railways of Providence, R. I., has ordered eight suburban express Twin Coaches, and the Boston Elevated Railway, Boston, Mass., has purchased five gas-electric Twin Coaches. The Central Transportation Company, Trenten, N. J., controlled by the Trenton & Mercer County Traction Corporation, has purchased two suburban express Twin Coaches.

120 Buses for Detroit

Orders have been placed by the Detroit Department of Street Railways with the Dodge Brothers division of the Chrysler Corporation for 120 Graham Brothers parlor coaches.

Each coach seats fifteen passengers, exclusive of the driver, in individual deep leather, air cushion, wicker chairs on spring bases and is roomy and comfortable. There are four seats at the rear of the bus, one over each rear set of wheels, facing in, six arranged in pairs on the left and three single seats on the right. Ventilation facilities, including an electric fan opposite the door, and ventilators in cowl and roof insure a steady flow of fresh air. The heating is taken care of by the fan blower system, the air being brought in, heated and forced through the coach. A sloping one-piece windshield has V-type ventilating wings at each side as well.



Each new Detroit bus seats fifteen passengers, exclusive of the driver

Lockheed hydraulic four-wheel internal expanding brakes with a hand brake which operates on the propeller shaft, an emergency door at the rear

Digitized by Google

of the coach, and a non-skid entrance step are included in the safety features. A suggestion of the Pullman car is given by the mirrors set in the window posts.

Six-cylinder motors with four-speed transmission provide the power, while the coach has the protection of the braking facilities in an automobile. Freedom from driving strain is assured by the nut-and-lever type steering gear, the varying ratio giving rapid action in turning and easy control on straight-away running.

The interiors are trimmed with leather and all windows are plate glass with roller anti-rattlers inside and out. Stops are signalled by a cord attached to a buzzer in place of the customary push button.

The bus is 20 ft. 6 in. long and 6 ft. 5 in. wide, equipped with four hydraulic shock absorbers and balloon tires with dual rear wheels. The oak flooring laid crosswise is covered with linoleum and 6 candlepower flush type dome lights furnish the illumination.

A distinctive color combination is used by the Street Railways Department, distinguishing the de luxe bus from others operated in Detroit. Around the base of the body is a skirt of black, then a wide strip of maroon topped by a red band set off by black and gold stripes and a beige top. The wheels are red, surmounted by black fenders.

Manitoba Line Nearing Completion

Construction on the railroad to Seven Sisters Falls—one of the shortest railways in Canada—will be completed early in December and will usher in a new period of hydro-electric development in Manitoba. It will also open up an important agricultural area and a realm for sportsmen.

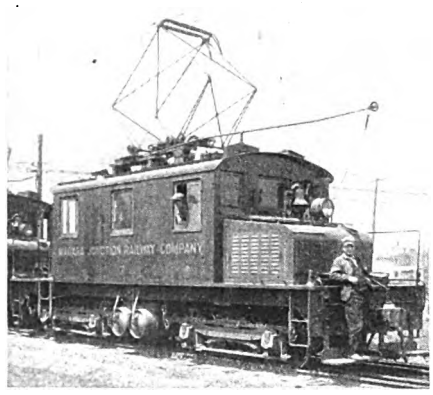
This railroad is being constructed by the Manitoba Eastern Railway, a subsidiary of the Winnipeg Electric Company. It commences at Whitemouth on the east main line of the Canadian Pacific Railway, 61 miles from Winnipeg and goes north approximately 14 miles to Seven Sisters Falls on the Winnipeg River, the site of the new power plant to be erected by the Northwestern Power Company, Limited. It will be a standard gauge modern railroad capable of handling heavy freight and passenger traffic.

The main purpose of the railway is to provide direct transportation facilities, via the Canadian Pacific Railway, from Winnipeg to the new Seven Sisters power plant, but it will also be a valuable asset to the surrounding district including a rich agricultural territory.

With the completion of the railroad, work will proceed rapidly on the Seven Sisters power plant. This plant will have an initial capacity of 135,000 hp. and an ultimate capacity of 230,000 hp. Construction of the plant will cost approximately $20,000,000 and provide employment for 1,500 or 2,000 men for two or three years.

Locomotives Purchased by Two Railways

A duplicate 60-ton locomotive has been purchased by the Niagara Junction Railway, Niagara Falls, N. Y., from the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa. This locomotive will be equipped with four 308-D-5 motors and HL control and is the second locomotive of this type being used by this railroad. The Niagara Junction Railway handles practically all transfer traffic between the important chemical factories along the Niagara River and the steam lines.



The type of locomotive purchased by the Niagara Junction Railway is equipped with four 308-D-5 motors and HL control

A 50-ton locomotive of this type has been ordered by the Waterloo, Cedar Falls & Northern Railway

A 50-ton, class B-1 locomotive has also been ordered by the Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa. This is an additional locomotive to the four that are operated by the Waterloo road, all of Westinghouse manufacture. The equipment consists of four type 562-D-5 motors, 16 notch "Alf" control, 14-EL air brake equipment, two 35 cubic feet compressors, together with blower equipment. There are approximately 70 of this type of locomotive in service in all parts of the country.

Profits of 392 Companies Up 10.99 Per Cent

Total net profits of 392 companies, in 21 lines of industry and miscellaneous, amounted to $2,268,106,000 in the first nine months of 1928, compared with $2,043,491,000 in the corresponding period of 1927, an aggregate gain of 10.99 per cent, according to a compilation prepared by Ernst & Ernst, accountants, from published financial statements.

Industrials lead the list with an increase of 19.17 per cent. Public utilities follow with a gain of 11.97 per cent. A group of 125 railroads report an income, before certain charges, but on a comparable basis, 3.02 per cent higher than in the same nine months of 1927.

Weekly Business Conditions

Industrial production, as reflected by the activity in steel plants, was greater during the week ended Dec. 1, than in either the preceding week or the corresponding period of last year, according to the weekly statement of the Department of Commerce. Petroleum production during the latest week was greater than in either the previous week or the same period of last year. Lumber output, though showing a gain over the previous week, was smaller than in the same period a year ago. Bituminous coal output was larger during the last available week than in either the preceding week or the corresponding period of 1927.

The general level of wholesale prices showed no change from the preceding week, but was about 1 per cent higher than a year ago. Prices for iron and steel showed practically no change from the preceding week, but were higher than a year ago. The wholesale price of copper showed no change over the previous week, but was almost 15 per cent higher than a year ago.

Loans and discounts of Federal Reserve member banks reached a new high point during the week. Interest rates on time money showed no change from the preceding week, but were consider-

WEEKLY BUSINESS INDICATORS

(Weeks Ended Saturday. Average 1923–25—100)

	1928				1927			
	Dec. 1	Nov. 24	Nov. 17	Nov. 10	Dec. 3	Nov. 26	Nov. 19	Nov 12
Steel operations	109.2	106.6	109.2	113.2	87.0	91.0	88.0	87.0
Bituminous-coal production	.....	112.6	112.1	108.2	92.9	90.6	102.6	97.0
Lumber production	.....	90.9	86.8	90.0	102.3	96.4	104.5	105.5
Petroleum production (daily average)	.....	120.3	119.6	119.9	119.1	119.9	118.4	118.5
Building contracts, 37 states (daily average)	.....	113.4	85.1	104.0	102.4	120.1	133.1	102.8
Price iron and steel, composite	87.3	87.4	86.8	86.5	85.0	85.1	85.4	85.6
Copper, electrolytic, price	114.5	114.5	114.5	114.5	100.0	98.6	97.8	95.7
Interest rates, time money	160.0	160.0	160.0	160.0	97.1	97.1	97.1	94.3

ably higher than at this time a year earlier. Prices for stocks made a new record during the week, while brokers' loans were higher than at any other previous time. Interest rates on call loans were higher than in either the previous week or the same week of last year. Bond prices, reflecting higher interest rates, were lower than in either the preceding week or the same period of 1927.

Cleveland Terminal to Have Largest Automatic Substations

The substations of the Cleveland Union Terminal Company, which is equipping the electric zone around the new Cleveland terminal, will be the first in the United States to use 3,000-volt direct current automatic control. Each motor-generator set will be of 3,000-kw. capacity so as to provide sufficient power for the heavy main line movement of passenger trains through the city of Cleveland. The substations, then, will also be among the largest of any railway units automatically controlled. In addition to savings in the cost of operation, automatic switching apparatus also furnishes additional protection which is not ordinarily obtained with manual operation of substations.

Mazda Lamp Prices Drop

President Gerard Swope of the General Electric Company, Schenectady, N. Y., announced Dec. 1, a further reduction in the prices of popular type automobile and flashlight lamps. This reduction averages 8 per cent on the types affected.

This price reduction on miniature lamps is the tenth since 1920. Today's prices of Mazda miniature lamps are 52 per cent under the 1914 prices.

The following price changes were made:

	Old Price	New Price
Mazda 1	$0.10	$0.09
Mazda 1110	0.29	0.27
Mazda 1129	0.27	0.25
Mazda 1130	0.27	0.25
Mazda 1158	0.28	0.26
Mazda 81	0.16	0.13
Mazda 82	0.16	0.13

Largest Electric Railway Exports to Brazil

Of the $212,382 worth of railway motors, electric, mining and industrial locomotives, starting and controlling equipment for electric railway and vehicle motors, railway signals, switches, etc., exported from the United States during the month of September, 1928, Brazil received $96,529 worth of this equipment. Of these exports to Brazil $83,929 was for railway motors and $12,600 was for starting and controlling equipment.

Canada received $48,827 worth of equipment which was divided as follows: Railway motors, $8,170; locomotives, $5,054; starting and controlling equipment, $2,944; railway signals, switches and attachments, $32,659. Japan received $39,273 worth of starting and controlling equipment and $8,800 worth of railway motors.

The classification of the total exports of the United States consists of railway motors, $100,899; electric locomotives, $13,391; mining and industrial locomotives, $3,085; starting and controlling equipment for electric railway and vehicle motors, $58,020; railway signals, switches and attachments, $36,987. The total exports of this equipment for September nearly doubled those of August, which amounted to $106,692.

METAL, COAL AND MATERIAL PRICES F.O.B. REFINERY

	Dec. 4, 1928
Metals—New York	
Copper electrolytic, cents per lb.	15.775
Copper wire, cents per lb.	17.875
Lead, cents per lb.	6.5
Zinc, cents per lb.	6.7
Tin, Straits, cents per lb.	52.5
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.375
Somerset mine run, f.o.b. mines, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	1.80
Franklin, Ill., screenings, Chicago, net tons	1.425
Central, Ill., screenings, Chicago, net tons	1.15
Kansas screenings, Kansas City, net tons	1.625
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.5
Weatherproof wire base, N. Y., cents per lb.	18.625

Linseed oil (5-bbl. lots) N. Y., cents per lb.	10.6
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.2
Turpentine (bbl. lots), N. Y., per gal.	0.67

Delaware Electric Receives Cars

The Delaware Electric Power Company, Wilmington, Del., has just received ten double-end, double-truck passenger cars from the J. G. Brill Company, Philadelphia, Pa. Plans and specifications of these cars were published in the July 28 issue of the JOURNAL, and a detailed description and photographs were published in the Exhibit Issue of Sept. 22, as this car was exhibited at the Cleveland convention.

The cars are double-end, double-truck type, seat 44 passengers and are 41 ft. 10 in. long, 8 ft. 4 in. wide, and weigh 36,640 lb. The bodies are semi-steel construction with arched roofs and folding-end doors.

The low-level platform, which has been a feature of Wilmington cars for years, has been retained in these new units. Speed in loading and unloading passengers is possible with only one step from the street to the platform. The cost of the cars is said to be about $160,000.

Springfield Rehabilitation in 1928

Rehabilitation of trackwork for the year 1928 by the Springfield Street Railway, Springfield, Mass., cost $357,735. During the year 1927 this company spent $325,000 for trackwork, making a total of $682,735 for the two years. In the year 1928 this company also bought new equipment costing $133,345 and in 1927 the equipment purchased amounted to $920,000, including the purchase of new cars. Most of the equipment purchased this year consisted of motor coaches and accessories. However, nine different labor-saving machines were bought for use in bus and car shops.

The railway had plans for replacing the present single track on Belmont Avenue with double tracks, from Bellevue Avenue to Oakland Street, which would facilitate the operation of cars on Belmont Avenue which is a very heavy traffic line. However, this project had to be postponed as the city was not ready to widen the street.

TRADE NOTES

WILLIAM W. TEFFT, who has been chief engineer of the Commonwealth Power Corporation for the last five years, has resigned to devote his entire time to his consulting engineering practice. He continues his residence and official headquarters in Jackson, Mich., where he has lived for many years. His association with the Commonwealth properties began in 1902 and for some years preceding his appointment as chief engineer of the Commonwealth he was a member of the Fargo Engineering Company. Mr. Tefft is the inventor and owner of the Tefft conduit spillway and accelerator which has been installed in several large hydro-electric developments during the last few years.

JAMES W. ARMOUR has been elected vice-president of the Riley Stoker Corporation, with headquarters at Worcester, Mass. Mr. Armour was graduated in mechanical engineering in 1913, from the Worcester Polytechnic Institute, and after four years in the pattern making business in that city served overseas in the ordnance department, attaining the rank of captain in the 26th division, A.E.F. He entered the drafting department of the Riley Corporation at Worcester in 1919, and after one year was transferred to the Detroit plant of that organization as inspector. He rose to the post of superintendent during the next five years and in 1925 returned to Worcester as engineering manager of the company.

C. C. CREIGHTON, district manager Galena Signal Oil Company, with headquarters in Chicago, has resigned to accept a position with the Standard Oil Company of New York as special representative of the industrial lubrication division, which comprises the railroad lubrication department. Mr. Creighton's experience in the railroad field and his many years service in various departments of the Galena well equip him for his new position. During the World War Mr. Creighton served as a flying instructor in the British Royal Air Force. His new address is care of the Standard Oil Company of New York, Room 1229, 26 Broadway, New York City.

Keeping the Whole Team in Step

FEW electric railways are entirely free from the difficulty resulting from the unequal influence exerted by the heads of the several departments. On one property it may be the equipment man whose influence predominates. On another possibly it is the track man who has the chief say; on a third, the auditor; on a fourth, the safety engineer; on a fifth, the superintendent of schedules—and so forth. To keep the influence of the department heads properly balanced is one of the vitally important duties of efficient management. It is a case of securing teamwork from a group of acknowledged specialists, each naturally enthusiastic for the advancement of his own department and more concerned about that perhaps than about the functioning of the transportation system as a whole.

To keep department heads pulling together for the good of all is not an easy task. There can be no favoritism in arranging budgets. The general manager must be a diplomat as well as an executive. He must be tactful without sacrificing one iota of final authority and he must be able to stand by his decisions as well as to make them.

Wanted: Maintenance Equipment

UNIQUE indeed is the commercial situation presented by the action of the American Electric Railway Engineering Association in calling attention to the need for improved electric railway maintenance equipment and machinery. To say that it is a strange condition in American industrial marketing, when potential customers for maintenance machinery take the initiative in trying to interest manufacturers in their needs, is putting the situation mildly. Furthermore, when general statements of the need for improved maintenance appliances are backed up by specific examples of what is needed, this matter warrants the serious attention of manufacturers.

Following a suggestion made by the engineering executive committee, the JOURNAL published an announcement requesting maintenance executives to outline their needs in the way of maintenance machinery and equipment. The response was almost immediate, and the first group of suggestions was published in the issue of Nov. 17. That, however, was only a beginning. In this issue there are more along the same line, and each mail brings additional letters from maintenance men adding to the list.

What have the manufacturers of such equipment to say? Obviously this demand on the part of operators represents an indictment of the commercial alertness and progressiveness of manufacturers of shop equipment. Has this class of manufacturers been overlooking the possibilities of the electric railway maintenance market? If not, what are the reasons for the unfilled demand that seems to exist? Perhaps the types of machinery needed are so highly specialized that the development costs would be expensive. Perhaps manufacturers are discouraged by other conditions or practices that exist in the electric railway field. If so, what are these conditions?

In the letters from operating men there seems to be a challenge to the alert manufacturer. The pages of the JOURNAL are open for his reply. Inquiries from manufacturers seeking additional information or letters commenting upon the suggestions being made by the operators will be published as they are received in order that this important subject of maintenance equipment may have the fullest possible discussion.

Significant Interurban News

CONFIDENCE in the earning capacity of the interurban when intensively developed is reflected in the news that application has just been made by the Cincinnati, Hamilton & Dayton Railway to the Public Service Commission of Ohio for permission to acquire the physical properties of the Indiana, Columbus & Eastern Traction Company and the Lima-Toledo Railroad, as well as all outstanding securities of the Lima Street Railway and of the Dayton & Columbus Transportation Company. The plan is fostered by the interests headed by Dr. Thomas Conway, Jr., which rehabilitated and converted the Chicago, Aurora & Elgin Railroad into an important earner, and more recently transformed the Cincinnati, Hamilton & Dayton, physically and financially.

Only the preliminary details of the new consolidation are available at this time, but there is every reason to believe that the development of the properties to be acquired will be carried out along intensive lines similar to those followed in the case of the Cincinnati, Hamilton & Dayton. Moreover, in the matter of the financial set-up it has been indicated that the same conservative course will be followed with respect to the capitalization of the much larger property as was done with the Cincinnati, Hamilton & Dayton. Bonded debt of the two properties now to be included will be scaled from $9,181,000 to $1,390,750, and annual interest charges cut from $469,050 to $83,445. This contemplates a financial set-up even more conservative with regard to the fixed obligations than anything the committee on finance of the A.E.R.A. had in mind, but no more drastic than owners feel necessary properly to re-establish the property on a satisfactory earning basis.

With the Cincinnati, Hamilton & Dayton as the nucleus, the proposed consolidation will form one of the large interurban systems of the country, a through trunk line direct and unbroken, between the gateway to the South at Cincinnati on the Ohio River, and Toledo and the great industrial centers on the shores of the Great Lakes,

This is the issue in December that is devoted essentially to maintenance and construction subjects

Digitized by Google

together with an east and west line connecting the cities of Dayton, Springfield and Columbus. To be specific, there will be 323 miles of track in the new consolidated company, and that property with its electric railroad connections will comprise a transportation network of more than 5,000 miles of track serving the great central west. This news, taken together with the previously announced organization of the Electric Railway Freight Company, certainly is significant with respect to the outlook for the interurbans in the central territory.

Supplying Transit for Ten Million a Real Problem

NEW YORK may be said to be only at the beginning of things transit-wise. True it is that the first subway was opened 25 years ago, and that tunnels, both railway and vehicular, cross the Hudson; that passenger tunnels run under the East River to Long Island, both for railroad and rapid transit service, and that where once the architecturally impressive Brooklyn Bridge stood majestically alone over the East River, there are now three other similar structures with another contemplated over the narrows to New Jersey and still another under way across the upper Hudson to connect uptown New York with the New Jersey Palisades district.

Each of these projects has been more or less a matter of expediency. That, of course, was all wrong. It is this recognition which has led the City Club recently to declare that unless some solution of the problem is found quickly, conditions of suburban traffic probably will become, within the next five years, just as intolerable as the conditions of municipal transit are at this time. That body is, of course, cognizant of the studies made by the non-partisan Russell Sage Foundation, the New Jersey Transit Commission, and the Suburban Transit Engineering Board, composed of representatives of the North Jersey Transit Commission, the Westchester Transit Commission, the two county engineers of the counties involved in the Long Island sector, a representative of the Board of Transportation of the City of New York, a representative of the Port of New York Authority, and three representatives of all the railroads involved.

After a long study of the general problems, the City Club's committee on suburban affairs has decided that the Port of New York Authority should be authorized by proper legislative action to take charge of these suburban passenger rapid transit matters. This is an attitude that may or may not be wise in the disposition that it seeks to make of the problem, but there can be no question of the justification for the City Club's conclusion that New York's transportation problem concerns the welfare of 10,000,000 people within a radius of 45 miles from the Manhattan City Hall.

Already there has been entirely too much waste, duplication and unwise construction attributable to the failure to approach the problem in its broad aspects. Whether or not one agrees with the proposal of the City Club to lodge the matter with the Port Authority, it is certain that permanent relief demands the elimination of individual projects conceived by interested groups or sections for their own selfish interests and not for the benefit of the community at large. The extent of the vision of those likely to play a part in a unification plan such as that which the inquiries so far made would seem to indicate are essential in New York, will be measured by the willingness they show to subordinate their own pet plans to the greater one of providing a program suitable for the present and future requirements of the community as a whole. The New York transit problem is immense and intricate. But it is not an insuperable one if it is approached intelligently.

The Back Yard No Place to Keep Lions

BITING sarcasm was turned loose by none other than Mr. Mencken of the *American Mercury,* writing in the Baltimore *Sun* about the traffic problem under the heading "Crowded Streets." It is not the first time that this wizard of words has had his withering fling in the defense of common sense in the use of the public streets. Doubtless he is a street car user. Whether or not that be so, he attacks in a fine frenzy the situation presented by modern traffic jams. He even asks why private motor cars should come into downtown streets at all.

As Mr. Mencken sees it, traffic congestion caused mainly by parked cars is an unmitigated nuisance. With this as a preliminary thrust at the privileged automobile, he turns loose a verbal broadside by declaring that parked cars in heavily traveled streets accommodate only a few idiots, delay the street cars on which 75 per cent of all users of the streets travel, and generally increase the dangers to life and limb in the streets. To Mr. Mencken it seems as insane to allow parking on such thoroughfares as Charles Street in Baltimore and the narrow part of Lexington Street as it would be to permit people to keep lions in their back yard. He contends that the streets belong to the busy man—not to the lazy and luxurious few. He asks why a hundred people should be inconvenienced in going to or from their work by a woman who refuses to walk four or five blocks. He also asks why one citizen should be permitted to appropriate 50 sq.ft. of public property for an hour or two, thus forcing all other citizens to scramble around at the risk of their lives. He says it is all too preposterous.

One thing Mr. Mencken has done. He has taken the tone of timidity out of the words with which this evil has frequently been approached. It is a case in which real militancy is needed. Far too many street railway men themselves seem to find it difficult to forget the old days—the days when street railway men, as Raymond Tompkins, author of "The Troubled Trolley" published in Mr. Mencken's paper, might possibly put it were looked upon as questionable citizens, and the railway itself as the work of Beelzebub. They need to speak up more forcefully. Mr. Mencken is right. The back yard is no place to keep lions. And the street is no place to store automobiles.

Effective Organization Needed to Meet Abnormal Maintenance Demands

MOST electric railways need every available car for peak-load service. This is particularly emphasized by the increased volume of riding during the holiday season. Inspection and repairs during this period must be carried on under trying conditions. Nevertheless, it is particularly important that the work be done thoroughly to avoid troubles and interruptions to service during the peak traffic season of the year. Therefore, since every car is needed, it becomes necessary at this time of the year to devote particular attention to the organization of maintenance work, so that cars will be turned out rapidly.

More intensive specialization and division of work within the several general departments is an aid to in-

Digitized by Google

creased speed. Take a modern shop of a large railway. Here one finds departments for truck overhauling and repairs, motor overhauling and electrical repairs, a babbitting room, forge shop, machine shop, air-brake department, tool room, body and equipment department, paint shop and carpenter shop. Of these the forge shop and machine shop do the work for other departments, but the rest are arranged to do a wide variety of jobs on their particular part of the equipment. For greatest speed, therefore, it is necessary to subdivide the customary departmental organization so that maximum specialization will result. Some larger properties adopt the practice of drawing upon carhouse inspection forces to augment the regular shop organization during the period of maximum demand. In several instances 100 per cent of the total available equipment has been kept in service during the day or two immediately preceding Christmas.

Spare equipment and a reserve stock of principal parts lighten the load. Repairs are made better and quicker with the particular part removed from the car. When spare parts are available, the work of removal and replacement may be handled entirely separate from the actual repairs. Under these conditions maintenance work can be organized on the most efficient basis.

Average requirements are known. Any demands in excess of normal can be handled best when spare equipment is available. It is seldom that abnormal requirements extend over a long period, so that the excessive demand of one day can be taken care of the next, or if demand continues for an unusual period, a little overtime will enable the department to catch up. The spare equipment thus acts as a flywheel to equalize the load and so permits a maintenance organization to function smoothly despite abnormal temporary demands upon it.

Faster Schedules Without Increased Maximum Speed

MUCH discussion regarding the improvement of electric railway service centers around the question of increasing the speed of travel. Passengers wish to be carried from their starting point to destination in the shortest time possible. There can be little question regarding that. But in frequent-stop city service, faster schedules do not dictate higher maximum speeds, and it is therefore important that the terms "schedule speed" and "maximum running speed" be not confused when considering the relation between speed and safety.

There is no intention of increasing the maximum speed of street cars in city streets. In fact, there is little occasion or opportunity for doing so, because the greatest possibility for time saving lies in reducing the time loss at stops and in cutting down traffic delays. Higher maximum running speed would avail little. It is through higher acceleration and retardation rates and greater alertness on the part of operators that transportation men hope to achieve faster schedules. What is needed and what is being sought is higher average sustained speed.

In considering higher acceleration rates, smooth operation is essential. With this end in view, the application of motors of larger capacity on some of the newest cars has been accompanied by improvements in control equipment which while designed to give high acceleration are intended also to provide smoothness in starting. Similar attention is being given to brake equipment. Most cars have adequate braking power after the brakes have been actually applied. But on many existing cars there is a serious lag between the movement of the brake valve handle and the actual brake application. Several railways have decreased this time lag by providing larger ports in the brake lines, by reducing the length of piping or by using special valves to provide quick applications and release. These improvements are all very desirable in that they lead toward higher schedule speeds with increased safety.

An Occasion for Pardonable Pride

TWO state papers that would be regarded as making history if the proper perspective were applied to them were delivered last week. They are the message of President Coolidge and the annual report of Secretary of the Treasury Mellon. They deal, of course, with peace-time problems, but problems that have come in the wake of the most devastating war in history in which five dynasties fell and the world was turned upside down economically and financially.

The President's speech and the Secretary's report do not lend themselves readily to brief editorial recapitulation, but whatever doubt may have lingered in anyone's mind about the attitude of President Coolidge on the matter of governmental invasion of the field of private enterprise was definitely set at rest. In a few choice paragraphs dealing with the Colorado River project he outlined his policy. The primary purposes of the dam, if and when it is built, are to be flood control and irrigation. There will be an incidental creation of water power which could be used for the generation of electricity. "A private enterprise can very well fill this field," says the President, "There is no need for the government to go into it." After reviewing the statements of the engineers who have surveyed the project he feels warranted in recommending "a measure which will protect the rights of the states, discharge the necessary functions of government, and leave the electrical field to private enterprise." Moreover, he leaves his readers in no doubt about his interpretation of "the necessary functions of government."

In dealing with the long-delayed Muscle Shoals problem the President is equally precise. This great plant was built ostensibly for the production of nitrates for wartime and agricultural purposes, with water power as a supplemental and incidental by-product. "Rent out the power rights," says the President, "thereby realizing a revenue of approximately $2,000,000 a year." As an alternative, he would lease the entire project for the production of nitrates. "I do not think," concludes the paragraph, "this property should be made a vehicle for putting the United States government indiscriminately into the private and retail field of power distribution and nitrate sales."

Similarly specific was the Secretary of the Treasury. But it is in the restatement of the economic situation as he sees it from his unusual vantage point, that business is interested. He gives the facts, but he avoids conclusions, except as his recommendations for legislation reflect them, and in this instance these recommendations concern mostly details to permit government fiscal policies to be put into effect. Still the conclusion is inescapable that the Secretary of the Treasury is reassured about the outlook. Neither one of these men is ever likely to indulge in anything smacking of extravagance of speech, but in the light of the accomplishments of the outgoing administration, it would, indeed, be unusually adamant if it did not reflect a certain measure of pardonable pride.

Introducing the ten new Brill cars of the Delaware Electric Power Company to the public of Wilmington. The parade passed through the heart of the city's business section and created much interest

Wilmington Solicits Public Patronage with NEW CARS

As part of a general modernization program the Delaware Electric Power Company recently placed in service ten new cars. Equipment was formally introduced to the city in an impressive parade

IN ITS modernization program the Delaware Electric Power Company is guided by a belief that the public will patronize public transportation of the right sort. Recently many of this company's older cars were rebuilt, new and more comfortable seats were installed, and the cars were painted a more cheerful color. Desiring to keep pace with the progressive spirit of the community which it serves, ten modern low-level cars were ordered. These were received the early part of December and the company made a gala occasion of introducing them to the public.

As soon as the cars arrived in Wilmington from the Brill plant in Philadelphia, the city's newspapers were informed by the management of the company's plans to hold a parade, and were given a description of the new equipment. Interest was stimulated in the parade by placing the cars in service temporarily on Sunday, Dec. 2. At noon of the next day the entire ten cars, gaily decorated with the national colors, started from the Pennsylvania Railroad Terminal on Second Street, traveled over Market Street, the principal business thoroughfare, to the Hotel du Pont at Tenth Street, and from Tenth Street to Delaware Avenue. The long line of attractive and brilliantly decorated cars, stretching almost a quarter mile attracted many people and brought forth much favorable comment.

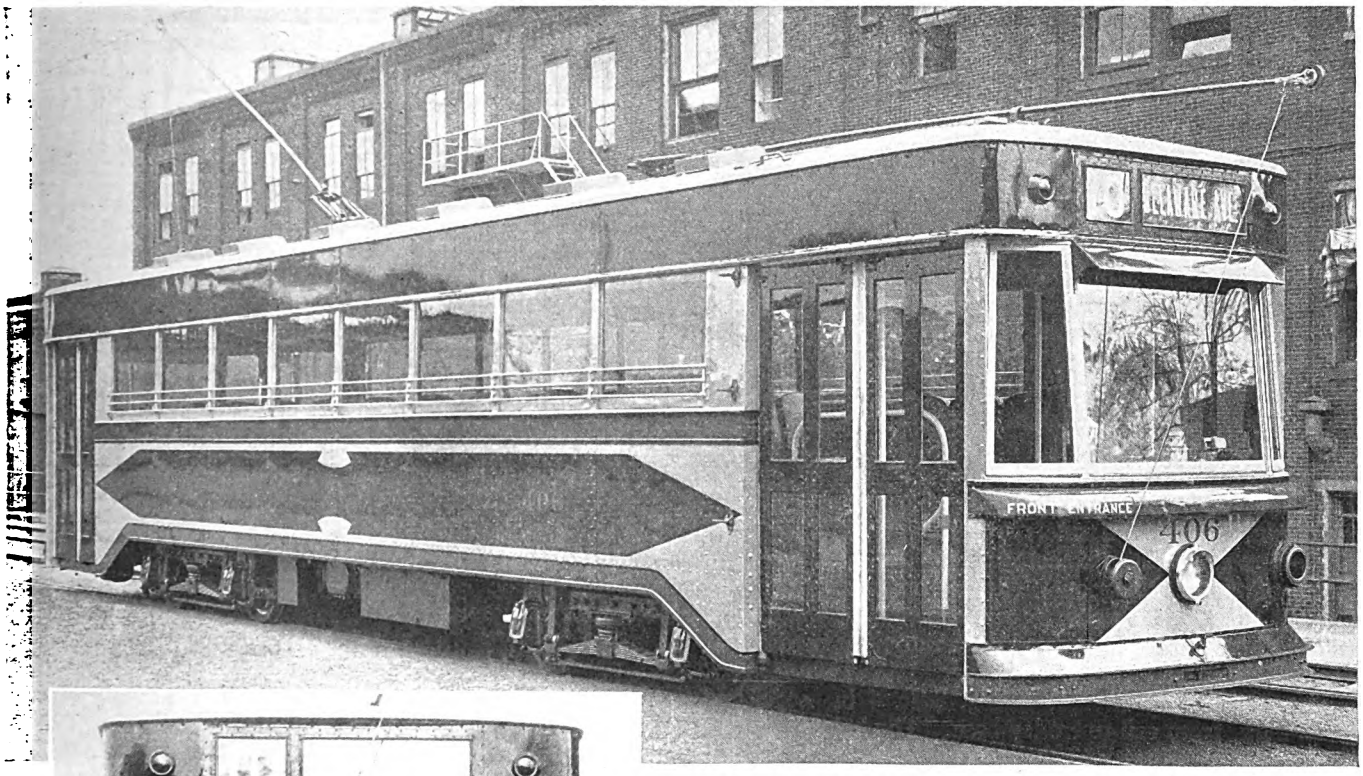
The arrangements for the parade were under the direction of D. E. Frame, master mechanic of the Delaware Electric Power Company, who was closely identified with the cars while they were being built in the Brill plant. P. T. Reilly, general manager, H. H. Geiger, superintendent of transportation, and R. T. Greer, assistant to the master mechanic, were also present at the demonstration.

On the following day, Dec. 4, the ten cars were placed in regular service on the company's Delaware Avenue line. This particular line serves a residential district terminating in the heart of the city's business section, and is an important route of the system.

Cars Designed to Meet New Demands

The ten double-truck, double-end, safety cars, one of which was exhibited at the A.E.R.A. convention in Cleveland in September, are "modern" in every sense of the word. A unique painting scheme, both exterior and interior illumination, and every detail of design have been developed by the company to meet the new demand for improved appearance, comfort, safety and convenience.

Digitized by Google



A unique painting scheme gives the car a striking appearance

The wide full vision front window, sun visor and hinged side sash give a pleasing effect. The dashers are floodlighted at night

A single step from the street to the platform permits quicker loading and unloading, and the elimination of unnecessary delays, with ease and convenience to passengers. Both platforms and body floors are ramped to obtain necessary truck clearance and to keep the step height to the minimum. The step from the street to the platform is 15¼ in., and the inside step 13 in. There is a ramp of 2½ in. on each side of each platform, and a 3-in. ramp in the car floor extending from the end sills to the body bolsters.

All doors are pneumatically operated and under the control of the motorman. A selector valve permits the operation of any door separately on the service side of the car. With an automatic treadle on each platform at diagonal corners, which controls a single two-part folding door, a circulating passenger load is accomplished. All passengers enter at the front and leave by way of the rear platform, thus eliminating any confusion inside the car. For safety reasons the control of this automatic treadle is interlocked with the brakes in the engineer's valve. The brakes must be applied and the car stopped before it is possible for the treadle to function. When desired, the operator may also prevent any passenger standing on this automatic treadle from leaving the car by throwing a switch at the front platform and making the treadle inoperative.

The cars are equipped with four 35-hp. motors, which are capable of accelerating the car very rapidly. Lightweight steel was used extensively in the construction of the car, another factor responsible for the rapid acceleration and retardation rates possible. Variable load brakes also were used.

Colorful Painting Scheme for Exterior

The painting scheme of orange, cream and red, and a complete system of exterior and interior illumination give the car a bright and cheerful appearance at all times. A row of lights over each dasher, floodlights at the doorways, stop lights and illuminated "exit at rear" signs inside the car, both of which function only upon application of brakes, and an ample supply of interior lights all contribute toward this end.

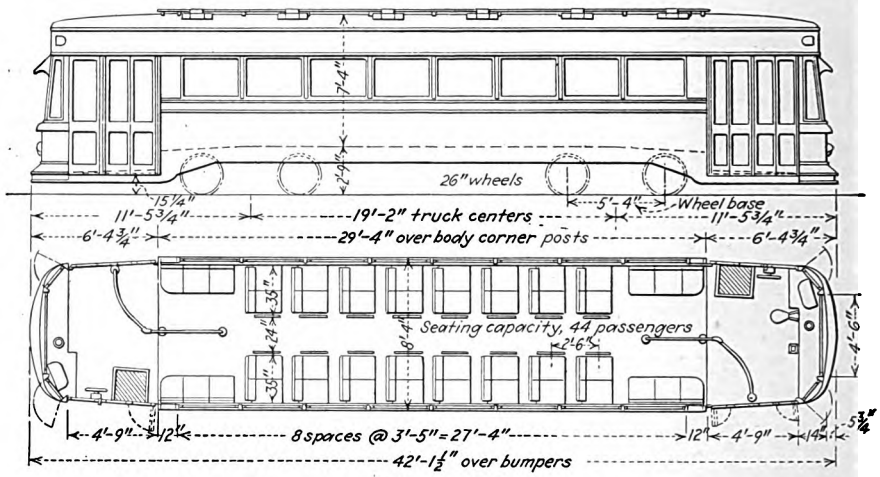
The appearance of the interior is enhanced by the finish of mahogany, the equipment cabinet on each platform hiding the various operating devices, a tan colored Flexolith floor laid on top of yellow pine flooring, a white enameled Agasote ceiling which extends through the car from vestibule to vestibule without interruption, and brown genuine leather upholstered reversible seats of the Brill No. 201-D type.

Wide full vision windows, with 3-ft. 5-in. post centers, and fitted with single metal sash which raise, also help to make car riding attractive. Each vestibule is fitted with central stationary sash, 4 ft. 6 in. wide, flanked on each side by a smaller hinged sash. All sash are of narrow tubular brass and those in the vestibule are fitted with non-shattering glass. This gives the operator and

Digitized by Google

passengers an unobstructed view forward, and at the same time the hinged sash, which may be opened any desired distance, assure adequate ventilation.

The elimination of body-end bulkheads not only affords an opportunity for a freer and quicker movement of passengers through the car body, but also contributes to a better view forward for the passengers. At each end sill, channel posts extend from side sill to side sill, serving as a support for the Haskelite roof and assuring necessary strength at this point. Commercial steel shapes, combined with pressed steel U-shaped side posts, deep aluminum letterboards between the corner posts and a side sheathing of $\frac{3}{32}$-in. steel constitute the principal points of the construction. The car bodies are mounted on Brill No. 177-E trucks. These are equipped with twin links and the approved type of Brill automatic mechanical slack adjuster.



Side elevation and floor plan of the Wilmington car, showing the seating arrangement and the principal dimensions

The cars are 42 ft. 1½ in. long, 8 ft. 4 in. wide, and 10 ft. high, from rail to trolley base. The bolster centers are 19 ft. 4 in. apart, and the trucks have a wheelbase of 5 ft. 4 in. The total weight of the car is 36,640 lb. Other dimensions and specifications are summarized in the accompanying table.

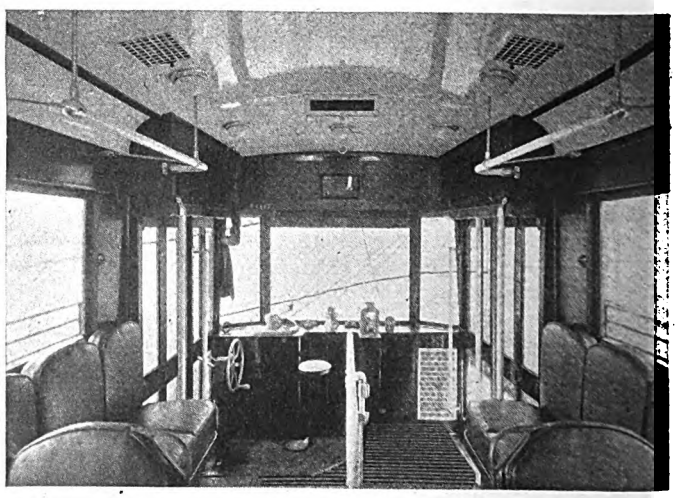
Company Serves Industrial District

The Delaware Electric Power Company not only serves the city of Wilmington, Del., but also Chester, an industrial city in Pennsylvania. The two cities are 13 miles apart, but their industrial activities have spread over large

Summarized Specifications of the Ten Delaware Electric Power Company Cars, Built by Brill

Weights	
Car body	17,300 lb.
Trucks	10,000 lb.
Equipment	9,340 lb.
Total	36,640 lb.
Principal Dimensions	
Length over bumpers	42 ft. 1½ in.
Length over body posts	29 ft. 4 in.
Bolster centers	19 ft. 4 in.
Truck wheelbase	5 ft. 4 in.
Width over side sheets	8 ft. 4 in.
Width of aisle	24 in.
Width of seats	35 in.
Seat spacing	30 in.
Window post spacing	41 in.
Height, rail to trolley base	10 ft. 0 in.
Height, rail to platform	15¼ in.
Height, platform to car floor	13 in.
Equipment Details	
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Brill
Body	Semi-steel
Car signal system	Faraday high-voltage
Compressors	Westinghouse DH-16
Conduit	Flexible
Control	K-35 J.J.
Destination signs	Hunter
Doors	End, folding
Door mechanism	National Pneumatic
Finish	Enamel
Floor covering	Flexolith
Gears and pinions	Noiseless
Glass	Non-shatterable
Hand brakes	Peacock staffless
Heat insulating material	Celotex
Heaters	Consolidated truss plank
Headlights	Keystone
Headlining	Agasote
Interior trim	Light mahogany
Journal bearings	Plain
Journal boxes	Brill M.C.B.
Lamp fixtures	Ivanhoe indirect dome
Motors	Four 35-hp., outside hung; Westinghouse 510 and General Electric 265
Painting scheme	Orange, cream and red
Roof	Arch
Roof material	Haskelite veneer
Sash fixtures	Curtain Supply Company
Seats	Brill No. 201-D, reversible
Seating material	Genuine leather
Slack adjusters	Brill mechanical
Step treads	Norton
Trolley base	Ohio Brass
Trolley catchers	Earll
Trolley wheels	Feist Ohio Brass
Trucks	Brill No. 177-E
Ventilators	Brill exhaust
Wheels	Standard Steel, 26-in. diameter

The longitudinal corner seats and the cross seats are all upholstered in brown genuine leather and have deep spring cushions



The various operating devices are concealed in a neat mahogany finished equipment cabinet

areas and the territory served by the railway now is essentially one large manufacturing district. The company has steadily increased its service in accordance with the needs, and has paid particular attention to co-ordinating its buses and rail cars. During the year 1927, a total of 37,000,000 passengers were carried by the company's railway system, and 4,000,000 passengers were carried on its bus lines.

In addition to strictly city service in Wilmington and Chester, the railway lines of the company also provide service over two separate routes between Chester and Philadelphia. The rail service south of Wilmington extends to Delaware City, where the United States government quarters a large contingent of soldiers at Fort du Pont. The railway lines serve Deemer Beach on the Delaware River and Shellpot Park, owned by the company and located in Wilmington.

The bus lines of the company have been instituted to extend the scope of the company's service, in answer to steady demands for increased service. They not only reach Newark, Del., and Glen Riddle and Broomall in Pennsylvania, but also join New Castle, Del., and Media, Pa., by a route passing through both Wilmington and Chester.

Modern Equipment Lowers Maintenance Costs

By H. S. Williams
Assistant Superintendent of Equipment
Department of Street Railways, Detroit, Mich.

When the subject of classifications for replacement of old cars with new ones arises, the question is raised as to the relative cost of maintenance of various types of car equipment and it is at these times that data on this subject become of utmost importance. Through several years the Department of Street Railways, Detroit, Mich., has kept maintenance costs by car groups. On this property there are three distinct groups of cars, one being the single-truck Birney car, the second a modern type Peter Witt car, and the third an older type comprising miscellaneous steel and wooden cars of relatively high weight, all of the latter being double truck.

The costs per car-mile of the maintenance group of accounts for these cars for the years 1925, 1926 and 1927 are shown in the accompanying table. To make the data of real value they should be supplemented with other figures such as the weighted average age, the weighted average weight, and the average seating capacity.

MAINTENANCE DATA AND COSTS FOR 1925, 1926 AND 1927

	Birney	Peter Witt	Misc.
Weighted average age—years	7	4.73	10
Weighted average weight—pounds	16,000	36,500	37,800
Average seating capacity	32	52	40

Maintenance Cost per Car-Mile		Maintenance Cost per Seat-Mile	
Birney	$0.0153	Birney	$0.000478
Peter Witt	0.0262	Peter Witt	0.000504
Miscellaneous group	0.0341	Miscellaneous group	0.000711

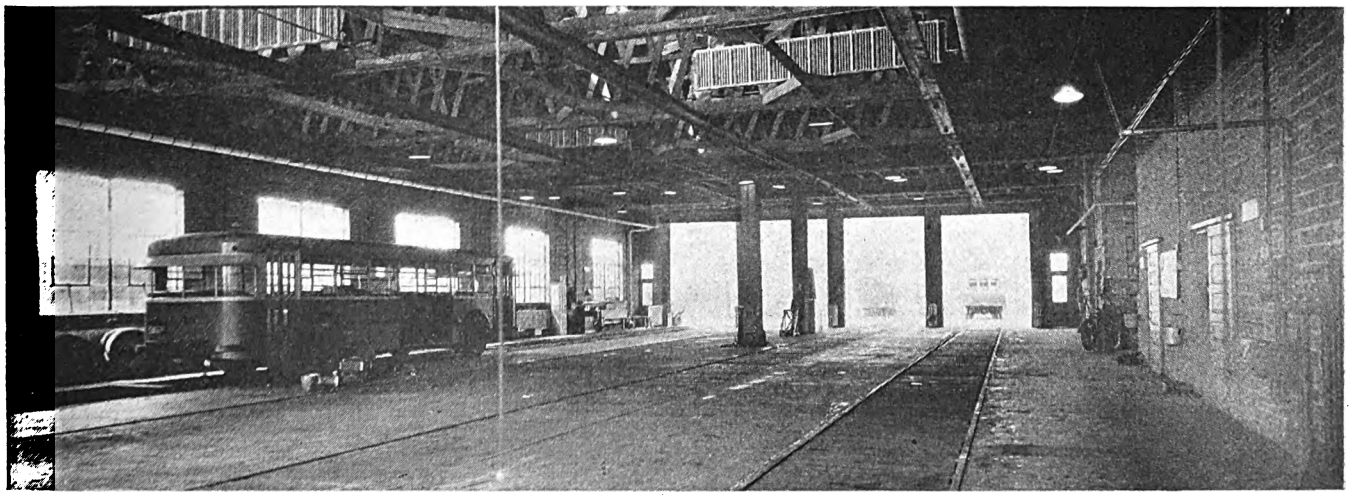
By converting these figures to costs per seat-mile they are made more strictly comparable. On this basis the old type equipment costs 41 per cent more to maintain than the modern type of car. It is also to be noted that during the first two years of life of the Birney and Peter Witt types of cars their maintenance was less than half of the amount mentioned.

Garage Facilities Increased in Akron

Complete inspection and overhaul terminal added by the N.O.P.&L. to accommodate fleet of twin coaches

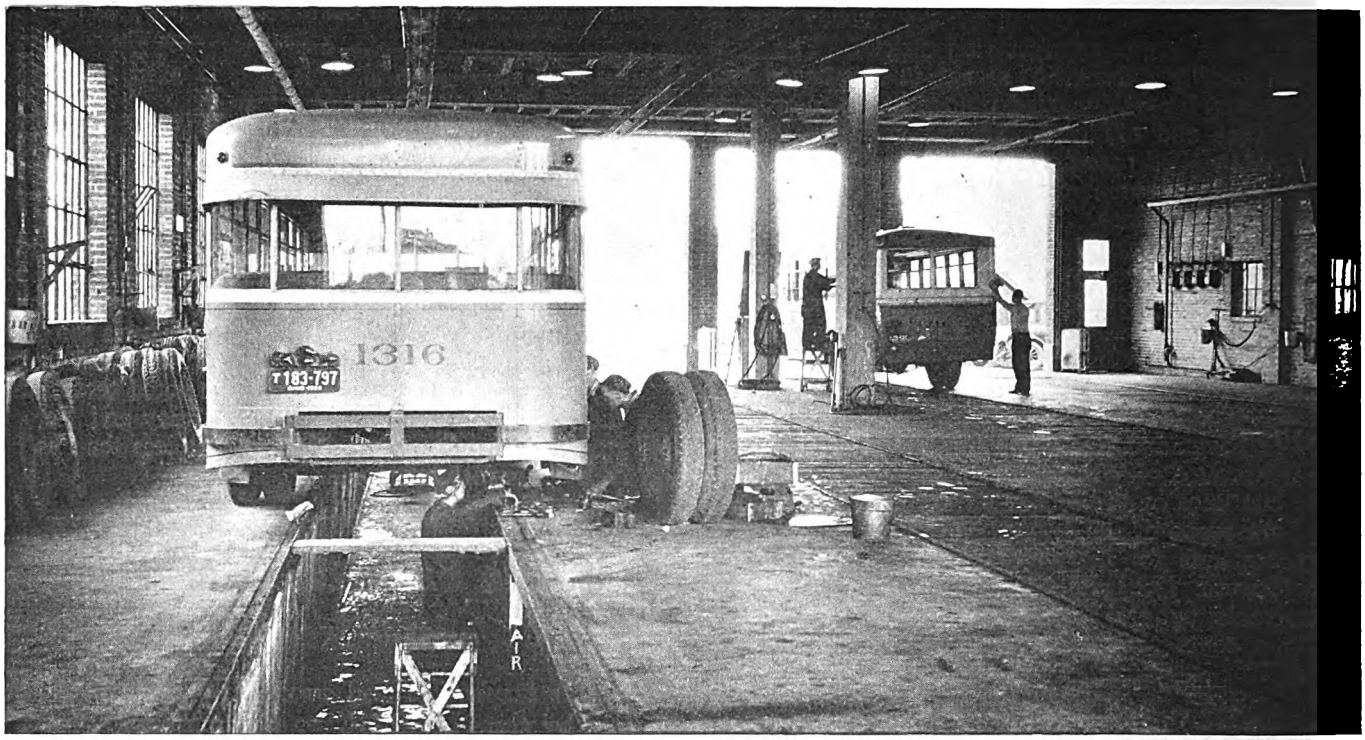
With the addition of a number of new Twin Coaches to the company's fleet of buses, it became imperative for the Northern Ohio Power & Light Company in Akron to secure more garage facilities. The company solved the problem by converting a practically new carhouse into a bus garage. Only a few alterations to the building were necessary to make it a complete bus inspection and overhaul terminal.

The structure, which is 76 ft. wide and 130 ft. long, is of face brick exterior with hollow tile walls and an arched roof, supported with cross-girder construction and uniformly spaced reinforced concrete columns. The building is equipped with steel curtain roll doors at both ends which divide both entrance and exit into four portals. Through each of these four doorways a track runs the length of the building over car repair pits, designed with generous widths and depths for the overhaul of electric railway equipment. Both sides of the building have a number of large metal frame windows. Offices and storerooms, however, utilize all the outdoor



Interior of the Brittain garage in Akron, recently remodeled to accommodate a new fleet of Twin Coaches

Digitized by Google



One of the car repair pits was left open for bus inspection and repair. The others will be opened as the need occasions

illumination on the one side of the garage. Steam radiators are mounted overhead at uniform spacings and have a heating capacity sufficient to withstand the severest weather. A great many industrial type white enameled lighting reflectors are suspended in the garage and supply adequate illumination for the ordinary routine tasks..

Three of the car repair pits have been boarded over with heavy planks for the present, while the fourth pit has been slightly remodeled to permit its use for bus work. Five-inch angle irons have been superimposed upon the rails to serve as guides for the buses as they are run over the pit. Actual experience with this form of guide rail has dictated the bracing of the angle iron at frequent intervals throughout the length of the pit with ½x4-in. irons reaching from the bottom of the pit to the under side of the angle pieces.

The bus repair pit is equipped with air lines and several connections for electric light extension cords. Since the length of the pit is nearly equal to that of the building proper, the inspection and lubrication of several buses can be carried on simultaneously. While only one of the four car pits is being utilized at the present time for bus maintenance, the three remaining track pits being boarded over, it is contemplated in the near future to open one or more of these pits as the demand for additional servicing facilities for the buses increases. The floor area available for buses measures 59x127 ft.

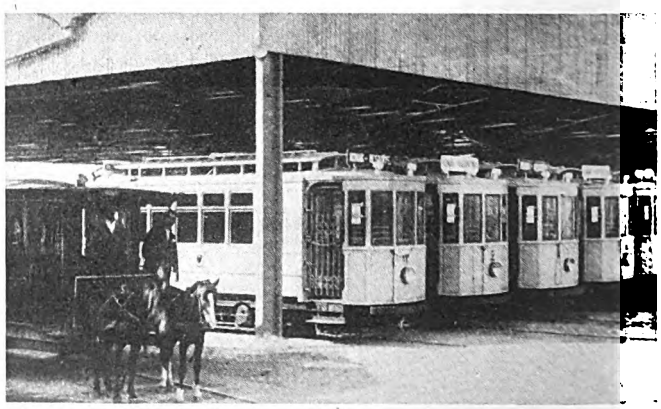
Near the front entrance of the garage, on the side where the offices are located, are the gasoline filling pumps and the oil reservoirs. These reservoirs not only provide the fresh oil supply, but have a drainage vat for the disposal to an underground tank of the old oil as it is removed from the bus crankcase. The old oil so stored is later removed for reconditioning.

Inasmuch as the bus garage is supplied with a concrete floor the buses can be washed almost anywhere, but special piping for the water for this purpose has been made at the end of the building farthest removed from the oil storage and gasoline pumps.

New Six Wheel Buses in Berlin

THE first few buses of the 100 recently ordered by the Berlin General Omnibus Company have been placed in service. It is expected that all will be in operation by the first part of 1929. The new bus is of the six-wheel deck type and has room on the lower deck for 28 passengers, and on the upper deck for 32 seated passengers. In addition, there is space for fourteen standing passengers. The seats on the upper deck are upholstered and the steps leading to the upper deck are under cover.

Smyrna Modernizing Its Transportation System



Smyrna, which was destroyed by fire during the conflict between the Turks and the Greeks in 1922, is now being rebuilt and being made one of the most modern cities of the world. Improved transportation is considered necessary. To the left of this view will be seen a horse car of the type now being abandoned. At the right of the horse car may be seen the successor to the old vehicles, modern electric cars, not unlike those in use in this country. Photograph from Wide World Photos.

Single-truck car of Kansas City Public Service Company converted into a meter-testing laboratory

Kansas City Builds Test Car to

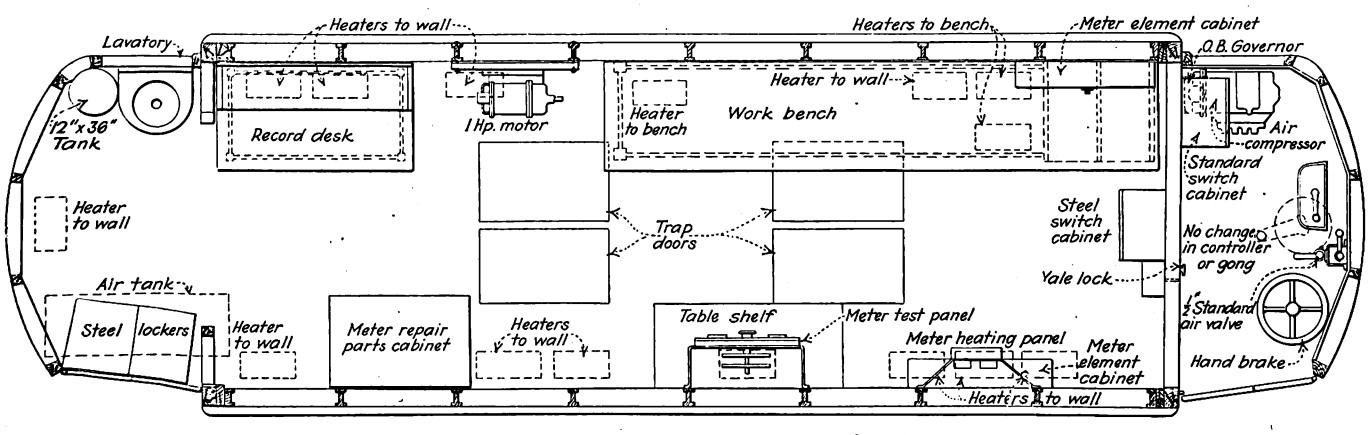
Maintain Energy Consumption Meters

Mobility of this laboratory permits testing meters at carhouses and saves time and expense of transportation to central point. All necessary equipment is provided for repairing and calibrating meters

By R. L. Reynolds
Superintendent of Traffic Kansas City Public Service Company

AT KANSAS CITY the street railway has been a user of energy-saving devices since July, 1917. During December last year 746 Economy kilowatt-hour meters were installed. The organization for handling the power conservation program through the Economy meters functions as a division of the transportation department, with a supervisor in charge. All instructions to trainmen, reports, records and maintenance of the meters, are handled through the car meter department and with the division superintendents. It is thought that by having all this work done under the supervision of the transportation head a better efficiency is secured, as closer co-operation is obtained between the car meter department and the division superintendents and trainmen than would be if the supervision of the meter operation was outside the transportation department.

With the installation of the meters came the necessity



Plan of the car showing the arrangement of equipment

Digitized by Google

of a testing laboratory. The kilowatt-hour meter is an accurate energy measuring device, and in order to derive the benefits it affords the meter must be maintained and calibrated on regular schedule. There must also be "trouble shooting" for the meters which get out of order before their regular test period. These things are doubly necessary, for not only must a true record be kept of the periodic energy consumption of each run, line, and of the system as a whole, but the faith of the trainmen must be maintained in the ability of the meters to give them credit for their power-saving efforts; as without the trainmen's confidence, very little would be accomplished toward the end desired.

When it came to the question of the type of laboratory to be installed, the fact that one on wheels could be taken to the meters much more readily than the meters could be taken to the laboratory was self-evident, and a meter test car was built to take care of this part of the power-saving work. It was built at the Kansas City Public Service Company's Tenth and Lister Street shops from a two-motor, single-truck car taken from passenger service.

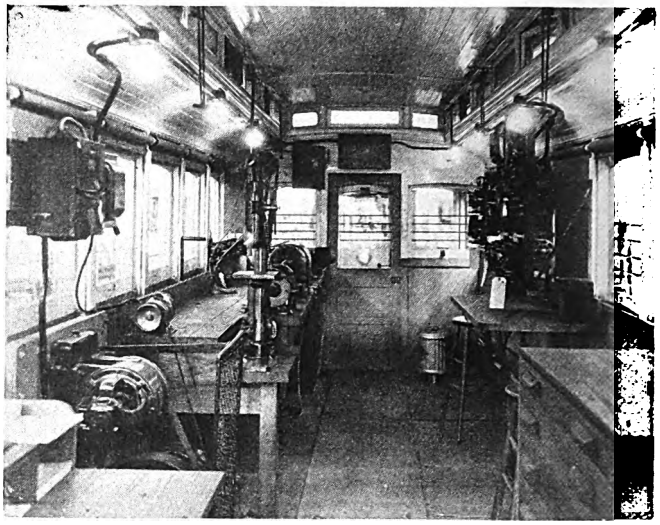
The car was one of the few on the system still operated without air brakes. As it went through the shops this feature was added. The front vestibule, of the inclosed type, is made accessible at all times for the purpose of moving the car about, but other windows are heavily guarded and the remainder of the car is kept locked when not in use, so that the apparatus inside may be protected.

The interior of the car is finished with the upper half white and the lower a Pullman gray. All wiring is done in conduit, and so arranged that circuits not necessary for moving the car can be cut off by a master switch just inside the car door. An Economy meter is used to measure the power utilized by the entire unit. This last item is in connection with the policy of attempting to account for all energy consumed on the property, and segregating it according to character of service.

The laboratory is made up of a work bench with its accessories, the meter element cabinets, the spare parts cabinet, the record desk, a generator battery unit, the element heating panel, and the meter test panel. In addition to these things there are two steel lockers and a lavatory with water storage, for the testers' use. The water storage is in a 20-gal. tank, provided with piping arranged to replenish the water supply through an outside hose connection.

Equipment Arranged for Convenience of Meter Tester

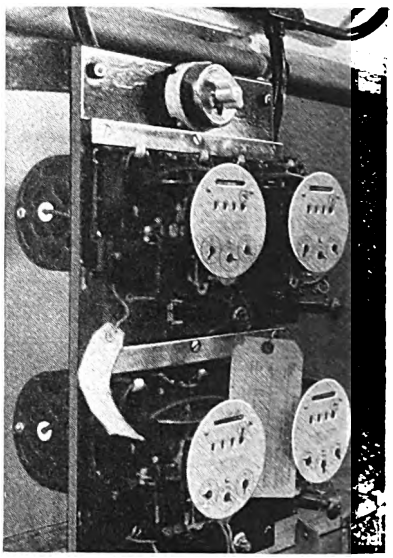
Convenience of the meter tester was considered in the locating of each piece of equipment. All work of taking down the meter, cleaning and reassembling it, is done at one end of the work bench. As the elements are brought in they are placed on an open rack at the back of the bench, and within easy reach are the cleaning lathe, the assembly chuck, a vice, air hose, and the drawers for tools, fresh mercury supply, cleaning rags, etc. Air used for blowing dust and particles from the meters is taken directly from the air-brake storage tank through a Romort air gun. The cleaning lathe is a double-end jewelers lathe with one end partly shrouded, enough opening being left, of course, to get the meter parts into the buffing brush where the mercury is cleaned from them, the mercury and foreign matter falling into a hopper under the shroud. An exhaust fan draws air through the shroud and over a set of baffle plates in the hopper which separates the dust from the mercury. The dust is exhausted outside the car while the heavy mercury draws to the bottom into a porcelain receptacle. As this mercury accumulates, it is reclaimed for further use by a nitric acid process at the company's chemical laboratory.



Inside view of the test car as seen from the rear

A small drill press and grinder placed at the opposite end of the bench are not used so frequently as the other tools, but are found to be almost indispensable at times. This end of the bench was also found to be a convenient location for the 6-volt generator. All rotating machinery is driven by line shaft from a 1-hp., 550-volt motor, with the line shaft running beneath the table.

Directly across from where the elements are cleaned is the meter heating panel. After the meters have been cleaned and assembled they are put on the heating panel to warm, as it was found that a meter tested "cold" against a "warm" standard will not show the same calibration which it would if both meters were warm, due to the fact the resistance of the voltage coil changes slightly with the change in temperature. The difference introduced is not great, but in order to overcome a known error all voltage circuits are warmed to the normal operating temperature before the calibration is made. Since the change of resistance of the current circuit is not discernible and has no effect on the current following through it, this part of the meter is not heated. The heating panel has a capacity of four meters. The meter calibrating or test panel, as well as the heating panel, is made of Transite board, the test panel being mounted above a bench with a clearance room for an element to lie on the bench top be-



View of the element heating panel where voltage coils on the elements are heated before being calibrated

Digitized by Google

neath it. Instruments on the board include an 0–15 ammeter, an 0–750 voltmeter, an inclosed Tumbell safety switch for the 600-volt circuit, and an open knife switch for the current circuit. A 7.5-ohm rheostat for current regulation is mounted at the back, with the control knob extending through to the front. Two meters can be calibrated on the panel simultaneously. The working standard is in the lower center portion of the board with an arrangement on either side for the meters to be tested. It is not necessary, however, to calibrate two meters at the same time, as either of the side units can be cut out by shorting across the current terminals of that part, using only the other side. External resistances for the three meters are on the back of the board immediately behind the elements. Binding posts for the elements on test were designed to facilitate mounting these meters, the current contacts being clamped down with wing nuts and the voltage terminals held by spring studs. The test board is adjacent to the heating panel.

The three-meter scheme has proved quite practical for checking the master meters. Two stand-by standards are retained which are checked together with the working standard each morning. These are all stock meters kept apart for this purpose.

As the meters are calibrated they are placed in a twelve-meter cabinet just under the heating panel. A similar cabinet is located over the work bench for storing damaged meters until such time as they are repaired.

Automobile Type Generator Used for 6-Volt Circuit

Current for the test board is provided by a 6-volt generator-battery combination. A motor-generator set was specified in the original design to supply the current, but further investigation developed the fact that a 550-volt motor-generator set for a job of this kind would cost more than it was thought advisable to put into one. As a substitute, a Bosch automobile-type battery charging generator was installed, driven from the line shaft, and the substitute has proved very satisfactory. A 210-amp.-hr., heavy-duty Exide storage battery which provides the necessary reserve, is located directly under the test board in order to reduce the voltage drop to the panel. The generator, being of the automobile type, has an automatic cut-out, eliminating the possibility of the battery feeding back into the generator while it is standing idle.

Two file drawers and three stationery compartments placed at the back of a flat-topped table makes up the record desk. It is here the meter tester keeps his records of the repairs made and meters tested. The spare parts cabinet contains a chest of divided drawers with a large compartment for more bulky materials in the bottom.

The meters are cleaned and calibrated on a schedule that requires the meter tester to make the rounds once in each nine months. In doing this the car is moved to a division where it will remain until all meters at that station have been taken care of. If meters at other divisions are reported as being in bad order the tester replaces them with O.K. elements, and brings the ones replaced back to the car where they are worked over and put into condition for use. When on routine work, the program for the day is made out the evening before and handed to the car placer, who will have those cars run onto a specified track the next morning, ready for the meters to be changed. The meter tester will then replace the elements on these cars with those which he has calibrated the day before, making sure that all register readings are identical with the ones being replaced to insure a continuity of the dial readings. This being done he devotes the remainder of the day to work on these elements at the meter car.

To provide for the needs of the various weights and types of passenger equipment on the property, it was necessary to install meters of five different capacity ratings. The motor elements are all interchangeable, but the register or trains are not, as the ratio of the gear trains vary with the different values of shunts, and anyone handling the meters must take precaution to see that the trains are placed in meters of a like rating.

More Bus Items Needed to Balance Contest

BUS maintenance is not receiving the attention that it merits in the items submitted in Electric Railway Journal's Maintenance Contest. The number of buses in service on electric railway properties has increased rapidly, the problems encountered are new, and much of value can be gained by a broad discussion of them.

Whenever a group of maintenance men assemble discussion of the new bus problems is lively. Other men are experiencing the same difficulties that you are, and when you find a satisfactory solution or an economical method you can assist many other men by passing on the information. Let us have a more extended discussion of this maintenance work.

Contest items are coming in rapidly now. Jan. 15, 1929, is the closing date for the first group of material to be passed on by the judges for the first four departmental prizes of $25 each. The greatest volume of material sent in so far is from the rolling stock and shops and the way and structures departments. Men in the electrical and line and buses and garage departments have a great opportunity to make a good showing by sending in material early. Go over the rules of the contest as published in Electric Railway Journal for Oct. 27, or send for an instruction folder.

$200 for the best maintenance idea submitted.

$300 to be distributed in twelve departmental prizes of $25 each.

A company trophy to be awarded for the greatest contribution to the improvement of maintenance practices, as shown by all items submitted from any particular property.

Departmental certificates of merit to each of the four departments making the best individual showing in the contest.

Digging the trenchway for the foundation of new track at Vancouver, Canada

After the steam shovel had finished its work. The 19-ft. trench is now ready for the concrete base

Pouring the concrete for the slab foundation

As the completed concrete slab foundation appeared

Permanent Track Laid in Vancouver

More than $390,000 being expended by British Columbia Electric Railway in constructing new track and replacing temporary rail structures with permanent track

EXTENSIVE construction work has been carried out by the British Columbia Electric Railway on its street car tracks in Vancouver during the last nine months. The work completed included relaying of permanent double tracks on Broadway West, from Granville to Trafalgar Streets, relaying of double paved tracks on Hastings Street East from Boundary Road to Renfrew Street, and construction of new tracks on Clark Drive from Hastings Street East to Venables Street. The existing track on the Hastings Extension line was also replaced to permit paving of road by the city. The approximate cost of these five projects was $290,000.

In addition to the above work, which was completed some months ago, the company's workmen have just finished replacing temporary tracks in Alma Road with permanent double tracks. This work cost approximately $13,000. Another project just completed was the relaying of tracks from Cordova to Hastings Streets on Granville Street. This job was done under traffic, and without diverting cars by another route. The rails in this section were laid in 1907 and are still good according to examination reports after removal. It was feared, however, that they would not outlast another paving which the city proposed laying, and accordingly it was decided to replace this track with heavier rail.

Construction gangs are now engaged in relaying the tracks on Pender Street West, and this job is estimated to cost $75,000. In this case also, similar conditions exist to those on Granville Street, as the track is not worn out, but is believed not to be capable of lasting out a new pavement. A great portion of the track is being laid on existing foundations.

Permanent Track Laid on New Jobs

The policy of the company for the past few years has been to lay permanent tracks on all new jobs, and to replace such temporary track as is necessary with permanent construction work. A typical example of the method followed by the company in relaying tracks, or constructing an extension line, is the work completed at Alma Road. T-rails, weighing 93 lb. to the yard and 62 ft. long were used in this construction. A steam shovel was employed in digging a trench 19 ft. wide, which was trimmed to a depth of 20½ in. Form boards were placed on each side 18 ft. apart, set up to grade and lined up ready for the concrete slab foundation. The concrete slab, when finished, was 18 ft. 6 in. wide, and 6 in. thick. Fir ties were spaced 2 ft. apart, and ⅜-in. steel tie plates were placed in position on these.

The rails used were 7 in. high and 62 ft. long to reduce joint maintenance and give long wear. Tierods were inserted 8 ft. apart. Common planing mill ends were used as shims under each end of the tie to bring the rails to grade. The shims bring the ties up to about 1 in. above the concrete foundation slab, and this space was tamped tightly with a mixture of coarse sand and cement.

Digitized by Google

After the steel had been properly surfaced and aligned, a second concrete gang filled concrete around ties and base of the rails, covering the whole substructure of the track to a depth of about 1 in. above the ties. The mixer was provided with flanged wheels and moved on rails in advance of the work.

Concrete was carefully tamped to eliminate pockets under the rails, and was struck to a uniform surface of 6½ in. below street level. In Vancouver, the usual paving practice is to use stone header blocks along rails and pave with concrete or asphalt. About 2¼ tons of concrete, steel, and pavement went into each linear foot of double track and the cost to the company was approximately $20 per foot.

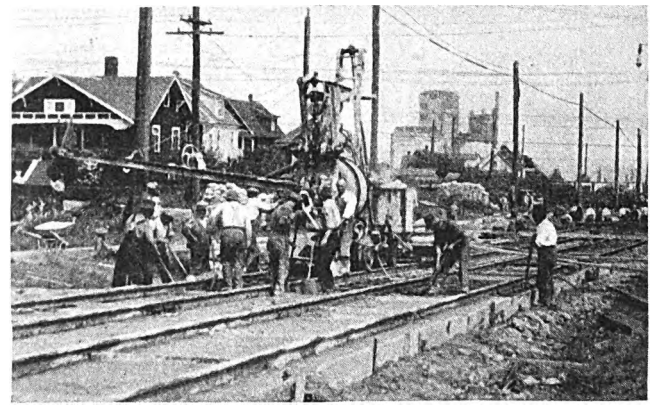
Manganese Steel Used Extensively

The company also has made a practice of using the specially hardened manganese steel for curves at such points where the traffic is sufficiently heavy to justify the extra expense. At one of the downtown corners in the company's system in Vancouver the curves are of open-hearth steel and wear out every three or four years, while at another corner where there is even greater traffic, manganese curves have been in service since 1912 and are not yet worn out. All switches, frogs and crossings are made of manganese steel. Owing to the growing weight of traffic, much more specially hardened steel is being used now than in the past. Though this steel costs more it is the least expensive when used over a period of years as for track.

In addition to this track laying work, the maintenance-of-way department is constructing an elaborate wye at the turning back point on the Hastings Street East line. Formerly, cars wyeing at this point had to turn up a steep hill and then back down again on to Hastings Street. This hill has now been cut away by steam shovels, and a pit made in the hill, level with Hastings Street and long enough to hold a two-car train with ease. A concrete retaining wall is being built around the sides of this pit and a paved road surface laid down between and around the tracks. Ornamental light standards will be erected on the top of the structure when completed. This work is estimated to cost around $13,000.

Tamping the sand cushion under the assembled track

The track was brought to grade by inserting shims under the ties and the rails aligned before pouring concrete



Concrete was poured around the ties and base, covering the substructure to a depth of 1-in. above the ties

Strathcona Memorial Fellowships in Transportation

YALE UNIVERSITY has issued a notice calling attention to the five Strathcona memorial fellowships of $1,000 each, which are available annually for advanced work in transportation. The holder of one of these fellowships is entitled to pursue investigation in any aspect of transportation in which the university offers competent guidance and supervision, whether along engineering, economic or legal lines. There are many such courses. The holder must have obtained his first degree from an institution of high standing. In making the award, preference is given, in accordance with the will of Lord Strathcona, to such persons or to sons of such persons as have been, for at least two years, connected in some manner with the railways of the Northwest.

Applications for these fellowshps for the coming year should be addressed to the Dean of the Graduate School of Yale University, New Haven, Conn., before March 1, on blanks which may be obtained from him.

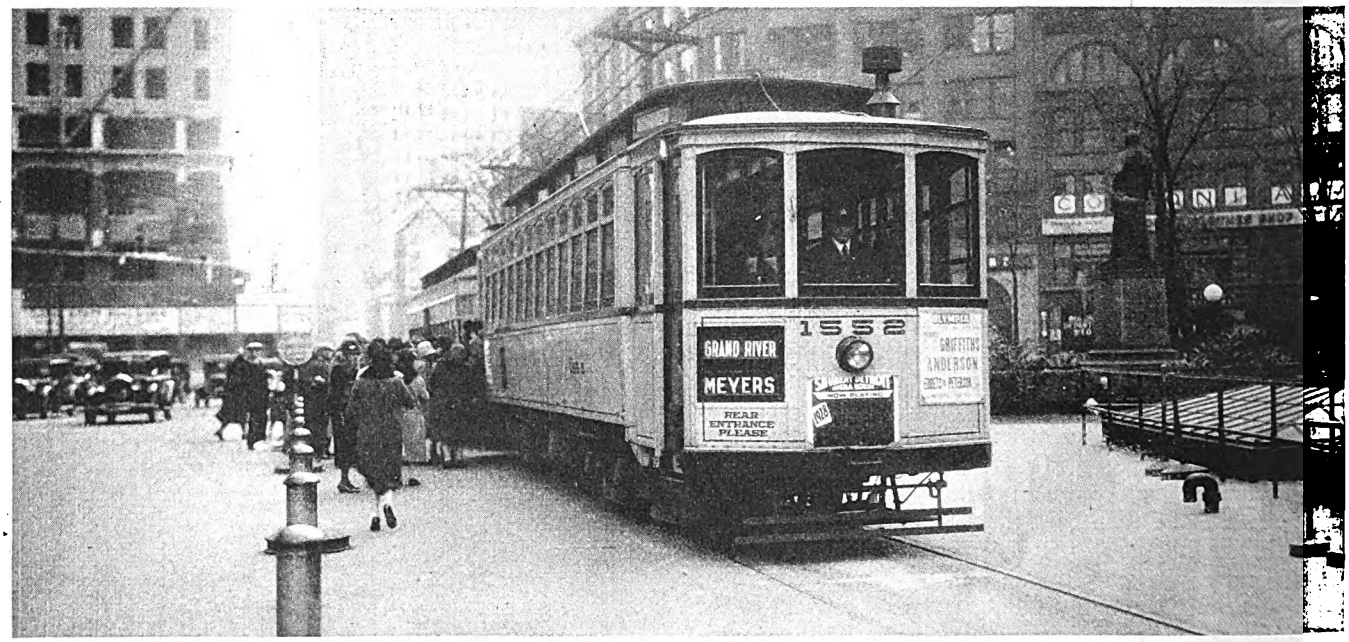
Detroit Extends Surface Rapid Transit System

Street cars now operating on express schedules on Grand River Avenue. Local buses supplement 18 m.p.h. car service. Automatic signals facilitate movement of traffic



A two-car train at the downtown terminal of the Grand River express line

WITH more than a year of experience in the operation of express street car service on the Jefferson Avenue line, the city of Detroit has now inaugurated a similar service on Grand River Avenue. This plan of express service was originally adopted on Jefferson Avenue as an experiment to increase the speed and efficiency of surface transportation on heavy traffic arteries. Cars were operated on an express schedule of 18 m.p.h., making only five stops in a distance of 4.15 miles. Buses handled the local passenger traffic, stopping at each street intersection. Free transfers between the two vehicles enabled passengers originating between express stops to board transfer coaches at the nearest street and transfer to express street cars at the first express station. Prior to the introduction of the express service the cars running on Jefferson Avenue made about six stops to the mile outside of the business district and the schedule speed on the line was less than 12 m.p.h.

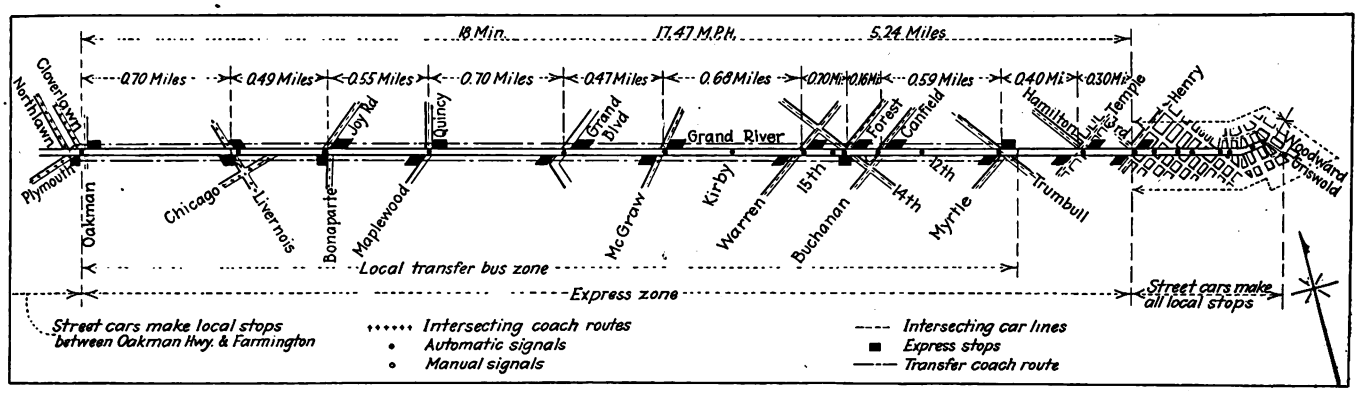
This method of operation became so popular that on Aug. 19, 1928, it was extended to the Grand River Avenue route starting with the establishment of an area between Henry Street and Joy Road with express cars stopping at the six intervening streets. On Oct. 3 the express area was extended to Oakman Boulevard with only one stop between that point and Joy Road. Local buses operating in this area make stops at all intersecting streets and deliver passengers to and from the express stations.

Express Service Saves Much Time

Cars operate to the express area from Henry Street to Oakman Boulevard, a distance of 5.24 miles, in 18 minutes or at a speed of 17.47 m.p.h. In the downtown congested business districts the cars make all of the local stops. A saving of seven minutes is reflected over the entire route of the Grand River line west of Oakman Boulevard. It formerly required 32 minutes to travel on the street car from Oakman Boulevard to Capitol Park, a distance of approximately 6 miles, but under express service this run is now made in 25 minutes. In addition to providing a faster service to the traveling public, express service has materially helped to accelerate the movement of vehicular traffic by reason of the elimination of many street car stops where vehicles were formerly required to stop behind a standing street car.

Buses give local service from Trumbull Street near the downtown end of the express area to the last outbound express stop at Oakman Boulevard. The distance traveled by the local buses is 4.54 miles. The local buses pick up passengers between express stops, or carry them to local stops after they have transferred from express cars.

Digitized by Google



Route of Grand River Avenue express lines, showing location of stops and signals. The local buses terminate at Trumbull Street and Oakman Boulevard

Figures are now available upon which to base an accurate comparison of results of operation on Grand River Avenue before and after the inauguration of express service. An analysis of these figures reveals that during the week before express service was started on Grand River Avenue, average daily operating receipts were $3,437.48 and the average daily operating expenses were $3,038.58, thus making a daily average net of $398.90. These figures are from Aug. 13 to 17 inclusive. For the period from Oct. 8 to 12, after the express service was started, the daily average operating receipts from street cars was $3,798.82 and the expenses were $3,332.41, showing a daily net profit of $466.41, or an average daily gain of $67.51. However, during the same period the average daily receipts from the coaches were $278.65, while the coach expenses were $466.64, thus showing a daily loss of $187.99 in coach operation. The net revenue from both coach and rail operation under express service was $278.42, or $128.48 less than the daily net revenue as shown for the period just prior to express operation.

Only from 10 to 15 per cent of the passengers on the Grand River line take advantage of the transfer facilities. By far the majority take either the car alone or the coach alone. As the system is operated, free transfers are given from the transfer coach to the express trolleys, while passengers transferring to intersecting lines pay only 1 cent for their transfer. Many more passengers transfer from car to coach than vise versa. The purpose of the bus operation is to provide another facility, which is taken advantage of by most of the passengers for a complete ride. This means naturally that the bus service must be kept well within bounds or otherwise the combined operation will show a loss.

Automatic Signal Devices Helpful

Traffic on Grand River Avenue, as well as on Jefferson Avenue, is now controlled by automatic traffic signal devices which favor the movement of cars at the same time expediting the movement of all vehicles on the street. The control consists of a combination of five relays connected in the circuit between the automatic timer and the signal head of a trolley traffic signal, and controlled by two trolley contactors on each trolley wire.

The normal position of the device is such that the automatic timer of the traffic signal controls the periods of the red and green lights, and when the street car operates the so-called "on" contactor, this device holds the green light on the railway side of the traffic signal until it is again released by the street car passing the

Digitized by Google

"off" contactor, when the device again assumes its normal position. The principal of operation of this device is to hold the green light on the railway side of the traffic signal without in any way interfering with the operation of the automatic timer, which is electrically interconnected with all other signals on the avenues through a master timer.

Traffic Device Operated by Cars

The "on" contactor is located at a suitable distance from the traffic signal, so that when an approaching street car passes under the contactor the operation of the device will hold the green light, if it should be lighted at the time the car passes under the contactor. On the other hand, if the red light is lighted when the car passes under the contactor the normal time period of the red light is prolonged so that the signal will change to "go" at approximately the same time the car reaches the corner.

During the peak hours the headway is so short that cars would pass the traffic signal at such frequent intervals that they would cause the green light on the railway side to remain lighted continuously and thereby interfere with cross traffic. To overcome this objection one of the relays of the combination has a time element adjustable from approximately one second to 30 minutes. This time relay is so connected in the circuit that when cars pass the traffic signal in the normal green period this relay does not function. However, if the operation of the cars is such that the green signal is kept lighted continuously for a period corresponding to the setting of this time relay, it will automatically disconnect the trolley contactors from the circuit at the end of its period and allow the automatic timer of the traffic signal to change the light from green to red for one normal period, after which time the cycle may again be repeated.

By this means it is possible to increase the period of green on the railway traffic from the normal period of the timer to any desired period. On Jefferson Avenue the time has been set for two minutes and 45 seconds. This was derived after a number of experiments and was found to allow practically all of the cars to pass without being delayed, at the same time not unduly obstructing cross traffic.

EQUIPMENT REQUIRED—DETROIT EXPRESS ROUTES

	One Way Route-miles	A.M.	Base	P.M.
Grand River cars	11.0	94 (42 trailers)	35	100 (46 trailers)
Grand River buses	5.25	18	9	18
Jefferson cars	6.76	71 (15 trailers)	16	51 (9 trailers)
Jefferson buses	4.15	33	15	43

Buses only operate through express zones.
Cars operate to city limits.

Sheltered Safety Zones Erected

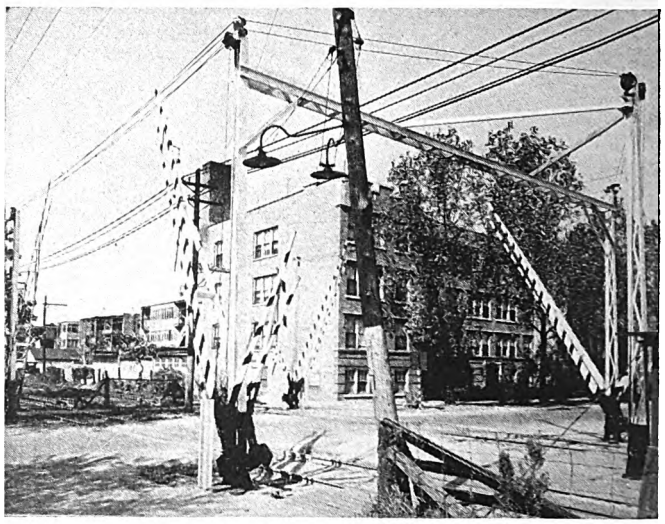
The safety zones at the express stops are the standard type used in Detroit, being 88 ft. long with upright stanchions 6½ ft. from the track and placed about 8 ft. apart. Canvas awnings over the safety zones and splash guards around the side have been erected to afford shelter for the passengers transferring between the local buses and express cars.

The buses pick up and discharge local passengers at the curb. At the express stations all vehicular traffic, with the exception of the motor buses, is compelled to drive to the right of the station. The buses run inside the safety zone, receiving and discharging passengers directly into the zone. Should a car and bus approach the station at the same time, the car is given the preference, but both the car and bus wait for the interchange of passengers from one unit to the other.

The average number of passengers carried per day by the combined operation of cars and motor coaches on the Grand River express service is 92,886, compared with 77,418 passengers per day carried by the cars before the express service was inaugurated. It is evident that the Grand River express service is meeting with the same public favor as that shown on the Jefferson Avenue line, and it is planned to extend the express area beyond its present limitations as soon as the work of constructing new tracks on Grand River Avenue is completed.

All Mechanism Above Ground in New Crossing Gate

AN IMPROVED type of overhead cable-operated safety gate for grade crossings has been developed by the Chicago Rapid Transit Company and is now being given a test at the Sacramento Avenue crossing on the Ravenswood branch of the North Side division. Constructed by one of the Rapid Transit signal engineers, this new gate eliminates all sub-surface construction work. An overhead steel frame, consisting of five upright beams 22½ ft. high and one cross-span, carries the cables connecting the gate arms with the levers in the operating shelter. The gates are of the two-cable construction. There are two levers, each controlling the gate arms on one side of the crossing.



Sub-surface construction work is unnecessary in this new type of crossing gate developed by Chicago Rapid Transit Company

The principal feature making this new gate an improvement over other manually-operated types lies in its greater operating efficiency. The gate arms can be stopped almost instantaneously at any position when being raised or lowered. Another factor that makes for greater grade crossing protection is the elimination of all danger of the cables freezing in cold weather, which frequently happens when the control apparatus is underground. Maintenance costs also are reduced by the new gate, due to its simplicity of construction, according to Rapid Transit engineers.

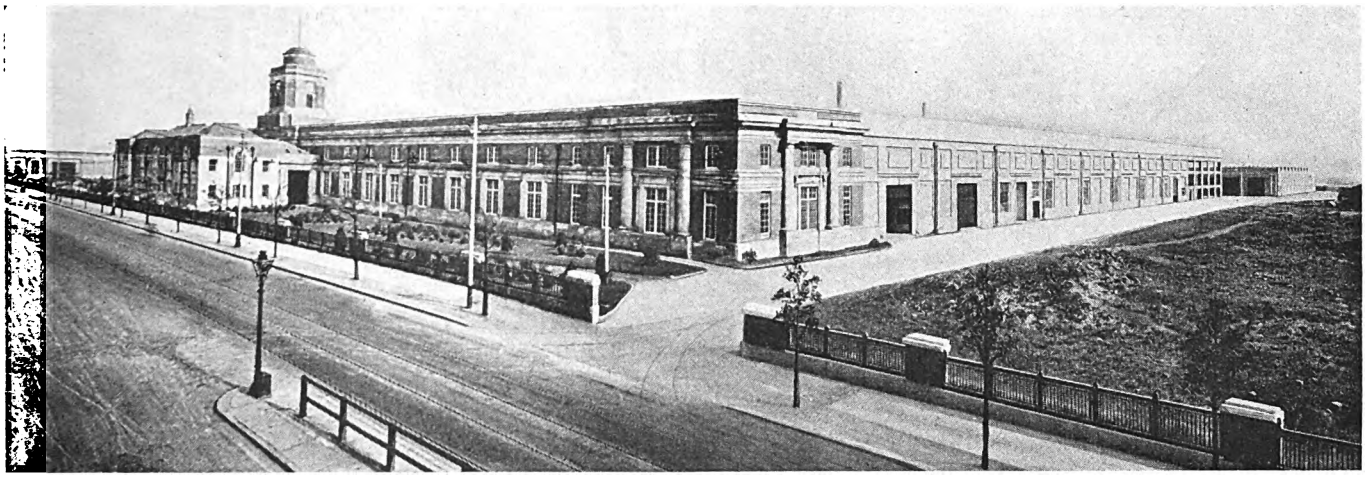
Liverpool Builds New Shops

Attractiveness of exterior and completeness of interior equipment for car repair are characteristics of the new plant of the Corporation Tramways



This building houses the new shops of the Liverpool Corporation Tramways

DESIGNED as it is in the classical renaissance style, with brick façade, stone pilasters, trim and set in a park, the attractive building pictured above might be taken by an observer, at first sight, to be a public school or State Capitol. Actually, it is a repair shop, just erected by the Liverpool Corporation Tramways for the maintenance of its cars and buses. The foundation stone was laid on May 17, 1926, and the official opening took place only on Oct. 17, 1928. The ground on which the shops are located comprises 15 acres. The building itself covers 7 acres, not including a carhouse, which has been built on one side of the plot and which covers more than 1 acre.

The front of the shops, as explained, is of brick, and the side and back elevation of reinforced concrete. The interior walls are also of reinforced concrete, finished with whitewash.

The main building is set 114 ft. back from the street on which it fronts; it has a frontage of 600 ft. and extends back a similar distance. In front, at the center, is the administrative block, containing offices, drafting rooms, lecture room, etc. On the second floor are dining rooms to accommodate the 800 employees, together with kitchen, etc. In the rear of the administrative block is a glass-roofed covered passageway, giving access to the shops.

The main area of the shops is divided into bays, extending parallel to the front of the building, with a traverser or transfer table with track extending the entire length of the building in the center. The transfer table is operated by a 25-hp. motor. The carhouse roof is supported on latticed posts set 45 ft. x 44 ft. 6 in. apart. Steam heating is used and the radiators are mounted on these posts, as shown in one of the illustrations.

The roof girders are set higher than might otherwise be the case because of the need of providing for double-deck cars. The roof is braced on all sides for wind and is of the sawtooth type. Boarding and slates are used for the 30-deg. south slope, and wireglass for the north slope.

To the left and immediately inside the main entrance of the plant is the electrical shop. It has a total floor area of 23,670 sq.ft. The electrical test room is situated on a gallery of this shop.

Beyond the electrical shop is the car repair shop, having ten pits, with a total length of 1,760 ft. This shop is equipped with three overhead cranes of the three-motor slip-ring type, and with various machine tools, such as lathes, planers, millers, grinding machines, wheel tire heating apparatus, etc. To the left of these shops and running the full length of the car repair shop is the fitting shop. At the north end of the fitting shop are three electric and one acetylene welding sets. The repair and overhauling shops have an area of 87,750 sq.ft.

Directly beyond the car fitting shop is the blacksmith shop, foundry and pattern shop. The blacksmith shop is fitted with power hammers, power cutting shears, fifteen blacksmith hearths, case hardening ovens, etc. The floor is of beaten ashes. The pattern shop adjoins the brass foundry and has an area of 1,670 sq.ft. The foundry has twelve furnaces, and is equipped with coke ovens with adequate working space for molding. Behind these shops are sand and foundry bins. The blacksmiths' shop has a floor area of 9,900 sq.ft., the pattern shop of 1,670 sq.ft., and the foundry of 3,620 sq.ft.

On the right side of the main entrance is the paint shop, which is self-contained and cut off from the dust from the other shops. It includes a varnish maturing room, bus varnishing room, drying room, etc., as well as a sign painter's gallery. This shop is separately heated to keep an even temperature throughout the year. An air purifying chamber on the west side supplies washed

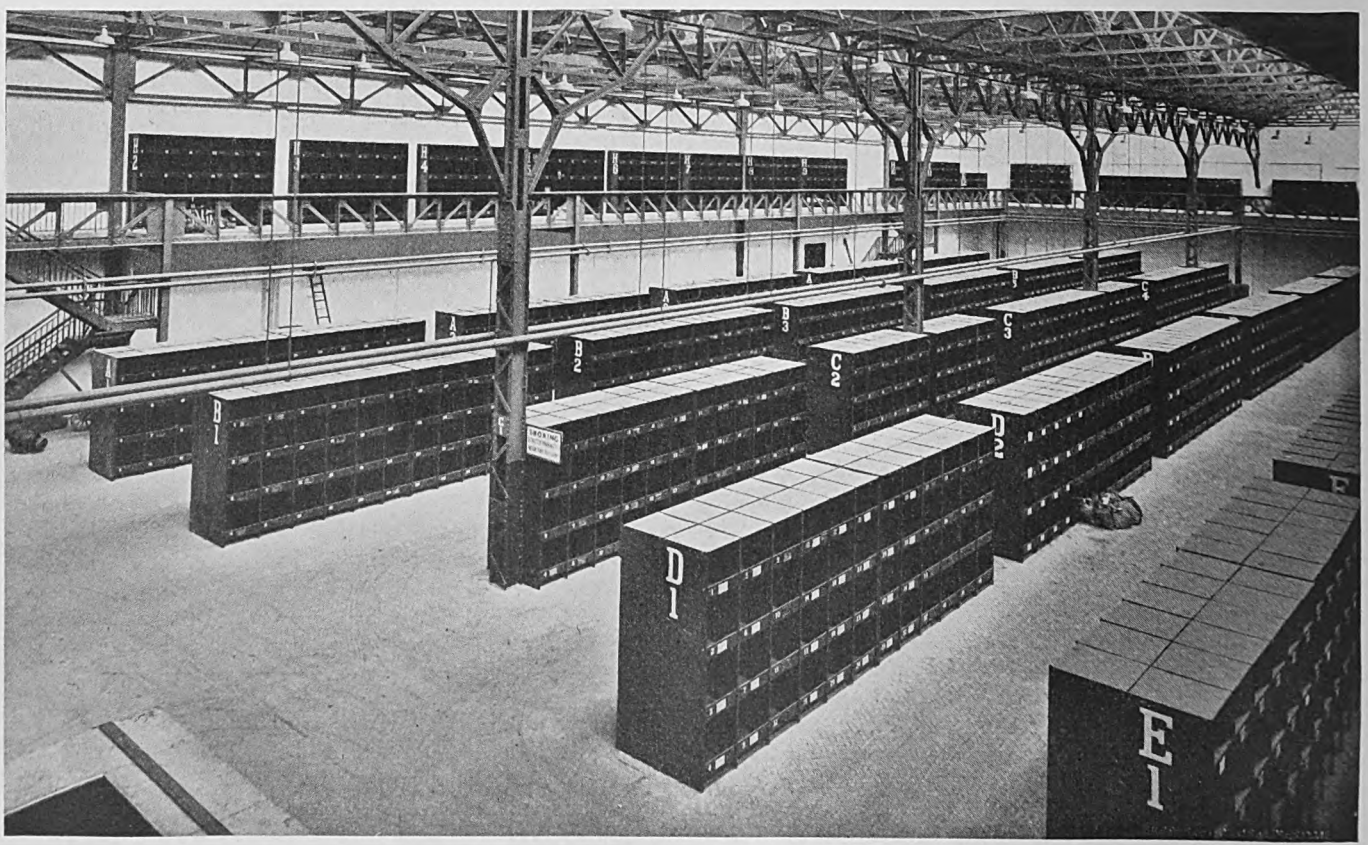
Some of the tracks in the car bay have pits, others have sunken aisles on each side of the track



The stores department has steel bins which can be used for counters. There also are racks in the gallery

Digitized by Google

and heated fresh air which is delivered from overhead. This shop has space to deal with 40 cars at any one time. It occupies an area of 32,210 sq.ft. exclusive of the sign painter's gallery, which has an additional area of 4,000 sq.ft.

Beyond the paint shop is the body repair shop, having six pits with an aggregate length of 1,042 ft. This shop has sufficient room for 30 cars, and is equipped with a special hot water supply for use in connection with the periodic washing of cars.

Adjoining the body repair shop is the body building shop. A foreman's office overlooks the body repair and body building shops and the saw mill. In the body building shop 24 cars or motor bus bodies can be dealt with at one time.

Adjoining the body repair and body building shop, but cut off from them by concrete walls and armored doors, is the saw mill. It is top and side lighted, has a wood block floor and is fitted with machines for dealing with timber from the log to the finished product. Dust and shavings are removed through a dust chamber near the outside entrance. The sawmill has an area of 12,400 sq.ft.

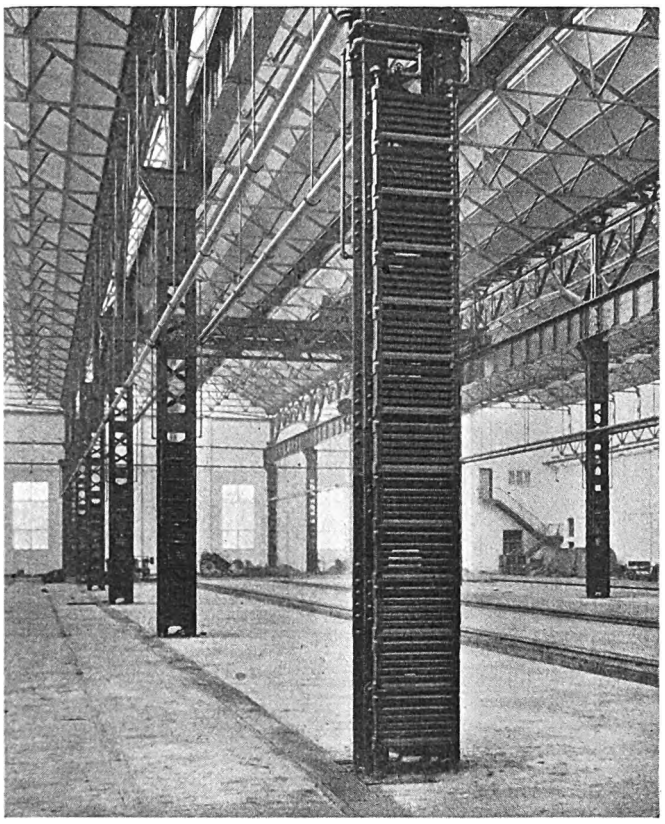
The final section on this side of the shop is the storeroom with 109 ft. of counter, and especially selected steel racks to fit the various parts of the equipment of cars and buses. Additional racks for storage on galleries provide an area of 4,500 sq.ft. besides the main area of the storeroom, which is 20,898 sq.ft. Lighting is from above. A railroad track leads up to this building.

Beyond is the store department, and in a separate building is the bus repair shop. It is entirely of reinforced concrete with steel frame and has an asphalt finished floor. It contains a series of inspection pits and is heated from the main building. Adjoining these shops on the left are the gasoline storage tanks, two in number, with a total capacity of 24,000 gal. Pumping equipment permits a delivery of 15 gal. per minute from each tank.

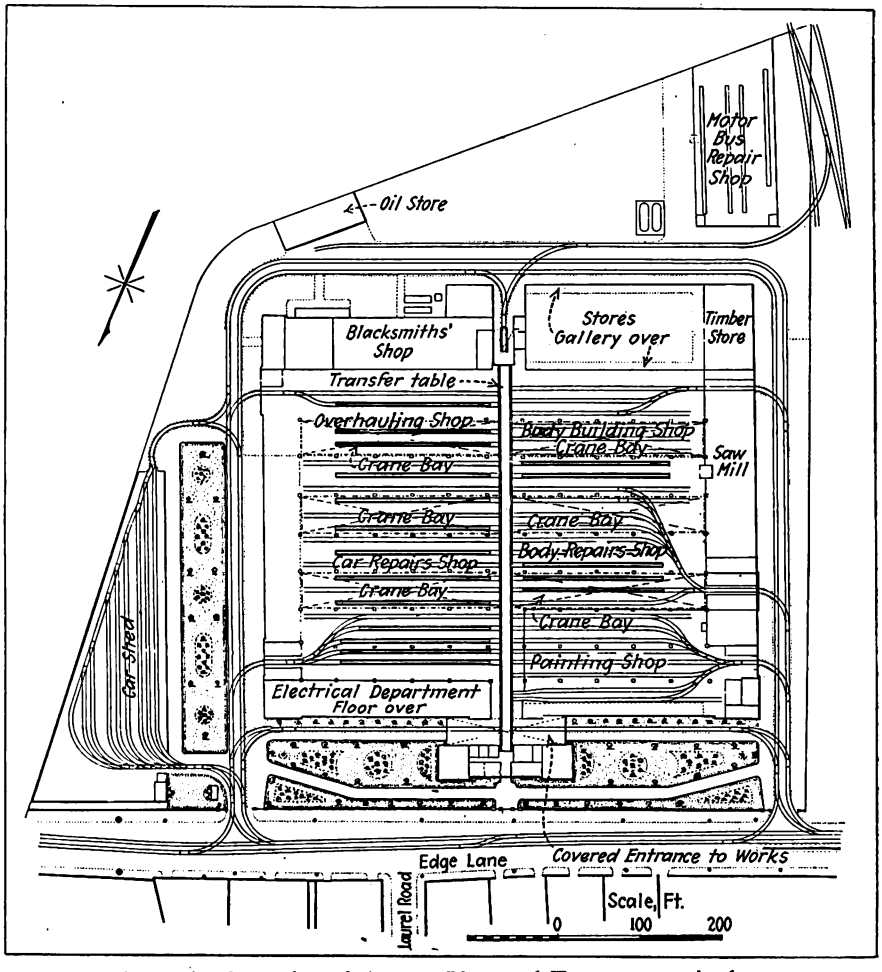
Near to the motor bus shop are the hydraulic gasoline storage tanks which are fed directly from tank cars from the railroad siding. These tanks, which are placed underground, have a capacity of 24,000 gal. The installation is divided into two distinct plants, each giving 15 gal. per minute delivery when all draw-off points are in use.

A 6-in. water main encircles the whole of the main building with a branch taken from the south end down the center of the building under the transfer table way. From these mains 4-in. branches fitted with standpipes serve the entire works, while on the 6-in. mains outside there are hydrants at essential points.

All external doorways at the sides and rear have steel roller shutters for the larger openings, and wood doors for the small openings. The internal entrance ways have steel roller shutters. The car entrances have armor-plated fireproof doors.



Radiators for the steam heat are attached to the vertical supporting posts



This is the floor plan of the new Liverpool Tramway repair shops

Commission Orders Crossing Signs

ORDER No. 75 of the California Railroad Commission, dealing with warning devices, is one of the most extensive ever issued by a similar body as regards highway protection. The ruling not only directs that electric interurban and steam carriers shall provide wholesale additional signs and signals at crossings, but indicates the type that shall be erected or installed at specific locations. It also standardizes into four classes the type, size, shape and location that will henceforth be acceptable to the commission. A number of abandonments of former types and relocation of numerous devices were ordered in the cases of several carriers.

Briefly stated, the following are the four standards of protection, outlined in the commission's order early this year:

Standard No. 1 is the common "crossed-arms on post" with black lettering "Railroad Crossing," to be located in a conspicuous position facing highway travel, preferably at either corner of the crossing intersection on the right-hand side of the highway traffic flow and in advance of the railroad track.

Standard No. 2 is a suspended sign with a white X on a black field. This field is 24 in. square. The sign may be used at a crossing in addition to the crossing sign designated as standard No. 1, or in cases approved by the commission, may be installed in lieu thereof. It must be placed in a conspicuous location facing highway traffic and preferably be illuminated during night hours.

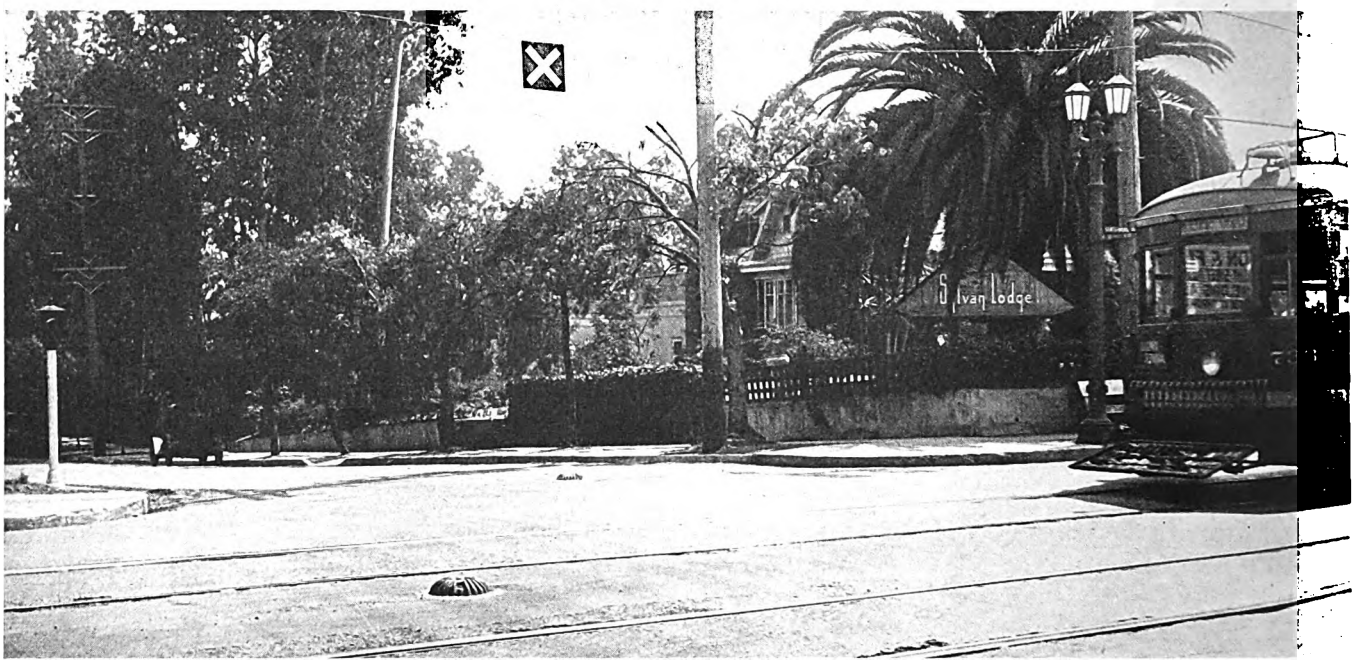
Standard No. 3, a wigwag, or automatic flagman, is to be located in a conspicuous position facing highway travel, preferably at either or both of the corners of the crossing intersection on the right-hand side of highway traffic flow and in advance of the railroad track. The warning aspect of the wigwag is a swinging red disk by day, in combination with a swinging red light by night. Unless omitted by special permission of the commission, the warning aspect shall be accompanied by the sounding of a bell. This wigwag is automatic, being started and stopped by trolley or rail contact devices. Installation is at curb.

Standard No. 4 is a wigwag, similar to No. 3, but installed in the center of the highway, on a heavy concrete base.

In addition to these standards, the state law prescribes advance warning signs, 300 ft. on each side of railroad crossings, to be put up by the county or city. This type of sign is circular, with a white cross on a black field, and is set on posts.

While the aggregate expenditure and number of new signs and signals to be installed by all railroads in California under this order is not available, the scope of additional protection may be seen by the manner in which the Pacific Electric Railway, operating in Southern California, is affected. On the lines of this railway, under the order, there are now 298 additional No. 1 crossing signs, 428 suspended No. 2 signs and 96 private crossing signs being erected. Four automatic flagmen are being installed and nine No. 1 crossing signs relocated.

With the exception of the new standard No. 2 the devices in the approved new standards have previously been used in California. A view is presented of this sign in use.



This new type of warning sign of a crossing is being used extensively in California. It is in addition to other warning devices

Government Provides New Form of Transportation Request

ELECTRIC railway companies are urged by the Assistant Comptroller General of the United States to familiarize themselves with the new procedure of the department in regard to the handling of transportation requests. Ticket agents and conductors on interurban lines should be advised regarding the nature and form of the identification cards and requests, so that a government employee traveling on official business would have only to fill in the necessary information and present them to any authorized agent to secure transportation to the value of $1 or more.

Emergency Stopping Device for Electric Cars*

By Albert Rivet
Carpenter Shop Foreman
Union Street Railway, New Bedford, Mass.

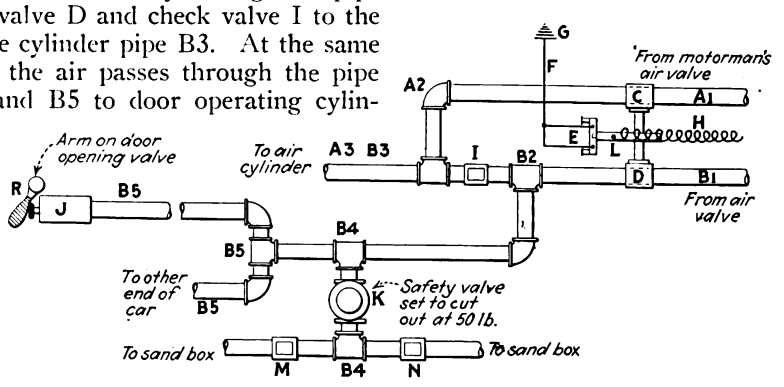
RECENTLY the Union Street Railway, New Bedford, Mass., increased the number of one-man cars in operation. Before inaugurating this service, it was necessary to equip a large number of cars with an emergency stopping device. All of these cars had manually operated doors. It was decided to place the customary pull cord in the center of the car, so that passengers might make an emergency stop. While this method is not new, the mechanical operation and the piping arrangement, was developed along somewhat original lines.

The operation may be followed by referring to the accompanying diagram. When the car is operated in the regular manner, air passes from the motorman's air valve through the pipe A1, valve C, and pipes A2 and A3 to the air cylinder.

To make an emergency stop the passenger can pull the knob G easily. This is attached to the cord F that trips the release catch E. When released the lever L is brought instantaneously into a vertical position by means of the strong spring H. This action closes valve C and opens valve D, so that the air then passes from the air tank directly through the pipe B1, valve D and check valve I to the brake cylinder pipe B3. At the same time the air passes through the pipe B2 and B5 to door operating cylinders and circuit breaker plunger J and also through the pipe B4, safety valve K and check valves M and N to the sand boxes.

When the air operates the piston of the cylinder J, it pushes against the arm R that opens the manually operated doors. The same action cuts off the power circuit.

To reset the apparatus it is necessary only to pull the lever L back down under the release Catch E.



Equipment and piping arrangement for emergency stopping device as applied to one-man cars of the Union Street Railway

TRACK AND WAY DEPARTMENT—39

Auxiliary Ground Box for Track Switches*

By L. H. McAdam
Electrical Department
Toronto Transportation Commission,
Toronto, Canada

DIFFICULTY has been experienced on lines of the Toronto Transportation Commission with water getting into the conduit which carries wires from poles to track boxes. This water freezes in winter, and in case of trouble on the wires it is necessary to dig up the conduit, which often results in considerable labor.

To overcome this trouble an auxiliary ground box is placed alongside the track box. This is used in making a flexible watertight connection between the circuit changer box located on the pole, and the track box cylinder of an electric track switch. The two-compartment ground box is made of ½-in. steel plate, and is 8 in. square. All joints are welded and the lower section is waterproofed by means of a ⅜-in. hemp gasket.

The underground wires are extended from the lower chamber through a D-5552 outlet by means of heavily insulated flexible twin cable which connects with the cylinder. A grounding terminal is provided in the lower compartment of the box at one side.

Since these boxes have been installed water is kept out of the conduit, and in case of trouble it is much easier to remove the underground wires. This type of installation also permits the cylinder to be removed readily and with less damage to the connections.

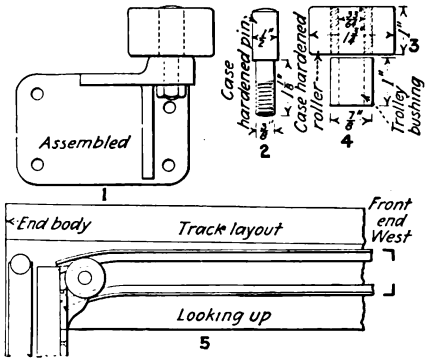
Making Car Doors Operate Faster*

By F. A. Marsh
Superintendent of Equipment
Municipal Railways, St. Petersburg, Fla.

SCHEDULED speed of an electric car is dependent upon the operation of the slowest piece of equipment. On the Municipal Railways, St. Petersburg, Fla., the slowest device to function was the car doors. As these were interlocked with the controls for safety they must close before the car can start. Hesitation in door operation held up the getaway of the car and was also annoying to both operator and passengers.

To remedy this condition the old small roller in the door hanger was discarded and a case-hardened, graphite and bronze bushed roller 1 in. high by 1¾ in. in diameter, turning on a ½-in. case-hardened pin was substituted. By curving the overhead track ½ in. outward, as shown in the accompanying sketch, an additional source of trouble was eliminated, and now a car is seldom turned in or even reported for door trouble. Feist oilless hinges were installed and, together with the trolley bushings in the door roller, they remove the necessity of oiling door mechanism. This saves time and also trouble from oil on the doors.



Assembly and details of roller and track for car doors

The cost of these modifications was less than $1 per door. Many have now been in service two years and the saving in cost of pull-ins and detriment to service has already paid the cost of the changes in the mechanism. This method of door roller and track construction has been adopted as standard by the railway, and all future cars purchased will be ordered equipped in this manner.

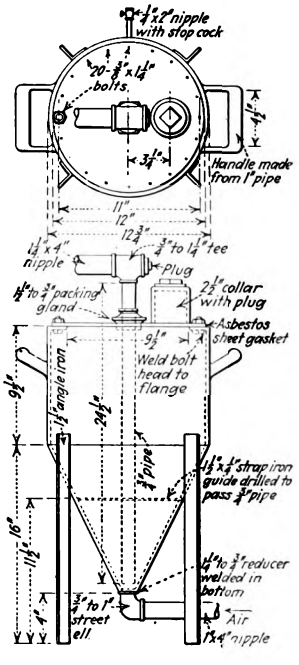
TRACK AND WAY DEPARTMENT—40

Sand Blasting Ties and Rails Before Welding*

By Louis T. Botto
Superintendent Maintenance of Way
San Antonio Public Service Company,
San Antonio, Tex.

DURING the month of October, 1928, the San Antonio Public Service Company, San Antonio, Tex., reconditioned 2,000 ft. of track with 60-lb. A.S.C.E. rail. For this work the asphalt paving and concrete was removed from both sides of the rails to the top of the steel ties. All tie-bolts and clips were removed and new bolts and clips were applied to every other tie. On the alternate ties the clips were electrically welded to the ties and no bolts were used. To provide a satisfactory welding job an air-sandblast was used thoroughly to clean the rails and ties at the point at which the welding was done.

The sandblast device consists of a funnel-shaped reservoir for the sand, and a piping arrangement so that the sand is forced by air through the opening at the bottom into a 1-in. pipe. The accompanying sketch shows the construction. Air for this sandblast device was furnished by a compressor and, in one hour, more and better work was done than was possible in eight hours previously with four laborers using chisels and wire brushes. The device is simple and inexpensive but has proved to be very efficient.



Type of sandblast machine used by San Antonio Public Service Company for sand blasting rails and ties previous to welding

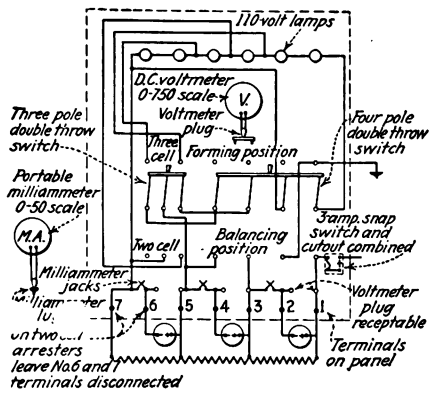
Equipment for Testing Lightning Arresters*

By H. J. Beadle

Engineer of Equipment Dallas Railway & Terminal Company
Dallas, Tex.

BELIEVING that protection against lightning is well worth the additional amount necessary to keep cell type arresters in good condition, the Dallas Railway & Terminal Company, Dallas, Tex., has arranged a special test outfit for this work. Aluminum cell lightning arresters of the two and three-cell types are used extensively by the railway on its cars. The chief advantage of the cell arrester over the gap type is the elimination of the time lag in the gap. During the past year, out of 77 four-motor cars equipped with aluminum cell arresters, not a single armature has been lost due to lightning. On the other hand, out of 200 two-motor cars protected with gap type arresters, seven armatures were lost which could be attributed as the direct result of lightning.

A two-cell aluminum arrester costs about $19 and allowing a life of five years which is conservative, the capital cost per year is $3.80. Adding to this the maintenance cost of $1.40 and the interest at 6 per cent, or $1.14, the cost per year is $6.34 not including installation, which would be about the same for any type of arrester.



Testing circuits as used for lightning arresters

The outfit for testing and building up the films cost the company about $150. The connections are shown in the accompanying illustration. It is complete for two and three-cell operation and was built in the shops of the railway. Before the arresters are put in actual service the films are built up by throwing the four pole switch in the position marked for forming. In this position the cells are placed in series with the six 110-

Hand Strap Leather Testing Machine*

By H. J. Coventry

Chief Draftsman United Railways & Electric Company
Baltimore, Md.

JUDGMENT of various inspectors has been relied upon by the United Railways & Electric Company, Baltimore, Md., to decide when hand straps should be removed from the cars as unfit for further use. The object of such inspections, of course, was to remove the strap and avoid actual breakage while the cars were in service. With this method it was inevitable that straps were removed for surface cracks although actually much stronger than others showing no cracks. This led to the desire for some method which would give definite knowledge as to the serviceability of a strap. A machine was accordingly constructed for submitting the strap to a tensile test under a measured load.

The machine consists of a frame work with two stud blocks free to move on guide bars. One block is tapped to receive a ¾ in. screw controlled by a handwheel. A spring balance fastened to the other block

Equipment for Testing Lightning Arresters*—Continued

volt lamps at the top of the panel. Immediately the lamps will burn bright and then become dark, showing that the film on the plate has been built up and no more current is allowed to flow in the circuit. The lamps are used merely to reduce the amount of current flowing during the formation period.

After the film has been formed the four-pole switch is thrown into the balancing position where it remains until everything abnormal has ceased and each cell has approximately the same voltage. Voltage readings are taken by inserting a voltmeter plug in the voltmeter receptacles. After the readings have been taken the voltmeter plug is removed and milliammeter jacks are inserted in the places marked in the illustration. This shows the leakage current across each cell. At first the leakage current is rather high but soon comes down to a normal value of about one milliampere. It is found that the leakage current per cell may run as high as two milliamperes and not be objectionable, before the cells under test are finally removed from the test board.

Since this equipment has been used no trouble has been experienced in balancing either the two of the three-cell type of arresters. The leakage current in either the two or the three-cell types is about the same. The test assures that arresters when installed on the cars are in first-class condition, and experience without such a test has taught the value of knowing that everything is right or else hot cells and minor troubles develop in service.

Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK—MISCELLANEOUS—52

Hand Strap Leather Testing Machine*—Continued

shows the load to which the hand strap is subjected.

The strap to be tested is placed on the stud of the spring balance block at one end and the handle of the strap is placed over the lug on the tapped block. To eliminate secondary bending stresses in the handle a wooden block carved to the inner contour of the handle is placed over the lug. This mounting gives a test to the strap and handle as a whole.

When it is desired to test the leather only, a $\frac{5}{16}$ in. steel plate is placed over the lug instead of using the wooden block. The plate has two flanges or ears lined with soft wood against which the top tapered portion of the handle rests. The loop of the handle is free of any other contact with the block.

The machine has not been in use long enough to show the savings effected, but as an index, three used and "rejected" straps were picked at random and tested in both ways described. Nos. 1 and 2, whole straps, did not break when subjected to 250 lb. No. 3, a whole strap, did not break when subjected to 275 lb. The leather of No. 3 was subjected to an additional test of 550 lb. without breaking. This strap had a cracked bakelite handle when removed from service before the test.

Many other uses for the machine have been suggested. By providing suitable clips different materials may be tested, and by providing a scale and an index pointer on each block the extension of the specimen under load may be obtained by taking the difference of the two indices before and during the test.

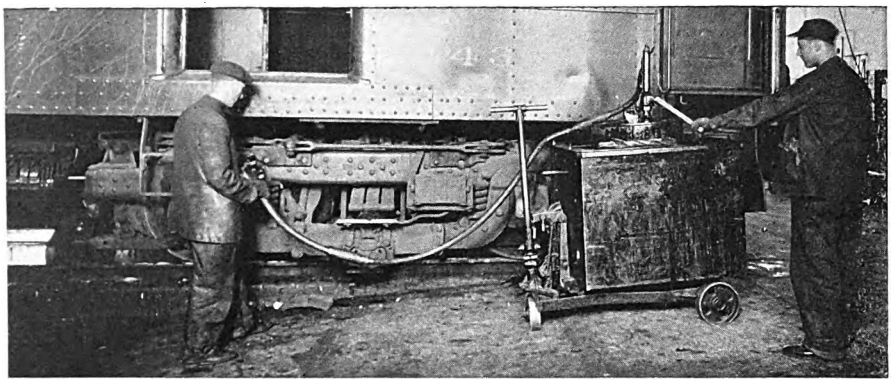
Convenient Equipment for Pumping Grease to Car Gearing*

By Harvey L. Bullock
General Foreman of Electrical Equipment
New York Central Railroad, White Plains, N. Y.

FOR greasing car gearing, a standard grease pump of the type found in many garages, is used in the White Plains shops of the New York Central Railroad. This is fitted to a special head that will fit over a standard grease drum. The drum with the grease is dropped by a crane into a galvanized iron box, lined with asbestos, which is anchored with expanded metal lath. Electric heaters are provided inside the box, so that the grease can be kept soft. Plugs and receptacles are provided so they can be connected to standard shop circuits. Current is supplied to the electric heaters for one to 1½ hours, and the grease is brought to proper consistency to pump.



Greasing gears in the White Plains shops of the New York Central Railroad by means of special equipment

Each revolution of the pump supplies 1 lb. of grease, and the man who does the greasing and carries the end of a metallic line canvas grease hose, tells the operator the number of turns required to give the desired quantity of grease. The end of the hose is provided with a molasses gate valve, so that the grease flow can be shut off with no drippage. The box into which the grease drum fits is mounted upon a ball bearing truck with a handle so that it can be pulled about the shop readily. A top fits around the drum tightly.

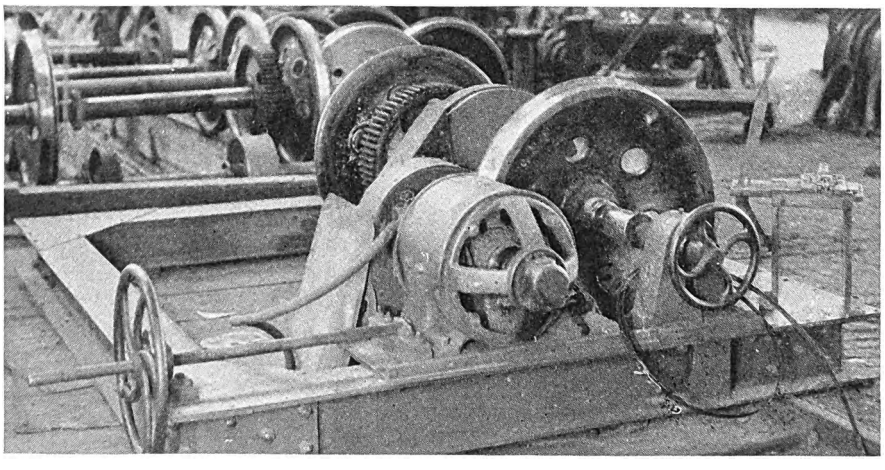
ROLLING STOCK—TRUCKS—34

Simple Type of Wheel Grinder*

By E. M. Lunda
Superintendent of Shops & Equipment
Grand Rapids Railroad,
Grand Rapids, Mich.

FOR grinding wheels while they are mounted on axles, a simple wheel grinding equipment has been made in the shops of the Grand Rapids Railroad, Grand Rapids, Mich. A framework of I-beams is used for supporting the wheels and grinding equipment. The grinder wheel is mounted directly on the shaft of a 3-hp. motor. It is 14 in. diameter and 2½ in. thick. This is the same as the width of the wheel tread. Wheels are revolved at a speed of 65 r.p.m., and the grinder wheel runs at 1,500 r.p.m. To rotate the wheels, a split pulley is bolted to the center of the axle, and this is belted to a countershaft which runs in the pit below. The motor for grinding the wheel is mounted at an angle of 1 to 25, so as to give the proper slope to the tread. The travel of the motor in and out while grinding is regulated by a large handwheel with a screw, the base of the motor sliding back and forth.



Wheel grinding equipment used in the shops of the Grand Rapids Railroad

To keep the grinding wheel true, a hand dresser is used. This is shown at the right corner in the accompanying illustration. When the emery wheel requires dressing, the hand dresser is bolted to the frame and travels across the stone face by pulling the handle of the dresser back and forth. This provides a quick and effective means for truing.

Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK—TRUCKS—33

Special Rack for Storage of Axles*

By C. B. Hall
Chief Clerk Mechanical Department
Virginia Electric & Power Company,
Norfolk, Va.

RESERVE axles of the Virginia Electric & Power Company, Norfolk, Va., are stored on a special rack erected by the mechanical department. Eight pieces of old cross ties were utilized, together with two sections of 100-lb. "T" rail, 30 ft. long. The cross ties are placed in the ground and extend 18 in. above it. The "T" rails are spiked to these supports.

Storage space is provided on the rails for 70 axles. A single axle can be removed without disturbing the others, and this feature is of particular advantage over the arrangement previously used where they were placed in a pile. Since the rack is in the open air all axles are painted before being subjected to exposure.

Rack for storage of spare axles

ROLLING STOCK—TRUCKS—35

Holding Dustguards in Position to Prevent Wear*

By Equipment Department
Georgia Power Company, Atlanta, Ga.

TROUBLE has been experienced from wooden dustguards in journal boxes of cars operated by the Georgia Power Company, Atlanta, Ga. The wooden dustguards rest on top of the axle and wear both the axle and the dustguard. This causes an opening at the bottom side of the axle.

To overcome this trouble a $\frac{3}{8}$x8$\frac{1}{2}$-in. machine bolt has been installed in the bottom of journal boxes. Dustguards are slotted, so as to fit over and rest on this bolt. Use of this bolt has also overcome trouble from the dustguard breaking out at the top and letting the guard drop down and extend out at the bottom of the journal box which was an annoying source of trouble.

Improvements Suggested for Maintenance Equipment

NUMEROUS suggestions for new tools needed for track and line maintenance were made in the Nov. 17 issue of ELECTRIC RAILWAY JOURNAL, and many more have been received since that time. Some of them are presented here. These suggestions have been made as a result of a campaign for better tools as advocated by the executive committee of the American Electric Railway Engineering Association. The industry has recognized that a higher standard of maintenance is essential, and in order to carry this out economically many improved tools are needed. Experience with present equipment has also shown that much of it is unsatisfactory in certain respects. Prominent men in the industry have recognized this need and are taking this means of calling attention of the manufacturers to needed improvements, in the hope that new equipment will be developed to meet requirements.

ELECTRIC RAILWAY JOURNAL asks that all men who have experienced difficulty in any line of maintenance work send in their suggestions concerning the kind of equipment that would be helpful to them. An outline of improvements that are needed in present equipment and new devices will prove of advantage. By co-operation of the men actually confronted by these problems, the limitations of present shop, track and line maintenance equipment can be brought forcibly to the attention of interested manufacturers. Suggestions will be published in these columns, and maintenance men and manufacturers are invited to enter the discussion. Manufacturers are urged particularly to tell why some of the much-needed tools are not available and to tell how some of these suggestions can be carried out with advantage. Letters are requested from anyone who has suggestions to make regarding needed improvements in existing equipment, or new devices that should be brought out.

Dry Concrete Material Mixer Needed

Suggestions by LOUIS T. BOTTO
Superintendent Maintenance of Way Department, San Antonio Public Service Company, San Antonio, Tex.

TWO years ago the San Antonio Portland Cement Company placed at the disposal of cement users in this section a fully equipped laboratory for free testing of concrete and of concrete-making materials. This service has been used much by our maintenance of way department, and we have found great advantages both in economy and in strength in making concrete by keeping the water content down as low as possible.

Our maintenance of way department has two Smith mixers that are used on all new trackwork where it is possible to keep the traffic off it for fifteen days. On our maintenance jobs, however, it is not always possible to keep traffic off the work and it is often necessary to use concrete with a water content much less than one of water to one of cement. In these instances it is necessary to mix and place the concrete by hand, as it is impossible for the ordinary concrete mixer to discharge this dry mix.

On three major repair jobs during this year, this dry hand-mixed concrete was used exclusively and after being tamped in place was topped with asphalt and the street opened to traffic. One great need of our maintenance of way department is for a concrete mixer designed especially to mix and discharge a concrete mix, containing only sufficient water properly to hydrate the cement in the batch.

A SMALL PAVING MIXER NEEDED FOR RAILWAY WORK

One of the greatest needs of our maintenance of way department is for an inexpensive mixer about the size of an ordinary two-sack concrete mixer, in which hot road oil of about 12 gravity, rock screenings and finely-ground asphalt or other combinations of asphalt and stone may be mixed thoroughly and from which the material can be discharged readily. For the past three years we have been mixing by hand in different combinations these materials for use in our regular paving maintenance work, and have effected a considerable saving over maintenance methods previously used to do this.

Our company has 250,000 sq.yd. of paving to look after and keep in good condition. As this paving becomes older it requires more and more attention. We do not feel that the amount of work which we have to do justifies our department in asking for an expensive paving plant, but we do believe that a suitable, inexpensive paving mixer would be very desirable and that it would pay for itself in a short time.

COME-ALONG CLAMP NEEDED FOR JOINT WELDING

Three years ago the San Antonio Public Service Company began a six-year program of seam welding and reinforcing rail joints of 60-lb. A.S.C.E. rail in gravel ballast track. The aim was to recondition from 4 to 6 miles of the 30 miles of this type of track each year until the entire work was completed. The type of joint used in this work was shown in the issue of ELECTRIC RAILWAY JOURNAL for Aug. 20, 1927. This work has gone forward as planned, and we have at this time 13.9 miles yet to be done.

In connection with the welding of these joints a new device is needed. This should provide for gripping the base or web of the rails on each side of the joint, and for pulling them together tightly while the welding is in progress.

Mr. Manufacturer

Have you any equipment that can be adopted to the needs outlined on these pages?

SEND IN YOUR COMMENTS

Digitized by Google

The use of such a device will also permit cars to pass over the track while the welding is being done. Such a device should be of light weight, strong and arranged so that it can be applied and removed easily and quickly, and by one man. We have designed and tried out several different kinds of come-along clamps, but none has proved entirely satisfactory.

With this class of construction work tracks are opened up and new ties are put in where needed. New ties are placed on 10-ft. centers, and the tracks aligned and resurfaced. Where rails are worn badly they are renewed. While this work is in progress the welders follow the track gang and weld the joints. The great advantage of having a satisfactory come-along clamp is to have the welding crew do all of the welding work, without the necessity of calling upon the track gang to come back and make the joints tight for the welders. A suitable device of this kind would speed up the work and insure better joints.

Equipment Department Lacks Improved Fixtures

Suggestions by H. S. WILLIAMS
Assistant Superintendent of Equipment Department of Street Railways, City of Detroit, Mich.

IN THE equipment department of electric railways workmen are under a great handicap due to lack of devices for holding and clamping parts in position during machining operations. There appears to be particular need for a line of air clamping devices which will hold work in drill press operations. Inasmuch as the maintenance shop has such a large proportion of drilling operations to perform, and these must be carried out on odd-shaped pieces in small quantities, there is no possibility of speeding up production by the use of jigs and fixtures. Quick operating devices and clamps are needed badly.

UNIVERSAL LINE REAMING MACHINE SHOULD BE DEVELOPED

It has been established that greater life may be obtained from armature and axle bearings of railway motors if adequate bearing preparation is used. This work necessitates a reduction of clearances to the minimum in the original fitting, and this in turn means true shaft bearings and liners which are machined in true alignment. It is believed that a universal line reaming machine can be developed which will function to line-ream the bearings of motors and so give them proper fitting.

MANY IMPROVEMENTS NEEDED THAT WILL REDUCE CAR NOISE

As to car equipment, the needs in this line are multitudinous. A few items can be suggested of outstanding importance. In connection with assistance needed in the campaign for noise reduction, the noise reduction committee of the American Electric Railway Engineering Association last year suggested that gear cases be covered with a sound-proofing material. Tests conducted showed that by doing so a great percentage of the total car noise could be eliminated. The commercialization of this feature should be pushed forward.

There is also a need for sound insulating material to absorb sounds reflected from the pavement into the car. Manufacture of such material will be of advantage.

Gear cases which will retain the oil lubrication better than present types are urgently needed. Railway gears as manufactured are notoriously incorrect, and much improvement is needed along lines outlined by the noise reduction committee.

> New equipment must be developed to provide and to maintain the improved service and comforts that the people demand.
>
> FRANK H. MILLER
> *President American Electric Railway Engineering Association*

More Permanent Overhead Needed

Suggestions by ANGUS G. SCOTT
Assistant Superintendent of Overhead, Cleveland Railway

AT THE present time the electric railway industry does not possess a stable overhead construction but one which requires frequent tearing down and rebuilding. An ideal type would be one which would, in a sense, be permanent. Suggestions on methods, tools and devices tending to establish permanent overhead construction would be of much value.

The use of non-ferrous wire and materials is a step in this direction. However, many parts of the overhead system which are now subject to wear, such as ears and splicers, crossing facilities, etc., can be developed further into units easily replaced which would cut maintenance costs considerably.

In the overhead department there is a broad field for the further development of present maintenance devices and for the invention of new tools, new equipment and methods. Hand labor, which plays a very prominent part in every overhead plant, can be cut down through the use and development of mechanical devices, such as span wire clamps, which eliminate the necessity of serving wire by hand. The assembling of the plant, which is now largely done in the field, could be done in the shop through new methods and tools.

At present, much overhead material by no means worn out is scrapped. Through the designing and use of the proper apparatus, this material could be reclaimed at a small cost. Such items as ears and splicers are in this class.

Clamping Trolley Ears Around Trolley Wire

Suggestion by JAMES F. NEILD
Electrical Engineer Toronto Transportation Commission

ONE of the specific needs of overhead departments of electric railways today is for a device for clamping trolley ears around the trolley wire. This can be accomplished either by pressing or rolling, so as to obtain a smooth underrun and eliminate the ridging caused by peening the ear onto the wire with a hammer. No matter how carefully an ear is peened on, ridges are left and these tend to set up vibration. The elimination of these will be a direct contribution to the industry.

Universal Boring Machine for Bearings

Suggestion by J. T. PORTER
Superintendent of Equipment Virginia Electric & Power Company, Richmond, Va.

THE Richmond shops of the Virginia Electric & Power Company are in need of a universal boring machine for boring out armature and axle bearings. The machine now in use has been in service around 35 years. While it takes care of the work after a fashion, it has become worn and cannot be depended upon to do accurate work. Repair parts for this machine are not available, and we cannot find a manufacturer who makes a boring machine which will do the work that this particular machine was designed to do.

There is an urgent need for such a machine on many electric railway properties. I have talked to several manufacturers and representatives about this condition, but as yet no one has come forward with a machine that will meet the need. It would certainly be a godsend to the industry if some manufacturer would produce a suitable bearing boring machine.

SHORT CUTS

for the Electrical Repair Room

Peculiar Effect of Miscounting Armature Lead-Spread

IN A four-pole, series-connected, armature with 15 bars and 15 coils, it is possible to divide the commutator bars and coils into three sections insulated from each other, by miscounting the lead-spread. The proper bar to which the number 1 bar should be

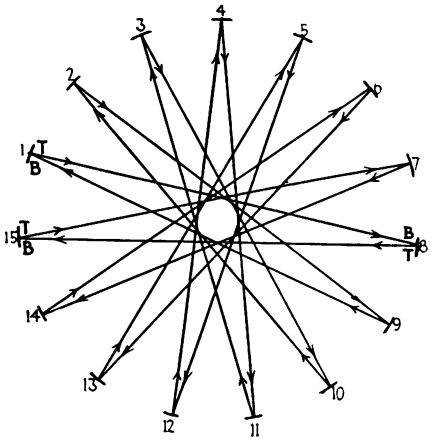

Fig. 1—Armature with 15 bars and coils, correctly connected

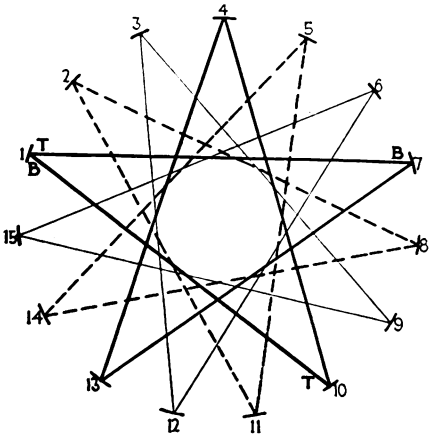

Fig. 2—Counting "one short" divides the commutator bars and coils into three sections, insulated from each other

connected is determined by a definite rule. Should the lead-spread be counted short, the three insulated sections will result.

In Fig. 1 is shown a 15 bar and 15 coil armature, correctly connected. As may be seen, each coil is connected to the one adjacent to it, through two coils in series, the bar joining these two being diametrically opposite the two adjacent bars. With the bars connected in this manner all around the armature, two parallel paths result. The correct spread of the leads of any coil is obtained by dividing the total number of bars by 2 and adding one-half or 1½, depending on the direction of rotation of the armature.

With a 15-bar armature the lead-spread would be either 8 or 9. Fig. 2 shows an armature with its first bottom lead connected to bar 7, instead of to bar 8 or 9, with the result that the bars and coils are divided into three sections insulated from each other. This mistake is called "counting one short." "Counting one over," will produce the same result.

Position of Winding Machine or Operator Affects Field Coil Polarity

FIELD coils that give reverse polarity when connected in the usual manner are said to be wound left-handed. Strictly interpreted, however, this expression is not true for it is not practicable to wind a field coil left-handed. The winding spindle would have to be turned toward the winder instead of from him, and the wire from the stock reel would have to pass under the winding form instead of over it. Also, the winder would be unable to guide the wire and wedge the turns into place unless he assumed an uncomfortable position.

It is not uncommon for winders of field coils to become confused with the method of winding when a new machine is substituted for an old one. To cite an example of this, a field coil winder had become accustomed to sit with an old machine to his right when winding coils. The operator became much confused in using a new machine, the construction and installation of which required that the winder sit at its right. The direction of rotation was the same for both machines, but this added to the delusion. All winding forms have either a hole or a slot through the flange on one side for securing the starting end of the winding. This, too, causes the winder to become confused, because he is almost certain to use the hole or slot already in the form.

To illustrate the difference, the winding *A* in Fig. 1 has been started on the right-hand side of the form, while the winding *B* has been started on the left-hand side. Viewing the starting side of the form as indicated in the diagram and conceiving current to enter the coil by way of the starting end, it will be seen that the current flow in the coil of *A* will be clockwise while that in the coil of *B* will be counter-clockwise.

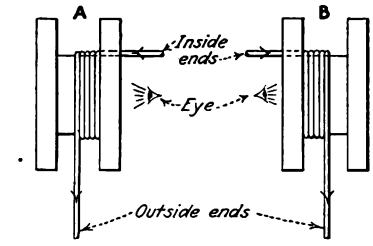

Fig. 1—Two positions of winding forms

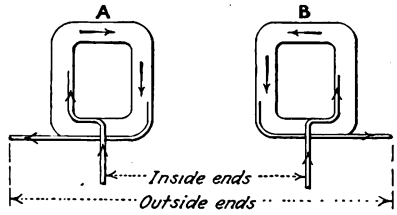

Fig. 2—Two coils removed from the winding forms showing the slight difference in appearance though wound from opposite ends

The appearance of the coils when removed from the form will be the same to the casual observer. The similarity of appearance is emphasized in Fig. 2, which shows the two coils when removed from the form. Unless trouble has been suspected, the error will not be detected and the coils will be insulated in the usual manner. When insulated, they will appear exactly the same, but this does not correct the effect of the reversed winding, namely, reversed polarity. To avoid this trouble when a machine that requires the operator to sit on the opposite side is installed, it is necessary to cut slots or holes in the opposite flanges of all winding forms.

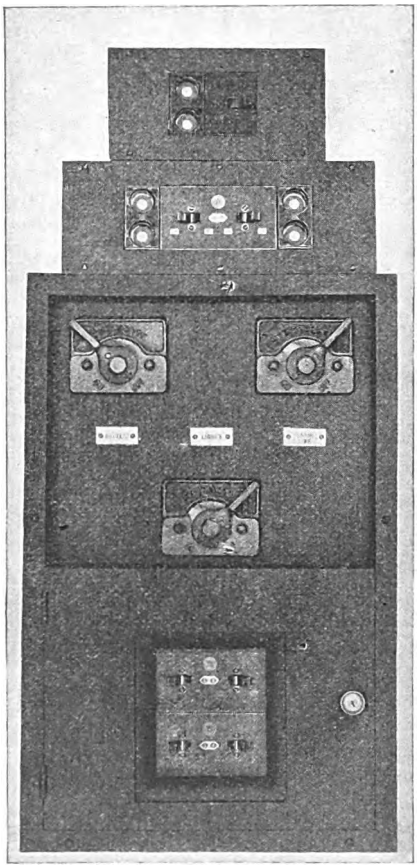
New Offerings of Useful Equipment

Safety Panelboards for Electric Cars

DURING the last year the Westinghouse Electric & Manufacturing Company has developed a new line of panelboards for controlling the lighting systems of electric and steam railroad cars. Full safety type panelboards place the entire control under the supervision of the operator, since they are so compact they can be mounted within easy access.



Panelboard for city or interurban cars

These panelboards were designed not only to provide safety for subway, elevated and steam railroad cars, but also to give the railways a lighting and power control panelboard that is flexible enough to meet all conditions. All mechanisms form individual units so that any one unit can be removed without disturbing the others. The compartments are arranged so that, where necessary, barriers are provided between all live parts.

The trims are made with two doors, one over the fuses and one over the switches. Each door requires a separate key which permits only authorized persons to gain access to the compartments. Trims are furnished in any color to match the interior finish of car.

Across-the-Line Reversing Switch

DEVELOPMENT of a new motor control switch suitable for reversing small alternating-current motors in cases where the motor can be thrown across the line is announced by the General Electric Company, Schenectady, N. Y. It consists of two triple-pole, barrier-type, magnetically-operated contactors, mechanically and electrically interlocked, and two hand-reset temperature overload relays mounted on a molded base and enclosed in a drawn-shell enclosing case.

Double-break contactors with silver contacts, operated by a high-speed solenoid, give the switch a very high interrupting capacity with minimum arcing. The new type silver contacts eliminate the need for the shunt straps and, since silver oxide is a conductor, minimize contact resistance.

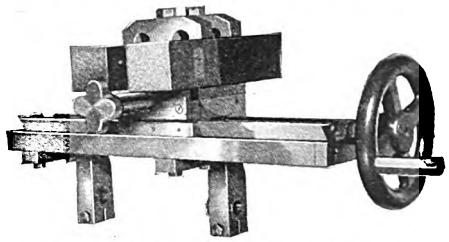
Two temperature overload relays protect the motor from overheating because of mechanical overload or single-phase operation. These relays are a fixed part of the switch, but have interchangeable heaters. To adapt this switch for use with a motor of a different rating but the same voltage, it is merely necessary to select heaters corresponding to the motor current.

The enclosing case, finished in black water Japan varnish, has rounded edges and corners which give it a neat appearance. The cover is held in place by two pins at the top, and by a screw at the bottom. Additional clips can be supplied to permit the use of a padlock.

Many applications, such as motor-operated doors and windows, valves and machine tools, require a reversing switch, a push-button and either a geared-type or track-type limit switch. The size and appearance of the new switch are such that it can be mounted readily on any machine for use with any of these applications.

Tool Rest Improves Commutator Grinding

TO INSURE a more nearly perfect job when using Ideal commutator resurfacers, the Ideal Commutator Dresser Company, Sycamore, Ill., has just placed on the market a new tool rest. This attaches to the brush arm and results in a great saving of time in commutator grinding, as it eliminates the necessity of dismantling motors and generators in order to resurface the commutators.



New tool rest for use in resurfacing commutators

Bases for the tool rests are available in lengths from 6 to 28 in., varying by 2 in. Those 14 in. or smaller have two supports while the 16 in. or longer bases have three supports. The supports are L-shaped, either 2 in. or 3 in. high, or T-shaped 3 in. high for attaching to round brush arms. Flat supports can be substituted when necessary to attach to flat brush arms. Each base has a large diameter wheel to facilitate easy operation of the cross feed, also a screw-infeed adjustment.

News of the Industry

Ten Cents in Rochester

Cash fare on the Rochester lines of the New York State Railways will be increased to 10 cents on Jan. 1, according to an announcement of James F. Hamilton, president of the company. The present fare is 9 cents. Car tickets will be sold at the present rate of twelve for $1. Thus only the casual rider who does not purchase tickets will be affected by the raise.

Under the terms of the service-at-cost contract with the city, the railway is allowed a 6 per cent return on its investment. The surplus goes into a balancing account fund. The contract stipulates that when the balancing account reaches $500,000, the fare is to be automatically reduced and when it goes below $200,000, the fare is raised. The balancing account, $300,000, was created in 1920 when the service-at-cost contract went into effect. The balancing account now shows a deficit of $80,000. The contract expired in August, 1930. If the increase in fare brings the balancing account up to $500,000 before Aug. 1, 1930, the fare will be automatically returned to 9 cents, Mr. Hamilton pointed out.

The fare was raised from 8 to 9 cents last December and from 7 to 8 cents in January, 1926.

Cash fare is 10 cents on the other properties of the New York State Railways in Syracuse and Utica.

Five-Cent Shuttle Discontinued in Seattle

Seattle's shuttle system, that in the vernacular "ran rings" around the business district from Yesler Way to Olive Way for the benefit of short-haul shoppers, has been discontinued by the Municipal Railway, whose sponsors said it was a losing business. The fare was 5 cents with no transfers, but the route was confined to a comparatively small district. One-man cars were used. The service, started on Nov. 7, 1927, was described and illustrated in an article in the JOURNAL for Feb. 11, 1928, page 253.

Rapid Transit Survey to Start Soon in St. Louis

Rudolph E. Kelker, Jr., Chicago, who has been retained as engineer for the Rapid Transit Survey Commission of St. Louis, Mo., visited St. Louis on Nov. 30 to confer with city officials and members of the commission. He will begin active preliminary work at once, after which he will outline for the commission his complete program of procedure. Actual field work will not be undertaken for several months. He said the city should first find out what it wants to spend money for and then spend it wisely. He stressed the necessity for a reasonable fare and the assurance of continued use of rapid transit facilities after they are constructed. He pointed to the St. Louis Public Service Company as a "probable tenant." Mr. Kelker said that subways should be built only where it is absolutely imperative. His opinion is that elevated lines can be made both sightly and comparatively noiseless.

20,000 New York Taxis Have $160,000,000 Income

A. Freed, president of the Paramount Cab Manufacturing Corporation, estimates that 20,000 cabs of New York's taxi fleet have a yearly income of $160,000,000. Mr. Freed pointed out that for every $1 spent on subway, elevated lines and trolley lines for fare, $1.02 is spent for taxi transportation.

Automobile Men See Parking Need

New York merchants suggest reasonable parking restrictions with policing regulations based on experience in Central West, particularly Chicago

MAYOR WALKER of New York has before him a report of the traffic committee of the Automobile Merchants Association of New York, making fourteen concrete suggestions for the improvement of traffic in New York City as follows:

1. Secure the necessary amendments to the building code and zoning laws to permit the erection of parking garages.
2. Follow the example of the city authorities of Chicago by providing ample parking space before drastic non-parking regulations be adopted.
3. Compel all sight-seeing buses to vacate streets immediately and occupy terminals.
4. Skip-stops for all surface cars and city-type buses.
5. Require all buildings above a certain height or tenant capacity either to provide garage facilities in lower floors or core of building.
6. Progressive control light system of traffic signals throughout the city.
7. Traffic light suspended in center at street intersections.
8. Install stop-street signs wherever required.
9. Permit driving through the safety zones.
10. Compel all slow-moving vehicles to keep well to the right.
11. Issue summons to pedestrians disregarding traffic signals and make it unlawful for any pedestrian to cross a roadway other than with released traffic, wherever traffic is directed by a police officer.
12. Hasten completion of express highway and provide parking facilities thereunder.
13. Hasten alterations on Queensboro Bridge in order that the movement of traffic at that point be expedited, and rush condemnation proceedings with respect to property required at western end so that the bridge has adequate approaches.
14. We believe the Police Department is doing splended work. We recommend that our traffic courts be reorganized, using as models the Traffic Violations Bureau of Detroit, the Chicago Traffic Bureau and the Los Angeles Traffic Violations Bureau.

In its letter to Mayor Walker, the committee suggested that its report be turned over to the engineering firm of Day & Zimmermann, which has been suggested to the Board of Estimate for retention to make a traffic survey of New York City. The committee believes that "the citizens of New York are looking for some kind of traffic relief as soon as it is humanly possible to accomplish it." The committee says:

We were fortunate in meeting Dr. Miller McClintock, who was employed by the Chicago Association of Commerce to make the original traffic survey and upon whose recommendations the ordinance is predicated. Dr. McClintock stated that he was quite familiar with the New York traffic situation, but did not desire to make a survey thereof unless he were assured that the city authorities were ready and willing to proceed with a definite plan of traffic relief immediately after such survey had been completed. We believe that steps should be taken to obtain the services of Dr. McClintock in order that a satisfactory solution of our local traffic problem be achieved.

The rapid movement of traffic on main highways in Chicago was of especial interest, particularly along such main thoroughfares as Michigan Boulevard, Lake Shore Drive, Lief Ericksen Boulevard, made possible by virtue of the following:

1. Thirty-five miles per hour on boulevards and main thoroughfares.
2. Twenty-five miles per hour through the Loop district.
3. Stop streets at intersections at main thoroughfares indicated by large stop signs.
4. Right hand turns permitted.
5. Left hand turns permitted against a red light at every other block under police direction.
6. Progressive system of traffic control on intermediate traffic lanes.

In Chicago the number of arrests for traffic violations is low, even though the fines are nominal. For example, they range for minor infractions from $1, $2 and $5 for the first, second and third

Digitized by Google

offenses respectively. General observations and conversations with police officers indicated to us that the Police Department was experiencing very little difficulty in connection with enforcement of the ordinance. Parking is permitted in the Loop after 6:30 p.m.

In conclusion, the committee believes that non-parking effective from 7:30 a.m. until 6:30 p.m. in the Loop, is a decided benefit to the city of Chicago.

Traffic Problems Discussed

Comprehensive reports on many phases of the traffic problem as it exists today were presented and discussed at the tenth annual meeting of the National Highway Traffic Association held Dec. 10-12 at the Automobile Club of America, New York City. Of particular interest to electric railway men was the report of the committee on traffic control on car tracks and adjacent to safety zones, of which E. J. McIlraith was chairman. The recommendation was made that the construction of the safety zones should provide a slightly raised area 4 ft. wide and extending a few feet more than the length of the longest car to be used in the zones, or the length required for two cars if a double-loading berth is to be used. The nearest side of the zone should be 30 to 32 in. from the gage line of the rail. The zone ends should be protected by a bumper of a type which will stop an automobile or deflect it sidewise without causing as much damage to the vehicle as would be the case if it were stopped by very heavy pipes set vertically in the pavement. The zone end should be thoroughly illuminated by floodlighting, and by two yellow flashing lights set about the height of the tail light of an automobile and pointed toward on-coming traffic. It was further recommended that alongside the curb, opposite safety zones and for a distance of at least 25 ft. beyond the end of the safety zone, parking should be prohibited.

The only object to be accomplished by prohibiting driving to the left of the safety zone, the committee pointed out, would be to avoid unnecessary interference to street cars.

Elimination of automobile parking was discussed in a report of the committee on parking regulations, of which Prof. Roger L. Morrison was chairman, and also in a talk on problems of efficient street use by vehicles and pedestrians, by Dr. Miller McClintock.

Pedestrian control was the subject of a report of a committee of which Prof. Lewis M. McIntyre is chairman. It was the consensus of opinion that pedestrian control is desirable, but it was generally admitted that enforcement is extremely difficult.

Reports were presented also on numerous subjects dealing with general phases of highway traffic, including economics, safety, insurance and terminology. A considerable number of electric railway men were present at the meeting and participated in the discussion about mass transportation.

No More Jitneys

Detroit Council passes measure that would rule them out forever. Corporation Counsel approves move

IN ANSWER to the proposal that the jitneys which were ousted from the main thoroughfares of Detroit, Mich., by the recent Supreme Court decision, be rented to the city at $1 a day each, the City Council passed an ordinance to prohibit the operation of so-called jitneys, on the streets, avenues, boulevards and public places of Detroit. This measure provides against the operation of jitneys on any city street or any thoroughfare mentioned in the original ordinance, the validity of which was finally established after six years of court action involving the jitneys and the city.

A letter from the corporation counsel, Clarence E. Wilcox, presented to the Council, cited that since the decision of the Michigan Supreme Court in the jitney litigation, 45 separate petitions were filed with the Mayor seeking permission to operate jitneys on some of the streets covered under the old ordinance. The number of individual applications involved was close to 11,000. For the most part these jitneys would all converge in the center of the city and contemplated the use of loading stations in the congested areas.

This, of course, would create a condition similar to the one found objectionable before, he pointed out. The requested routes were for the most part on streets already served by street cars or buses. He further expressed the opinion that the city should take a definite stand on these applications, and not leave to litigation the matter of how many privately-owned jitneys should operate or the streets they should use. He said the question was "whether or not further operation of jitneys is desired in the City of Detroit." He said:

> The granting of licenses or permits to a large number of independent organizations or individuals would render adequate protection to the traveling public impossible. No form of insurance protecting property or personal damage would be possible or practicable. No regulated or prescribed schedule could be enforced. Privileged tax based on mileage would be almost impossible to ascertain.

The new ordinance was presented to the Council simultaneously with Mr. Wilcox's letter, and passed its first and second readings at once. It was finally passed at the next regular meeting.

Aviation Discussed at New York Railroad Club Meeting

More than 3,000 persons attended the annual dinner of the New York Railroad Club at the Hotel Commodore, New York, on Dec. 13. It was "A Merrie Christmas" as the program and seating list said. It was particularly merry for W. G. Gove, superintendent of shops of the Brooklyn & Manhattan Transit Corporation, who was presented a watch, and for J. S. Doyle, assistant general manager of the Interborough Rapid Transit Company, who received an autographed album as a testimonial for his work in behalf of the club. But enthusiasm for this part of the program must not be permitted to becloud the fact that the addresses were all concerned with transportation of the future. President Eliot Sumner presided. George Le Boutillier, vice-president of the Pennsylvania Railroad, was the toastmaster. Between Mr. Le Boutillier and Count Ernesto Russo, who discussed "America As I Find It," the diners were certainly kept amused. When a foreigner finds America it usually is funny. Even the Indians thought so in Columbus' time. Count Russo brandished no tomahawk, but he did some verbal scalping. He preserved his disguise until the last. The hilarity of the evening was tempered with the addresses: "What the Air-Rail Business Means," by C. M. Keys, president of the Transcontinental Air Transports, Inc.; "America's Transportation of the Future," by Elisha Lee, vice-president of the Pennsylvania Railroad; "Comments on the Airship Situation," by Commander Charles E. Rosendahl, U. S. S. Dirigible Los Angeles, also naval observer on the Graf Zeppelin; "The Co-ordination of Air and Rail Transportation," by Charles M. Paulding, vice-president in charge of public relations of the New York Central Lines.

Useful Pamphlet Issued in Erie

A transportation folder of the City of Erie, Pa., is being distributed this month by the Erie Railways and Erie Coach Company. It contains schedules of street cars and coaches and other information regarding the city's transportation facilities.

New Parking Ordinance in Chicago

Automobile parking on North Michigan Avenue, between Randolph and Oak Streets, Chicago, except for 30 minute periods between 11 a.m. and 4 p.m. is prohibited under a new city ordinance which became effective on Dec. 7. No-parking restrictions have been in effect on Michigan Avenue south of Randolph Street and on streets in the "loop" district for nearly a year.

The new regulation makes possible eight full lines of moving traffic, thereby increasing by approximately 40 per cent the capacity of this important north and south boulevard. A two-day test of the new order showed a remarkable acceleration of traffic to and from the "loop" district at the southern end of the restricted zone, according to the police department. Movement of traffic on this thoroughfare had been further expedited by the recent installation of a progressive signal light system.

Witnessing the immediate relief from congestion the West Chicago Park commissioners passed an ordinance prohibiting parking on the principal west side thoroughfares, and on Oakley and Sacramento Boulevards.

Is the Subsidy Coming?

There is no secret as to what is happening to street railways. Increasing use of automobiles has cut seriously into their revenues, while congestion of the streets, which is becoming worse and worse, presents immense obstacles to efficient and economical operation. The matter is becoming one of profound importance to the general public, involving the growth and progress and well-being of our cities. Students of the subject, not themselves interested in the business, are predicting the possibility that municipalities will be compelled to contribute to the support of street railways. The suggestion of such a policy emphasizes the gravity of the problem.—*Baltimore Sun.*

Higher Rates Effective in Illinois

The Illinois Commerce Commission on Nov. 27 vacated previous orders of suspension and announced that car and bus rates in several cities served by the Illinois Power & Light Company will be increased at once to 10 cents with three rides for a quarter, from 7 cents with four rides for a quarter. The commission had suspended the increases until May 24, but that delay is now set aside. The cities affected are: Jacksonville, Danville, Galesburg, Quincy, Bloomington, Normal and Decatur.

Mayor O. W. Smith of Decatur, Ill., has suggested that the city enter the bus transit business in order to bring about lower fares on the lines of the Illinois Power & Light Company. Mayor Smith would charge only 6 cents on the city-owned buses.

Just for Maine's School Children

The Biddeford & Saco Street Railway began operations on Dec. 7 between City Square, Biddeford, Me., and Granite District, a suburb of Biddeford. This line was abandoned several months ago after repeated attempts to put the line on a paying basis. Service is being reestablished solely for the benefit of school children and comes after an arrangement between the Biddeford Board of Education and officials of the railway. Permission was secured from the Maine Public Utilities Commission. One trip will take the children to school at 8:10 a.m. and another will bring them home at 4:05 p.m. The line is believed to be the only one in the country operated solely for school children.

T. H. Tutwiler Honored

T. H. Tutwiler, president of the Memphis Street Railway and the Memphis Power & Light Company, Memphis, Tenn., was recommended as a member of the board of directors and the executive committee of the Southwestern University. Mr. Tutwiler has consented to serve.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Jan. 4, 1929—Metropolitan Section, American Electric Railway Association, 33 W. 39th St., New York, N.Y.

Jan. 14-18—American Road Builders' Association, convention and road show, Cleveland, Ohio.

Jan. 15-16—Kentucky Association of Public Utilities, annual meeting, Brown Hotel, Louisville, Ky.

Jan. 22—New York Electric Railway Association, mid-winter meeting and dinner, Hotel Commodore, New York, N. Y.

Jan. 23-25—Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.

Jan. 24-25—Central Electric Railway Association, Claypool Hotel, Indianapolis, Ind.

Jan. 25-26—Central Electric Railway Accountants' Association, Claypool Hotel, Indianapolis, Ind.

Jan. 28-Feb. 1—American Institute of Electrical Engineers, annual convention, 33 W. 39th St., New York, N. Y.

Feb. 7-8—Midwest Electric Railway Association, Midwinter meeting, Robideaux Hotel, St. Joseph, Mo.

Feb. 14—Central Electric Railway Master Mechanics' Association, Youngstown, Ohio.

Sept. 28-Oct. 4—American Electric Railway Association, 48th annual convention and exhibit, New Public Auditorium, Atlantic City, N. J.

Ready to Serve as Mediators in Chicago

The committee of five citizens appointed by Federal Judge James H. Wilkerson, as a traction settlement committee to co-operate with city officials and railway companies in agreeing upon a new franchise for Chicago, is awaiting endorsement of the movement by the City Council. The Council has refused to suspend the rules to consider approval of the commission.

Judge Wilkerson, in whose court is pending the receivership of the Chicago Railways, representing 60 per cent of the Chicago Surface Lines, appointed the commission in the hope that it could determine on a plan for settlement and legislation necessary to obtain from the General Assembly, and get the approval of the city and companies.

Federal Judge James H. Wilkerson is expected to rule within the next few days on the request of the receivers of the Chicago Railways for permission to purchase 60 new cars. If permission of the court is obtained by the receivers for these cars, it is thought likely that the Chicago City Railway, the remainder of the Surface Lines property, will also agree to purchase 40 cars, making a total of 100 for the system. The management wants to purchase cars with front entrance and central exit seating 61 passengers.

Beside Mr. Simpson, who is chairman, the other members of the citizen's committee are: Col. A. A. Sprague, former commissioner of public works; Joseph R. Noel, a Chicago banker, John A Carroll, local real estate operator, and Charles M. Thompson, dean of the College of Commerce of the University of Illinois.

In announcing the new committee, Judge Wilkerson explained that it would not supplant the City Council's transit committee nor would it attempt to speak for the companies. Instead, the committee will probably start considering the ordinance drafted last summer by the Aldermen and upon which negotiations are now being based. It will undertake to smooth out the differences which have frequently created deadlocks in the dealings between the Aldermen and the companies' representatives, by suggesting compromise that would be fair both to the city and the security holders.

Terms of the new ordinance upon which the city and companies are not yet in agreement are the rate of return and powers of the proposed local transit commission. Another important issue which is now under discussion at the joint meetings of the transportation subcommittee and company representatives is that of surface lines extensions. The present draft of the proposed franchise carries a provision which would retain to the city the power to compel the building of extensions. The Aldermen insist that a fund of $135,000,000 should be set aside definitely to take care of extensions during the first ten years of operation under the new franchise. The companies contend that a provision of this kind is unnecessary, in view of the fact that a local transit commission would have mandatory control over the new company's operations and service.

Assistant Corporation Counsel Frederick Bangs recently said to the Aldermen that no legal referendum could be held until the next general election in November, 1929. Because of the opinion it is expected that legislation conferring this authority will be asked in the enabling bills to be presented to the General Assembly next month.

Skip Stop on Albany Line

The United Traction Company, Albany, N. Y., put into effect on Dec. 1, the alternate skip-stop system on its Broadway line. If successful on this route, it is anticipated the system will be extended by the company to other divisions.

More One-Man Cars Authorized for Key System

Under authorization of a decision issued Nov. 30 by the California State Railroad Commission, the Key System Transit Company, Oakland, will start extension of one-man street car operation on lines throughout the east bay cities of Alameda and Contra Costa counties as quickly as is "found feasible."

The order is in direct opposition to recent action taken by the Oakland City Council. It was issued in response to an application for the installation of one-man operation made by the Key System recently. The commission's decision reads in part as follows:

It is hereby ordered that applicant be authorized and directed to operate one-man cars on all its traction division lines in the Counties of Alameda and Contra Costa, State of California, except local street cars operated upon and along each of the three following lines, which are primarily devoted to transbay service:

Piedmont Avenue line from 40th and San Pablo Avenue to 41st and Piedmont Avenue.

Berkeley line from 40th and San Pablo Avenue to Ward and Shattuck Avenue.

Sacramento Street line from 40th and San Pablo Avenue to Northbrae, subject to the following conditions:

Said one-man operation shall be installed on the respective lines of applicant as and when applicant shall be financially able to install such operation.

The commission found it to be the fact that street cars with one man can be safely operated on all of the traction division lines of the applicant; that such operation would be adequate and would fully meet the convenience and necessity of the traveling public in all of the communities served, and would result in more economical service and operation than is now being performed.

President Lundberg declared that the company had done its utmost to carry out the pledge made at the time of the 7-cent fare decision, and to meet the recommendations of the commission along the lines of introducing "every possible economy in its operation."

Explanation of Electrification Situation by Long Island

In a letter recently sent to the Glen Cove Chamber of Commerce on the matter of the electrification of the Oyster Bay Branch of the Long Island Railroad, George Le Boutillier, vice-president, states that the subject has been studied with the idea of deciding whether or not operating economies could be effected. Studies showed a discouraging prospect—an expenditure of $2,150,000 for electrical construction and $1,130,000 for equipment. This total would produce an operation saving of only 3.9 per cent, or 1.1 per cent less than the interest charges on the new capital required. It would seem unwise, he maintained, to entertain the hope that immediate growth of the territory in response to electrification would materially increase the gross earnings of the branch.

In conclusion, Mr. Le Boutillier said:

As you are undoubtedly aware, this company endeavored for several years before the regulatory bodies, without success, to secure an increase in commutation rates in order to have sufficient surplus to make just such improvements as you are requesting. In the absence of this much needed revenue, we are forced to make our expenditures along the lines before mentioned, and regret that we cannot at this time consider those improvements which might be expected to improve our service.

New Deal Proposed in Canton

Tentative contract covers operation for ten years. Ten-cent cash fare with five tokens for 35 cents suggested against present 6-cent cash fare with six tokens for 35 cents

THE Transportation Commission which has been making a study of the transportation needs in Canton, Ohio, for the last six months, with a view to preparing a franchise to be submitted to the City Council, has completed its work and drawn a tentative contract covering future transportation in Canton for a period of ten years. For convenience, and to localize the operation, it is proposed to set up a new company to be known as the Canton Railway & Transportation Company, a wholly-owned subsidiary of the Northern Ohio Power & Light Company. To this company a contract will be awarded for all mass transportation in Canton. The tentative ordinance provides:

1. A 10-cent cash fare, five tokens 35 cents, school tickets 5 cents. Free transfers.
2. A ten-year contract with arbitration periods for readjustment.
3. A transportation commission of five men with an advisory commissioner.
4. Arbitration for all disputed points.
5. Commission control of service.
6. Complete operation of all bus and rail service.
7. Modern type of cars and buses.
8. Right to operate freight, express and interurban cars.
9. Establishment of a shelter house in Public Square.
10. Company to keep paving between tracks in good condition. Paving made necessary by new construction to be done as determined by commission.
11. Provision made for purchase of property by the city.
12. Provision made for purchase by operating company of independent bus lines.
13. Penalty clause for failure to obey commission orders.
14. Name of company to be known as Canton Railway & Transportation Company.

Conferences among the commission, City Council and Mayor have begun looking toward possible revision and adoption of the proposed franchise.

One of the principal features of the proposed new franchise is the setting up of a transportation commission consisting of five members who shall be selected jointly, for the term of the ordinance, by the City Council and the company. Members of the commission shall be residential electors of the city. No member of the commission shall be an officer or employee of the city, nor shall have been within the last three years preceding his selection to the commission, and no employee, shareholder or director of the company within the same period be eligible to membership. This is to keep the commission free of all political and other influence.

The commission is empowered to regulate transportation service, including the right and power to require the company to provide additional facilities and service on existing railway and bus lines, and to establish additional bus service in territory not already served.

A Transportation Commissioner Provided

Power is conferred on the commission to select a transportation commissioner, resident of the city, who shall be the adviser of the commission in all matters of operation under the ordinance. The same safeguards are thrown around the selection of this commissioner as are placed about the appointment of members of the commission. The duty of the commissioner shall be to keep informed as to all conditions and elements affecting the costs, quality of service supplied, revenue, expenses, value of company's property, rate of fare and return yielded the company. The company shall supply offices for the commissioner and pay the expenses of the whole board, including the salary of the commissioner. The commissioner is to have access to all books and documents of the company relating to or bearing upon the operation of the company under the franchise.

If either the city or company is dissatisfied with the finding of the commission as to increase of service, extension or abandonment of lines, it shall have the right to have such finding submitted to arbitration. Notice of such action requires 30 days. One arbitrator is to be selected by the company, one by Council, and in event of failure to agree upon the third the presiding judge of the Court of Appeals is to make the selection. In arriving at their decision the arbitrators shall take into account that the company, under the franchise, is entitled to a reasonable return. The finding of the arbitration board is final.

The Transportation Commission controls paving requirements in case of new construction only. Old paving must be kept in repair by the company.

The company is to have the exclusive right under the franchise to operate street cars and buses over streets it occupies. The city agrees not to permit any one to operate buses or jitneys over these streets or in territory served by the company. Should the city fail to do this, the company has the right, at its option,

Digitized by Google

to terminate the contract with the company.

The right of purchase upon three-months notice is reserved to the city. Should the negotiators fail to agree upon a price, arbitration is provided upon the same basis as service arbitration. The city shall pay within six months the full cost fixed by the arbitrators, if it elects to be fully bound by the decision.

All tracks not now in use shall be removed or covered with pavement. This work shall be done under the supervision of the commission. Certain tracks on Market Avenue from Second Street south to Second Street north are to be removed immediately. Certain other tracks are to be relocated. Other tracks are to be brought to grade.

Right is reserved to the company to transport freight or express and to operate interurban passenger cars on such routes and during such hours as the Transportation Commissioner may direct, but such transportation shall be commensurate with the needs of manufacturing and business interests and with full regard to the safety and convenience of the traveling public. The company shall not be required to carry city passengers on interurban cars or buses.

All buses are to be brought through the public square, and a shelter station with safety approaches and zones is to be built, the company and city jointly sharing the cost. The station is to cost $40,000. It would be lighted, heated and maintained by the city.

The franchise provides that the company shall purchase all usable and useful buses and equipment, owned and in operation by individuals engaged in transportation service in Canton, as of Nov. 1. This requirement, however, is limited to such buses as may be approved in conference as being suitable for city service under the ordinance. An arbitration board shall settle all differences as to price. The board's finding shall be final.

A penalty of $50 a day is provided in the event the company fails to live up to the franchise provisions.

The present rate of fare in Canton is 6 cents cash, six tokens for 35 cents. The proposed franchise provides for a 10-cent cash fare, five tokens for 35 cents with a 5-cent ticket fare for school children, the tickets to be handled and sold by school officials. Free transfers are provided for continuous passage. The rates of fare fixed shall be binding for five years. After that period the company may either raise fares or surrender its rights under the ordinance, but must first give the city notice in writing six months in advance. Upon its part, however, the city has a year from the expiration of the five-year period to determine whether it will authorize the increase or permit the company to withdraw. During the year the fare is to remain unchanged. The provision covering the question of fares seems to offer the only possible stumbling block to the passage of the ordinance. Some members of the Council think the initial rate too high.

Comment on Twin City Fare Proposal

Comment friendly to the Twin City Rapid Transit Company characterizes the editorials in the papers there, in discussing the plea of the company for increased rates. By this is meant that agreement is expressed with the idea that the company is entitled to a fair return, but at least one of the papers has doubt about the ability of the company to achieve this end through resort to the method it has proposed. As the Minneapolis *Journal* put it, the question is "whether another raise will not be followed by another falling off in business." This same commentator says, however, that if the company's figures are accepted, it is entitled to larger revenues. "If in Minneapolis," it adds, "the company is earning only 4.15 per cent on the actual investment, and in St. Paul only 2.56 per cent, the previously announced report of the commission that 7.5 per cent is a 'reasonable return' seems to make the railway's case unassailable." To this it adds:

> And as the commission itself fixed the fair values of the plants and equipment, and as the companies offer evidence that the average rate of street car fare in the United States is 1 cent higher than the local company's present rate, it has established a *prima facie* case.

In the course of comment in which it stresses the fact that the street car still remains an essential form of transportation, the St. Paul *Pioneer Press* says:

> A word of appreciation is due officials of the St. Paul Street Railway for the manner in which their application for a higher fare has been handled before the State Railroad & Warehouse Commission during the past six or seven months. Last spring a proposal was before the voters to relieve the company of its obligation to pave along the tracks of its property. This burden is relatively heavier in St. Paul than in Minneapolis. To equalize costs of operation between the two cities, a relief measure was indorsed by many public-spirited citizens. Because of long-standing antagonism toward the company, however, this proposal was defeated at the polls, thereby restoring the situation to the point at which it rested a year ago when the company applied for a separate increase in St. Paul. Since then the company has held its hand, and now makes its request for higher fare to apply in both St. Paul and Minneapolis.

That paper feels that one rate of fare for St. Paul and another for Minneapolis would be "illogical, absurd and unjust." It says that every consideration of common sense argues for unity of treatment of the matter in the two cities.

Would Dismiss Injunction Suit in Indianapolis

Dismissal of a suit of the Indianapolis Street Railway, which asked a permanent injunction against officers of the Amalgamated Association, was sought in a motion just filed in federal court in Indianapolis. The injunction suit was brought in connection with the strike of employees in June, 1926. A temporary restraining order was issued against John M. Parker and Robert Armstrong, organizers, at that time, but hearing on a permanent injunction was postponed after both served 90-day sentences for contempt of court.

Attorneys for the railway told Judge Baltzell that the motion for dismissal was filed because the contract which the company had alleged would be violated in event of the strike, no longer is in effect, a new contract having been arranged with the employees. The court indicated a ruling would be made when a formal motion was presented in writing.

Party for Juveniles in Akron

Free rides for the boys and girls! That is the gift of the Northern Ohio Power & Light Company, Akron, Ohio, to the youngsters who will attend the fun-fest on Dec. 22 at the Keith-Albee Palace Theater. Upon presentation of a party ticket the children will be permitted to ride free between the hours set aside preceding and immediately following the party. These tickets will not be collected by the operator, but will be retained by the children for admittance to the theater and for the return ride. The tickets will be distributed by mail.

In making the fun-fest accessible to all needy children, the company is cooperating with the *Beacon-Journal,* the Junior League and the management of the theater.

All Opinions in St. Louis Wage Issue to Be Aired

Oral arguments of both sides in the wage controversy between the St. Louis Public Service Company, St. Louis, Mo., and its union employees, which is up for arbitration by the Missouri Public Service Commission, will be held at Jefferson City on Dec. 21. Testimony in the case was completed recently.

Insurance Policies Christmas Gifts in Omaha

All of the 1,100 employees of the Omaha & Council Bluffs Street Railway operating in Omaha, Neb., and Council Bluffs, Ia., who have served a year or more will receive Christmas presents in the form of life insurance policies amounting to $500 without cost to them. Men who have completed two years of service will be insured to the extent of $750 while men whose service records date back three years or longer will be insured for the maximum amount of $1,000. The policies are being formulated by the Equitable Life Assurance Society of the United States.

According to C. D. Porter, vice-president and general manager, while it is optional with the company management to cancel any or all of these policies at any time, it is its intention to make this insurance plan permanent.

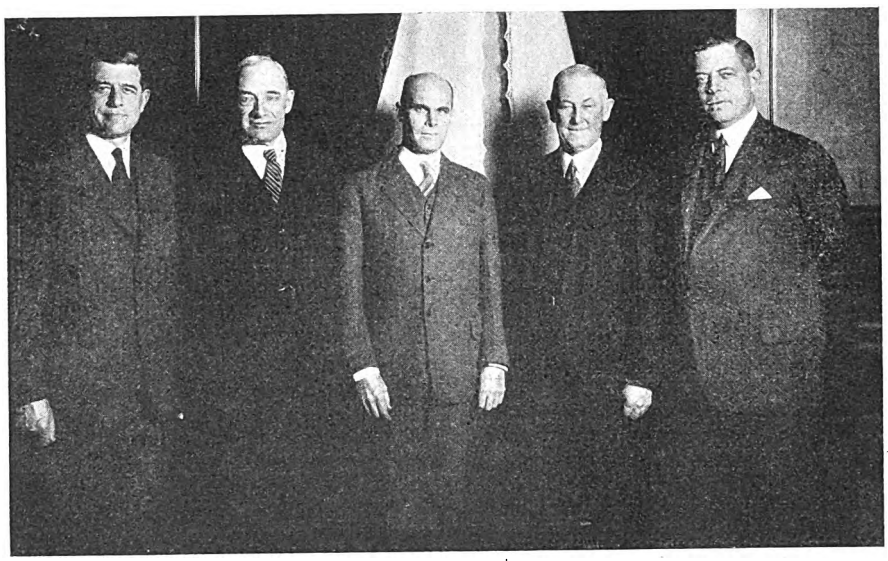
Richmond Celebrates Again

Virginia Electric & Power Company lauded in Chamber of Commerce gathering for its notable contribution to transportation development

STONE & WEBSTER, INC., and the Virginia Electric & Power Company, operated under its management and awarded the Charles A. Coffin award for distinguished transportation service in 1928, were again honored in Richmond on Dec. 1 by state, city and Chamber of Commerce officials at a buffet supper in the Chamber of Commerce club rooms. Charles A. Stone and Edwin S. Webster, heads of the firm that bears their name, were the guests of honor. The Virginia Electric & Power Company was represented by William E. Wood and other officials, while Mayor J. Fulmer Bright, of Richmond, represented the city. State Tax Commissioner C. H. Morrissette was the official representative of Virginia, in the absence of Governor Harry F. Byrd.



Left to right—C. F. Wetterer, Charles A. Stone, C. W. Kellogg, E. S. Webster and William E. Wood snapped at testimonial dinner

Stone & Webster was lauded for the efficient service offered in Richmond and elsewhere in Virginia. Heads of the company, modestly refusing to accept credit for having won the Coffin award, passed on to the officials of the Virginia Electric & Power Company the high tributes paid by each of the speakers.

President of Chamber of Commerce Welcomes Guests

E. B. Sydnor, president of the Richmond Chamber of Commerce, extended a welcome to the honor guests and the chamber members who gathered to express their appreciation for the service rendered by the Stone & Webster Company. John Stewart Bryan, publisher of the Richmond *News Leader* and twice president of the American Newspaper Publishers' Association, presided as toastmaster.

In calling attention to the fact that the award was made in part for the creation of a friendly public, Mr. Sydnor declared: "Gentlemen, this is a new day. To think that a great corporation places this as its first consideration!" In noting the rapid growth of Richmond from a city of 109,000 persons in 1908 to 200,000 in 1928, Mr. Sydnor said that the service rendered by the Virginia Electric & Power Company played an important part in this development.

Mayor Speaks for Public

Mr. Sydnor presented the toastmaster, Mr. Bryan, who, in turn, introduced Mayor Bright, who pointed out that "the award means more than the people of Richmond realize." He continued: "We realize that the welfare of the city is in direct ratio to transportation development. Our program of improvement this year has resulted in 9 miles of paved streets." Some of this work, he explained, had been done upon streets upon which street cars operated.

Mr. Stone, the senior member of the firm of Stone & Webster, referred to the gathering as one unusual in his business experience.

Virginia's development, even as far back as the first permanent English settlement at Jamestown, was due largely to the transportation available, he said. He recalled that Virginia was the first state to have a complete system of canals and declared that he was pleased to find that Virginians still realized the importance of transportation. He expressed his appreciation to city officials and citizens of Richmond for the cooperation accorded the efforts of his company in their program of development.

Mr. Webster made a brief address, thanking the Chamber of Commerce and city officials for the recognition of his company's service and lauding Mr. Wood and other officials of the Virginia Electric & Power Company for their work in this city.

C. W. Kellogg, president of the Engineers' Public Service Company, and C. F. Wetterer, referred briefly to the work of the Virginia Electric & Power Company and the co-operation under whose management it is operated.

"Richmond, the new Richmond," said President Sydnor, of the Richmond Chamber of Commerce, in his talk, "was born in 1910. By that I mean the industrial Richmond, the city that now has a population of 200,000 persons." During that period, he said, the postal receipts had increased from $539,000 to $2,252,000 annually; the value of the city's manufactured products from $76,000,000 to $250,000,000, and its bank deposits from $31,000,000 to $136,000,000. Pointing to the state as a whole, Mr. Sydnor declared that during the past five years $150,000,000 in outside capital had been invested in Virginia. This, he said, amounted to more than had been invested during a 25-year period prior to 1923.

Mr. Morrissette, speaking for Governor Byrd, expressed regrets that the state's chief executive was unable to attend the function. He took advantage of the opportunity to review, briefly, the tax reforms of the state, and declared that Virginia's rapid development in recent years was due largely to such improvements.

Mr. Herrman Also Honored

Among officials of the Virginia Electric & Power Company in attendance were Mr. Wood, president; T. Justin Moore, vice-president and general counsel; Thomas P. Walker, vice-president; J. M. Penick, manager of the railway division; T. Norman Jones, general manager of the Norfolk division; J. B. Hayes, manager of the Norfolk railway division; G. B. Williams, comptroller; R. J. Throckmorton, manager of the Richmond light and power department, and R. C. Foreman, of the personnel department.

Prior to the dinner on Dec. 1 A. H. Herrman, director of publicity and of public relations of the Virginia Electric & Power Company, Richmond, Va., was the honor guest of the Richmond Advertising Club on Thanksgiving Eve. He was lauded for his work in connection with the Charles A. Coffin award for 1928. William E. Wood, president of the Virginia Electric & Power Company, also was present.

Hydro Asked to Cut Fares

Representatives of municipalities served by the Hydro-Electric Railways, Toronto, Ont., adopted a resolution recently, calling on the management to introduce a new and lower rate of fare. The joint transportation committee consented to a continuation of the 7-cent cash fare but called on the Hydro-Electric Commission to fix a ticket rate of nine for 50 cents, at once and retain it for a six-months' trial period.

Permission has been granted by the Indiana Public Service Commission to the Terre Haute, Indianapolis & Eastern Traction Company to cancel its bus operating certificate in Richmond, Ind.

Recent Bus Developments

East Penn Traction Would Buy Bus Company

The East Penn Traction Company, Pottsville, Pa., applied to the Public Service Commission on Dec. 12 for permission to acquire the controlling interest in the East Penn Transportation Company, which conducts a bus service in Schuylkill and Carbon counties. In the application it was said the bus company was incorporated in the interests of the traction company, and that stockholders of the East Penn Transportation would be reimbursed for their payments on subscriptions of stock.

Akron Company Reacts Favorably to Petition

Upon request of a large number of Goodyear employees living adjacent to Copley Road and Maple Street in the western limits of Akron, Ohio, the Northern Ohio Power & Light Company has begun a new express bus line from the west side of the city to the Goodyear plants at the extreme eastern side of the city.

Extension by San Jose Road

A certificate of public convenience and necessity has been granted by the Railroad Commission to San Jose railroads, San Jose, Cal., to operate auto stage service between Minnesota and Lincoln Avenues in the city of Willow Glenn, and Curtner and Lincoln Avenues in the County of Santa Clara.

Boston to Maine Buses to Connect With Street Cars

The Boston & Maine Transportation Company, which operates the Boston & Maine bus and truck service, has obtained a permit from the Massachusetts Department of Public Utilities to run its buses into Boston. The Fitchburg-Cambridge line will be permitted to carry passengers to Park Square, which it has never been allowed to do before. Two restrictions are attached to the certificate, as follows:

That this certificate is issued upon the condition that vehicle operated hereunder shall not, when bound toward Boston, take on or admit passengers in Cambridge or Boston nor, when bound in the opposite direction, receive passengers to be discharged, nor stop to discharge passengers, in Boston or Cambridge.

That this certificate is issued upon the condition that the applicant shall with its vehicles make such connections with such railroads or street railways at such points as the department may from time to time order, and shall, in connection with said railroads or street railways, provide such through transportation upon its vehicles and upon such railroads or street railways and such joint rates therefore, as the department may from time to time order.

Pittsburgh Buses No Bonanza

A. W. Robertson, president of the Pittsburgh Motor Coach Company, Pittsburgh, Pa., says that, contrary to some opinions, it is a difficult problem at best to make even a reasonable profit from the operation of that company. He cites the fact that the three months ended September, 1928, were probably the worst the company has experienced. One reason is that routes recently started have proved unprofitable.

STATEMENT OF PITTSBURGH MOTOR COACH COMPANY FOR JULY, AUGUST AND SEPTEMBER, 1928

Total bus revenues (Fares and all other income)	$173,629
Total expenses, taxes and licenses. (Paid out for wages, gasoline, oil, tires, etc.)	$184,667
Loss from operations	$11,037
Interest paid on borrowed money	$5,213
Total loss for three months	$16,251

In slightly more than three years of operation the Pittsburgh Motor Coach Company shows on its books a surplus of only $72,363, a profit of 1½ cents per passenger carried. No dividends have been paid.

The total bus investment on Sept. 30, 1928, was $594,952. The amount earned for the twelve months ended Sept. 30, on this investment was $45,176, or 7.6 per cent. Mr. Robertson explains that, unfortunately, bus companies have more passengers than they can carry for a short time in the morning and evening and more buses than necessary at other times.

In the expenses for July, August and September is included an item of $31,665 for renewals and replacements. This establishes a fund to replace wornout buses and other equipment of the company. The money accumulated is used from time to time to buy new buses and other equipment. In this connection the president says:

If too much is set aside, the company would be able to buy more buses than were worn out. That would not be fair to the public. On the other hand, if not enough is set aside, the company cannot buy as many buses as are worn out. This would not be fair to the public or to the company.

The average useful life of the buses is estimated to be four years. None of the older buses have been run this long. We think the allowance is about right for the present ones. This money does not go out of the treasury of the company, so that no injustice is done, even though the amount for a given month is too high or too low, as the sum set aside can always be corrected by actual experience.

Rehearing on Independent's Operation in Amsterdam

A rehearsing is scheduled before the Public Service Commission on Dec. 19, on the petition of the Fonda, Johnstown & Gloversville Railroad relating to the commission's order of Oct. 18, granting a certificate to Charles Vollmer for the operation of a bus line over certain streets in Amsterdam, N. Y. The railway alleges that since the granting of the certificate the trolley has suffered a material decrease in receipts on certain lines. It is further alleged that Mr. Vollmer is carrying passengers in parts of Amsterdam where he is prohibited under the terms of the certificate granted.

Awaiting Bus Debut in Geneva

After 43 years of service the Geneva, Seneca Falls & Auburn Railroad has gone practically into the discard. It is continuing to operate with two large cars and one small car as the only rolling stock, in addition to the snowplow, sweeper and repair car. Other cars are being dismantled.

Although the Geneva Railway Bus Lines, successor to the trolley line, holds franchises to operate buses between and through Geneva, Waterloo, and Seneca Falls, no move has been made to place machines in operation. A fleet of buses is on the way and any day may see the trolley line abandoned and a bus schedule substituted.

Colonial Coach Lines, Inc., with headquarters in Watertown, will take over the local franchises and property of the Geneva Railway Bus Lines, as indicated when franchises were sought.

Brooklyn Routes Under Discussion

The New York Transit Commission has announced no decision will be made until Dec. 19, although the 30-day period allowed the Equitable Coach Company for negotiations with Brooklyn-Manhattan Transit Company over Brooklyn bus routes expires on Dec. 15, indicating material progress is being made toward an agreement between the Equitable and the B.-M. T. in connection with bus operation in Brooklyn. It is reported the Brooklyn company will virtually take over the Equitable's franchise through purchase of a controlling interest in the company. As the franchise now stands, the Equitable must operate 55 per cent of the routes authorized by the Transit Commission.

Temporary Suspension on St. Louis Line

The St. Louis Public Service Company, St. Louis, Mo., has discontinued its Sunday and holiday bus service on De Baliviere Avenue from Delmar Boulevard to the Jefferson Memorial Building in Forest Park. Service will be resumed next spring.

Financial and Corporate

332-Mile Merger

Cincinnati, Hamilton & Dayton to be nucleus for one of largest interurban systems in the United States

THE Ohio Public Utilities Commission, on Dec. 10, authorized a merger of interurban railway and bus properties, serving Columbus, Springfield, Dayton, Lima and Toledo, with the Cincinnati, Hamilton & Dayton Railway into one system comprising 332 miles of track.

Involved in the deal, but not included in the consolidation, is the Lima Street Railway, ownership of which also passes to the Cincinnati, Hamilton & Dayton, but to be operated independently under present management.

Properties to be merged with the Cincinnati, Hamilton & Dayton are the Indiana, Columbus & Eastern Traction Company, operating between Columbus, Springfield and Dayton and between Springfield and Lima; the Lima & Toledo Railway, operating between those cities, and the Dayton & Columbus Transportation Company, operating buses from Dayton via Springfield to Columbus, and between Springfield and Lima.

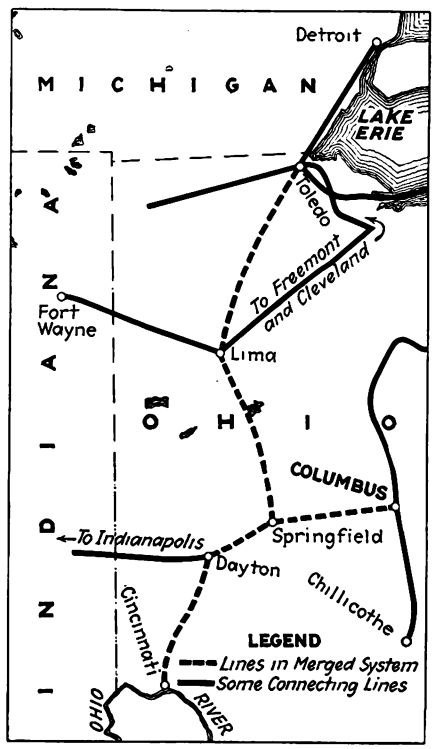
The merged system, including the parent company, which operates between Cincinnati, Hamilton and Dayton, will connect the Great Lakes at Toledo with the Ohio River at Cincinnati and extend as far eastward as Columbus.

System Will Quicken Freight Deliveries

The control of the Cincinnati, Hamilton & Dayton after the consolidation will remain, as heretofore, in the hands of the Cincinnati, Hamilton & Dayton Corporation—a holding company organized some three years ago by the present management of the Cincinnati, Hamilton & Dayton.

The new consolidation is prompted by a purpose to supply up-to-date transportation for the people of Ohio. The capitalization of the Cincinnati, Hamilton & Dayton has been most conservative and will be continued on a like basis, its bonded debt representing, dollar for dollar, new capital invested during the past three years in the modernization of its property. A similar conservative course will be followed in capitalizing the much larger property. The bonded debt of the Indiana, Columbus & Eastern and the Lima-Toledo properties will be scaled from $9,181,000 to $1,390,750 and annual interest charges cut from $469,050 to $83,445. In brief, the Cincinnati, Hamilton & Dayton contemplates an extension of its methods and policies over a much wider territory. To this end it will seek to enlist co-operation on the part of the public, the municipalities, and the operating personnel.

It is expected that consolidation will markedly quicken freight deliveries and will make possible the provision of additional freight equipment, the extension of sidings, the enlargement of freight stations, and other facilities required. By creating a situation of economic stability, in place of the highly unstable situation now existing, and backed by its record of achievement, the Cincinnati, Hamilton & Dayton will be in a position to command the necessary new capital which the properties about to be taken over cannot themselves raise.



Between "The Gateway to the South" and the Inland Lakes

On the operating side it is expected substantial economies will be made possible, among them the elimination of many overhead expenses; the rearrangement of schedules, achieving in full measure the advantages of unified operation; the concentration of major repairs in the Cincinnati, Hamilton & Dayton's new carhouse and the reduction in freight loss and damage claims, in consequence of the elimination of much rehandling of freight, now required. The consolidation will remove many of the obstacles which heretofore have largely paralyzed the efforts of the officers of the properties lying to the east and north of Dayton, and will bring about not only a physical merger but a unification of effort and purpose which should galvanize the entire personnel to render ever better service to the public.

In this connection sight should not be lost of the fact that the physical and financial transformation of the Cincinnati, Hamilton & Dayton is one of the outstanding achievements of the last three years in the electric railway industry. Its passengers now ride over what is probably the finest interurban track in the State of Ohio. Its new all-steel passenger equipment embodies the latest developments in the car builders' art and affords the maximum degree of comfort and safety to the traveling public. Its passenger stations have been thoroughly rehabilitated. Eight new sub-stations supply adequate power at all points for the propulsion of its trains and have extensively reduced this very important element of operating costs. The Cincinnati, Hamilton & Dayton's new carhouse, situated at Moraine, Ohio, is equipped with every device necessary in connection with the maintenance of cars. In short, the Cincinnati, Hamilton & Dayton has been transformed, by the investment of more than $2,000,000 of new capital, from an obsolete, decrepit, interurban property to one of the most modern of electric railroad properties. It is the recognition of this willingness to work shoulder to shoulder in the solution of new problems along lines dictated by efficiency and the requirements of good service, that has enlivened public interest in the possibilities ahead of the roads to be taken over.

Negotiations Begun for Sale of Omaha Bridge

President Shannahan of the Omaha & Council Bluffs Street Railway, Omaha, Neb., has begun negotiations with the committees named by the Councils of the two cities for the sale of the bridge connecting them. He is urging as the preliminary step that a price be agreed upon for the bridge first, after which the value of the lease may be taken up. The bridge company owns the bridge and the Council Bluffs lines, but is paid a net rental of $60,000 a year in excess of all interest charges by the railway on a ninety-nine year lease. The profits from the bridge are about $200,000 a year. The lease provides that if the Omaha & Council Bluffs Railway & Bridge Company cannot renew its franchise in Council Bluffs in 1947, the lease could then be terminated.

The Omaha & Council Bluffs Street Railway naturally attaches considerable value to its lease because of its profitable character. Moreover, the bridge company recently refunded a $2,000,000 bond issue. The Omaha company has a second lien for $893,000 for improvements, payable at termination of the lease. These are merely some of the angles to the matter. President Shannahan admits the difficulties are great, but feels they are not insuperable.

Tacoma-Seattle Line to Cease Dec. 30

Formal notice has been filed with the State Department of Public Works at Olympia, Wash., by Scott Z. Henderson, receiver, calling for termination of operations of the Puget Sound Electric

Digitized by Google

Company's interurban line from Tacoma to Seattle on Dec. 30. The action is in compliance with an order issued by Federal Judge E. E. Cushman. The interurban has been in operation for 25 years, and has been steadily losing money in the last few years.

Sale of the property was recently postponed.

Eighth Report on Rochester Operations

Review of service-at-cost contract between city and New York State Railways shows continued trend of decreased riding

ROCHESTER lines, New York State Railways, failed by $329 to make the 6 per cent return on operation during the year ended July 31, 1928, guaranteed under the service-at-cost contract with the city of Rochester, N. Y., according to the report of Railways Commissioner Charles R. Barnes to Mayor Joseph C. Wilson and the Council. This deficit is considerably less than the $60,128 deficit of the preceding year. However, the report points out, the accumulated deficit under the service-at-cost contract as of July 31, 1928, was $341,791. The contract between the railways and the city is for a ten-year period, expiring in August, 1930.

The deficit is mainly due to bus operation, which shows a loss of $60,105. Subway operation which began Jan. 1, 1928, shows an $8,123 deficit while the surface trolley lines returned a surplus of $67,898. Despite the deficit in the bus and trackless trolley operation, Commissioner Barnes declares that the service has justified itself through giving increased flexibility to the trolley system, opening new sections of the city and increasing the value of property. The losses are held "more apparent than real due to acceptance of street car transfers on the buses."

The report reveals a decrease in passengers over the previous year of 5,180,000 or 7.7 per cent. A table accompanying the report shows a steady decline each year since the inception of the contract system. This is blamed largely on the increased use of private automobiles.

The base valuation of the Rochester properties is shown to have increased to $20,314,905.

Relief from the "unjust burden" of street paving costs is urged in the report, which also recommends the increased use of one-man cars. The commissioner points out that of the fourteen lines in the city, on only two are one-man cars being operated. Extension of the use of this type to other lines, with increased headway in non-rush hours, is recommended.

A substantial part of the report is devoted to a résumé of the results of operating the new subway railroad, built by the city and run by the railways.

PASSENGERS CARRIED BY NEW YORK STATE RAILWAYS ROCHESTER LINES

Year	Revenue Passengers	Total Passengers
1920–1921	75,317,829	100,160,130

Would Shorten One Line in Rome

The New York State Railways applied, on Dec. 4, to the Public Service Commission for approval of a declaration of abandonment of a part of its line in Rome, a distance of 3095 feet. It is alleged that this part of its road is no longer necessary for adequate and successful operation or for the convenience of the public.

Rate of Return Reduced in California Case

The Railroad Commission of California has found unanimously that a rate of return of 7 per cent per annum on the capital invested, in the case of a stable and established utility like Southern Counties Gas Company is reasonable, instead of allowing a return of 7½ or 8 per cent, as heretofore. This action was taken in fixing the rates for service of natural gas in Ventura City and County by that utility.

The decision marks a precedent in favor of 7 per cent rate of return on the capital invested by a public utility, in view of the "marked decline in the cost of money" during the last few years. The commission held that with the lower rate of return it would be

Digitized by Google

possible for the utility to obtain the needed capital to function properly.

The commission fixed rates upon a basis estimated to result in a total reduction of approximately $50,000 a year to consumers throughout the area served. However, certain of the so-called convenience users of gas will have their bills increased slightly, due to the establishment of a service charge.

The commission found that a rate base of $1,350,950 would be reasonable for the company, or approximately $68,000 less than the amount claimed by the company.

Another Move Made Against Philadelphia Underliers

The Council of Philadelphia has sent to the committee on transportation and public utilities the resolution on proposed city condemnation of the P.R.T. underliers. The measure would authorize the City Solicitor to ask Common Pleas Court whether such city debts as may arise from purchase of the underliers will not constitute a burden against municipal borrowing power. Prior to introduction of the Mayor's resolution, communications from the Public Service Commission and President R. T. Senter, of the P.R.T., were read. The commission indicated that it would approve a purchase agreement based on the underlier valuation of $139,000,000, plus the $10,000,000 mortgage on the Market Street subway. Mr. Senter offered assurance that the P.R.T. will continue to pay the city the rentals that are now paid to underliers if the city buys the franchises.

Kansas Sale Indefinitely Off

Owing to a better situation in local business in Pittsburg, Kan., the sale of the Joplin & Pittsburg Railway has been indefinitely postponed. It had been announced by John F. Layng, general manager for M. H. McLean, receiver, that all the properties of this company would be offered for sale on Dec. 1. The sale was to be made on orders from the federal court for the Western District of Missouri.

$16,800,000 Intercompany Transaction in Brooklyn

The board of directors of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., on Dec. 7 authorized the sale to the Chase Securities Corporation, Hayden, Stone & Company and J. & W. Seligman & Company of $16,800,000 principal amount of the New York Rapid Transit Corporation's refunding mortgage 6 per cent sinking fund gold bonds, series B. They were authorized some time ago by the transit commission to be issued by the New York Rapid Transit Corporation because of extensive purchases of new cars and other capital betterments, and to be sold to the Brooklyn-Manhattan Transit Corporation.

Personal Items

V. S. Shinkle Resigns

Vincent G. Shinkle, secretary and treasurer of the Spokane United Railways, Spokane, Wash., resigned on Dec. 1. In announcing his resignation Mr. Shinkle said he wanted to gratify his life-long ambition to travel. He plans to visit California shortly and then Europe.

Mr. Shinkle entered the employ of the Washington Water Power Company on July 1, 1907, as storekeeper. Two years later he became purchasing agent and on June 1, 1918, he was made secretary-treasurer. When the Spokane United Railways was formed on July 1, 1922, he was named secretary and treasurer of that company.

I.C.C. Nominees Go to Senate

The nomination of Patrick J. Farrell of Vermont and the District of Columbia to be a member of the Interstates Commerce Commission was sent to the Senate on Dec. 6 by President Coolidge. Mr. Farrell is to succeed Commissioner John J. Esch.

Nominations of Claude R. Porter of Iowa and Clyde B. Aitchison of Oregon to be members of the commission also were sent to the Senate. The last two are reappointments.

Transit Counsel C. M. Lewis Resigns

Clarence M. Lewis, counsel for the New York Transit Commission since July 1, 1926, resigned on Dec. 3 for "private and personal" reasons.

His first step after his appointment was a complete reorganization of the commission's law department. Prior to his appointment to the commission he was a member of the Home Rule Commission and was at one time chairman of the legislative committee of the Citizens' Union and chief counsel to the State Housing Commission. He is the author of several law books.

Walter Burke Praised for His Work in Southwest

Fitting tribute is paid by *Cactus Points*, published by the El Paso Electric Company, to Walter H. Burke, district manager for Stone & Webster in the Southwestern district, since April, 1927, who was recently transferred to the company's Boston office. The El Paso paper says that Mr. Burke "represents the type of keen official whose youth and vigor is in keeping with the electrical industry."

Fifteen years ago he was a student engineer in the Boston office, later being made clerk to the manager at Dallas. At that time the light, power and transportation company at Dallas was operated under the executive management of Stone & Webster, Inc. Following the change here, Mr. Burke went back to the Boston office and for seven years was assistant to the division manager in charge of the Southwestern district.

In this position he gained valuable experience and was made manager at Keokuk, Iowa. Subsequently he became manager at Houghton, Mich., going to Texas from the North. Mr. Burke was made manager of the Northern Texas Traction Company at Fort Worth in July, 1925, and in April, 1927, became manager of the Southwestern district, with headquarters in Houston.

While in office as manager of the district, he made many friends among the personnel of the various companies. *Cactus Points* says that in leaving the Southwest district Mr. Burke has the best wishes of the officials and employees of the El Paso Electric Company.

A. W. Koehler with Safety Body

A. W. Koehler was recenty appointed secretary of the National Conference on Street and Highway Safety. Mr. Koehler has a record of effective service in organization and accident prevention work.

At Purdue University Mr. Koehler specialized in industrial engineering, and after he was graduated in 1916 he saw service for several years in accident prevention and industrial relations work with the Commonwealth Steel Company, Granite City, Ill., and the Atlantic Steel Company, Atlanta, Ga. During the World War he went into the Naval Service, received an officer's commission and was assigned to engineering duty. Since the war he has served as executive secretary of the Safety Council of the Rochester Chamber of Commerce, and subsequently as head of the accident prevention work of the railway systems of Rochester, N. Y., and Milwaukee, Wis.

In making the announcement, Col. A. B. Barber, director of the conference, pointed out that the appointment is an indication of the increased activities which the National Conference on Street and Highway Safety is undertaking as an outgrowth of the completion of the Uniform Vehicle Code, the Model Municipal Traffic Ordinance and other measures for promoting nation-wide uniformity of traffic regulations and assistance in dealing with the problems of street and highway traffic.

J. L. CAMPBELL was appointed chief engineer of the Northwestern Pacific Railroad, San Francisco, Cal., effective Nov. 1, 1928.

Edward Jones Pearson

President of New Haven had confidence in company's electric railways and approved program providing for their rehabilitation. Was quick to appraise bus

EDWARD JONES PEARSON, who retired recently as president of the New York, New Haven & Hartford Railroad, died suddenly on Dec. 7 at the Johns Hopkins Hospital in Baltimore.

It was in April, 1916, that he went to the New York New, Haven & Hartford Railroad, and after serving for thirteen months as vice-president, he succeeded the late Howard Elliott as president of the road.

At that time the work of rehabilitation of the New Haven was only just beginning to get well under way. In 1913 the dividends on common stock had been suspended, the morale of the personnel was at ebb and the system was pretty generally discredited with the public in the communities which it served.

Into this situation, first as vice-president and then as president, Mr. Pearson threw himself with the full vigor characteristic of the man, with the result that his entire term of office was one of progress. Separate operation had been arranged for the lines of the Connecticut Company, but when the matter of the possible disposition of the local railways in Springfield and Worcester came up for settlement, Mr. Pearson, through Vice-President Buckland, announced the confidence of the New Haven management in the local railway situation there by pledging the railroad to the expenditure of several million dollars for rehabilitation, in order that these properties might be converted into the earners he visualized them rightly to be.

Not only that, but in the midst of the general program of reclamation of the entire system came the bus with its threat of competition. One would think that Mr. Pearson's experience in knitting together the loose ends of the transportation empire embracing steam lines, trolleys and steamships, which had gone almost completely to smash, would have made him hesitate in his attitude toward the newcomer. He did, but not for long. Then he entered upon the program under which the bus has been converted into an ally to an extent that makes the New England Transportation Company, the New Haven's bus operating subsidiary, with its 400 vehicles, certainly the biggest operator in that respect, if not in actual route miles, among the steam railroads. It was not diversity of activity that had brought the New Haven to the brink of ruin, but lack of co-ordination that had helped to invite disaster. That Mr. Pearson and his associates were convinced of this, appears to be attested beyond a doubt by the evidence in both of these cases.

One of Mr. Pearson's greatest achievements was in inducing the business men and bankers of New England to raise money among themselves to prevent foreclosure. After five years of uphill fighting, the private offering of $23,000,000 of 6 per cent bonds to refund the issue maturing April 1, 1925, was over-subscribed. Mr. Pearson saw in this novel experiment in railroad financing the beginning of a new era of co-operation between the industries of the section and the railroad.

And the record of the man is all the more remarkable, since of the arts by which popularity is commonly secured he had not a trace, but he had as friends those who were doing their work in the spirit with which he did his—for the sake of the thing to be accomplished and not for personal remuneration. It was well said of him by his associate on the New Haven board, Arthur T. Hadley, president emeritus of Yale, that in every part of the country, north, south, east and west, the name of Mr. Pearson is gratefully remembered by his fellow-workers from chief engineer down to trainman. Mr. Hadley said:

> Two years ago we saw that he was beginning to wear himself out, and besought him to take a well-earned rest, but he was not the man to rest while his work for others was undone. Only when he saw light ahead, saw that the heaviest part of his work was done and that he might safely confide the future to others, was he willing to think of rest, and then it was too late for him to enjoy the fruition of his hopes and plans, not too late for him to have received that profoundest enjoyment which comes from the confidence and loyalty of those who have worked with him and under him.

Mr. Buckland said:

> It is not easy at a time like this to say what one feels regarding the loss of a leader and a friend. Mr. Pearson was more than leader and friend; he was a comrade—loyal, inspiring and generous. Mr. Pearson's administration was a striving against and mastering of overwhelming odds. We, who were associated in his service, are proud to have served under him; we shall cherish in our memories his years of service and comradeship.

Edward Jones Pearson was born in Rockville, Ill., on Oct. 4, 1863. He received his early education in the West and came to Cornell University for his technical training, obtaining in 1881 the degree of Bachelor of Science in civil engineering. In the year of his graduation Mr. Pearson got a job as a rodman with the Missouri Pacific and began a career of railroad building.

He then became chief engineer of the Pacific Coast Extension of the Chicago, Milwaukee & St. Paul, remaining until June 1, 1911, when he became first vice-president of the Missouri Pacific and the St. Louis, Iron Mountain & Southern railways, in which capacity he served until April, 1915. For one year following he was first vice-president of the Texas & Pacific.

On Nov. 27 when the New Haven was returned to a regular dividend basis, President Pearson offered his resignation because of the state of his health. His resignation was accepted, but no successor was named.

J. J. Sullivan

Jeremiah J. Sullivan, at one time a leader of railway interests in Philadelphia, Pa., and other parts of the country, died in Philadelphia on Dec. 11. For many years before his death he had been president of the Union Traction Company, Philadelphia, and also of the Frankford & Southwark Philadelphia City Passenger Railroad of which he was president for twenty-eight years. In 1890 he bought the Lehigh Avenue Passenger Railway and later participated in the formation of new companies and the mergers of others.

In addition to his local railway interests, Mr. Sullivan at the time of his death was president of the Scranton Railway, the Altoona & Logan Valley Railroad and the Bridgeton & Millville Traction Company. Not long ago he resigned from the presidency of the Chicago & Joliet Electric Company. Besides his street railway affiliations he was one of the founders of the Philadelphia Electric Company and had been a member of the board of directors from its beginning.

Mr. Sullivan was born in County Cork, Ireland, ninety years ago. He completed a business course at Crittenden College, later going into the wholesale dry goods business with his brother and forming the firm of Sullivan & Brother in 1860. A few years later he became interested in the promotion of various street railways which obtained long-term operating rights to the city streets, but are now included in the system of the Philadelphia Rapid Transit Company, which runs them under lease.

HENRY INNES ROGERS, the head of the firm of Brecknell, Munro & Rogers, well-known British manufacturers of electric tramway fittings, died recently. In his earlier years he installed electricity on a number of tramways for various firms. Later he became chairman of Brecknell, Munro & Rogers, pioneers in their business. In recognition of his services in the production of munitions during the war, he was made a member of the Order of the British Empire.

DANIEL J. MCDONALD, night depot master at Flatbush depot of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., for more than thirteen years, died recently. He was appointed a motorman on Feb. 13, 1896, at the Flatbush depot. On Dec. 3, 1909, he was promoted to line inspector.

VICK N. FLOWERREE, former assistant general manager of the Kansas City, Leavenworth & Western Railway, Kansas City, Mo., died on Nov. 13 in Los Angeles. He was for many years connected with the old Metropolitan Street Railway, Kansas City.

Additional Equipment Orders Planned

Chicago Railways plans purchase of 100 new cars. Track construction projected in Seattle. Brooklyn subway construction program expedited

COINCIDENT with the beginning of the winter months, the volume of orders for material and supplies continues to decrease, according to reports received from a number of electric railways. At the same time, however, additional improvement programs continue to be made.

Permission to purchase 100 new street cars at an estimated cost of $1,725,000 has been asked in a petition filed recently in the Federal District Court of Chicago, by Henry A. Blair and Frederick H. Rawson, receivers for the Chicago Railways Company. The hearing on the application will be held on Dec. 20. The petition recommends a front-entrance, center-exit type of car, designed to seat 61 passengers, as compared with a capacity of 51 passengers in the most recent type of equipment placed in service by the Chicago Railways. The cost of the new cars, it is proposed, shall be met out of the special equipment fund of the Chicago Surface Lines, established by order of the Illinois Commerce Commission in 1920. The average cost of the 496 cars previously purchased was $15,289, as compared with an estimate of $17,250 for each of the new units.

Chicago Railways, which operates on the north and west side surface lines in Chicago, has been in receivership under the jurisdiction of Federal Judge James H. Wilkerson since January, 1927. In their petition, the receivers point out that no new passenger equipment has been acquired by the railroad since 1926 and the number of revenue riders in that time has increased about 17,000,000 annually.

Seattle Construction Planned

Immediate appropriations to finance new construction necessary for the rerouting of West Seattle street cars into the business district over First Avenue South, and possibly for building a new line on Fourth Avenue from Spokane Street to Dearborn Street, was asked by the Seattle Municipal Street Railway, Seattle, Wash. It is estimated that it will cost approximately $99,000 to do away with the so-called Whatcom Street elevated, and switch the West Seattle cars to First Avenue. Approximately $80,400 must be spent for replacing rail and incidental paving on this avenue, between Spokane and Stacey Streets. These figures are part of the $244,000 worth of reconstruction and repair work contemplated by the railway at once.

Against the recommendation of Superintendent Avery, the Seattle City Council has voted unanimously to order the construction of a single-track extension of the Beacon Hill street car line. This has been petitioned for repeatedly by the residents of that district. A single-track line extension to Columbian Way which was ordered at this time, will cost $23,210 and to Graham Street, $42,250. Another step in the proposed city-wide improvement program for the street railway system, which will give a closer transportation service to a thickly settled area of more than a square mile in the northwestern part of the city, is the construction of a new street car line to be built along Eighth Avenue, northwest from Leary Avenue to the north city limit at West 85th Street. This work will cost $100,000 and is to begin early in the coming year.

Brooklyn Subway Project

The chairman of the New York Board of Transportation announced recently at a public hearing on the form of contracts to be let for the construction of the proposed Fulton Street subway in Brooklyn, between Lafayette and Alabama Avenues, that work on the line, in all probability, will be under way by the middle of next year. The section of the line to be started first extends about 1½ miles from Lafayette Avenue to Nostrand Avenue. The program calls for the beginning of work beyond Nostrand Avenue to Alabama Avenue as soon as designers can be released from work on the first section.

This construction will be made by the cut and cover method, and an effort will be made to avoid disturbances of sidewalks and highways as much as possible. Surface car operation in the street will be maintained during construction and the Fulton Street elevated structure will be supported as were such structures in Manhattan during similar operations. The stations will be among the largest on the new city-owned subways and will be built with entrances at street corners at each end, and will be equipped with automatic turnstiles. The subway as planned will have four tracks, providing for express service.

Milwaukee Subway Started

Excavation work has been started on the rapid transit and subway project to cost $4,000,000 in the west section of greater Milwaukee by the Milwaukee Electric Railway & Light Company. The operation marks the first step in the actual construction of the new line, which will extend along the north side of the Menomonee Valley on a private right-of-way to Eighth Street and St. Paul Avenue, where the subway starts. The new route covers a distance of 2.8 miles.

The grading work will be pushed as rapidly as possible to 30th Street, and eastward from there as soon as the necessary land is acquired. It is estimated that the overground part of the line can be finished in about eighteen months, and a year will be required for the subway. Double tracks will be laid as the grading progresses and provision will be made for the laying of an additional pair of tracks in the future.

In taking over the Windsor, Essex & Lake Shore Railway, Kingsville, Ontario, the Ontario Hydro-Electric Power Commission has undertaken to provide the new management with $100,000 working capital, and also to place $700,000 to the credit of the management in the bank so it will be available for road improvements. As soon as these undertakings are carried out, the Ontario Hydro Commission will take over the management of the road.

All rapid transit lines through the city of Evanston, Ill., are now operated on the temporary elevated structure which has been completed by the Chicago Rapid Transit Company, Chicago, Ill. This new structure eliminates twelve grade crossings and clears the way for construction of the permanent structure which has already been started with the grading of crossings at Ridge Avenue and Lincoln Street. These streets are to be open under the elevated structure. Crossings at these locations were formerly elevated over the surface tracks of the railway.

Line Materials in Demand

Pittsburgh Railways, Pittsburgh, Pa., contemplate the purchase of 40 miles of No. 00 round copper trolley wire, 160 30-ft. creosoted yellow pine poles, and eighteen 45-ft. creosoted pine poles. Among line materials ordered by this company, are 100,000 ft. of No. 8 weatherproof copper wire, 2,500 16-in. No. 0000 rail bonds, 1,500 ft. of ⅜-in. copper weld span wire, 9,000 ft. of ⅛-in. copper weld span wire, 45,000 ft. of ¼-in. copper weld span wire, and 85 No. 8 cone anchors. The miscellaneous line material ordered by this company includes six electric track switches with T-3 ground box and circuit changers, 40 universal frogs, 30 No. 00 solid crossings, 250 midget train insulators, 600-500,000 circ.mil. straight line insulators, 300 1,000,000 circ.mil. corner insulators, 150 No. 00 cam tip approaches, 100 No. 00 renewable approaches, 50 double curve suspensions, 50 molded insulators, five type C friction insulators, and seventeen type LCD floodlight projectors.

Line materials ordered by the Chicago Surface Lines, Chicago, Ill., include 500

Digitized by Google

No. 0000 9-in. bonds, 500 No. 000 left-hand, and 300 right-hand malleable switches with 6-in. approaches, and 200 No. 000 90-deg. rigid galvanized malleable iron crossovers complete with 6-in. brass renewable tips. Track and construction material ordered by this company includes 400 7-in. fishplates, 200 Arrow sledgehammers, 500 concrete points, 100 Toledo bombshell torches, 300 African bass push brooms, 400 16x2¾x1¼-in. grinding wheels, and 400 Dietz lanterns with ruby globes.

Track Equipment Ordered

Track material ordered by Pittsburgh Railways include 10,000 white oak ties, 15,000 creosoted ties, 155 tanks of oxygen, 50 tanks of acetylene, 30 kegs of boat spikes, 45 kegs of track bolts, 20 pair of 18-ft. switch points, 20 pair of 7-in. joint plates, 30 drums of Tarmac, one carload of molding sand, 20 sewer drops, six carloads of lumber, namely 2-in., 3-in., 4-in. white oak, and 4x6-in. stringers, and two cars of ½-in. screening.

This company has ordered one set of rewinding material for an 1,800-kw. 600-volt, six-phase rotary converter and one set of armature coils for a direct-current generator of 1,000-kw. 550-volt capacity. Among some equipment ordered are two Blecker blacksmith hammers. Seven 4,300 type low-floor, center-entrance cars, are being remodeled for one-man operation.

New revolving chairs have been ordered for installation in the parlor observation cars of the Chicago South Shore & South Bend Railroad, Michigan City, Ind. The chairs will be of the latest type, set at a convenient angle and free to be completely revolved at the passenger's will. Installation of these chairs in the parlor cars is expected to be completed shortly after the first of the year.

Pittsburgh Railways has ordered two 29-passenger Yellow coaches and three 21-passenger Yellow coaches. The Illinois Power & Light Corporation, Decatur, Ill., will replace five of its old buses with new ones costing approximately $8,000 a piece. The old buses will be remodeled for trucking purposes.

The Boston Elevated Railway plans a repair shop 85 ft. x 150 ft. to cost approximately $100,000 with equipment and boiler house.

Detroit Car Order Signed

The contract for the purchase by the Detroit Street Railway of 100 street cars from the Perley A. Thomas Car Works, High Point, N. C., has been formally signed. While Commissioner of Purchases Joseph E. Mills, appearing before the council, informed that body that deliveries would be speeded up, the contract does not alter in any way the original bid of the company. The Thomas company was the low bidder, but it was contended that its offer did not conform with specifications. The case is now before the Michigan Supreme Court.

1928 Improvement of Union Traction

Indicative of the improvement program of the Union Traction Company of Indiana, Anderson, Ind. are the purchases made during the year 1928 by this company. Track materials ordered during the year include ten carloads of rail, 70,000 Northern white cedar ties, 30,000 creosoted ties, one carload of tie plates, one carload of joint plates, three carloads of spikes and one carload of bonds. Track construction and maintenance equipment purchased include two hand cars, one gasoline car, a rail drill, an electric welder and similar maintenance equipment. Overhead line material ordered include three carloads of trolley wire, one carload of hard drawn bare wire, one carload of insulated wire, 2,000 poles, two carloads of insulators, overhead frogs and crossovers and line department equipment sufficient for regular maintenance.

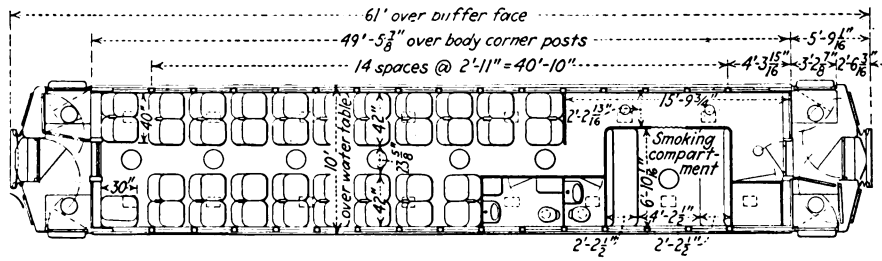
All interurban and city cars were repainted and fifteen cars were remodeled and rebuilt. It is contemplated to purchase from ten to twenty one-man cars in high grade used condition for several short lines on the road. This company purchased nine used White buses which were remodeled and rebuilt in first-class operating condition. All buses of the system were thoroughly overhauled, repainted and placed in good condition. Ten rebuilt freight cars and approximately ten flat bottom gravel cars were purchased.

Shop and garage equipment purchased included three battery charging outfits, two air pumps and small supplies of equipment necessary for the operation of three bus garages. All buildings were remodeled with the addition of new roofs, floors, etc.

Specifications on Cars for South Shore Line

Chicago, South Shore & South Bend Railroad, Michigan City, Ind., has ordered ten more steel passenger cars, as mentioned in Electric Railway Journal of Nov. 10. Five of these cars are motor equipped and five are of the trailer type. They are similar to the former order of cars and are being built by the Standard Steel Car Company, Hammond, Ind. They are the double-end, double-truck type designed for operation by two men in interurban passenger service. Each car is 61 ft. long, 10 ft. 1¼ in. wide, and weighs 133,600 lb. fully equipped. The bodies are of all-steel construction with arch roofs and swinging end doors, and seat 48 passengers. They are finished in orange and maroon lacquer, the interior finish being mahogany. The seats are attractively finished in plush with leather trim. Brass sash ventilators are installed in the lower rail and each car is equipped with a Pullman style smoker.

The trucks are equipped with two inside-hung motors and 36-in. rolled steel wheels. Both the armature and journal bearings are of plain type. Further details of the motor cars are given in the accompanying specifications. The trailer cars are similar in construction.



A Pullman type smoking compartment is included in the new cars being built for the Chicago, South Shore & South Bend Railroad

Weights:	
Car body	67,500 lb.
Trucks	33,400 lb.
Equipment	12,700 lb.
Motors	20,000 lb.
Total	133,600 lb.
Bolster centers	38 ft.
Length over all	61 ft.
Length over body posts	49 ft. 6¼ in.
Truck wheelbase	7 ft.
Width over all	10 ft. 1¼ in.
Height, rail to trolley base	13 ft. 1 in.
Date of order	Oct. 1, 1928
Date of delivery	March, 1929
Window post spacing	35 in.
Body	All steel
Roof	Arch
Doors	Swinging end
Air brakes	Westinghouse AMU
Armature bearings	Plain
Axles	Heat-treated steel 5½x10 in.
Car signal system	Electric Service Supply Company 32 volts
Compressors	Westinghouse D-3-F
Conduit	Metal
Control	Westinghouse HBF 1,500 volts
Couplers	Tomlinson form 23
Curtain fixtures	Railway Curtain Supply Company
Curtain material	Pantasote
Destinatio n signs	Hunter
Energy saving device	Sangamo kwh meters
Finish	Sherwin Williams lacquer
Floor covering	Linoleum and rubber tile
Gears and pinions	Westinghouse grade BP
Glass	Plate
Hand brakes	Peacock Staffless
Heat insulating material	Balsom wool
Heaters	Railway Utility, electric
Headlights	Golden Glow, portable
Headlining	Aluminum
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Adams & Westlake
Motors	Four Westinghouse 567C, inside hung
Painting scheme	Orange and maroon
Roof material	Canvas covered poplar
Safety car devices	Deadman control-Westinghouse
Sash fixtures	O. M. Edwards
Seats	Hale and Kilburn No. 900
Seat spacing	35 in.
Seating material	L. C. Chase Byzantine plush, leather trim
Slack adjusters	Westinghouse form "J"
Steps	Stationary
Step treads	Saf-Kar treads
Trucks	Bladwin
Ventilators	Railway Utility Company
Wheels, type	Rolled steel, diameter 36 in.
Wheelguards or fenders	Steel pilot

ELECTRIC RAILWAY MATERIAL PRICES—DEC. 11, 1928

Metals—New York

Copper, electrolytic, cents per lb.	15.775
Lead, cents per lb.	6.5
Nickel, cents per lb., ingot	35.00
Zinc, cents per lb.	6.7
Tin, Straits, cents per lb.	49.5
Aluminum, 98 or 99 per cent, cents per lb.	23.90
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	53.00
General service	31.50

Bituminous Coal

Smokeless Mine Run, f.o.b. vessel, Hampton Roads, gross tons	4.375
Somerset mine run, f.o.b. mines, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	1.8
Franklin, Ill., screenings, Chicago	1.425
Central, Ill., screenings, Chicago	1 15
Kansas screenings, Kansas City	1.625

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb.	2.80
Tie plates (flat type), cents per lb.	2.15
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.90
Steel bars, cents per lb.	1.95
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	$1.40

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb.	2.8
Sheet iron, galvanized (24 gage), cents per lb.	3.55
Galvanized barbed wire, cents per lb.	3.20
Galvanized wire, ordinary, cents per lb.	3.00

Waste—New York

Waste, wool, cents per lb.	18.
Waste, cotton (100 lb. bale), cents per lb.:	
White	17.25
Colored	13.5

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	10.4
White lead in oil (100 lb. keg), cents per lb.	13.25
Turpentine (bbl. lots), per gal.	$0.65
Putty, 100 lb. tins, cents per lb.	5.725

Wire—New York

Copper wire, cents per lb.	17.875
Rubber-covered wire, No. 14, per 1,000 ft.	5.3
Weatherproof wire base, cents per lb.	17.125

Paving Materials

Paving stone, granite, 5 in., f.o.b. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd., f.o.b.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots, f.o.b.	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd., delivered	3.375
Cement, Chicago consumers' net prices, without bags, f.o.b.	2.05
Gravel, ¾-in., cu.yd., delivered	3.375
Sand, cu.yd., delivered	2.125

Old Metals—New York and Chicago

Heavy copper, cents per lb.	13.375
Light copper, cents per lb.	11.625
Heavy yellow brass, cents per lb.	7.875
Zinc, old scrap, cents per lb.	3.375
Lead, cents per lb. (heavy)	5 125
Steel car axles, Chicago, net ton	$15.75
Cast iron car wheels, Chicago, gross ton	14.50
Rails (short), Chicago, gross ton	17.50
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	8.25

Encouraging Business Outlook

In the general business situation there is ample evidence to support the expectation of continued prosperity, according to the Guaranty Trust Company, New York City.

This evidence is not found in the mere fact of great industrial activity; for such a condition, while it certainly implies a large volume of aggregate purchasing power, may only be contributing to an unsound position in commodity markets, if the purchasing power is flowing into the wrong channels. The significant fact is that the high wage scales and the widely distributed income of the last few years apparently continue to operate as strongly as ever, so that active industrial operations are balanced by a ready movement of goods into the hands of consumers. The situation has been improved this year by further agricultural recovery, by a stronger position in certain industries that have been facing special difficulties, by a decline in unemployment, and by a continuance of economic progress in foreign countries.

General Electric Dividends

The regular dividends of the General Electric Company were declared at a meeting of the board of directors of the company on Dec. 7, 1928, amounting to $1 per share on the common stock and 15 cents per share on the special stock, payable Jan. 25, 1929, to stockholders of record as of Dec. 19, 1928. In addition an extra dividened of $1 per share, payable on the same date, was declared on the common stock from the surplus of the company accumulated from the financing of time installment sales, which surplus had been set aside as a reserve as stated in the 1926 annual report and which amounted to upward of $5,000,000, and from the increase during the present year in income from investment and sources other than regular sales.

English Electric Companies Merger

At recent meetings of the British Thomson-Houston Company and the Metropolitan-Vickers Electrical Company, it was stated that steps were being taken by these companies together with the Edison-Swan Electric Company and the Ferguson-Pailin Company which would lead to close co-operation, the elimination of unnecessary duplication of effort and expenditure, and the effecting of economies generally. The arrangements foreshadowed are now reported to be completed.

The Metropolitan-Vickers Company has acquired a large majority of the ordinary shares of the British Thomson-Houston, Edison-Swan, and Ferguson-Pailin Companies, and also a large majority of the preference shares of the last mentioned company. It is proposed to change the name of the Metropolitan-Vickers Company to make the title more comprehensive and the number of directors will be increased to include representatives of the various financial interests in the enterprise. H. C. Levis will be chairman and Sir Philip Nash managing director.

The majority of the shares will be owned by British holders. It is not intended that the activities of any of the four companies should be curtailed, but that they should actively co-operate under the general guidance of a central board. The business of the Metropolitan-Vickers Company will continue to be carried out by an existing subsidiary company, called the Metro-Vick Electrical Products.

TRADE NOTES

MAX RUBENSTEIN has been transferred from the Philadelphia sales office of the Standard Underground Cable Company, Division of General Cable Corporation, to the general offices of the company in Pittsburgh where he will devote his time to the sales promotion of cable accessories.

CUTLER-HAMMER MANUFACTURING COMPANY, Milwaukee, Wis., has moved its Atlanta office into new quarters at 150 Peters Street, S.W., Atlanta, Ga. In addition to sales and engineering service on motor control apparatus and wiring devices, the new location provides warehouse facilities where many types of standard devices will be carried in stock for direct shipment to customers in that territory. A. C. Gibson is manager in charge of the Atlanta office.

BOTFIELD REFRACTORIES COMPANY, Philadelphia, Pa., announces that McCarthy-Jones & Allen Company, 111 First Avenue South, Nashville, Tenn., has been appointed distributor.

ADVERTISING LITERATURE

ARMCO CULVERT MANUFACTURERS' ASSOCIATION, Middletown, Ohio, has issued bulletin No. H-34, entitled "Selecting Culverts and Drains on the Basis of Cost per Year." This bulletin includes comprehensive information on the purchase price, transportation from factory to site, cost of installation, maintenance and repairs in service, depreciation or cost of retirement, annual cost, and effect of durability on annual cost. The subjects discussed in this bulletin are supplemented with illustrations, drawings, detail tables and charts.

RUSSELL T. GRAY, Chicago, Ill., has issued bulletins Nos. 2 and 3 descriptive of Master equipment. Bulletin No. 2 is devoted mostly to various types of pliers. Bulletin No. 3 includes an illustrated description of a new method of handling high-voltage line maintenance and a complete description of Master tools and line equipment.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued bulletin No. 249A, descriptive of GE-258 railway motor bearings; 61B, constant speed direct-current motors, type C.D.; 844A, across the line type of magnetic reversing switch for single-phase, two-phase and three-phase motors; 518A, type K-75 low, light-weight railway controller; and 746B, describing hinged type fingers for railway and industrial haulage controllers.

Paracelsus, Wherever He Gazed, Beheld a Star

IT HAS truly been said that ideals rule the world, even while the world cynically derides them. Ideals lift men above the commonplace and the material. They are frequently hidden and guarded behind the human masks that are worn to meet a hard work-a-day materialism. Only for brief moments are the masks themselves thrown aside. And only then does mankind, in every walk of life, reveal its ruling spirit. At this season of the year we call it the Christmas spirit.

It is lack of imagination that makes life's Scrooges what they are and that blinds them to the many manifestations of this Christmas spirit in our daily work and play. When the employees of the Louisville Railway sat in a great banquet to celebrate their own devotion to duty and to the saving of human life and suffering, the Christmas spirit walked among them to bless their contribution to human happiness. When the entire city of Richmond rose up to honor a public service management which had won national honors for the "Old Dominion" through its accomplishment in rehabilitating a vital community transportation service, it was a shining demonstration of the practical application of this same spirit. Something transcending monetary award motivates men who face driving storm and howling blizzard to insure the safety and comfort of their fellows.

This Spirit of Christmas is, after all, a very practical thing. We see it reflected on every hand, wherever men work or play. In our work we call it the spirit of service. In our play we name it good sportsmanship. A great nation-wide association of business men have adopted as their motto: "He who serves best profits most." The Christmas spirit is a state of mind that raises men above the level of a mere struggle for existence. At this season we cast aside that struggle, for a moment, to rejoice at the coming of the simple Man of Galilee and open wide our hearts.

Electrification After 124 Years

A WELL-KNOWN adage declares "Happy the country which has no history." If this is true also of railways, a line in Swansea, Wales, must have had a joyful time for the 124 years that it has been in existence. At least it has been spared growing pains. Though continuously in operation, it has remained the same length —6 miles—that it was when horses drew the first car from Swansea to Oystermouth. Like the one-horse shay celebrated by Oliver Wendell Holmes, it has kept serenely at its work while empires have risen and fallen.

For more than 70 years, horses continued to haul cars over this modest Welsh railway. Then, in 1877, a great step forward was taken. A few steam locomotives were purchased, but the cars continued to be of the street railway type. Finally, in this eventful year of 1928, when some pessimists are saying that electric cars are becoming obsolete, the directors decided to adopt electric power. This momentous event in the history of a 124-year-old road is chronicled in this issue.

Managers elsewhere, harassed by many problems of street congestion, automobile and bus competition, demands for extension and talk about abandonment, will extend congratulations to their British compeer. They will express the hope that it may have another 124 years of continued life and success with no further change in motive power.

Community Welfare the Proper Basis for Traffic Regulation

BRANDING as obsolete the theory that streets are designed for moving vehicles, the Fifth Avenue Association of New York City has come out flatly in favor of parking on that important thoroughfare. Whatever may be said concerning the theory, the practice of moving vehicles is practically obsolete there. Traffic moves at a snail's pace now and complete stagnation appears to be not far away.

Despite the present serious congestion, a large majority of the Fifth Avenue merchants are reported to believe that liberal parking regulations are vital to the successful conduct of their business. They "estimate" that 30 per cent of their customers come by private automobile and they seek therefore to maintain Fifth Avenue as a garage for their customers rather than to allow it to function as a real traffic artery.

The weakness of this position lies in the fact that Fifth Avenue belongs not to the particular stores located there but to the whole city. If no one but the customers themselves suffered from the present traffic congestion the public might well regard it with indifference. But many people other than customers use this important street, and they, too, suffer from the congestion. Moreover, one need not be a mathematician to calculate that the curb space on Fifth Avenue is insufficient to accommodate the number of customers claimed to come by automobile. The fact is that many of these automobiles are parked on other streets besides Fifth Avenue itself. In other words, the aristocratic avenue trade is usurping a large amount of curb space on the humble side streets. This is one of the most serious causes of traffic congestion in mid-town Manhattan. Undoubtedly the public as a whole would be better off if Fifth Avenue and the adjacent streets were used for traffic instead of garage purposes.

In pleasing contrast to the selfish and parochial attitude of the Fifth Avenue Association is that of the

Digitized by Google

Citizens Traffic Committee recently organized under the auspices of the Board of Trade. Many leaders in business and civic affairs are included in this group. As one of the speakers at the organization meeting pointed out, there has been too much talk about individual traffic problems and too little planning for the city as a whole. It is thought by the committee that a means may be found to make better use of existing facilities and thus bring speedy relief. There is sound common sense in this proposal, and the wide variety of interests represented on the committee affords ground for hope that this body is headed toward a city-wide plan of improvements. Only by considering the welfare of the entire community can a real solution of the traffic problem be found.

Detroit Substitutes Buses for Jitneys

HISTORY was made in Detroit on Nov. 25 when the Department of Street Railways inaugurated service on the first of its de luxe bus routes, established to accommodate the former patrons of the ousted jitneys. Whether the decision to provide this service will prove to be a wise one or not remains to be seen, as actual operating experience is the only measure by which a venture of this kind can be judged. However, it is an unusual step, a very significant one, and it will bear close watching by all transportation men.

De luxe service has been given in other cities, notably Pittsburgh, Toronto, Washington and Newark, but the Detroit installation is very much different from any of these. Not only is the character of service somewhat different, but also it was instituted for a much different reason than any of the others. In Washington, some of the lines were developed as sightseeing lines. In Pittsburgh, the lines were started to develop an entirely new class of patronage, those who were accustomed to driving to the city in their own automobiles. The de luxe service in Detroit, however, was started after the city passed an ordinance demanding all jitneys to cease operation, and was instituted entirely to serve the former patrons of the jitneys. This is a somewhat different set of conditions than experienced in any other city and the very nature of the installation and the size of the proposed system make it an outstanding venture.

Much criticism has been leveled against the new system. A great deal of this, of course, has come from the owners of the jitneys that were ousted, and other chronic kickers. The argument has been presented that the D.S.R. should have purchased more large capacity buses and street cars to increase the service on its mass transportation lines rather than to set up an entire system of small capacity, high-speed buses. In support of this, proponents of the plan for more mass transportation vehicles point out that service is inadequate on practically all of the lines and that the proper move would have been to add more vehicles to relieve this condition. They claim also that the former jitney patrons, numbering about 80,000, could have been accommodated with a much smaller number of larger buses or street cars and that the company would have assumed less risk of losing on the installation. The opposite stand is that the majority of the former jitney patrons would not use mass transportation vehicles, even if more were provided, but rather that they would use their own or their neighbors' automobiles.

The Department of Street Railways also has been criticized for ordering as many as 160 parlor coaches and definitely deciding upon several routes, in view of the system being in every sense of the word an experiment. The chief reason for the company instituting so many lines was to take care of as many of the former jitney patrons as possible. The city was responsible for ousting these vehicles and felt a responsibility to give the people a comparable service.

A few commentators have gone so far as to claim that the company decided to use buses of too small a capacity. In this respect, the company was very wise, for only with small vehicles can a service be given comparable to that of the jitneys. Whether or not such a service can pay on 10, 15 and 20-cent fares remains to be seen. These buses are to give what may be called correctly a convenience service and not a necessity. It really accommodates a class of patrons that is willing to pay higher fares, and as such should be considered from the angle of opening up a new field for organized public transportation. Should the Detroit venture prove successful, no doubt other cities will take steps to install similar systems. The developing of higher classes of service by buses, with correspondingly higher fares, has been advocated for some time, and it is encouraging to see a step in this direction so important as that in Detroit.

Intricacies of the Negligence Law

THE usual rule that a person must bear the consequences of his own carelessness is by no means universally applied in law. Its principal exception is that if one careless person injures another, and the latter would not have been hurt if he himself had not been careless, the contributory negligence of the second person may save the first from paying damages. Still another exception arises when the person injured is engaged in unlawful business, where this business contributed to, or as it is termed, was "causable" to the accident.

In a number of recent street railway cases this principle has been applied, and the courts have gone to considerable trouble to define the circumstances in which violations of the law by the person injured have been, or have not been, contributory to the accident. Thus, it has been held in Massachusetts (Bacon *vs.* B.E.R. Co., 152 N.E., 35) that an improperly registered automobile is a nuisance on the highway, and consequently if it is injured in a collision with a street car the railway company is not responsible. This case is especially interesting because the automobile was licensed, but the owner, a woman who had been married for two years, had registered it under her maiden name.

A case involving a somewhat similar principle was decided the other way in New York State in Klinkenstein *vs.* Third Avenue Railway, 168 N.E., 886, where a car collided with a bus which was operating under a permit from the Department of Plant and Structures but was violating the law because it had not also obtained a certificate of convenience and necessity from the Public Service Commission. In this case the court held the railway responsible on the ground that the illegal act was not that the bus was on the street but that it was carrying passengers for hire. Hence, the violation of the statute had no direct connection with the injury which was suffered from the collision. Moreover, the statutes covering the licensing of common carriers provided penalties for failure to comply with them, and the court thought it should not add other penalties.

So important do courts consider the question involved that the whole subject has just been reviewed in a lengthy

Digitized by Google

decision by the Supreme Court of New Hampshire (Johnson vs. Boston & Maine R.R., 143 A., 516). In this case an automobile driver was injured by a train at a grade crossing and lost his claim for damages because it was discovered that he had not taken out a state driver's license. The court pointed out that although the law required the driver to have his license with him, it made a difference whether he had simply left it home by carelessness or whether he had never applied for one. It pointed out that the purpose of the law was to exclude incompetent drivers from the roads, and this could best be done by requiring all drivers to be licensed. Had the driver simply left his license at home the court intimated the decision might have been in his favor.

In expanding this idea, the court cited the case of an injury to a boy who was violating the law by working when he should have been in school, but here the violation made no difference because the law was designed to promote education and for no other purpose. Violation of the Sunday law comes under the same rule, the court pointed out, as does driving on the wrong side of the road, unless that contributes to the accident.

These decisions are of particular interest in that they have a bearing upon several important phases of negligence cases.

Are the Earnings Recorded in Red or Black?

RED or black? That was the question asked, not in Monte Carlo, but on a certain small electric railway system where a decision was being made whether certain lines should have improved rolling stock, new track and overhead renewals, or should be abandoned. In other words, it was a process of separating the sheep from the goats. The engineering office of the holding company in a remote city called "Red." The superintendent of the local railway department answered "Black." The engineers showed that the line in question had failed by a good many thousand dollars to meet its operating expenses, while the superintendent's analysis indicated an operating surplus about equal in amount to the deficit shown by the engineers.

When the reason for the discrepancy was sought, it was found that the engineers had obtained their results by allocating expenses on an arbitrary basis of the ton-mile, the car-mile or the car-hour, without considering the relation of these elements to the particular section of the property. The superintendent had apportioned each item according to what he knew were the peculiar physical and operating characteristics of the route in comparison with the rest of the property.

Going further into the explanation, the superintendent was able to prove that "Black" was the correct answer. Here is how he did it.

Energy was determined from actual watt-hour meter records for the type of car and mileage operated. Maintenance of track and roadway, signal and interlocking equipment was taken from direct expenditures on different lines as far as possible, the rest being prorated according to the ton-miles operated per line. Maintenance of paving was divided in proportion to the ton-miles operated on each line in the paved districts. Maintenance of electric lines was proportioned by route-miles. Maintenance of buildings and fixtures was prorated according to the car-miles on each line. To distribute these, the items equipment cost and wages of carhouse employees were studied specially, the number of car defect reports and pull-ins being taken, with a pull-in counted as three defects. Miscellaneous car service expenses were divided in proportion to the car-miles operated on each line. The transportation expense was proportioned according to the platform hours on each line. The ratio of all other operating expenses, exclusive of traffic, general and miscellaneous expenses and taxes were determined for these lines as compared with the total for all lines of the system, and then traffic, general and miscellaneous expenses and taxes were apportioned to each line in the same ratio.

Some of this allocation may be debatable, and some of the assumptions made may be questioned. But the method used of determining individually from known distributions each of the principal items of expense and the result obtained give a striking illustration of the need for careful analysis before the decision is made to abandon investments worth thousands of dollars.

Overlooking the Asset of Safety

AGAIN the committee designated by the American Museum of Safety has met to select the winners of the Anthony N. Brady Memorial Medals, the names to be announced at a meeting of the Metropolitan section of the A.E.R.A. in New York on Jan. 4, 1929. Again the number of participants has been disappointingly small, and the choice of the committee was of necessity limited to the all too few excellent briefs submitted.

The apathy of the industry toward this very meritorious contest is difficult to explain. Surely, there is no lack of interest in safety and accident prevention. One of the most acute problems before the transportation industry today is that of reducing the appalling wastage—for it is nothing else—involved in the settlement of damage claims. To fall into the vernacular, it would appear as though those companies which fail to participate in this contest are overlooking a bet. Intrinsically, of course, the award is not great. But the moral and psychological value of these medals can, if properly capitalized, be made far-reaching in its consequences.

Winner of the Brady Award for Safety! This is an asset and an honor not to be overlooked. Consider the effect upon the personnel, upon the safety habits of the community. Here, indeed, public opinion will say, is a mark at which to shoot. Our street railway is distinguished above all others for its safety of operation. The trainmen on our cars have contributed to make our community an unusually safe place to live in. Why cannot the rest of us be equally distinguished? Our truck drivers, our autoists—are they doing equally well? Will they co-operate to the end that we may maintain civic leadership in this respect?

Consider the effect in accident litigation wherein the trolley company is involved. Will not opinion unconsciously lean toward a company noted for its safety record? Will not witnesses be inclined to favor such a company? Small factors, all, perhaps, but looming large in the general scheme of things and sure to be reflected in ultimate damage cost experience. Congratulations to the winners of this year's awards, whoever they may be! But the industry needs to wake up on the possibilities of this contest. Safety of its service is one of the greatest of the assets which the electric railway can claim in its struggle with the competition of the individual automobile. There should be scores of entries for next year's awards instead of the mere handful who have during the past two years had the vision and the will-to-win spirit to enter this important competition.

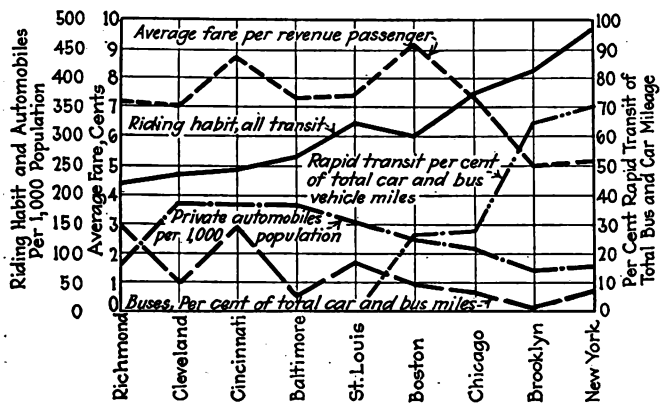
Analysis Made of

Factors Affecting Riding Habit in Large Cities

Study by Beeler Organization indicates that the influence of rapid transit lines is to increase street car riding, while the tendency of bus operation is to decrease it. Failure to provide rapid transit encourages automobile competition

AN EXTENDED analysis of the various factors affecting the riding habits in large cities has recently been made by the Beeler Organization of New York for the Brooklyn-Manhattan Transit Company and the Brooklyn City Railroad. The analysis, in the form of a report, has been submitted to the Public Service Commission by counsel for these companies. It is expected to assist the commission in deciding the question of additional bus franchises in Brooklyn. The report considers the influence on car riding of such factors as rate of fare, use of buses, development of rapid transit lines, and employment of private automobiles. Owing



Factors affecting riding habit in nine large cities, 1927

to the general interest in the nature of this subject, an abstract of this study has been prepared for these columns. The general discussion appears in this issue. A subsequent article will give details of the individual cities.

The results show that the cities employing rapid transit are in a class by themselves. Because of its superior time-saving qualities, great changes in the distribution of population and in the location of its business and industrial sections are occasioned by the introduction of rapid transit. In such cities, the surface lines are not generally patronized for long haul rides, but by the short haul rider to rapid transit stations and to business, theater and shopping districts. Hence, the total car riding per inhabitant is noticeably larger than before the introduction of rapid transit. Indeed, the construction of a rapid transit line often brings an increase in passengers carried by the surface lines only, though the riding changes from long haul to short haul.

In large and medium sized cities, where rapid transit facilities do not exist, the automobile is employed extensively to provide rapid transportation from point to point and the taxicab comes into greatly enlarged use, to the detriment of the slower moving service, and car riding falls off. Rapid transit lines serve to create short haul riding on surface lines because many rapid transit riders use a surface line at one or both ends of the trip, but the use of the automobile does not have this effect. Another element assisting to the decline of the riding habit, in cities without rapid transit, is the growth of community business, shopping, banking and amusement centers in outlying districts. To some extent increase in rates of fare has had its effect. In this connection it may be noted that the bus fare is generally higher than the street car fare.

Fares and Riding Habits

Today there are two general schools of thought on the subject of fares. One is that the increased fare has brought about a decrease in riding. The other is that the decrease in riding has made the increase in fare necessary, especially in later years after the first fare increases were made to adjust fares to the new level of wages and cost of materials. This suggests a third probability: i.e., that in later years the buses, being largely competitive, have caused a decrease in car riding which in turn has made an increased fare necessary.

Table I gives rides per inhabitant and average fare, in each of five cities without rapid transit, yearly from 1918 to date. While the figures show a decrease in riding with an increase in fare, they do not indicate a definite relation between the riding habits and rate of fare that holds true in every case. For example in Cleveland, with a 58 per cent increase in fare, there has been a 29 per cent drop in riding habit, while in Cincinnati, although the fare has increased 74 per cent the riding habit has dropped but 5 per cent. In fact, Cleveland has the lowest and Cincinnati the highest rate of fare in these five cities. One outstanding fact brought out by this table, however, is that the riding habit in these cities begins to fall at about the point where fares increased 30 per cent above the 1918 level. Furthermore, it may be noted, that coincident with the marked increase in bus operations in the past three years, the total surface riding habit, including that on the bus, on the average has continued to decline. These data do not indicate that the

*Includes entire city of five boroughs. (a) Rapid transit included.

introduction of buses increases the total number of riders. Rather, they show that by large increases in service each year, the bus has taken more and more passengers from the street cars.

Table II presents similar figures to those in Table I but in four communities with rapid transit, i.e., Brooklyn, New York City as a whole, Chicago and Boston, a very different tendency is shown to prevail. These cities are all served by rapid transit lines which have stimulated development in outlying districts and increased local surface car riding. In Boston, where the rapid transit and surface lines are completely unified, and a 10-cent fare pays for a ride on both surface and rapid transit lines, even though more than two buses or cars may be used in making a trip, an apparent decrease in the riding habits is shown. This situation is not comparable to the other rapid transit cities, because in the latter, where a passenger may take two or three rides today to complete his journey, he is counted each time, whereas in Boston he is counted only once. Recent checks indicate that each revenue passenger in Boston actually averages 2.16 rides to complete his journey.

In Brooklyn, where the greatest progress in rapid transit development has been made recently, the surface riding habit has maintained a new high level for the past five years, being 22 per cent higher than in 1918.

Automobiles and Riding Habit

The automobile, with its high degree of mobility and convenient individual service, has stimulated the demand for speed in transportation. While it is a more expensive means of transit than traction or bus service, it saves time and is not subject to the delay caused by frequent passenger stops. Of course, the delays caused by traffic lights, traffic regulations, cross town traffic and general street congestion are encountered. These limitations and the difficulty of finding parking space in congested centers reduce the possible use of the automobile, particularly in the larger cities, where traffic congestion extends over greater areas and the proportion of street parking space is generally less than in the small cities, thereby stimulating the demand for the taxicab.

The riding habit during 1927, in the nine cities discussed, is shown in Table III, and in parallel columns some of the factors affecting riding habit are recorded. These include automobiles per 1,000 population, average fare per revenue passenger and per cent of total car or bus-miles operated by rapid transit, street car and bus. The data recorded are also shown in the chart on page 1070.

These data show that rapid transit is the predominating factor in stimulating riding, for the riding habit in the cities so served exceeds that in the other cities. New York, with the highest riding habit (485) has the highest percentage of rapid transit service, or 70 per cent. Brooklyn, with the second highest riding habit (412) has the second highest percentage of rapid transit service, or 64.4 per cent. Similarly, Chicago comes third and Boston fourth in both riding habit and percentage of rapid transit service.

Table III and the chart on page 1070 also show that the rapid transit cities with the highest riding habit and highest percentage of rapid transit service make the least use of the automobile. New York and Brooklyn, with the highest riding habit and percentage of rapid transit service, have the lowest automobile registration, with Chicago next and Boston fourth.

The only rapid transit city in this country besides the four mentioned in Table II, is Philadelphia, where, as in Boston, the operation of all transit facilities is co-ordinated under one management. Unlike the other cities, however, a large proportion of the taxicab service is co-ordinated with the other transit facilities. Philadelphia has not been included in these tables, because the data required for use in such an analysis of its transportation activities are not available. From published records for the year 1926, however, it is found that the total rides per inhabitant per year on all transit facilities except taxicabs in Philadelphia were 343, and the average fare per revenue passenger was 7.36. The division of total mileage between rapid transit, street car and bus

*Street car and rapid transit combined.

service is not known. However, the foregoing would indicate that the results in Philadelphia appear to be in line with those in the other rapid transit cities.

As already explained, the increased use of automobiles has undoubtedly caused a reduction of the riding habit on the established local service transportation system throughout the country. It is equivalent to the addition of a competing transportation system in the community. Since it is unorganized, however, only fragmentary statistics covering its operation are available, and it is impossible to measure its effect on the business of the established transportation system. The known facts, however, point to certain conclusions regarding the effect of automobiles on riding habit, and particularly that the riding habit in rapid transit cities has increased in the past decade while in the cities not served by rapid transit, it has decreased.

The present trend throughout the country is toward bus and street railway operation within each city. In the cities already listed, the bus service is being operated by the company providing the street railway service in Chicago, Boston, Cleveland, St. Louis, Baltimore, Cincinnati and Richmond. In Boston, Cleveland and Richmond all service has been co-ordinated and is run by one operating company. This method applies to a considerable extent in Baltimore and Cincinnati, and to a lesser degree in St. Louis and Chicago.

Such co-ordination of bus and street railway service is most desirable from the standpoint of both the public and the operating company, since it eliminates or minimizes any cause for the operation of duplicate service, and thus enables the company to develop new territory and serve the public in the most economical manner.

The charts and tables already presented give the general trend in street railway travel during the ten years ending 1927. A special study has been made to determine the effect, if any, on surface car riding of the employment of buses. To do so, the extent of the car riding just before and just after the introduction of buses has been compared in the cities whose traffic has been studied in this report.

In Cleveland, Cincinnati and Richmond, bus operation began in 1925. In St. Louis and Baltimore, there was some bus operation prior to 1925, but the period of rapid expansion began in that year. Therefore, a comparison of the three-year period beginning in 1925, when bus service was developing rapidly, with the three previous years when it was inconsequential, should be of importance in ascertaining the effect of the use of the bus on surface transportation. The years comprising these two three-year periods are all normal with no peak, such as occurred in 1920, and no slump as in 1921. The total miles of service rendered during each of the three-year periods in the foregoing group of cities, before and after the enlarged use of the bus, are given in Table IV.

The total service rendered by street cars and buses increased from 437,205,421 miles to 480,388,956 miles. Coincident with this large increase in service, the total riding actually dropped from 2,894,034,734 to 2,826,252,975, or 67,781,759. Although the new bus service reached into many districts considered as inadequately served by street cars, much of it was competitive.

The Cities With Rapid Transit Compared

A comparison of the annual rides per inhabitant, showing the average of the three-year period ending in 1924 with the three-year period ending in 1927 for the rapid transit cities before and after enlarged use of the bus, is given in Table V and one chart on page 1073.

Table VI shows that in the Borough of Brooklyn and in the City of New York as a whole, where rapid transit

Per cent increase in population, miles operated and revenue-passengers for ten-year period in nine cities

facilities are the greatest and this method of transit is expanding rapidly, not only does the riding habit continue to grow but it is much higher there than elsewhere.

Chicago, with its more limited system of rapid transit service, follows Brooklyn closely in total riding habit, and like Brooklyn and New York the total riding habit of the second period shows a substantial increase over the riding habit for the first period, in direct contrast with all the cities served by surface lines only, in which the second period, with its enlarged use of the bus, shows a decrease.

Boston, the fourth rapid transit city, apparently indicates the lowest total riding habit of any of the rapid transit cities. One reason for this, as has been already shown, is that the rapid transit and surface lines are completely unified into one fully co-ordinated system where one 10-cent fare entitles the passenger to a free transfer between all classes of service. Joint prepayment inclosures admit patrons to both surface and rapid transit cars and this prevents the segregation of street car from rapid transit passengers. Bus passengers, however, are a matter of record and are indicated.

The average number of revenue passengers carried for the three years, 1925, 1926, and 1927, for each car and bus-mile operated in the cities indicated, are set forth in Table VII.

Conclusions

From an analysis of data compiled, the following conclusions may be drawn:

1. That urban transportation should be separated into two classes; rapid transit and surface. Rapid transit is a fast service for the long distance rider on an unobstructed right of way, while the street surface lines, whether street car or bus, render a slower service.

2. Cities having the largest proportion of rapid transit service have the highest riding habit and the lowest registration of automobiles per thousand population.

3. The building of rapid transit facilities changes the function of the surface line where affected, from long haul carriers to local or feeder lines.

4. Expansion of rapid transit facilities may change the character of the riding so much that the local and feeder service riding exceeds the surface line loss in long haul passengers.

5. The total revenue rides per inhabitant are increasing faster in cities with rapid transit facilities. This is due not entirely to the fact that people are taking additional journeys but also because they will use both rapid transit and surface facilities in completing a trip where the combination saves time.

6. Buses perform a function similar to the street cars in that they operate on the street surface and at a similar speed.

7. Where the territory is already served by street cars, the addition of bus service does not stimulate any considerable amount of new business.

8. The increases in the average fare per revenue passenger, in the cities served by rapid transit, have had a minor effect on the riding habit for the riding habit has continued to increase. In the cities served by surface lines only, the riding habit has on the average held up until the fares increased about 30 per cent above the 1918 level. With further increases in fare, however, the riding habit has generally decreased.

9. In all the cities served by rapid transit except Boston, which for reasons already stated is not strictly comparable with the other cities, the riding habit has increased faster than the service given, whereas in every case where cities are served with street cars and buses only, the riding has not kept pace with the service offered.

10. In the cities served by surface transit only, the demand for rapid transit service has been met by the use of the automobile and the riding habit of the surface lines reduced thereby, for, while rapid transit lines serve to create short haul riding on surface lines, automobiles do not.

11. In cities depending only on surface transportation, when buses have augmented the street car, the result has been that the former riding has been divided between the two types, with little, if any, addition to the total.

The easy chairs in the new parlor car, shown at the left, are finished in blue plush. Richness with simplicity is the note struck by the North Shore line in the new diners, shown at the right

More New Cars for North Shore Line

TWO additional dining cars and one parlor-observation car, ordered by the Chicago, North Shore & Milwaukee Railroad from the Pullman Car & Manufacturing Corporation, have been delivered and are now in regular service between Chicago and Milwaukee. Altogether, eighteen new all-steel cars have been placed in high-speed passenger service by the North Shore on its main line this year. Besides the three cars just mentioned, fifteen passenger motor cars embracing the latest devices for the comfort and safety of the passengers, including the new easy chair type seats upholstered in gray Byzantine plush, were delivered by the same company recently.

The three cars just placed in service are the last word in travel luxury. The diners, seating 24 persons each, are finished in buff inside with walnut panels and have ornamental sidelights. Their elegance of finish is emphasized by the absence of decorations, a beveled mirror on the wall adjoining the kitchen being the only embellishment.

The parlor-observation car has seventeen of the latest type revolving easy chairs finished in light blue frieze plush. The interior is finished entirely in walnut. The carpeting in both the parlor-observation car and the diners is in black and gold, with felt padding underneath.

New equipment costing over $900,000 has been placed in service by the North Shore line during 1928.

Wheeling Traction Company Spreads Holiday Spirit

WITH the view of aiding merchants and post office employees by inducing the public to shop and mail early, as well as to spread the spirit of the holiday season, the Wheeling Traction Company, Wheeling, W. Va., has placed a "Christmas Car" in operation over the various lines in the city. Painted in the traditional Christmas colors, red and green, brilliantly illuminated at night, and with the slogans "Shop Early," "Mail Early" and "Ride the Trolleys" displayed in gold lettering along the sides, the car presents a very attractive appearance, and has been the object of much favorable comment. Blazoned along the letterboard at the top of the car is the legend "Merry Christmas and Happy New Year." The front dash carries the suggestion that "Early Buyers Get the Best." The rear dash carries the injunction, "Mail Early, Direct with Care." In addition to being operated in Wheeling the car will make appearances in Moundsville and Bellaire, which are also served by the Wheeling Traction Company.

The smaller motor coaches are well adapted for operation in the heavy downtown traffic of Detroit

De Luxe Bus Lines

Now Serve Detroit

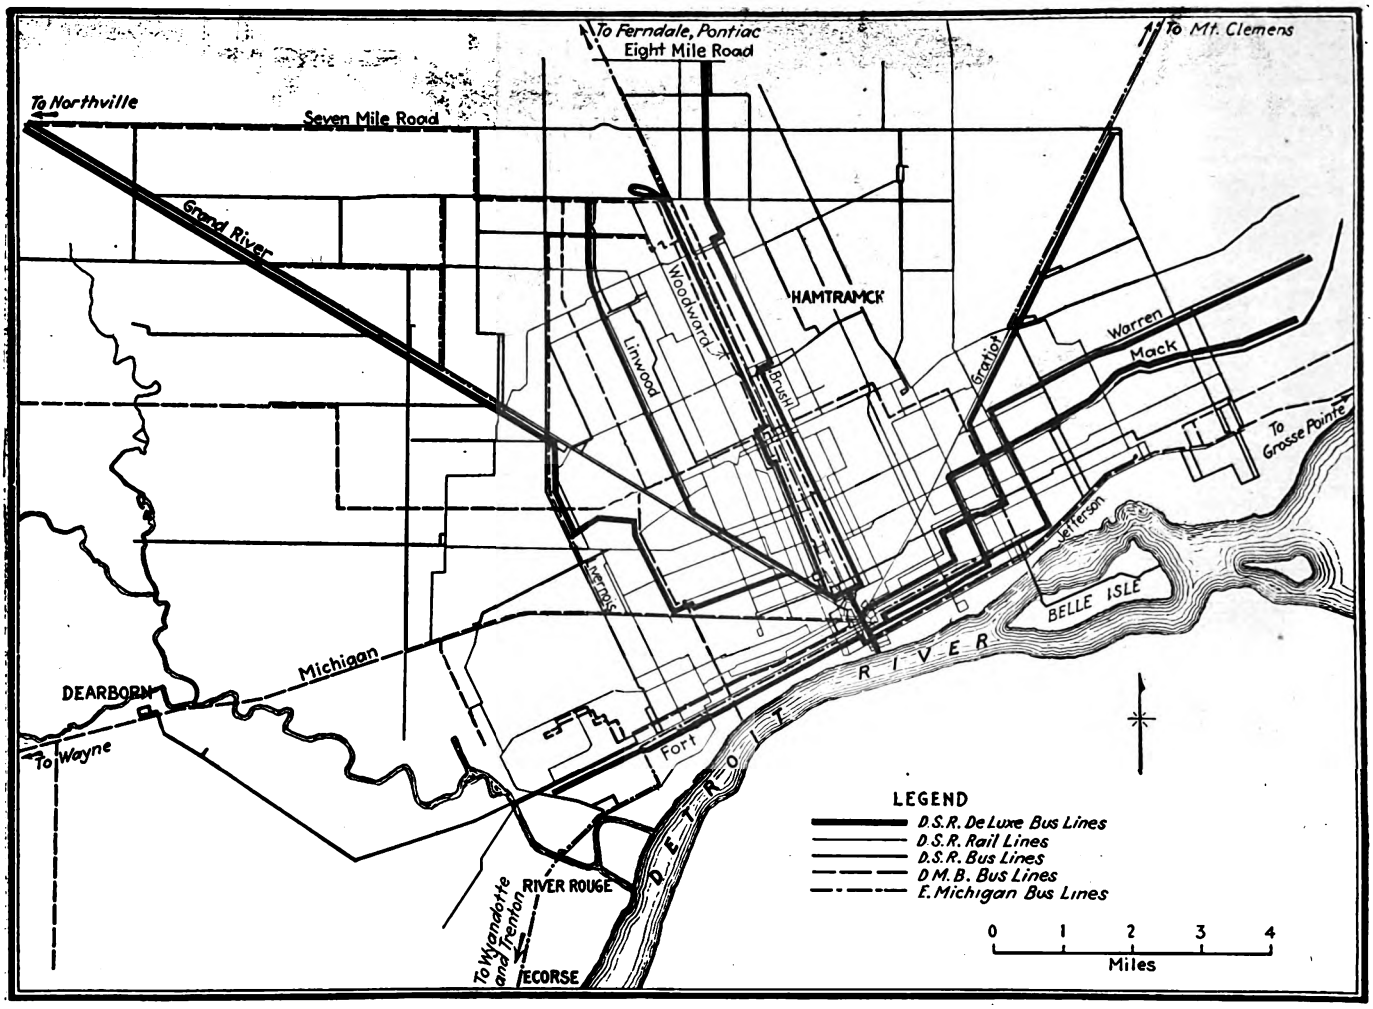
Four of six routes have been started and 160 parlor-type coaches ordered to render service replacing that formerly offered by the jitneys

UNUSUAL, indeed, was the step taken by the Department of Street Railways of Detroit, when it decided to establish several de luxe bus routes to serve the residents who previously had used jitneys. The railway has decided not only to serve the four principal routes over which the jitneys formerly operated, but also to extend other routes into new sections of the city. A total of 160 small-capacity parlor coaches have been ordered for use in this service. Of this number, 120 are Grahams and 40 are Yellows. Aside from the magnitude of this venture into a new field, the program is of importance from a co-ordination standpoint. The jitneys proved to be serious competitors of the Department of Street Railways, and their removal from the streets and the substitution of a similar service by the electric railway should eliminate several difficulties. While most of the de luxe buses will travel over streets also served by street cars and buses, they will give essentially a different class of ride and will have as customers the former patrons of the jitneys.

Public Willing to Pay Extra Fare

The Department of Street Railways on Nov. 25 inaugurated the first of the lines which have been definitely decided upon. This first line extends over Woodward Avenue from Palmer Woods, its outer terminus, to the downtown section of Detroit, operating part of the way over Cass and Second Avenues. The fares charged are comparable to those of the former jitneys: 10 cents from downtown to Grand Boulevard, 15 cents from down-

Digitized by Google



Of the nine de luxe bus routes shown on the map, four have been established, two have been definitely decided upon and three have merely been proposed

town to Highland Park, and 20 cents from downtown to the Six Mile Road. According to General Manager Del A. Smith, the line is meeting with favorable and immediate response from the public, proving conclusively that they are willing to pay the graduated fares of 10, 15 and 20 cents for this type of service. Because the service proved so popular on Woodward Avenue, the original eighteen coaches placed in service could not carry the full load and the company had to increase the number of buses on this route.

On Dec. 1 operation was started on the Grand River line, the second of the six routes. The number of buses was increased as they were delivered from the manufacturers. This particular line leaves the downtown section by way of Grand River Avenue, but branches for part of the route passing over Ash Street, West Grand Boulevard, Milford, Beechwood and Woodside Avenues, again joining Grand River Avenue at a point south of Livernois Avenue. This increases the distance by ¾ mile, but it is believed that better time is possible because of the lighter traffic encountered.

Since the starting of the Woodward Avenue and Grand River Avenue lines, two others have been established, one on Jefferson Avenue and another on Mack Avenue. The outer extremity of the Jefferson line is at Wayburn Avenue. The Mack Avenue route leaves the downtown section by way of Congress Street, goes north on Elliott Avenue and then out Mack Avenue. In addition to the four routes established, two others have been definitely decided upon, making a total of six routes. These two are the Fort Street and Linwood Avenue lines. The Fort Street line will terminate at Woodmere Cemetery. The Linwood Avenue line will leave the downtown section by way of Grand River Avenue and extend out Linwood Avenue to the Six Mile Road.

Three other routes have been proposed but no decision has been made on them as yet. The three routes are: Out Brush Street and Oakland Avenue to the Eight Mile Road; from Gratiot Avenue and the Seven Mile Road to Gratiot and East Grand Boulevard, thence downtown via the Boulevard, Verner Highway, McDougall Avenue and Macomb Street; out Lafayette Avenue East, Van Dyke Avenue and Warren Avenue. A line to Windsor, Ontario, may be considered later.

Due to the zoning arrangement, inbound buses will use the pay-as-you-enter system and the outbound vehicles the pay-as-you-leave. No interchange of transfers is permitted, either between the various de luxe lines or between the de luxe lines and the street cars or regular buses of the municipal system. Officials of the Department of Street Railways are considering the issuance of pass cards to be purchased by patrons and to be good for a certain number of rides, the card to be punched by the bus operator for each ride. Printed schedules will be distributed to the patrons as soon as the de luxe lines are completely established.

The buses ordered include 120 six-cylinder, 15-passenger Grahams and 40 eight-cylinder, 17-passenger,

Digitized by Google

model W Yellow parlor cars. The added equipment will be paid for on a rental basis, the rate being 20 cents a mile for the first four months, and 11½ cents a mile thereafter. The Department of Street Railways guarantees a minimum of 100 miles a day and has the option of returning the vehicles at the end of four months. At the end of this period, payment can be completed either on the rental basis or it can be paid in full at any time.

The Graham Brothers parlor coach has many refinements to add to the comfort of the passengers. The seats are upholstered in Spanish leather and have deep spring bases and air cushions. The bus seats fifteen passengers, exclusive of the driver, so that plenty of room is provided. There are three double seats on the left side of the bus and three single seats on the right side. Four more seats are located at the rear and one over each wheel housing.

The bus is heated by a fan blower system. Ventilation facilities include an electric fan opposite the door, ventilators in the cowl and roof, and a sloping one-piece windshield which has V-type ventilating wings at each side. Among the safety features are the Lockheed hydraulic four-wheel internal expanding brakes, a hand brake which operates on the propeller shaft, an emergency door at the rear of the coach and a non-skid entrance step.

A distinctive color combination is used to distinguish the de luxe buses from the others operated by the company. The body is finished in two tones of cardinal red and the top in beige. The wheels are red, in contrast to the fenders and body base of black. Black and gold stripes give a finished appearance to the exterior. The interiors are trimmed with Spanish leather to correspond to the upholstery of the seats. All windows are of plate glass and are equipped with roller anti-rattlers both inside and out.

The flooring which is of oak is laid crosswise and is covered with linoleum. The usual push-button switches of the stop signal system are replaced by a cord atached to a buzzer. The interior is illuminated by 6-cp. flush-type dome lights. A suggestion of the Pullman is given by the mirrors set in the window posts. The buses are equipped with six-cylinder motors and have a four-speed transmission. The nut-and-lever type of steering gear is used, with varying ratios to make the driving easy.

The 40 Yellow coaches ordered are the 17-passenger, type W parlor coach, especially designed for de luxe service. This type is powered by the Cadillac eight-cylinder, V-type engine, modified to meet the requirements of motor coach service. Other distinctive points of this coach are the four-wheel, four-segment service brakes; the external, contracting emergency hand brake,

The first of the de luxe bus lines was started on Woodward Avenue on Nov. 25

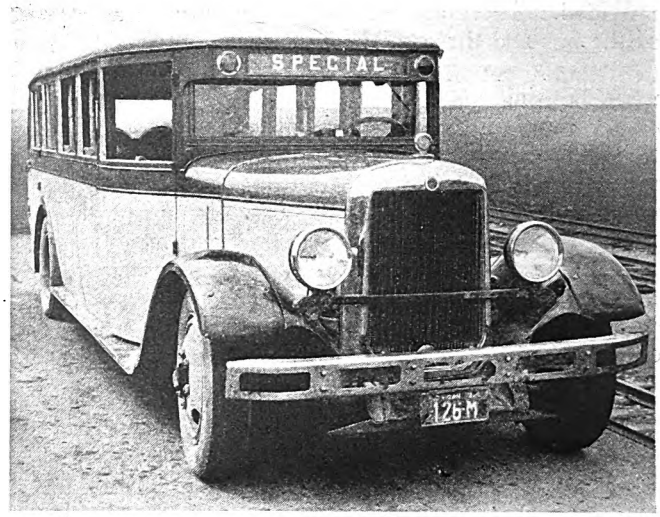
The Graham parlor coaches are designed to give the utmost in comfort to the passengers

working on two gun iron drums on either side of the propeller shaft bearings; the underslung, worm-driven rear axle of over-size capacity; unusually long and wide springs, with an improved type of suspension for the front springs; a four-speed transmission; and steering gear designed for ease of control. The seats in this coach are arranged in pairs on the left side and singly on the right side. They are upholstered in leather and have deep spring cushions.

Only the most courteous and dependable drivers of the 500 now employed by the Department of Street Railways are being picked to operate the de luxe buses. The driver's uniform chosen for this service is of a dark cardinal red shade with a French style fatigue cap to match.

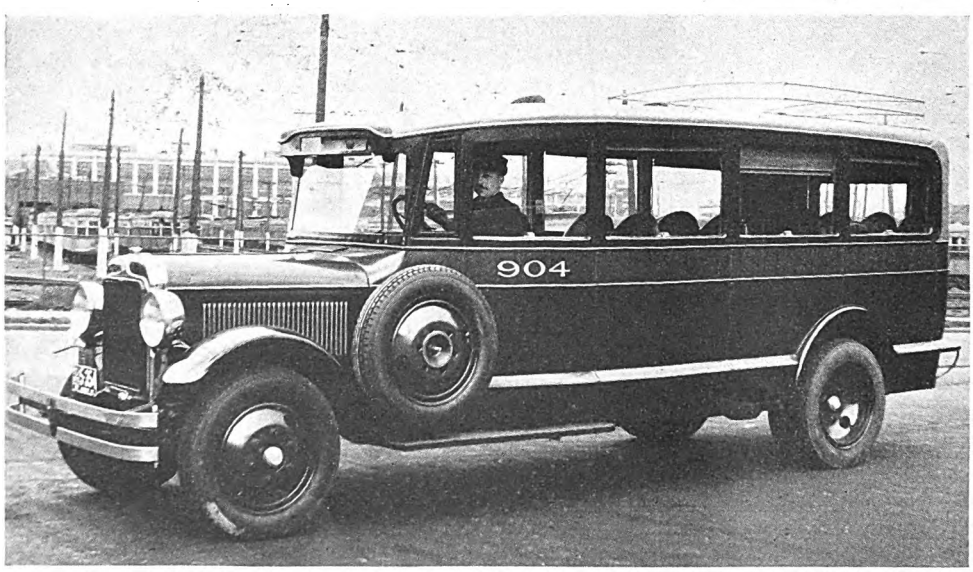
Status of Jitneys Contested for Six Years

Jitney operation on the streets of Detroit, conducted for the past six years under the protection of a series of injunctions, was terminated by the Police Department acting under a decision of the Michigan Supreme Court. The jitney ordinance was signed by the Mayor of Detroit on May 29, 1922, and it became effective the following October. On Oct. 24 of this year the Michigan Supreme Court in a majority opinion, upheld the validity of the ordinance and indicated that further legislation aimed to delay enforcement would not be tolerated. The ordinance prohibited the operation of jitneys on Fort Street East and West, Michigan Avenue, Grand River Avenue, Woodward Avenue, Jefferson Avenue, Cass Avenue, John R Street and the parks and boulevards. The Supreme Court's opinion was handed down on the city's motion to dismiss the bill of complaint of the Red Star and the Blue Ribbon Jitney Drivers' associations. The court also took up the city's appeal, asking for a writ of mandamus to compel the circuit judge to dismiss his injunction under the protection of which the jitneys were operating. The court opinion stated that with the dismissal of the bill, the injunction based upon the bill goes down with it. The order dismissing the writ was signed by the circuit judge when presented by the corporation counsel, leaving the city free to enforce the ordinance.



Forty type W Yellow parlor coaches, seating 17 passengers, were ordered for the new de luxe service

Because they had taken steps to obey the ordinance, 30 jitneys were granted permits early in October. These continued to run on Hamilton Avenue, from Library Square downtown to the southern limits of Highland Park, following the ousting of the others on Oct. 24. The route paralleled to a large extent one of the D.S.R. trolley lines. Recent steps, however, were taken by the Mayor of Detroit to banish jitney service of any kind. In answer to the proposal, the City Council recently passed an ordinance to prohibit the operation of so-called jitneys on the streets, avenues, boulevards and public places of Detroit. This measure provides against the operation of jitneys on any city



A total of 160 buses were ordered, 120 of which are to be 15-passenger Grahams of the type shown above

Digitized by Google

The attractive interior of the type W Yellow parlor coach gives an atmosphere of refinement

street or any thoroughfare mentioned in the original ordinance.

At the time the Supreme Court decision was put into effect, about 1,000 jitneys were being operated on the city streets. Only about 500 of these were involved in the six-year legal proceedings. The others were newcomers, usually referred to as "wild cats," that began to appear during June and July of the present year. The general scheme was to follow a route that led into some important downtown point where regular loading points with starters were established. Starters were also maintained at the outlying terminals to control the drivers, establish spacings, and exercise general supervision. Parking space was available at the outlying terminals, but downtown the jitneys would often be making a circuit on near-by streets and waiting their turn to get into the stand and pick-up passengers.

Once the jitneys were removed, additional service was given by the Department of Street Railways. It rented 40 trolleys from the Eastern Michigan Railways and 30 cars and trailers from the Cleveland Railway. Service was augmented particularly on the Woodward, Jefferson, Grand River and Fort Street lines, where the majority of jitneys operated.

British Tramway Traffic Increases

STATISTICS of the tramway undertakings in Great Britain are published each year by the Ministry of Transport. These figures from tramway companies for the year ended Dec. 31, 1927, and for the municipal lines for the year ended March 31, 1928, have just been issued. They show 233 systems, of which 167 are owned by the municipalities and 66 by private companies. The number of miles of route was 2,514, a decrease of 40 miles compared with the previous year.

The total capital expenditure at the end of the period mentioned was £99,913,760, an increase of £1,303,255, as compared with the previous year. The revenue from operation during the year was £27,751,504 and the operating expenses £21,943,147. The net income was £5,808,357.

The passengers carried during the year were 4,705,842,932, an increase of 5.51 per cent as compared with the previous year. There was also an increase of 4.70 per cent in car-miles run, the figure for the year just past being 396,554,545.

The report also shows that there were eleven trackless trolley lines, the length of route operated amounting to 111 miles, an increase of 24 miles. The number of passengers carried on these lines was 80,112,970.

Diagonal Versus Parallel Parking

AN INTERESTING analysis of the effect on street traffic of diagonal and parallel parking has recently been made in the city of Houston, Tex., by the Beeler Organization. The report relates to Main Street, the principal business thoroughfare of Houston, and in a sense is a supplement to the traffic report on that city published in abstract in the issue of ELECTRIC RAILWAY JOURNAL for Dec. 8.

Main Street is 60 ft. wide from curb to curb, and at the present time, diagonal parking is followed. With this kind of parking, a maximum of 378 cars can be accommodated in the nine blocks of the business district. With parallel parking, a total of only 288 cars could be accommodated in the same nine blocks. The figures in each case represent the maximum when all of the curb length was used, but normal restrictions on parking in front of fire hydrants, at the entrances to public buildings and some stores, and some obstructions due to building operations will reduce these totals to about 284 and 216, respectively. If the parked cars were changed each hour during the ten hours of the day, 680 additional cars could be accommodated daily by the diagonal system of parking, but this number represents only 1.3 per cent of the 51,824 passenger cars in the city.

With diagonal parking at 45 deg. the roadway left open to traffic is reduced 30 ft., which is theoretically sufficient for three streams of traffic, but owing to the varying lengths of vehicles and the need for drivers to be on the lookout for cars backing out of their stalls, moving traffic is practically limited to two streams.

With parallel parking, on the other hand, 46 ft. of clear roadway would be open, allowing four traffic streams free to travel at a brisk rate between the comparatively smooth lines of the parked vehicles. Parking at an angle of 30 deg. at the curb reduces the standing capacity to about that of parallel parking, and reduces the effective roadway to almost the same extent as the 45-deg. angle parking.

It will be noted that the 30 per cent additional capacity provided by the 45-deg. angle parking requires a street area practically double that required by parallel parking. Parallel parking requires 14 ft. of street width, while angle parking requires 30 ft. In other words, the additional 68-car capacity obtained from diagonal parking consumes a street area 16 ft. wide throughout the length of the nine blocks, which if devoted to moving traffic would provide space for two additional traffic streams with an hourly capacity of approximately 2,000 cars. The volume of traffic which can enter the Main Street business section is therefore cut approximately in half by angle parking. Angle parking also increases the hazard of driving, reduces freedom of movement and makes it impracticable to operate an express bus line on Main Street, as has been proposed. Such a line, it is estimated, would carry approximately 2,685,000 people in and out of the Main Street business section during the first year of operation.

Need for Increasing the Capacity of the Railway Caused the Electrification of This Suburban Line in India

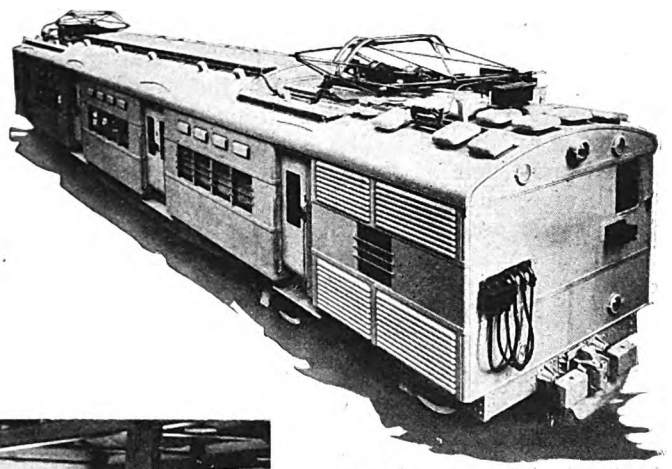
Bombay Electrifies Its Suburban Service

Need for increased capacity was determining factor in electrification of 23-mile section of Bombay, Baroda & Central India Railway. Multi-side-door cars are used. Stations remodeled and signals installed

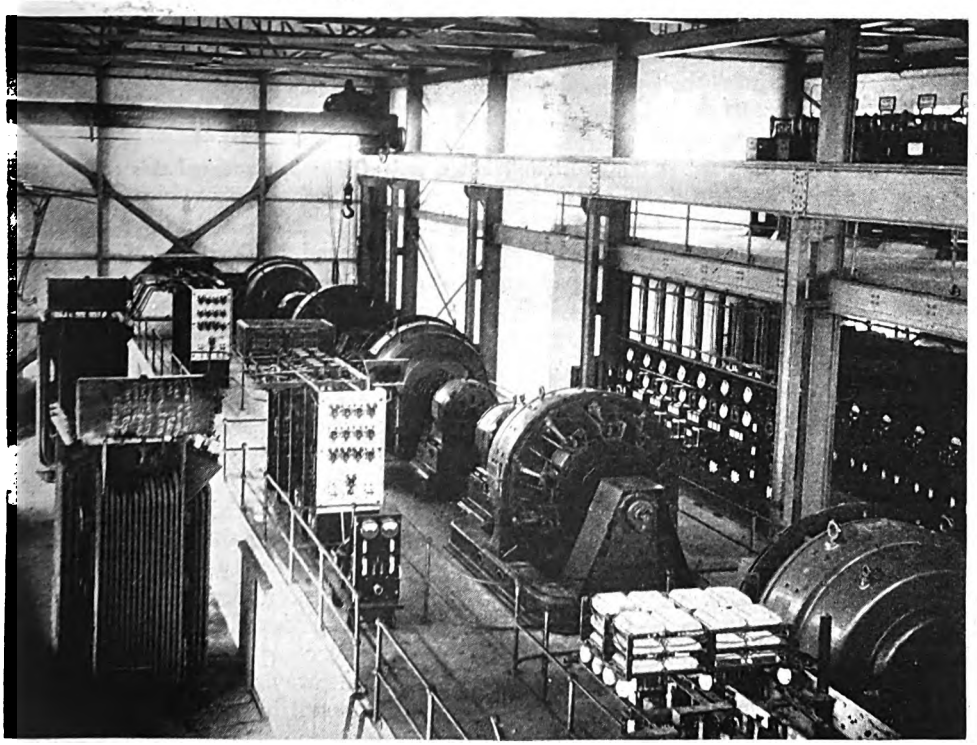
ELECTRIFICATION of suburban service on the Bombay division of the Bombay, Baroda & Central India Railway is one of the recent transportation developments in the Orient. Business on this division has grown at a very rapid rate during the past twenty years. No record is available to show the number of passengers carried on this division prior to 1888, but in that year the total was 10,000,000. This figure is useful in reviewing the statistics of more recent years. In 1914, 24,000,000 passengers were carried; in 1918, 30,000,000, and for 1927 the figure has been put at 38,000,000 passengers. During a boom in 1922, when rents in the city of Bombay rose to an excessive level, no less than 45,000,000 people were carried, causing a severe test on the capacity of the division which at that time had no modern equipment for the acceleration of train movements. It has been this continuous increase in demand for transportation which made necessary the conversion of the road from steam to electric traction. Opportunity was taken of this change to make other permanent improvements, including a remodeling of most of the local stations, installation of signals over the entire suburban section of 23 miles, and the construction of a number of over-bridges to do away with grade crossings.

According to the original plan, it was hoped that electrification would have been completed in 1926, but the opening did not take place until early in 1928. The power required is secured from the hydro-electric stations in the Western Ghats, some 100 miles from Bombay. It is transmitted to Bombay as three-phase alternating current at 110,000 volts and 50 cycles, and is first transformed at the substations to 22,000 volts and then converted to direct current at the trolley voltage of 1,500 volts. The converters in the three substations are controlled from one point. The 1,500-volt direct current is distributed to the cars by two overhead wires with catenary suspension.



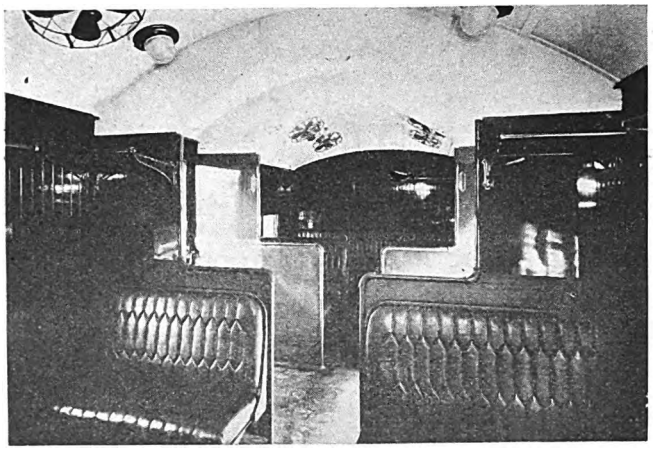
Motor coach on the Bombay, Baroda & Central India Railway

The cars are of steel and entirely new. They were supplied by the English firm of Cammell Laird & Company. The design allows for free circulation of air between the inner lining and the outer shell of the car. They are equipped with wide sliding doors of aluminum alloy construction. The electrical equipment was supplied by the British Thomson-Houston Company, Ltd., each motor car being equipped with four 750-volt ventilated interpole motors,



Interior view of Bandra power station

Digitized by Google



Interior view, showing first-class compartment

which are permanently connected in two groups of two motors in series.

Inside, the cars are lined with teakwood throughout. The seats of the third-class coaches are also of teak. In the first-class coaches upholstered seats are used. Altogether there are 160 cars which are in service coupled in units of four, one motor coach and three trailers. These units can be operated separately or coupled to form full trains of eight cars. The seating capacity of an eight-car train is approximately 1,000 persons and is 33 per cent greater than the capacity of the previous steam trains. With the equipment of four motors, having a combined rating of 1,100 hp., on each motor car, a fully loaded train unit of three trailers and one motor car can be accelerated at 1 m.p.h.p.s. The control equipment provides for automatic acceleration. The cars are 68 ft. in length and 12 ft. wide, as compared with a width of 10 to 10½ ft for the steam cars.

Railway Electrification Proceeding in Morocco

PROGRESS in railway electrification is being made rapidly in Morocco, where water power is plentiful and all coal has to be imported. Already, the Morocco Railway Company has about 200 km. (130 miles) of track equipped with electric power. The entire system in operation by electricity and steam comprises about 583 km. (265 miles), with projected extensions of nearly the same length. The railway is owned by a French company with largely the same interests as control some of the principal trunk line railroads in France.

At present the lines are receiving a considerable portion of their power from steam stations, but a large hydro-electric station is being built on the Oum-er-Rebia River, the principal river in western Morocco.

Direct current at 2,000 volts is being used, and ten locomotives and the same number of motor cars have been purchased. The electric locomotives are 38 ft. 9 in. over all, weigh 160,000 lb. each and have an hourly rating of 1,340 hp. Each motor car is equipped with four 140-hp. motors and is capable of hauling two trailers. Further particulars are given in a paper contained in the May-June Proceedings of the French Institution of Civil Engineers. It was contributed by H. Parodi, consulting engineer of the Morocco Railway Company and of the Orleans Railway Company of France.

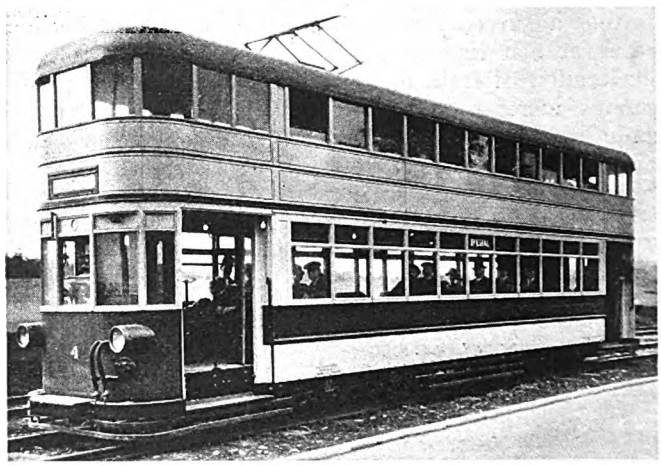
Oldest Railway in England Is Electrically Equipped

Built as a horse car line in 1804, it celebrates its 124th birthday by adopting electric power and buying new cars

THE oldest railway now in operation in Great Britain, possibly in the world, is a 6-mile line between Swansea and Oystermouth in Wales. It is popularly known as the Mumbles Railway. This road was authorized by an act of Parliament dated June 29, 1804, and completed shortly after. Several railway lines were incorporated and constructed in England before this date, but all of them have either been abandoned or absorbed into larger systems. But for the past 124 years the Mumbles Railway has retained its individuality.

As first constructed, the rails were of angle iron in 3-ft. lengths, set into granite blocks, spaced 3 ft. apart. As the rail was flanged, there were no flanges on the wheels. The first change was to rails weighing 28 lb. to the yard, then to 56-lb. rails, and then to the present standard of 85-lb. rails.

Originally the road was built to haul iron ore and limestone from some mines and quarries that were at the end of the line, but in 1816 passenger cars were added.



Britain's oldest railway has just adopted this car

The mines and quarries were exhausted and abandoned many years ago and the principal business of the road now is passenger transportation.

Up to 1877 all cars, including the freight cars, were hauled by horses. In 1877, however, the motive power was changed to steam. With steam, the type of passenger cars retained in service was similar to those ordinarily used for horse-car service elsewhere at that time; that is to say, they were light four-wheel, double-deck cars with the upper deck open.

This year, steam has been abandoned in favor of electric power. The new cars are of the British double-deck, double-truck type, with a capacity for 48 passengers on the lower deck and 58 on the upper deck. A special feature of car design was introduced, however, because of the unusual physical features of the route, which has the sea on one side and a highway on the other throughout its entire length. The result is that as the cars have a stub terminal at each end, both entrance and exit are on one side of the car only, with no doors on the other side.

The clinic is well supplied with apparatus and instruments needed in surgical practice

Interborough Cares for Medical and Surgical Needs of Employees

WORK done by the medical department is a feature of the welfare activities of the Interborough Rapid Transit Company. The headquarters of this department is on the ground floor of the company's new shop and car yard at 147th Street and Seventh Avenue. The medical department takes care of the medical and surgical needs of 16,000 employees, as well as those of their wives and children. A record is kept of the cases treated, and in 1927 treatments were given to 3,555 patients. The average number of treatments per patient was slightly less than six.

At the 147th Street carhouse the department has a clinic with three examining rooms, sterilizer and other equipment for operations, a number of therapy aids in the way of electrical machines, etc. One of the company's full time physicians, as well as nurses, is always in attendance or within quick call. Here are all the remedies and appliances needed for prompt treatment in case of accident in the shop. There is also another clinic at the company's shops and car yard at Lexington Avenue and 98th Street.

All extensive surgical work is conducted at the Post Graduate Hospital at Twentieth Street and Second Avenue. The company has an arrangement with this hospital for accommodations, and Dr. John J. Moorhead, chief surgeon of the company and head of its medical department, is also professor of surgery at the Post-Graduate Hospital and Medical School. A male ward of ten beds is maintained at this hospital for the benefit of the male employees of the company. After a company patient at this hospital is able to leave, he is treated at one of the company's clinics.

The medical department includes six full-time physicians and surgeons besides Dr. Moorhead, who performs the operations at the Post-Graduate Hospital. Besides these physicians, the company has an arrangement with 28 others who give part time. Their offices are scattered about the territory in which the employees live. They

Digitized by Google

may be called through the medical department to attend or give medical advice to any employee.

When a case of sickness develops at home and is reported to the department, the procedure is as follows: A visit is immediately made to the home of the employee by the company's head nurse or one of her assistants. This nurse has authority to care for the medical and surgical needs of the patient by sending him to a hospital or by calling in a physician. She also has authority to see that the family is cared for during the absence of the patient if it should be either the father or the mother of dependent children. She also has authority to advance a loan for any necessary expenses. If the injury or sickness develops while the man is at work, he is sent to the clinic by the foreman in charge.

Records are kept of each case treated. Two of the cards used for this purpose are published. The first is known as the doctor's office record, and covers the cases treated in any outside office. The other is used when the case is treated in one of the clinics. So long as patients are under treatment these cards are kept in a file known as the active list. This list usually includes about 500 cards.

In another record all cases are classified by nature of trouble. From this record the accompanying table has been prepared.

TABLE SHOWING CASES TREATED BY I. R. T. MEDICAL DEPARTMENT IN ONE YEAR

Diagnosis	Number of Cases	Average Number of Treatments	Average Time Lost, in Days
Lacerations	1,039	5	1
Contusions	543	3	2
Medical cases	362	4	8
Sprains	235	3	1

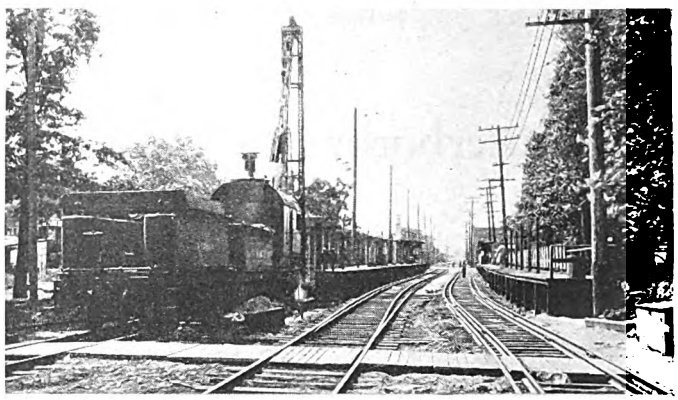
After an employee has been on the sick list, he must pass a physical examination before returning to work, to determine whether he is again physically fit for his job. Foremen, instructors, nurses and others who are brought into touch with the employees have authority to call the attention of any employee to the need for a physical examination. Other than this there is no definite period for physical re-examinations of employees in service. The men are encouraged, however, to take such examinations at any time they feel it necessary, by being assured that no one will lose his position with the company because of physical incapacity in any particular. If an employee cannot be kept at his existing job for physical reasons, he will be assigned to another. The company always has enough openings as storekeepers, watchmen, or for work at some passenger station, to take care of any trainman or other employee no longer fitted for his existing work. If an employee has been with the company for 25 years or more he is entitled to a pension.

A service of the medical department not heretofore mentioned is the contribution frequently to the employees' magazine, the *I.R.T. News,* of a column on health hints. This column is conducted by Dr. Henry Green, one of the company's surgeons, and in this column he answers questions on medical topics sent in by mail, unless a personal answer is requested by the correspondent. He also contributes to the *I.R.T. News* from time to time, articles on such practical topics as causes for common ailments, remedies for and prevention of them.

Grade Separation Project in Evanston Progressing

STEADY progress is being made on the elevation of the Chicago Rapid Transit Lines' right-of-way between Church and Isabella Streets, Evanston, Ill., on the north side division. Construction of the temporary trestle for the north-bound track was completed the first week in October and north-bound traffic is now being routed over this structure. Work has been started on the trestle for the south-bound track and when this is completed all trains will be operated over the temporary structures. It was expected that both trestles would be completed by the end of the year.

When the trestles are finished work will proceed on



Looking south from Hamlin Avenue, Evanston, the regular surface platforms soon to be superseded can be seen. The pile driver is in position for driving the first trestle

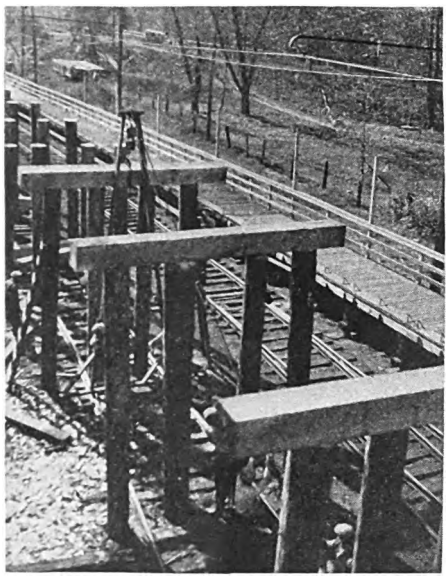
the permanent construction, which includes the placing of concrete walls, building bridges over street crossings, filling in the permanent embankment, erecting new stations and laying tracks.

The work of driving the trestle is being done in sections to give a better balance to the track and trestle work. Temporary tracks carry the traffic on the sections where the construction work is in progress and temporary island platforms are used for loading. Three of these were built between the two trestles, at Foster, Noyes and Central Streets, the present station locations. These platforms, constructed simultaneously with the north-bound trestle, are of sufficient length to accommodate eight-car trains. For surface operation, new temporary platforms for south-bound traffic have been constructed at Foster and Noyes Streets and existing station buildings moved to them. At Central Street station, the platforms and tracks were shifted west to make room for driving the first trestle. In the accompanying illustrations are shown the various steps in constructing the platforms and trestles.

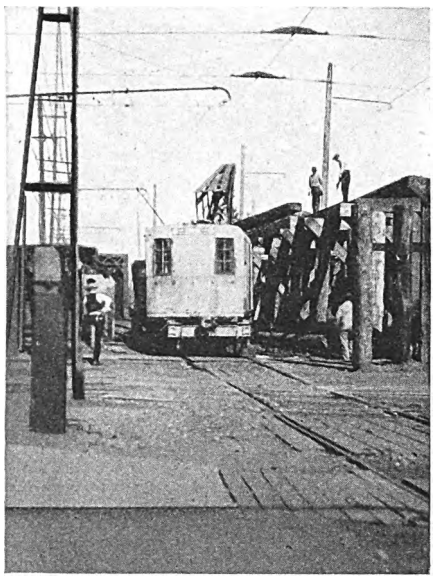
The track layout has provided at all times for two operating tracks and one construction track. These, supplemented by crossovers where needed, have made it possible to conduct the regular transportation business and the construction work on the same right-of-way without the slightest delay to either. North-bound trains were switched to the old south-bound track, while

Digitized by Google

The south-bound trestle is going up rapidly, the pile driver shown in the background being kept busy from dawn to dusk



Portable block and tackle used to hoist the cross sills or caps in place atop the piles



A gasoline-driven traveling crane unloads the heavy stringers directly from the flat-car to their ultimate location on top of the caps

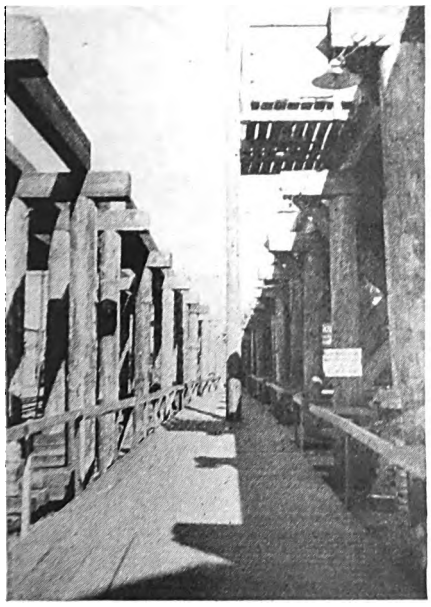
south-bound traffic was switched to a temporary track on the west side of the right-of-way through the section where construction work was progressing.

The two trestles are being constructed on a minimum of 17 ft. centers to allow clearance for a center line of poles supporting the overhead. At stations these centers are increased to permit room for the island platforms. Maximum curvature on the trestles is 6 deg., equivalent to a No. 10 turnout.

Temporary Track Reduced to a Minimum

Owing to the track and station conditions in Evanston, the north-bound trestle has been located on the east side of the right-of-way, 8 ft. from the east right-of-way line. The second trestle is being driven from the surface track used for north-bound traffic under the temporary operating scheme. South-bound trains operate on the surface over a track formed by utilizing an existing freight spur from University Place to Hamlin Avenue, the Edinger coal track between Noyes and Colfax Streets, and a new piece of temporary track laid between Hamlin and Simpson Streets. These arrangements have served to reduce temporary track construction to a minimum.

In carrying out the work outlined, certain changes had to be made in the operation of the North Shore trains into Evanston. The use of the tracks in the terminal at Church Street has been discontinued. Passenger operation consists only of half hourly service in and out for three hours each morning and evening; consequently it has been possible to make use of a temporary loading platform built along the east yard track, west of the main line which extends north from Church Street. Freight business is being handled at the Chicago, Milwaukee, St. Paul & Pacific freight house at Church Street. At Foster and Noyes Streets the North Shore passengers are using the Rapid Transit platforms.



The north-bound trestle to the right has been completed; the south-bound trestle is just being started

This locomotive, oil tank car, sanding car and crew are used by the Pacific Electric Railway in oiling roadbeds

Weed Fighting in California

Extended trials with hand elimination, burning and chemical treatment have led to spraying by crude oil. This is the method now standard

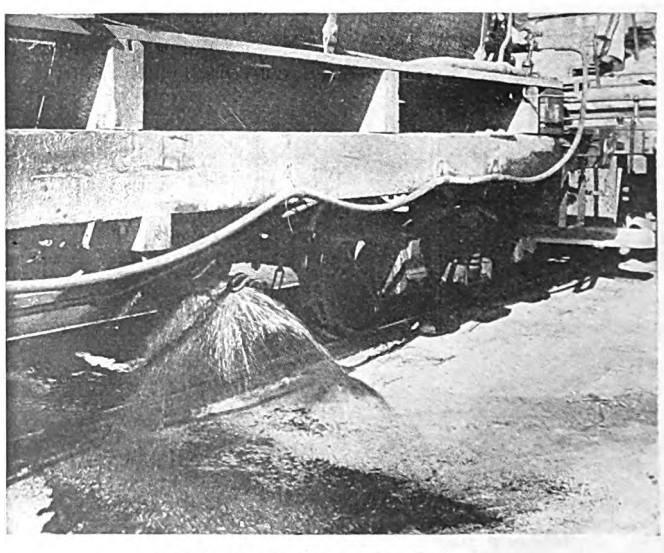
SINCE rails were first laid, the weed nuisance has been more or less of a problem to maintenance-of-way forces of all railways operating over private right-of way. In Southern California, the problem has been especially serious, because of the readiness with which all plants grow. The Pacific Electric has run the gauntlet of experiences in fighting weeds on its rights-of-way.

Not so many years ago large crews of men cleared the rights-of-way by hand. This process was an expensive one, and the burning method of elimination, which came into popular favor some years ago, was tried out. While this process was satisfactory, inasmuch as it dealt a death blow to the growth, it created a fire hazard that was objectionable.

Another plan of dealing with the weeds, is the use of chemicals. This method provides for spraying rights-of-way with some chemical like sodium arsenite, diluted with water, according to the hardiness and thickness of the vegetation to be destroyed. This process has proved far more effective than any other tried up to the time of its introduction, and it still remains the most economical weed destroyer where the problem is solely a matter of destroying vegetation. However, there are other angles to the problem which suggested the wisdom of using crude oil as a weed executor. The theory underlying this plan and found to work out in actual practice is that the oiling process serves four purposes all of which are useful. They are (1) it kills weeds; (2) it settles dust; (3) it improves the appearance of the rights-of-way and (4) it removes the glare from a rock ballasted and other ray throwing roadbed.

The method of applying the oil to the roadbed was developed by the engineering department of the Pacific Electric. It is similar to that used in the application of the chemical weed killer. A regulation tank car is converted into an "oiling car" through the addition of a slotted pipe spray connected to the outlet of the tank. This slotted pipe extends from its connection with the bottom tank outlet to either side of the roadbed proper, and is so constructed that extensions may be brought into use for the spraying of extra wide strips of rights-of-way.

The spraying car is also equipped with a 2-in. centrifugal pump connected to a 5-hp. d.c. motor with a hose connection to the tank proper. There are also two lengths of 1-in. hose about 25 ft. in length with a nozzle on each hose through which the pump forces oil. The nozzles atomize the flow so that it is a simple matter for a man to hold the hose and spread the oil evenly. This latter equipment is called into use only when extra wide strips of rights-of-way are to be sprayed, or where obstructions in the form of posts, poles or fences make it dif-



A "close-up" of the Diesel oil spray

Digitized by Google

ficult to use the regular extensions to the roadbed spray.

Immediately following the oil car is a sander, which is a converted flat car, being boxed with sides 18 in. high. There are four spouts, over which is placed a fine screen, into which men placed on the car shovel sand. In this way the greasing effect on the surface of the rail caused by the oiler is neutralized, and the track is left in safe operating condition.

When spraying with regular equipment under average conditions the oiler moves at a speed of 8 to 10 m.p.h., spreading approximately 2,000 gal. of oil per mile. When the hose sprays are used the speed of the train is of necessity slower, depending on the area to be sprayed and the many other local conditions encountered.

The oil used for this purpose, commonly known as Diesel oil, is a low grade distillate with the asphaltum removed, being of 24 deg. gravity.

The oil penetrates the ground very rapidly, to a depth of between 1½ and 2 in. within the first hour, and does not leave a gummy or sticky surface as might be surmised. The cost per barrel of Diesel oil at this writing varies between $1.08 and $1.10, f.o.b. the refinery.

Cost Per Mile Reasonable

The cost of applying the average coat of oil is $40 per single-track mile. This figure includes the cost of the oil, and all operating expenses of equipment, labor and supervision. Where it is necessary to spray by hand, sections of the right-of-way too far distant from the regular equipment, the cost naturally runs higher, being estimated at about 0.2 of a cent per square foot.

Experience on the Pacific Electric Railway shows that best results are obtained through the periodical spraying of the roadbed. The oil is applied at intervals of six months until three coats have been applied. After that it is only necessary to repeat the process about once every two years, and then only with a light single coat. It is simply a matter of getting the ground "set for the killing" and then keeping it that way through occasional spraying.

After the three applications of oil, practically all seeds within the soil of the right-of-way have been killed and thereafter seeds that reach the right-of-way, because they do reach the interior of the soil, do not germinate, but lie dormant until they die. The oil application is effective against all species of weed growths. Particularly has it been "dynamite" against Bermuda grass, more commonly known as the hated "devil grass."

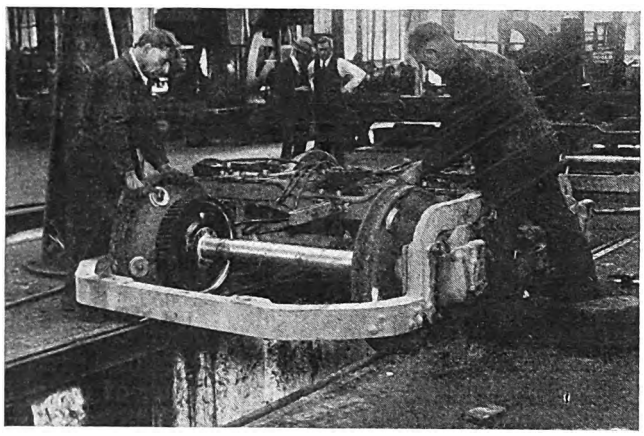
During the past summer season, extensive spraying operations were carried on. To date, 123.55 miles of single track roadbed and 1,153,000 sq.ft. of right-of-way have been treated with oil. The work is still in progress and will continue until the rainy season.

The Pacific Electric Railway has oil treated its San Bernardino, Long Beach and San Pedro lines, all major arteries, besides various strips on practically every line of the system. Oil also has been effectively used in the improving of private rights-of-way in the largely populated cities of Glendale, Long Beach and Culver City.

From any angle viewed, so far as the Pacific Electric is concerned, the oiling process is superior to previous methods. Ultimate cost will show a "smiling" credit on the ledger. Dust is pleasingly and permanently controlled. Roadbed is improved in appearance to the point where complaints have been entirely eliminated, and the glare strain on motormen's eyes is removed through the darkening effect of the oil application. The fourfold purpose which the oil serves, as compared with single benefits of the chemical process, places the oiling method in a class by itself so far as the treatment of the railway roadbed and right-of-way are concerned.

Public Service Installs Noise Reduction Devices

ENGINEERS of the Public Service Co-ordinated Transport, Newark, N. J., have been experimenting for some time with various devices by which it is hoped to reduce materially the noise of street car operation. To damp the noise-producing vibration of the wheel, four holes have been bored through the web. Circular wooden blocks slightly larger than the hole are placed on both sides of the web and bolted together. Grooves have been cut around the gears and pinions and filled



Installing wooden disks to reduce wheel noises on cars of Public Service Co-ordinated Transport

with lead to eliminate the grinding ring of the gears. Canvas strips have been placed between moving metal parts to reduce the scraping noises of metal in contact.

These devices have been installed on one car now in service on the Mount Prospect line in Newark. Preliminary tests indicate that the noise of operation has been reduced about 50 per cent. Other cars are being similarly equipped as they pass through the shops for their regular periodic overhauling. If further tests prove as successful as it is expected, all of the company's cars will be equipped with the new devices.

New Englanders Consider New Cars

MORE than 300 members and guests attended the December meeting of the New England Street Railway Club, held at the Hotel Statler in Boston on Dec. 13. The program, arranged by R. B. Stearns, vice-president and general manager of the Eastern Massachusetts Street Railway, included an exhibition of two Birney cars, one a single-truck and the other a double-truck, in the morning, two addresses in the afternoon and a musical entertainment in the evening. The two speakers, Ross Schram of the Twin Coach Corporation, and C. O. Birney of Stone & Webster, Inc., described in detail the new automotive street cars manufactured by the Twin Coach Corporation and the St. Louis Car Company, respectively. W. E. Wood, president of the Virginia Electric & Power Company, gave a talk on the Coffin Award for 1928.

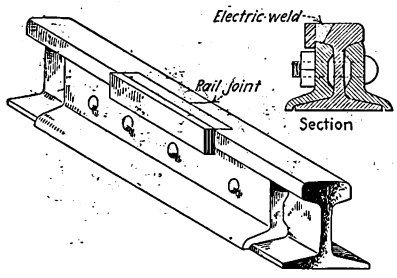
Time and Labor Saving Ideas

Inexpensive Welded Rail Joint*

By Louis T. Botto

Superintendent Maintenance-of-Way Department, San Antonio Public Service Company, San Antonio, Tex.

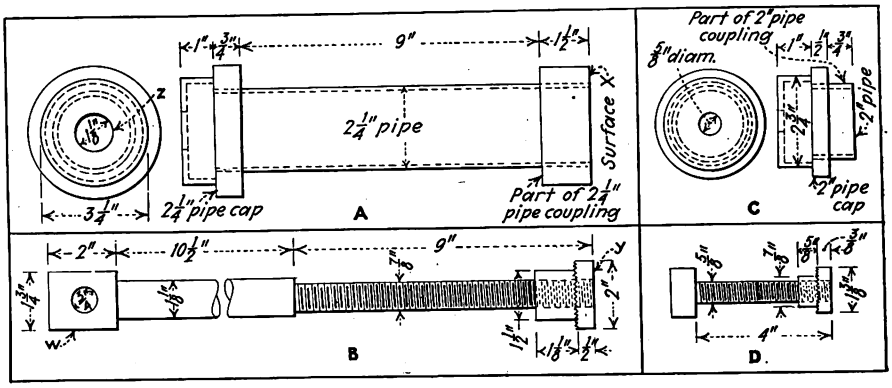
ON LINES of the San Antonio Public Service Company, San Antonio, Tex., in gravel ballast track that is not welded throughout, many bad joints have been reconditioned by a very inexpensive method of welding. The accompanying sketch shows the construction used. A part of the rail head at the joint is cut out on a bevel. A piece of boiler plate is then applied to the outside of the rail, and the space left by the portion that is cut out is filled in by welding. This forms a permanent joint between the angle bar, the rail and the plate. It has been found that this weld does not pull apart in service, and makes a very smooth joint.



Details of welded rail joint used by the San Antonio Public Service Company

Simple Air Compressor Bearing Press

TROUBLE was experienced by the Richmond Railways, Inc., Staten Island, N. Y., in removing armature and pinion bearings of the Westinghouse DH-16 air compressors from their housings until Air Equipment Inspector E. Niksic designed a hand press to perform this work. Prior to the adoption of this tool it took a long time to remove the bearings from the housings, and often the bearings were unfit for further service after their removal. The tool referred to is shown in the accompanying sketches. Illustrations *A* and *B* show the parts of the press used for the removal of the main armature bearings; the other two show the parts of the press used for removing the pinion bearings. Both are similar so that a description of the design and use of one will suffice.



These tools provide means for effecting a very substantial reduction in air compressor maintenance expense. Above, press for removing main armature bearing. Below, press for removing pinion bearing

Referring to the main armature bearing press, this consists of two parts, *A* and *B*. Part *A* is made of a piece of 2¼-in. iron pipe 11¼ in. long. One end is fitted with a 2¼-in. pipe coupling 1½ in. long, and the other with a 2¼-in. pipe cap. The assembled parts are 12¼ in. long. The center of the pipe cap is drilled with a 1⅛-in. hole.

Part *B* is a round rod 19½ in. long fitted with a head 1¾x2x1¾ in. and drilled with a ¾-in. diameter hole. The rod is turned to 1⅛ in. diameter for a distance of 10½ in. from the bottom of the head. The remaining 9 in. is turned to ⅞ in. and threaded with a standard ⅞-in. thread. The end of this threaded portion is fitted with a 1½ in. diameter collar with a 2 in. diameter by ½ in. thick flange. The inner face of this flange has saw teeth to assure that it will grip the bearing during removal.

This tool is used as follows: Collar *Y* is removed and the rod *B* inserted into cylinder *A* through the hole *Z*. Then the rod *B* is passed through the bearing and the surface *X* placed against the bearing housing. Collar *Y* is then screwed onto the rod *B* until the saw teeth press against the end of the bearing. A lever rod is then placed in hole *W* and the screw is turned. The saw teeth in the collar grip the bearing tightly and prevent it from turning. Continued tightening of the screw gradually pulls the bearing from its housing and deposits it in the cylinder *A*.

Sign Rack Saves Time of Car Crews*

By C. B. Hall

Chief Clerk Mechanical Department Virginia Electric & Power Company, Norfolk, Va.

A DASH SIGN rack erected in the car yard of the Virginia Electric & Power Company, Norfolk, Va., has proved a great time saver to car crews. The rack is of simple construction with partitions to separate the different dash signs carried by the

**Submitted in* Electric Railway Journal *Prize Contest.*

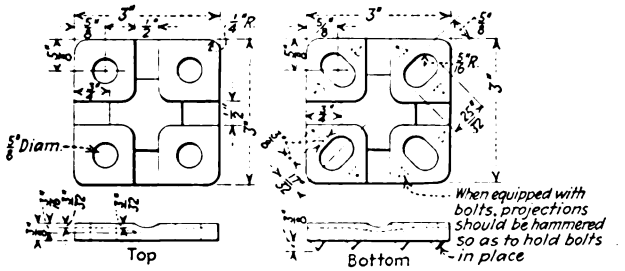
Dash sign rack at the dispatcher's office of the Virginia Electric & Power Company

Digitized by Google

cars. It is installed in the direct path of the operators when leaving the dispatcher's office for their respective cars. All that is necessary is to draw out the particular sign desired. Carhouse mechanics remove the signs from the cars at the close of the day's run, and return them to the proper sections in the rack.

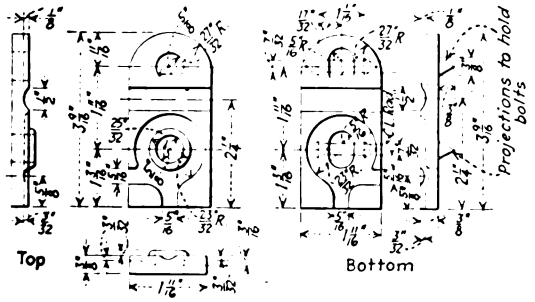
Overhead Line Devices That Save Labor and Reduce Maintenance

ACCOMPANYING illustrations show seven types of overhead devices utilized by George Butterick, supervisor of lines for the Connecticut Company, New Haven, Conn., and which have proved of particular benefit in that company's line construction. The devices include three types of supporting brackets, two clamps and two types of switches.



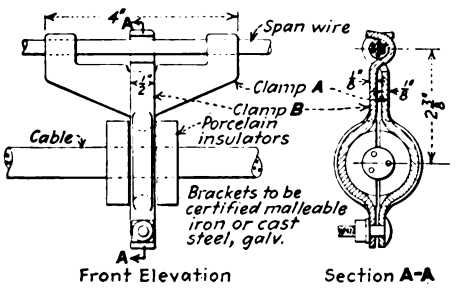
Four Bolt Span and Backbone Clamp

This is used where a backbone is installed on the front side of the pole. It has resulted in a considerable saving both in labor and material for trolley curve work.



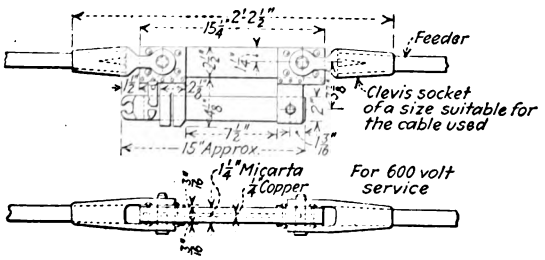
Standard Clamp for Pull-Offs on Backbones

Used on curves, this does away with the necessity of a pull-off on backbone, thus saving thimble and serving of pull-off wires.



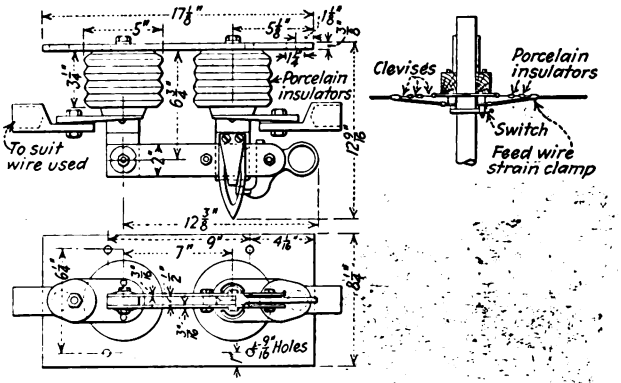
No. 4 Signal and Electric Track Switch Cable Bracket

A convenient device for suspending signal and electric track switch cables on span wires or messenger wires in connection with automatic signals and electric track switches. It can be used also for suspending cables for traffic signals, street lights, etc.



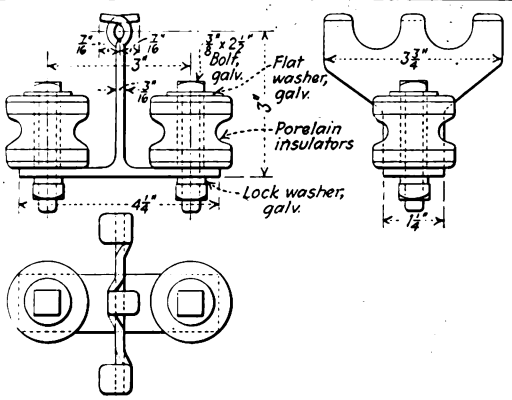
Knife Switch for Feed Span Where Boxes Cannot Be Installed

This is used in feed spans for trolley service where city or municipal authorities prohibit the use of switch boxes on poles.



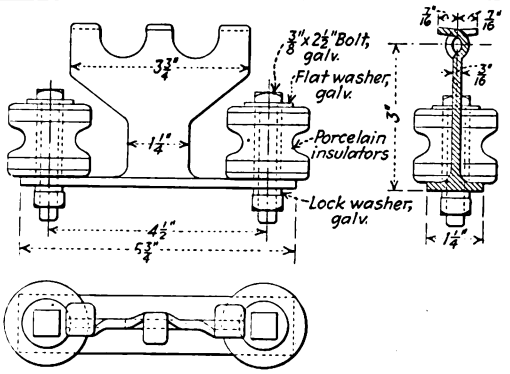
D.C. Disconnecting Switch To Be Used Under Crossarm Where Switch Box Cannot Be Used

Where city or municipal authorities prohibit the use of a box on the poles, the type of direct-current disconnecting switch shown is used under crossarm.



Assembly of No. 2 Straight Way Type Signal Wire Bracket

For carrying signal contactor wires under the span from the signal contactor to the automatic signal, the assembly No. 2 straight way type signal bracket shown is found of particular convenience.



Assembly of No. 3 Cross-Way Type Signal Wire Bracket

This is used on spans to carry either two signal wires or two telephone wires between turnouts where the same cannot be carried on crossarms due to tree interference, or they may be used between turnouts instead of installing on crossarms.

New Offerings of
Useful Equipment

Portable Oil Testing Set

FOR determining the dielectric strength of insulating oils, a new ½-kva. portable oil testing set has been brought out by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. It is mounted

New portable oil testing set

in a cast aluminum case and includes besides the transformer a double pole self-restoring push switch, control rheostat, portable plug for connecting to an ordinary 110-volt light socket, voltmeter calibrated in kilovolts, an oil test cup fitted with standard testing electrodes and a feeler gage for setting. All these are mounted on a panel at the top and inside of the case.

When making a test, the gap between the electrodes is set with the feeler gage and the cup is filled with the sample of oil to be tested. The rheostat control arm is moved forward, so as to give a gradual increase in voltage until the oil in the test cup flashes over. The rheostat control handle returns to the starting position automatically when released. The voltmeter reads the equivalent of the test voltage and the value of the oil failure is thereby observed.

Tests have shown that as little as 0.005 per cent of moisture will reduce the dielectric strength of oil to about one-half its dry strength. The N.E.L.A. recommends that oil samples from all substation apparatus and power station equipment be tested at least once every three months and that samples for distribution transformers be tested at least once a year.

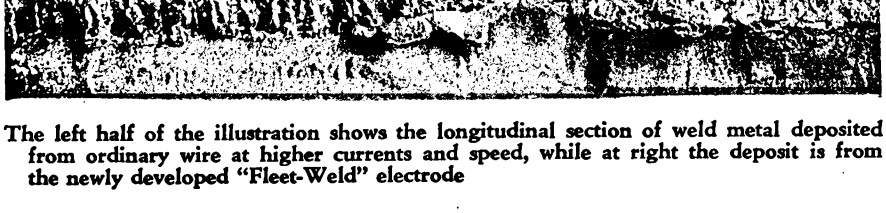
Welding Rod Increases Speed of Welding

FOR producing a dense weld of great ductility at increased welding speeds, the Lincoln Electric Company, Cleveland, Ohio, has developed a welding electrode known as "Fleet-Weld." The speed of welding has been doubled or trebled by use of the new rod and welding costs have been lowered.

The wide use of high-speed electrodes has been retarded in the past, due to the porosity obtained when the higher currents necessary for fast welding are used. The newly developed rod has overcome this difficulty. In the illustration a comparison is made of the porosity of beads laid down with the common type of wire and with the new electrode.

An incidental advantage which the new electrode offers is the smooth finish of its bead. This in part is caused by the higher speed of travel allowed by the new electrode, and also in part by the composition of the rod.

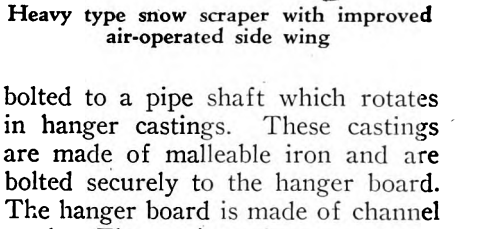
Greater ductility of the bead and deeper penetration are two of the requisites of better welding which the newly developed high-speed wire also offers. The electrode itself is an extruded wire that permits high-speed welding without loss of denseness and ductility to the weld metal. While "Fleet-Weld" electrode has so far been a laboratory product, it is expected to be commercially manufactured and placed on the market in the near future.



The left half of the illustration shows the longitudinal section of weld metal deposited from ordinary wire at higher currents and speed, while at right the deposit is from the newly developed "Fleet-Weld" electrode

Improved Scraper With Air Wing

FOR removing drifts and heavy falls of snow, a scraper with a wide blade and a side wing, operated by air, has been announced by the Root Spring Scraper Company, Kalamazoo, Mich. The springs are made of $\frac{5}{16}$-in. spring steel instead of ¼ in. used with previous types. They are



Heavy type snow scraper with improved air-operated side wing

bolted to a pipe shaft which rotates in hanger castings. These castings are made of malleable iron and are bolted securely to the hanger board. The hanger board is made of channel steel. The springs have a mould board and attachment to the scraper edge which comes in contact with the pavement. It is reversible, permitting wear on both sides.

Springs are constructed so as to hold the scraper blade to the pavement. In the event of catching any obstruction the springs are forced back, which allows the blade to pass over without injury to the car or to the scraper. The mould board is from 18 to 24 in. high, and is made from 9 to 12 ft. in length. The blade is raised by air cylinders and is also lowered and held in operating position by air.

The air-operated side wing can be attached to the truck or side sill of a car. It is 24 in. high and 6 ft. long. The wing moves the snow from the side of the track, where it is delivered by the scraper, and rolls it 6 ft. away from the car. It can be folded quickly with the car moving to pass automobiles parked along the curb, and can be extended again just as quickly.

News of the Industry

Committee on Movement of the Vehicle Considers Congestion

Meeting at the Hollenden Hotel, Cleveland, Ohio, on Dec. 17, the committee on The Movement of the Vehicle, of the Transportation & Traffic Association, proceeded to organize and discuss in a general way the subjects to be studied during the coming year. In recognition of the fact that speed is the prime requisite of good electric railway service, discussion resolved itself around the best ways and means of attaining this end. The prevalent traffic congestion in all of the larger cities of the country came in for its share of comment, as did the question of the parking of autos both in the business sections and outlying districts of cities. It was the consensus of opinion that the halting of cross-traffic at high speed thoroughfares, on which street car service was given, would result both in faster street railway service and fewer accidents.

For future study the work of the committee was divided between four subcommittees to which subjects were assigned as follows:

Committee No. 1, C. H. Evenson, chairman—parking regulations; merchants' survey of store traffic; general traffic survey; store-door deliveries.

Committee No. 2, E. D. Merrill, chairman—signals, traffic control and boulevard stops.

Committee No. 3, Joe Ong, chairman—car and coach stops, platforms and safety zones.

Committee No. 4, R. H. Pinkley, chairman—equipment for handling passengers as related to vehicular movement.

The next meeting of the committee is scheduled for March 1, 1929, in Chicago.

Among those who attended the meeting were D. L. Fennell, chairman; C. W. Wilson, vice-chairman; Paul S. Wilson, sponsor; O. A. Broten, C. H. Chapman, M. W. Cooke, E. R. Fitch, Donald Goodrich, C. H. Evenson, H. H. Hill, E. D. Merrill, J. Metcalf, William H. Lines, Joe R. Ong, R. H. Pinkley, J. C. Thirlwall, W. E. Thompson, and J. W. Welsh, general secretary American Electric Railway Association.

Exchanging Tickets in Gary

A joint tariff has been filed by the Gary Railways and the Gary & Southern Traction Company of Gary, Ind., with the Public Service Commission of Indiana asking the privilege of exchanging commutation tickets on the lines of the two systems. The Gary & Southern line, recently purchased by the Midland Utilities Company, Chicago, is being operated under the direction of the Gary Railways, which also is a subsidiary of the Midland Utilities Company. Under the proposed tariff the Gary & Southern will sell its 50-ride monthly commutation ticket form, with transfer privileges to the Gary City lines of the Gary Railways, giving passengers from Crown Point on the Gary & Southern the opportunity to use a free transfer to any first connecting zone on the Gary Railways. The charge for monthly commutation books with the free transfer privilege will be $1.50 over the present rate of $11.25.

Changes in the names of all stations between Gary and Crown Point on the Gary & Southern Traction line have also been announced by operating officials. The changes were made to identify the name of each station closely with its territory. Formerly, each station was known as a numbered stop.

Franchise Negotiations in Rochester

Active work on preparing new grant to extend present service-at-cost contract to be begun after first of year. Amendments likely

CITY officials of Rochester, N. Y., are gathering data with a view to renewal of the ten-year service-at-cost contract under which the Rochester lines of the New York State Railways are operated. The present contract remains in effect until Aug. 1, 1930, but written notice of renewal must be filed by the Mayor before Aug. 1, 1929.

It appears likely the agreement will be renewed, but it is considered equally certain that it will be amended in several particulars. For one thing, provision must be made in the new contract for operation of the new $12,000,000 city-owned subway in the bed of the abandoned Erie Canal. The railway has been operating the subway lines since Jan. 1, 1928, under an extension of the service-at-cost contract.

The contract, drafted in 1920, attracted wide attention. The city's interests are guarded by a railway commissioner. Charles R. Barnes, a veteran in the street railway industry, has held that position since the inception of the contract system. The contract guarantees the railway a 6 per cent return on its investment. The fare is determined by a balancing account. It is expected that these two features will be retained in the new contract to be made, although the valuation of the lines, which serves as a basis for the whole contract, is sure to be a bone of contention. The city has a suit in the state courts, seeking a lower valuation.

However, the litigation over the valuation of the lines will not be pressed during the life of the present contract, city officials admit. City Manager Stephen B. Story summed up the city position in these words:

> It is always possible that a revaluation may result in setting a higher valuation than now exists. The city wishes to be sure of its ground before proceeding.

City officials also are awaiting a verdict in a valuation case now in United States Supreme Court which is regarded as having a direct bearing on the Rochester situation.

Speaking for the New York State Railways, James F. Hamilton, president, has said that the railway believes a higher valuation is justified, but in the interests of harmony, is willing to let the figure stand as is.

It is expected that actual negotiations for a renewal of the service-at-cost contract will start shortly after the first of the year. City officials studying the situation include, besides City Manager Story, Commissioner Barnes and Mayor J. C. Wilson, members of the staff of the Bureau of Municipal Research.

The Holiday Spirit

NOW comes the yearly Christmas rush
With almost ev'ry trip a crush;
In ev'ry load are anxious mothers
With babes in arms, kid sisters, brothers,
All on their way to view the toys
St. Nick's prepared for girls and boys.
They'll walk about for miles and miles
Their happy faces wreathed in smiles.
But when the shopping day is o'er
They may be tired and cross and sore,
Their tempers may be sadly tried
When ready for the homeward ride,
So that's the time for us to be
Considerate; our sympathy
And any help we give will tend
To make each passenger a friend.
It's up to us to do our share
By courtesy, good temper, care—
By ev'ry kindly act in reason
To *live* the Spirit of the Season.

—JOHN E. WILKIE,
Vice-President, in Chicago Surface Lines Service Magazine.

To Resume Utility Hearings

Unless court engagements interfere, the Federal Trade Commission is expected to resume public hearings in the publicity phase of its power and gas utilities investigation early in January, according to an interim report of the commission transmitted to the Senate. Between fifteen and twenty accountants are now working in the offices of a

Digitized by Google

number of the largest holding companies, each of which controls companies in many states. They are securing data supplementary to the information called for, in the general report form sent out by the commission to utility companies.

New Brief for New York City in Fare Case

Through its counsel, Charles L. Craig, Joseph A. Devery, and Edgar J. Kohler, the city of New York has filed a "brief" with the Supreme Court of the United States in the case of the Transit Commission, etc., and the city of New York vs. Interborough Rapid Transit Company and Manhattan Railway. The brief covers 186 pages, which is considerably less than the number in its previous brief. This latter was criticized by the Supreme Court because it was too lengthy.

Contracts Not a Subject of Regulation

The new brief shows that the city makes nine points in its argument. They are as follows:

1. The contracts between the city of New York and the Interborough Rapid Transit Company are not a subject of regulation. The city of New York does not require a railroad corporation for the operation of its rapid transit railroads; an individual would do as well, and the terms which the city makes with an operator of its rapid transit system are not subject to regulation under the Public Service Commission law.

2. The power of regulaiton is never exercised except in the public's interest. It is not in the public's interest to frustrate the city's plan and policy for the distribution of its population by a low flat fare. The powers and duties of the municipal government cannot be transversed to or invested in or subordinated to the Transit Commission, a body of State officers, in disregard of the local government provisions of the State Constitution.

3. If the assumption is made that the lessee of the subway is a public service corporation, as distinguished from a private corporation, valid contracts existing between it and the city of New York fix the fare at 5 cents during the term of the lease. This contract was made under full and express legislative authority. The validity thereof and the constitutionality of such legislation have been adjudicated and sustained by the Court of Appeals of the State of New York. Where there is a contract there is no confiscation.

4. The Rapid Transit Act, pursuant to which such contracts and elevated railroad certificates were made, is a comprehensive special section, excluding any possible subordination to the public service commission law.

5. The Legislature has not at any time empowered the Public Service Commission to regulate the rates of fare agreed upon in contracts made by the city of New York pursuant to the Rapid Transit Act.

6. The decisions of the State Court in gas and street surface railway cases do not sustain the conclusion of the court below, but are contrary thereto. In particular, the decision in the so-called Garrison cases on reargument are fatal to the claims of the Interborough Company, based on the Nixon case. The city claims that the three so-called Garrison cases, 229 N. Y. 575, exclude from the control of the Public Service Commission over fares, franchises granted by municipal authority subsequent to the passage of the Public Service Commission law on July 1, 1907. The so-called Nixon case, People ex rel., City of New York v Nixon, 229 N. Y., 356, decided July 7, 1920, upheld the right of the commission to make changes in franchise conditions in certain cases.

7. There is no confiscation of public property from the present fare, in spite of the claim of the company that it is entitled to earn an 8 per cent return on all of the property owned by the city of New York, as well as on its own investment used for rapid transit purposes. The city also claims that there is no confiscation of private property through a maintenance of the present fare.

8. The elevated railroad certificates, by which permission was granted to the Manhattan Railway to build additional tracks and extensions, are affected by the same statutory authority and contract obligations as are the subway contracts.

9. There is no federal question in the case. The court below, whose decision was in favor of the Interborough Company, was imposed upon.

In conclusion, the city counsel ask that the order appealed should be reversed and that the application be denied with costs.

Season's Greetings
The Cleveland Railway Company
1928

A Railway's Attractive Message

New Board in Boston

Governor Alvan T. Fuller of Massachusetts has appointed a new board of trustees for the Boston Elevated Railway, Boston, Mass., under the public control act of the Legislature. Henry I. Harriman, president of the Boston Chamber of Commerce and chairman of the Metropolitan Planning Board, is appointed together with General Charles H. Cole, who was the Democratic nominee for Governor this year, and George B. Johnson, president and director of R. H. White Company, one of the largest department stores in Boston, recently consolidated with William Filene's Sons Company.

In addition to these three men, who will be new members of the board, the Governor reappointed Stanley R. Miller and Edward E. Whiting. The men who were dropped from the board are former Congressman Samuel L. Powers and Frank O'Hare.

Under the law the board of trustees will elect its own chairman, and it is expected that it will elect Mr. Harriman, who is one of the best informed men in the state on the subject of transportation facilities for the Metropolitan district. In accepting the appointment Mr. Harriman asked that he be relieved of his post with the Metropolitan Planning Board, and Colonel Charles R. Gow was appointed by the Governor to succeed him on that Board.

Injunction in Baltimore

The first formal step to get the fare case of the United Railways & Electric Company, Baltimore, Md., before the United States Supreme Court has been taken by the company in the filing of a petition in the Circuit Court of Baltimore. An injunction is sought to restrain the Maryland Public Service Commission from interfering should the company charge a straight 10-cent fare. Company officials explained that the petition does not mean that the United will attempt to put the 10-cent fare into effect, but is an effort to get the legal records in such shape that the case can be taken to the highest court.

Recently, the Public Service Commission, acting on a decision of the Maryland Court of Appeals, reconsidered the depreciation issue of the fare case and authorized the company to charge a 10-cent cash fare with four tokens for 35 cents. At that time the case had been appealed to the Supreme Court, but that tribunal would not consider it because it had been remanded to the Public Service Commission, and the petition was dismissed.

When the original case was taken into the Maryland Courts it was held by Judge Ulman in the Circuit Court that it was confiscatory to limit the company to an earning of only 6.26 per cent. The Court of Appeals, however, held that this was not confiscatory, but remanded the case on the depreciation issue. It was then that the Supreme Court dismissed the petition.

Another Committee on Congestion in New York

Sixty civic and business organizations have been called in consultation to consider the question of traffic congestion in New York.

A remedy is promised for next summer by a committee of 45, called the New York Citizens' Traffic Committee, organized at a meeting sponsored by the Board of Trade.

Two general plans are under consideration. The committee may urge construction of new traffic facilities, or it may devise methods for more efficient use of the streets.

W. J. L. Banham, president of the Board of Trade, suggested that the committee confine itself to the better use of existing facilities. He pointed out that Day & Zimmerman, engineers engaged by Mayor Walker, are to report in February on the cost of multiple-decked traffic thoroughfares, a tri-borough bridge, a traffic tunnel from Manhattan to Brooklyn, and a traffic tunnel running the length of Manhattan.

Philip Le Boutillier, president of the Retail Dry Goods Association, urged immediate action.

"One of the chief causes of the present situation has been the deferring of action on projects that should have been carried out long ago," he said.

Percy S. Straus, vice-president of R. H. Macy & Company, was appointed to confer with merchants and manufacturers, suggesting that they do their heavy hauling at night.

The parking problem will also be studied. The Fifth Avenue Association is opposed to absolute prohibition of parking, on the ground that it would hurt trade.

Members of the committee, which is to be enlarged later, are as follows:

Dr. John A. Harriss, former deputy police commissioner.
Logan Billingsley, president Bronx Chamber of Commerce.
Gilbert Hodges, president New York Advertising Club.
W. F. H. Koelsch, president 34th Street Midtown Association.
Col. Michael Friedsam, president Fifth Avenue Association.
Arthur H. Woods, president Automobile Association of America.
George W. Sweeney, president 42nd Street Property Owners Association.
George Daniels, president the Merchants Truckmen's Bureau.
John C. Forster, president Eighth Avenue Association.
Lee J. Eastman, president Broadway Association.
Congreve Jackson, president First Avenue Association.
Judge Alfred E. Ommen, West End Association.
Philip Le Boutillier, president Retail Dry Goods Association.
William G. Campbell, president Central Park West and Columbus Avenue Association.
William J. Pedrick, vice-president, Fifth Avenue Association.
C. E. Denney, vice-president Erie R.R. Company.
Albert Behning, president Harlem Board of Commerce.
David Robertson, president Downtown League.
Fred Muschenheim, president Hotel Men's Association.
Henry A. Wise Wood, manufacturer.
R. A. Pope, engineer.
W. W. Arnheim, merchant.
George H. Pride.
James P. Roe.
W. G. Curren, Baltimore & Ohio R.R.
Mr. Horowitz, president Thompson Starret Co.
H. G. Bragg, Automobile Merchants Association.
L. F. Loree, president Chamber of Commerce of the State of New York.
Willis H. Booth, president Merchants Association.
Peter Grimm, president Real Estate Board.
Philip D. Hoyt, first deputy police commissioner in charge of traffic.
Charles H. Tuttle, United States Attorney.
Richard E. Enright, representing the Civitan Club.
Robert E. M. Cowie, president American Railway Express Company.
Percy S. Straus, vice-president R. H. Macy & Company.
C. P. Perry, president James McCreery & Company.
J. S. McCulloh, president, New York Telephone Company.
M. S. Sloan, president New York Edison Company.
Frank Hedley, president Interborough Rapid Transit Company.
George McLaughlin, president Brooklyn Chamber of Commerce.
L. C. L. Smith, president Queensboro Chamber of Commerce.
Richard S. Childs, president New York City Club.
Jules S. Bache, banker.
John F. Galvin, chairman Port Authority.
Sol Raives, Theater Owners' Association.

How Railway Men Look as Santa Claus

Neil Funk, of the Louisville Railway, Louisville, Ky., was one of a number of business men cartooned by Paul Plaschke, staff cartoonist of the Louisville *Courier-Journal*, who ran them on a special sheet on Dec. 16, under the heading "How They Would Look As Santa Claus." Neil has been much in the limelight as a leader in Safety Work.

Grand Rapids Speaker Urges Co-ordination

Former Commissioner Edwin F. Sweet of Grand Rapids, Mich., returned to that city from the recent conference of the National Rivers and Harbors Congress at Washington, convinced more than ever of the need of co-ordination of city transport services. This he made plain in an address before the local commission in Grand Rapids. Mr. Sweet reported in Philadelphia the operating utility has pressed taxicabs and buses into service to relieve the situation, and information received from officials of that company was to the effect there was no apparent reason why a similar system could not be worked out in Grand Rapids. He said:

There is in my mind particularly an idea that perhaps such a system, working with only one overhead expense and as one corporation and under the necessary city supervision, could give better results with less expense to the public.

Outlining the increased need for transportation at reasonable cost in the years to come, Mr. Sweet recalled Herbert Hoover's statements several years ago that the population of the United States had doubled in 25 years and the country would need twice as much transportation facilities in the next 25 years.

No official action was taken upon Mr. Sweet's suggestion that a special investigating committee be appointed to gather data on the local transportation situation, but those present appeared to be in sympathy with his idea.

Activities in Cleveland

The City Council of Cleveland, Ohio, recently passed Cleveland Heights' fare franchise, providing for a rate 2 cents higher than Cleveland's fare and for extensions on Mayfield, Fairmount and Cedar Roads. The increase goes into effect as soon as extensions are completed about Jan. 1. East Cleveland already pays the 9-cent fare. Other suburbs are expected to follow.

Cleveland city and county officials have backed the plan to take all street cars off the Public Square and build a subway terminal underground there to relieve surface traffic.

Judges to Hear Decatur Fare Case

Five superior court judges have been appointed by Governor L. G. Hardman, of Georgia, to serve in the places of as many supreme court judges who recently declared themselves disqualified to hear the appeal of the Georgia Power Company from the 5-cent fare decision affecting Decatur. Only one justice of the Supreme Court—Marçus W. Beck—was qualified to sit in the case, all the others having declared that relatives owned stock in the company.

A hearing on the appeal will be held shortly.

Committee Indorsed in Chicago

The committee on local transportation of the Chicago City Council has indorsed the citizens' traction settlement committee appointed by Federal Judge J. H. Wilkerson. However, the council committee provided in its resolution of indorsement that other citizens or civic clubs should be permitted to participate in the negotiations. The purpose of the citizens' traction settlement committee is to study all interests and make recommendations.

Brooklyn City Operators Win Bonus Awards

Distinguished from their fellows by an accident-free year to their credit, 52 motormen, conductors and safety car operators of the Brooklyn City Railroad were entertained at luncheon Dec. 15, 1928, as the guests of Clinton Morgan, general manager, and, in addition to receiving their regulation bonus of $60, were presented with Hamilton railroad-model watches. Four of the number, who had operated two years without a chargeable accident and had already received watches, were presented satin-lined cases, each containing five $10 gold pieces.

After the luncheon at which the presentations were made, A. L. Hodges, assistant general manager, visited the various carhouses on the system and distributed bonus checks to other trainmen, not quite so fortunate as the 52, but enough so to have won bonuses aggregating $77,300. Of a total of 2,182 car operators on the Brooklyn City system, 2,099, or 96.2 per cent, qualified for the individual bonuses, receiving from $5 to $60 each.

This was the third bonus distribution to the Brooklyn City men, the award having been instituted Aug. 1, 1926. The 1926 bonus award was $20,770, the 1927 bonus was $71,470, and the one distributed Saturday totalled $80,600. During the year ending Nov. 30, 1928, "at fault" accidents on the property were reduced by 28 per cent compared with the preceding twelve months.

Heavy Electric Traction Committee Organizes

The first meeting of the year of the heavy electric traction committee of the American Electric Railway Engineering Association was held in New York on Dec. 14. The principal purpose of the meeting was to organize the work for the ensuing year and appoint the various sub-committees. Those present were: Messrs. Armstrong, Birch, Brown, Blake (representing Mr. Buck), Butt, Barclay (representing Mr. Cooper), Daus, Davidson, Davis, Febrey, Hagan, Healy, Huber, Grady (representing Mr. Smith), Thorp and Winship; Mr. Neff, guest; and Mr. Hecker and Mr. Baker of association headquarters, a portion of the time. The sub-committees will be made up as follows:

A review of existing manual sections: Messrs. Wells, chairman, Bosenbury, Butt, Davis, Duer, Hagan; study of track and third rail bonds for heavy traction work, Messrs. Febrey, chairman, Birch, Butt, Davis, Duer, Hagan. Thorp and Winship; branch line electrification and self-propelled cars and locomotives; Messrs. Armstrong, chairman, Bosenbury, Brown, Butt, Cooper, Davidson, Healy, Winship and Wright; articulated train operation; Messrs. Daus, chairman, Buck, Hamilton, Johnson, Smith and Wood; train make-up and terminal switching with multiple unit cars; Messrs. Wright, chairman, Brown, Butt, Hagan, Hamilton, Smith, Thorp, Vandersluis and Wells; electrified mileage and electric locomotive tonnage, Messrs. Cooper, chairman, Armstrong, Birch, Buck, Davis, Duer, Healy, Winship and Wood; third rail and overhead clearances with special reference to shipments and steam locomotive operation (if this subject is approved by the association), Messrs. Winship, chairman, Bosenbury, Brown, Butt, Davis, Duer, Johnson, Vandersluis, and Wright.

Thursday, Feb. 28, was chosen as the tentative date of the next meeting.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Jan. 4, 1929*—Metropolitan Section, American Electric Railway Association, 33 W. 39th St., New York, N.Y.**

***Jan. 14-18*—American Road Builders' Association, convention and road show, Cleveland, Ohio.**

***Jan. 15-16*—Kentucky Association of Public Utilities, annual meeting, Brown Hotel, Louisville, Ky.**

***Jan. 22*—New York Electric Railway Association, mid-winter meeting and dinner, Hotel Commodore, New York, N. Y.**

***Jan. 23-25*—Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.**

***Jan. 24-25*—Central Electric Railway Association, Claypool Hotel, Indianapolis, Ind.**

***Jan. 25-26*—Central Electric Railway Accountants' Association, Claypool Hotel, Indianapolis, Ind.**

***Jan. 28-Feb. 1*—American Institute of Electrical Engineers, annual convention, 33 W. 39th St., New York, N. Y.**

***Feb. 7-8*—Midwest Electric Railway Association, Midwinter meeting, Robideaux Hotel, St. Joseph, Mo.**

***Feb. 14*—Central Electric Railway Master Mechanics' Association, Youngstown, Ohio.**

Committee on Industrial Relations Plans Activities

At the call of Edward Dana, chairman, the committee on industrial relations of the American Association met in New York City Dec. 17 and 18. The matter of subjects to be considered during the coming year was discussed at considerable length and, with the realization that a wide range of activities must be covered, it was finally decided to perfect the organization of three subcommittees to consider the general subjects of education and training, employment and advancement, and health and safety, with J. S. Hyatt, Clint Smith and W. G. Marshall as the respective chairmen.

Among those who attended the meeting and took part in the discussions were L. P. Baurhenn, F. G. Buffe, H. H. Norris, C. W. Chase, H. H. Fenton, Edward Dana, E. C. Foreman, R. W. Emerson, W. G. Marshall, Thomas Fitzgerald, J. S. Hyatt, John Dewhurst, A. J. Sarre, Myles Lambert, A. B. Gibson. Col. W. V. Bingham, representing the Personnel Research Federation, was also present at the invitation of Mr. Dana.

Suspension Lifted on Pittsburgh Line

Service on the Evans Avenue, McKeesport route, of the Pittsburgh Railways, operated at a 3-cent fare and suspended on Nov. 27, has been restored by the railway pending settlement by the Public Service Commission of the use of the one-man cars on a route of this kind. The withdrawal of the service was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 8, 1928.

$106,000 Christmas Bonus for B.-M.T. Employees

Bonuses totalling $106,000 will be distributed shortly to 3,300 employees of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., who have earned them during the past year under the various plans to promote safety and efficiency of operation. These bonus awards are in addition to awards totalling $27,000, paid by the system in August to 1,100 employees on the rapid transit lines for efficient and courteous service.

Lease of Seattle Lines Proposed

Declaring a confirmatory vote by the people would be necessary under the city charter to legalize adoption of the plan, Karl H. Kaye, Seattle investment broker, on Dec. 10, urged the Seattle City Council to submit at the next city election an ordinance accepting the proposal of himself and associates to lease the Seattle Municipal Railway System. Accompanied by his attorney, Mr. Kaye appeared in person and urged the Council to an early decision. The matter is now in the hands of the Council franchise committee for consideration and recommendation.

Digitized by Google

Mr. Kaye and his associates are proposing to lease the municipal railway lines for 50 years, pay off the bonded debt immediately, operate the system for the term of the lease, finance necessary extensions and improvements, and then turn the lines back to the city free of indebtedness. In connection with the railway lease, however, Mr. Kaye asks for a 50-year exclusive franchise for operation of taxicabs and sightseeing cars.

"Stay Alive" Movement Will Seek 20,000,000 Members

To promote safe and careful driving and walking on public streets and highways, "The Stay Alive Club of America, Inc.," has been formed and will solicit membership from 20,000,000 registered motorists. The directors are Marcus A. Dow and Sidney H. Somerton, New York, and William Boal, Port Chester. Mr. Dow was president of the National Safety Council from 1922 to 1923. He has just written a series of talks on safety for drivers and pedestrians which are brought together in a book called "Stay Alive," reviewed in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 8. The club will be engaged in the dissemination of entertaining and instructive literature looking toward the education of the people in safety.

Free Rides in Amsterdam

A surprise "free" ride awaits the shopper in Amsterdam, N. Y., through a movement sponsored by the Merchants' Bureau of the Chamber of Commerce which will last until Christmas. On the inbound cars of the Fonda, Johnstown & Gloversville Railroad the free ride is in vogue, but is not known by the shopper until the conductor refuses her fare. One free trip is being made by all the lines from the suburban and residential sections.

Will Bid for Service in Springfield

In accordance with a decision made recently by the City Commission of Springfield, Ohio, an advertisement for proposals for a transportation system for that city will be inserted in local newspapers. In this advertisement, the City Commission will ask for proposals for electric railway, bus and combined railway and bus service. The proposals must contain terms and conditions suitable for a future franchise, and must state for how long a period of time the franchise is desired.

One of the important stipulations of the commission's request is that bidding utilities shall state the rate of fare to be charged. While the rate of fare will be taken into consideration by the commission and will be considered an essential feature of the proposal, City Commissioners indicate that the main object in asking for proposals is to secure an adequate system of transportation.

Recent Bus Developments

Merger for Brooklyn

Plan now under way would bring B.-M.T. surface routes under separate company with bus auxiliary

ANNOUNCEMENT that the Equitable Coach Company, New York, would seek modification of its franchise was made by Mayor Walker on Dec. 19, following a four-hour conference, attended by members of the Board of Estimate, Transit Commission and Board of Transportation, and officials and counsel of the B.-M.T. and the Equitable. Earlier in the day the Transit Commission suspended all proceedings in the Equitable's pending application for certificates of necessity and convenience for its franchise routes. The action was taken when the commission was notified that the petition to modify the franchise would be presented to the Board of Estimate.

The steps presage the move to merge the bus routes of the Equitable Coach Company in Brooklyn and Queens and the surface lines controlled by the B.-M.T. into a single corporation entirely divorced from the B.-M.T.'s subway and elevated lines.

The merger contract was among the documents presented to the Board of Estimate on Dec. 20. The petition for modification of the franchise, it is understood, calls for abandonment of some Brooklyn bus routes as originally approved by the Board of Estimate, and the lengthening or shortening of others.

Ultimate approval of the plan by the Board of Estimate and the Transit Commission is expected to provide the following set-up:

1. Merger of B.-M.T. trolley lines and Equitable bus routes in Brooklyn, with the expenditure of from $10,000,000 to $15,000,000 by the new surface transportation company for new cars, buses and other equipment. Bus franchise for Brooklyn to be terminable upon due notice of recapture at price representing actual investment less depreciation, with possibility that trolley car franchises may be changed to terminable type instead of being left perpetual as at present.

2. Operation of 82 miles of bus routes by B.-M.T.'s new corporation in Queens, under same type of terminable franchise, on routes not to conflict with Queens trolley car lines.

3. The Equitable to retain its franchise rights in Manhattan, where it has cross-town routes only. It is understood that the B.-M.T. is to assist in the $4,000,000 of financing required for buses, garages and other equipment.

4. The Equitable stockholders to be paid by the B.-M.T. in securities of the new corporation to the extent of actual money expended by Equitable to date, the amount to be proved at hearings before Transit Commission and not to include any valuation of the franchise rights transferred.

The New York *Times* said:

The Brooklyn City Railroad, with 208 miles of surface lines in Kings County, is left out of the agreement between the B.-M.T. and the Equitable, but the merger contemplates a combination of bus and trolley routes which will not compete with its lines. The merger contract is so drawn as to permit the fitting in of the Brooklyn City Railroad system with the merger routes in the future to make a comprehensive surface transportation layout for the borough. This prospect of ultimate merger of all Brooklyn surface lines is one factor which leads transit circles to believe that the present move is a step toward acquisition of the B.-M.T. rapid transit lines by the city, as part of the general rapid transit unification scheme.

A commentator said:

Word of the merger contract was received in transit circles as confirmation of the report, current in recent months, that the Equitable, balked in efforts to obtain sufficient financial backing and faced with the possibility of protracted litigation over the validity of the franchise and of any certificates of necessity and convenience which it might obtain from the Transit Commission, would be forced to make the best terms possible with the B.-M.T. Although the Walker Administration is not enthusiastic over acquisition of the franchise by any of the existing traction systems, it is felt that the contemplated merger, if properly safeguarded and put through under a system of terminable franchises paving the way to ultimate unification of the city's rapid transit lines, will be a forward step.

The Equitable Company's application to the Transit Commission for certificates of necessity and convenience met with strong opposition from the B.-M.T. in a long series of hearings before the Transit Commission. That body reached a decision on Nov. 15, but deferred announcing it when informed that the Equitable and B.-M.T. were negotiating over route allocations.

Detroit Jitneys Threaten to Come Back

Jitneys are again appearing on the streets of Detroit under the guise of the Michigan Mutual Auto Owners' Service Corporation. The new company was formed according to a scheme originated by Edward N. Barnard, who acted as counsel for the jitney organizations during the six-year fight which intervened between the time of the passage of the jitney ordinance and the recent Supreme Court decision which upheld the city's right to oust the jitneys. The plans of the corporation were outlined by Mr. Barnard in a talk over the radio. It is intended to return practically all of the former jitneys to their respective runs, unless some step is taken by the city to prevent such action.

All of the jitneys, it was announced, had been transferred to the new corporation. A chauffeur and garage service are to be provided for each car, these items to be supplied by the corporation.

Digitized by Google

No fare is charged for riding on the jitneys but in lieu of collecting fares, the corporation is offering for sale membership cards which entitle the holders to ride at any time without further payment. Thus no money will change hands in the jitneys. Instead the passengers merely show their membership cards before boarding the jitneys. The charge announced for membership is $5 a month.

This charge is based upon the assumption that regular riders formerly paid at least 20 cents per day for a round-trip ride. All ticket holders are considered members of the corporation, and are regarded as joint owners of the automobiles which can be used only by those holding tickets. It is planned to change the color of membership tickets each month.

The vehicles being used are the same automobiles formerly owned and operated by the members of the Blue Ribbon and the Red Star Motor Drivers' Associations.

Mr. Barnard, their sponsor, says that with the automobiles the property of the participating members, he has made them private cars, and that it will not be necessary for them to have licenses as common carriers. It is further contended that efforts to bar the cars of the corporation from the streets will be nothing short of class legislation.

No efforts have been made by the Detroit Police Department to stop the limited number of white cars that have been put back on their routes, but only a few passengers are being carried. The matter of the next step to be taken by the city rests with Corporation Counsel Clarence E. Wilcox.

Pending Settlement Would Discontinue St. Louis Line

Permission has been sought by the St. Louis Public Service Company of the Missouri Public Service Commission to abandon temporarily its bus service connecting Maplewood, Webster Groves and Kirkwood, Mo., via the Big Bend and Manchester Roads. The commission on Nov. 2, ordered the De Luxe Bus Company, which was operating over the same route, to suspend operations. That company has ignored the commission's order and is running buses in competition with the St. Louis Public Service Company fleet. As a result, the bus line is costing the railway $165 a day more than receipts. The company wishes to suspend operations until the St. Louis Circuit Court has passed upon the right of the De Luxe company to continue in business over the route.

Bus Changes in Boston

The Boston Elevated Railway, Boston, Mass., started operating an additional bus line on Dec. 16 and changing the route of another. Fares are four tickets for 25 cents without transfer privilege and a 10-cent fare with transfer privilege.

Sale of Gary Bus Project Being Arranged

Negotiations for the purchase of the Midwest Motor Coach Company of Gary, Ind., by a new corporation headed by Charles W. Chase, president of the Shore Line Motor Coach Company, are well under way. The Shore Line Motor Coach Company is controlled jointly, through common stock ownership, by the Chicago, South Shore & South Bend Railroad and Gary Railways, both of which lines are subsidiaries of the Midland Utilities Company, Chicago. The Shore Line system is composed of approximately 230 route miles with through service provided between Chicago and Benton Harbor, Mich., and local service in northwestern Indiana. The Midwest Company operates a fleet of coaches between 63rd Street, Chicago and Whiting, Indiana Harbor and Gary. The proposed purchase has not yet been approved by the Indiana Commission.

Mr. Chase announced that the Midwest Motor Coach Company would be operated as a separate unit if the negotiations are successful. Both companies would continue to operate coaches between Gary and 63rd Street, Chicago. The service would be coordinated, however, for the benefit of the traveling public.

In arrangements for the purchase, Mr. Chase said he was acting in an individual capacity. It is understood that the proposed purchase does not involve outright acquisition of the securities of the Midwest company but only its physical assets and coach equipment.

The Shore Line company holds a franchise from the Indiana Commission to carry passengers on its Gary-Chicago route only between points in Indiana and destinations in Illinois. The franchise held by the Midwest company, on the other hand, permits it to handle local business within the state of Indiana as well as interstate traffic. Last summer the two companies became involved in a rate war which reduced through fares nearly 50 per cent.

Formal Franchises Asked for Syracuse Buses

Formal petitions for franchises for bus lines, instead of the yearly permits now in vogue, were presented to the Common Council of Syracuse, N. Y., recently and referred to the franchise committee without reservation. They bring nearer the effort which the bus owners have been making to better their financial standing by obtaining perpetual grants. If new grants are made on the new basis, they may mean a 7½-cent ticket and a 10-cent cash fare on the motor lines, as is charged on the trolleys.

Application for a fifth line, to serve the eastern part of the city, has been made by Benjamin E. Tilton, vice-president of the New York State Railways. In return for the perpetual rights, the bus lines agree to cover 10 additional miles on the four routes now in operation in addition to the proposed new line east.

They also declare that they will buy twelve new buses to add to the nineteen now in use. The railway has spent nearly $170,000 for bus equipment.

Express Service Planned on Jacksonville Line

The permit granted by the City Council to the Jacksonville Traction Company, Jacksonville, Fla., for the operation of a bus line from Laura and Forsyth Streets to Avondale and Murray Hill will be signed and become operative when the company files the necessary bond with the city recorder. According to J. P. Ingle, manager, the company plans to operate large capacity buses on the line and to give express service to residents of Murray Hill and Avondale to the downtown section of the city.

Pennsylvania Company Issues Complaint

Complaint against the Tri-State Motor Freight Company, of Philadelphia, alleging it is operating between Philadelphia and Easton and Allentown and Bethlehem without a certificate of public convenience was filed with the commission by the Lehigh Valley Transit Company, Allentown, Pa.

Pittsburgh Railways to Expand

Under plans made known through presentation of petitions to the Public Service Commission in Harrisburg, the Pittsburgh Railways and its subsidiary, the Pittsburgh Motor Coach Company, expect to operate the street cars and motor buses of other companies along the Monongahela River, including areas nearly 50 miles from this city. If approved by the commission, the change will be effective Feb. 1. More than a dozen large towns and villages in the upper valley will be affected. Coordination of suburban transportation facilities in the Monongahela valley is sought, it was declared as part of the company to provide "more adequate service."

The petitions seek approval by the commission of agreements whereby the Pittsburgh Railways would operate the West Side Electric and the Webster, Monessen, Bellevernon & Fayette City Street Railways.

The Pittsburgh Motor Coach Company asks permission to operate the West Side Motor Transport Company. Four motor coaches and a number of street cars, the latter operating on about 32 miles of trackage, are said to be involved.

The move for operation under this plan was said to have been made at the solicitation of the smaller companies. By co-ordinating schedules, local railways men held, better service could be provided without additional cost.

Digitized by Google

Interstate Bill Introduced

New measure introduced by Representative Parker requires certificates of convenience and necessity

A NEW bus bill, to replace the one lost at the last session of Congress, was introduced in the House on Dec. 20 by Representative James S. Parker of New York, chairman of the interstate and foreign commerce committee.

The new measure differs from the old one mainly in the requirement of certificates of "public convenience and necessity" for interstate bus lines and the filing of applications with the Interstate Commerce Commission.

Closer appreciation of each other's problems was reflected in the agreement recently reached on the draft of the suggested bill. Four major changes mark this draft when compared to the Parker bill. Most important is the method of considering and granting certificates of convenience and necessity. Next to that in significance is the agreement upon Nov. 1, 1928, as the date for the grandfather clause. Third is the inclusion of a declaration of policy concerning administration which states that nothing contained in Sec. 500 of the transportation act of 1920 shall be construed to express a policy of Congress in favor of any form of transportation by motor vehicle, or to affect the issuance of a certificate for a bus company deemed proper in the public interest after all pertinent facts and circumstances have been duly considered on their merits. And last is the exemption of interstate motor carriers from the provisions of the Clayton anti-trust act, which makes illegal the consolidation of competing interstate lines. This latter idea applies to two or more motor carriers as well as to a railroad and a motor carrier.

In brief, the new method of considering and granting certificates gives the primary jurisdiction to representatives of the state commissions. However, they act as federal agents, thus reducing greatly the possibility of the measure being unconstitutional.

Under the new draft an application for a certificate would be made to the I.C.C. This body would refer it to a joint board consisting of a representative from each of the states in which the route lies. This representative would be designated by the state commissions either from its own membership or staff, or from the membership or staff of another state commission which is interested in the proceeding. If any state (or states) fails to designate a representative, the joint board would function without him. If no representatives were designated by any of the states, the I.C.C. would hear the case.

Each joint board would decide the matter referred to it. The decision would be filed with the I.C.C. Barring appeals the commission would issue an order or certificate in accordance with the decision of the joint board. If the latter should fail to reach a decision on an application or fail to hear the case within 60 days, the entire matter would then come before the commission for definite action.

Contentions in Burlington Upheld

The Vermont Public Service Commission upheld the Burlington Traction Company, Burlington, Vt., recently on all of its objections and refused to grant a bus petition to W. S. Appleyard. At two hearings the company contended before the Public Service Commission that the proposed bus line would be in direct competition with its own route in the South Union and Pine Streets section of the city. It also brought out that 3.3 miles of the proposed line would parallel the tracks of the railway.

William S. Appleyard, who would operate the buses, said that the line was a public necessity since the public wished to ride in buses.

Confessions of a Taxi Driver

"IN ORDER for a taxi to take in any money, it is necessary to keep wheeling all the time that one is on duty. I work from about 10 a.m. to 3 a.m. every morning.

"We were instructed to run on the street car lines and drive very slowly past each corner, as our street pickups were a large percentage of our business. The best stands are located at the corners and (after 10:30 p.m. we could stand all our cars on the street, procuring many more loads from people waiting for street cars) and opposite the theater which is close to —— and —— streets.

"Other business consists principally of people who are regularly street car riders going to and from business. There are very few tips from this type. This type of clientele was largely the working class of people with the exception of our night business.

"However, as one owner quits, there seems to be two to take his place, they assuming that they can well compete with street car service. This same assumption brings forth jitney competition. Why is it allowed?

"I have learned that this jitney and taxi competition in small towns has caused the abandonment of street car operation. I have also learned that due to this competition, certain factors of street railways in large cities have been lopped off. Of course, this results in a greater expense to those whose work and business requires purchased transport means. How long will it be before wage earners and others of industrial communities may tumble to these facts?"—*Motorman, Conductor and Motor Coach Operator.*

Substitution Planned in Connecticut

The Connecticut Company, New Haven, Conn., has petitioned the Public Utilities Commission to discontinue railway service between Torrington and Winsted and between Thomaston and Waterbury. Permission is also sought to cease service in Portland and across the Connecticut River Bridge from Portland to Middletown. The latter service will be replaced by bus transportation to operate from the Gildersleeve post office to Hillside Avenue, South Farms. All three lines have been operating at an increasing loss despite efficient and economic operation, according to the company.

Wants Proposals for Operation in Buffalo

Mayor Frank X. Schwab of Buffalo is asking the International Bus Corporation, a subsidiary of the International Railway, Buffalo, N. Y., and other interests to submit proposals for the operation of buses over a route which would connect the new terminal of the New York Central Railroad with the principal downtown hotels, a distance of almost 3 miles. The Mayor says he will recommend to the City Council the granting of a franchise to the company which will operate buses at the lowest rate of fare. The new passenger terminal of the New York Central will be completed and placed in operation about April 1, 1929. No street car or bus lines now reach the section of the city in which the station is being built.

Rights of Roads on Bus Operation Upheld

The operation by a railroad of a subsidiary bus line without the authority of the Interstate Commerce Commission is permissible under the present law and does not constitute a violation of the interstate commerce act, in the opinion of Examiner Leo J. Flynn.

Dealing with a complaint of an Oregon bus company against the practices of the Spokane, Portland & Seattle Railway in operating a subsidiary bus line, Examiner Flynn reported to the commission that the jurisdiction of the federal body does not cover truck or bus service which extends beyond terminal districts and becomes what is commonly designated as a line haul and which may in effect act as an extension of the lines of the carrier.

The Spokane road, the report explained, organized a new company called the Spokane, Portland & Seattle Transportation Company, which operated a bus line between Portland and Astoria, Ore. All of the capital stock of the transportation company is owned by the railroad. The competing bus line charged in its complaint that the railroad had violated the interstate commerce act by extending its lines (through the bus service) without seeking government permission.

Financial and Corporate

Passenger Revenue from Madison Fares Increases

Gross passenger revenue from fares of the Madison Railways, Madison, Wis., for November, 1928, showed an increase of $289 over the total reported for a similar month last year. The total for the month this year was $36,700 compared with $36,410 reported a year ago. Railway revenue alone for the month showed a decrease, with only $31,571 reported for November this year compared with $32,246 reported a year ago. Passengers carried on street cars at Madison during November totaled 416,669. This represented fewer passengers than the average for a similar month during the four years between 1920 and 1924 when 592,598 passengers were carried.

Further Steps in Omaha Bridge Negotiations

Stockholders of the Omaha & Council Bluffs Street Railway are shortly to pass on the question of what price will be fixed for the purchase of the bridge across the Missouri River connecting the two cities. The company also holds title to the lines in the Iowa City. The disposition of these lines is of moment also, because without the bridge and without their operation, in connection with the Omaha lines, they probably could not be operated except at a loss.

Some stockholders who have been interviewed on the proposal say that they should be paid the par value of their stock. This is $1,500,000, and the sale made subject to the $2,000,000 bonds, callable at $2,100,000, as well as the lien of $893,000 held by the Omaha company. The stock has been paying a 4 per cent dividend, because of the $60,000 yearly bridge rental paid by the Omaha company, and has been quoted at $25.

Mayor Dahlman of Omaha says that the joint commission named by him and Mayor Green of Council Bluffs will take no action until after the first of the year. Meanwhile, the commission is gathering necessary data for a new bridge and also a statement of the cost, revenues and operation of the present bridge. Bills are being framed by the corporation counsel for passage by Congress and the Iowa and the Nebraska Legislatures, that will give the cities power to construct or buy a bridge across the interstate stream.

President Shannahan holds that the question of purchasing the present bridge should be settled before others are negotiated. He says the railway would prefer to retain ownership because it cannot hope to receive as its share of any sale price, any amount that will compensate for the $200,000 a year net the lease brings, but being an Omaha institution it must be ready to sacrifice something in allowing the people to have what they wish. That sacrifice must be kept as low as possible, however, because whatever is lost in bridge revenues to the railway might have to be made up in rates. This year more than $100,000 of the net profit on the lease, for which the company pays $60,000 a year, was used to pay interest on railway bonds.

Suburban Road in New York Does Better

A marked reduction both in operating revenues and in operating expenses characterized the operations of the Auburn & Syracuse Electric Railroad, Syracuse, N. Y., for the quarter ended Sept. 30, over those of the corresponding period the preceding year. Here are the comparative figures:

	1927	1928
Railway operating revenues	$92,497	$49,874
Railway operating expenses	82,093	31,846
Net revenue, railway operations	$10,404	$18,028
Taxes assignable to railway operations	4,689	912
Operating income	$5,714	$17,116
Non-operating income	608	487
Gross income	$6,322	$17,604
Total deductions from gross income	22,472	22,472
Net corporate loss	$16,151	$4,869

Increase in Capital Stock of Indianapolis Company

The officials of the Interstate Public Service Company, Indianapolis, Ind., have filed papers with the secretary of state showing an increase in the capital stock of 125,000 shares of no par value common and $2,500,000 preferred.

Merger Sought for Worcester Companies

Approval has been given by the Massachusetts Public Utilities Commission to the petition of the Worcester Consolidated Street Railway, Worcester, Mass., to take over the property and franchises of the Worcester & Shrewsbury Street Railway and the Worcester & Shrewsbury Railroad. The tracks of the two companies connect with the tracks of the Worcester Consolidated and are leased by them.

Recent hearings disclosed that all the common stock of the three companies is held by the New England Investment & Security Company. Bentley W. Warren stated that a merger was desired to eliminate the cost of rental of the tracks of the two small companies and to bring about a single organization. The two Worcester-Shrewsbury companies concurred in requesting the merger.

More Shares of St. Louis Stock to Be Offered

The St. Louis Board of Estimate and Apportionment has voted to sell 15,820 shares of St. Louis Public Service Company stock to provide funds with which to complete the Civil Courts Building now under construction. Previously the city sold 400 shares of the stock at $83 a share. A minimum of $80 a share is placed on the 15,820 shares.

Brooklyn Income Decreases Slightly

For the five months ended Nov. 30, 1928, total operating revenues of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., were $20,000,198 against $19,551,991 for the five months ended Nov. 30, 1927. Total operating expenses increased from $12,840,031 to $13,142,902 for the current year. After the consideration of total income deductions, the net income for the five months' period of this year was $2,432,231. This compares with $2,460,432 for the period ended November, 1927.

Part Payment of Denver Preferred Dividend

The Denver Tramway Corporation, Denver, Col., has declared a quarterly dividend of 75 cents a share on its preferred stock, which is at the rate of only 3 per cent whereas the stock calls for 7 per cent. The directors say:

Any increase in the dividend is not warranted just now. At the time the statement of earnings and expenses for the nine-month period, Jan. 1 to Sept. 30, was given to the public, it was accompanied by the announcement that operating revenue for the period had decreased $67,843 and that operating expenses for the same period, due to strict economy and the fact that maintenance was subordinated to a reconstruction program, and in some instances, deferred, had decreased $90,365.

Operating revenues continue to show a decrease, but it is the opinion of the officers and the board that the curtailment in expenses cannot be continued for any sustained period without detriment to the property and public service. Any increase in the dividend under these circumstances is not warranted until such time as there is an adjustment which will result in increased operating revenue. Furthermore, sinking fund requirements approximating $225,000 per annum, which must be met to prevent defaults in mortgages securing bonds, must also be considered in arriving at the net income.

Partial Discontinuance in Connecticut

Discontinuation of railway service between Rockville, Conn., and Martin's Corner has been announced by the Connecticut Company. Service will be maintained between Rockville and West Bridge, Snipsic Lake, on reduced schedule. Four trips to this point will be made daily, except Saturday when only one trip will be made. There will be no service at all on Sunday.

Cincinnati Railway Holdings to Car Company Owners

As noted elsewhere in this issue stockholders of Cincinnati Car Company have approved terms of merger with Versare Corporation, Albany, N. Y., into a new company, the Cincinnati Car Corporation. From the deal there will be excepted 89,661 shares of Cincinnati Street Railway stock, ownership of Cincinnati Traction Building Company and earnings and profits of Cincinnati Car Company for 1928. The stockholders of the Cincinnati Car Company have authorized the distribution of Cincinnati Street Railway stock to Cincinnati Car Company stockholders, also the formation of the Cincinnati Traction Building Company, a holding company.

Additional Directors for Engineers Public Service

The directors of the Engineers Public Service Company recently elected as additional directors, W. Cameron Forbes, partner of J. M. Forbes & Company of Boston and Governor General of the Philippines under President Taft, and Thomas N. Perkins of the Boston law firm of Ropes, Gray, Boyden & Perkins. Both men have been connected with the Puget Sound Power & Light Company, recently acquired by Engineers Public Service, for more than 30 years and are now among its directors. The properties controlled by the company include the Virginia Railway & Power Company, operating in Richmond and other cities in Virginia.

Strang Line in Receiver's Hands

An interurban, the Strang line, operating between Kansas City and Olathe, has gone into receivership because of inability to meet interest payments on second mortgage bonds. The application for receivership was made by the Fidelity National Bank & Trust Company, trustees for the second mortgage bondholders. Judge George T. McDermott, of the Federal Court in Kansas City, Kan., appointed George A. Clark, Topeka, receiver and J. F. Rhodes, Kansas City, attorney for the receiver. In January, 1927, the company was compelled to default in the payment of interest on its bonds. Increasing use of the private automobile by people living along the line is blamed for the shrinkage in revenue.

The company was incorporated in 1905 by the late W. B. Strang as the Missouri & Kansas Railway. It soon came to be better known as the Strang line. The company is capitalized at $1,777,000 of which $1,000,000 is in stock, $500,000 in first mortgage bonds, and $277,000 in second mortgage bonds. Thomas Riley, builder of the road, has been vice-president and general manager since its completion. Mr. Strang died several years ago, but it is understood his estate retained stock in the company.

The company lists physical assets of 22 miles of tracks and a right-of-way extending from the western city limits of Kansas City to Olathe; five passenger coaches; two freight cars, shops and carhouse at Overland Park.

Providence Company Would Issue Securities

Petitions by the United Electric Railways, Providence, R. I., for the issuance of stocks and bonds to reimburse it for for capital expenditures have been filed with the Public Utilities Commission.

The United Electric Railways, in one petition, seeks authority to issue $265,800, principal sum, prior lien mortgage 25-year 6 per cent gold bonds; $60,000 general refunding mortgage 30-year gold bonds and 170,200 shares of common capital stock.

Another petition by the same company seeks authority to issue $280,000 principal sum prior lien mortgage 25-year 6 per cent gold bonds, and 500,000 shares of common stock to reimburse its treasury for like purposes.

Anticipated Returns in Portland

Passenger revenue of the Cumberland County Power & Light Company, Portland, Me., for September, 1928, was $97,025 against $93,294 for a similar month a year ago. In October, 1928, passenger revenue was $100,025 against $93,611 for October, 1927. These figures reflect the anticipated results of the fare increase which became effective on July 1, 1928, and show an improvement over the July returns on the higher fares. In that month revenues increased 4½ per cent.

Rates provide an initial cash fare of 10 cents for a two-zone ride or less, and a 5-cent cash fare for each additional single zone. School tickets are on the basis of 5 cents for a continuous ride of three zones or less and are valid for a two-zone ride or less.

Discontinuance on One Chattanooga Division

Upon petition to the Tennessee Railroad and Utilities Commission, the Chattanooga Traction Company was granted permission to discontinue service on the Woodland Heights division, effective Feb. 1, 1929. The petition set out that the railway was losing $400 monthly in the operation of the line.

Market Street Earnings Hold Up

H. M. Byllesby & Company announce that net earnings, including other income of the Market Street Railway, San Francisco, Calif., for the twelve months ended on Nov. 30, were $1,465,949, compared with $1,644,323 for the previous year. Gross earnings were $9,795,829, against $9,827,296.

Holding Company Organized by Delaware & Hudson

The Delaware & Hudson Railroad has been incorporated in New York State by the Delaware & Hudson Company to own and operate the railroad properties of the Delaware & Hudson. Organization of the new company follows authority granted to the directors by shareholders to segregate the railroad assets into a new corporation, all of whose stock would be owned by the Delaware & Hudson Company. Completion of the latest step will leave the Delaware & Hudson Company strictly a holding corporation, owning all of the stocks of the two operating companies which will run the coal and rail business and owning stocks in electric railways and other enterprises.

Under its old charter granted more than one hundred years ago, the Delaware & Hudson Company has been operating by an act of the New York State Legislature. Its rail operations under this charter, according to L. F. Loree, president, have been restricted more than those of companies running under the general railroad law of the state.

The Delaware & Hudson Company is not selling to the new corporation its miscellaneous properties. The new company, parceling the railroad lines separately, would make it more feasible for the Delaware & Hudson to dispose of its railroad interests if such appeared best in the settlement of the Eastern consolidation plan.

In the wake of the additional news of the proposed segregation of the properties of the Delaware & Hudson Company comes the statement that the company will shortly announce the sale of its system of electric railway properties in northern New York State. The Delaware & Hudson entered the electric railway business at about the same time the New Haven did, although on a much smaller scale. It is said to be the desire of the management to dispose of these properties, now that earning power is being shown by the electric railways following the increase of the fare in the Albany district to 10 cents and the abandonment of some of the unprofitable interurban mileage.

The Delaware & Hudson Company now owns the United Traction Company of Albany. This system with subsidiaries controls more than 216 miles of electric railway serving the cities of Albany, Cohoes, Rensselaer, Troy, Watervliet, Glens Falls and Ballston. In addition, the company owns half the stock of the Schenectady Railway, the other half being owned until recently by the New York Central Railroad.

This electric railway system constitutes one of the most important in the State from the point of view of mileage. The liness were acquired in 1905 by the Delaware & Hudson, and represented an initial investment of approximately $14,500,000. Later, large advances were made by the parent company to help develop these lines and meet their fixed charges.

Personal Items

J. H. Morgan Appointed Auditor in Detroit

John H. Morgan, Detroit City Statistician and former member of the Michigan State Tax Commission, has been appointed auditor of the Detroit Department of Street Railways, by the street railway commission. It has been announced that the auditor will retain his position as city statistician. Mr. Morgan, the commission announced, will make a financial survey of the Detroit Street Railway, the first step toward an up-to-date audit being a complete appraisal of the property. This, it is expected, will require several months. Mr. Morgan has had extensive experience in auditing utilities, including the Detroit Edison Company, Michigan State Telephone Company and the Detroit City Gas Company.

The audit made by Price, Waterhouse & Company, covering the conditions of the Detroit Street Railway system up to June 30, 1928, is to be brought up to date by Mr. Morgan, using the same methods employed in auditing private utility companies. Several audits have been made in the past by Price, Waterhouse & Company, differing from those of the Detroit Street Railways' auditor on the manner of figuring depreciation. The different methods of approach to this problem have been the subject of discussion previously in the ELECTRIC RAILWAY JOURNAL. They are a matter of interpretation of the conditions under which the system is run.

Employee Elections in Buffalo Co-operative Association

Robert H. Gilbert, Niagara Falls, a motorman on the Niagara Falls high-speed line division of the International Railway, Buffalo, N. Y., was elected president of the International Railway Employees' Co-operative Association for 1929, at the annual meeting of the organization held in Buffalo. Isidor Spati, air compressor repairman in the mechanical department at the Cold Spring station, was elected vice-president.

Changes in El Paso

H. C. Webb, Jr., sales manager of the El Paso Electric Company, El Paso, Tex., since March, 1927, has been transferred to the Virginia Electric & Power Company as sales manager at Richmond. In this capacity he has served at Baton Rouge and at Lake Charles as superintendent of sales of the Gulf States Utilities Companies.

J. H. Warden returns to El Paso to fill the vacancy caused by the withdrawal of Mr. Webb. At the time of his transfer to Lake Charles, La., in March, 1927, he was acting sales manager at El Paso. He also has had considerable experience with other Stone & Webster properties.

R. B. Stearns to Devote Time to Personal Interests

When Robert B. Stearns, vice-president, general manager and treasurer of the Eastern Massachusetts Street Railway, Boston, Mass., resigns on Jan. 15, 1929, he hopes to avoid a lot of

R. B. Stearns

the pressing details of business activities, but by no means does he plan on being idle. As indicated previously in the JOURNAL, Mr. Stearns will continue as a director of the company. The effective date of his resignation coincides with the date of expiration of the ten-year public trusteeship. Mr. Stearns has managed the property during these entire ten years; in fact, he went with the road in the summer of 1917 from a long and varied street railway experience in the Middle West.

The Bay State Street Railway, which was the predecessor of the present Eastern Massachusetts Street Railway, was already headed for receivership when Mr. Stearns took charge in the summer of 1917. In December of that year the road did go into a receivership and in June, 1919, it passed under the control of a board of five public trustees. Mr. Stearns brought to this system modern methods and has witnessed—indeed has taken the most prominent part in achieving—the entire transformation of the Eastern Massachusetts Street Railway from a bankrupt system extending throughout the entire eastern part of Massachusetts to one now in most excellent physical condition, with restored finances and greatly improved *esprit de corps*.

It will be recalled that under the supplementary public control extension act, which has been accepted by stockholders of the Eastern Massachusetts, a new board of three public trustees will be appointed by the Governor to operate the road for five years dating from next Jan. 15. One of the first important duties of the new board will be to select a successor to Mr. Stearns.

It is generally agreed that in leaving the road after giving practically his entire time to it during the past eleven years, Mr. Stearns does so with the present physical and financial condition of the company in a highly satisfactory condition.

Hoover to Name Seven to Interstate Commerce

Before he leaves the White House President Coolidge must name two members to the Interstate Commerce Commission and a third named as a recess appointment must be confirmed by the Senate. Claude R. Porter, Iowa Democrat, a lawyer formerly with the Federal Trade Commission, was appointed by the President to fill the unexpired term of Henry C. Hall, ending Dec. 31, this year. Patrick J. Farrell, former counsel for the commission, has not been confirmed yet as commissioner. The term of Clyde B. Aitchison, Republican lawyer, of Oregon, appointed first in 1917, expires this year.

At the end of 1929 the terms of Joseph B. Eastman and Richard V. Taylor expire. Mr. Eastman was appointed from Massachusetts by President Wilson. He is regarded as the leader of the "liberals" on the commission. Mr. Taylor, appointed from Alabama by Mr. Coolidge, is the only former railroad executive on the commission.

In 1930 the terms of Thomas F. Woodlock and Frank McManamy end. Mr. Woodlock is a Coolidge appointee. He has frequently dissented from majority rulings of the commission. Mr. McManamy, a Democrat, was appointed by Mr. Harding.

Johnston B. Campbell and Balthasar H. Meyer are slated to retire at the close of 1931. Mr. Campbell, another Harding appointee, is a lawyer from the state of Washington. Mr. Meyer, economist and professor, has been with the commission since he was appointed by Taft in 1911.

Only one commissioner's term ends in 1932, that of Ernest L. Lewis, former newspaper writer, appointed from Indiana by Mr. Harding and reappointed by President Coolidge in 1925. Ezra Brainerd, appointed by President Coolidge to succeed Commissioner J. J. Esch, will be in until 1933.

D. E. BELL, general manager of the St. Helens Corporation Tramways, England, has been appointed general manager of the Yorkshire (Woollen District) Electric Tramways.

Paul Shoup Heads Southern Pacific

Official long directing head of Pacific Electric Railway and other railways operating 1,500 miles of electric railway made president of western railroad empire

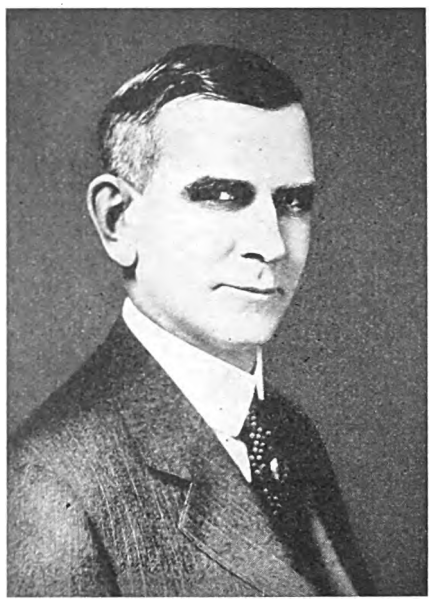
PAUL SHOUP, vice-president of the Southern Pacific Railway, president of the Pacific Electric Railway, first vice-president of American Electric Railway Association and an officer of the electric railways controlled by the Southern Pacific, has been elected president of the company to succeed William Sproule.

Announcement to this effect caused very little of a stir. For this there is very good reason. Toward the post to which he has been elected, Mr. Shoup, it has long since been recognized, was directly headed. He has been with the Southern Pacific since 1891. Over the years his advance was not spectacular, but he climbed from post to post, being signally honored on July 11, 1918, when he was elected a director, vice-president and assistant to the president of the Southern Pacific Company. While his election made him one of the highest officials of the Southern Pacific, Mr. Shoup did not sever his connections with the Pacific Electric Railway, of which at that time he had been president since 1912. He was the executive representative of the Southern Pacific Company on the Pacific Coast with headquarters in San Francisco. He also continued to have general supervision over the Pacific Electric Railway and at that time succeeded William Sproule in connection with the various corporations in which the Southern Pacific Company is interested.

As president of the Pacific Electric Railway, in which he succeeded William F. Herrin, Mr. Shoup has been responsible for the management and operation of one of the largest systems of city and interurban lines in the United States. The properties embrace 1,060 miles of road, with very diversified service. They are known particularly for their high-grade service and for their excellent personnel.

Prior to 1912 Mr. Shoup was vice-president of the lines. Before becoming connected with the Pacific Electric Railway he was assistant general passenger agent of the Southern Pacific Company. He entered the service of the Southern Pacific Company in 1891 as a clerk in the office at San Bernardino, Calif. When the narrow-gage railroad between Riverside and San Bernardino went into the hands of a receiver, Mr. Shoup was practically in charge, and he is said to have been largely responsible for converting the road into a paying investment. Mr. Shoup next entered the passenger department of the Southern Pacific Company. Soon thereafter he went to San Jose as district freight and passenger agent of the road. He went to Portland, Ore., later and reorganized the freight department of the Southern Pacific Company in that city.

From December, 1908, until April, 1910, Mr. Shoup gave his time to the interests of the late E. H. Harriman in California not related to the Southern Pacific Company. Prior to his election as vice-president of the Pacific Electric Railway Mr. Shoup was assistant general manager of the Southern Pacific Company, in charge of its electric lines in California, which included the Los Angeles-Pacific Company and Peninsula Railway, San Jose.



Paul Shoup

In addition to being president of the Pacific Electric Railway, Mr. Shoup at the present time holds among other electric railway offices those of president of the Visalia Electric Railroad, vice-president of the Fresno Traction Company, vice-president of the Northwestern Pacific Railroad and president of the Stockton Electric Railroad. The electric railway systems of which he is an officer, operate about 1,500 miles of track.

MACK NOMBURG, newspaper man, was appointed as assistant secretary to the New York Transit Commission recently to succeed George Wood. Mr. Nomburg was on the staff of the New York City News Association.

R. HOGGARD, formerly general manager of the Lincoln Corporation Tramways, England, has been appointed general manager of the Chesterfield Corporation transport undertaking succeeding W. G. Marks, who was recently appointed general manager of the Nottingham Corporation Tramways. The Chesterfield undertaking was recently converted from tramway to bus. Mr. Hoggard's previous experience includes positions with the tramway undertakings of Sheffield, Wigan and Lincoln.

"Success" to Virginia Men

In the November issue of *Vepcovian*, the official publication of the Virginia Electric & Power Company, Richmond, Va., best wishes and good luck are heaped upon J. Frank McLaughlin, Tom P. Walker and Joseph Bowes, whose promotions were referred to in ELECTRIC RAILWAY JOURNAL, issue of Nov. 17. Mr. McLaughlin has been promoted from vice-president in charge of operation at Richmond to district manager of the Stone & Webster properties in Texas, Louisiana, New Mexico and vicinity. Mr. Walker, formerly vice-president of the company in the Norfolk district, succeeds Mr. McLaughlin. Joseph Bowes goes from the El Paso district to the Norfolk district as vice-president of the company.

Change in Louisville Legal Staff

Charles W. Milner was elected general counsel of the Louisville Railway, Louisville, Ky., at a recent meeting of the directors and also a director and a member of the executive committee. He was formerly assistant general counsel. He succeeds Churchill Humphrey, who has tended his resignation to the board after serving as general counsel since 1920.

Mr. Milner is a native of Atlanta, Ga. In 1909 he received the LL.B. degree at the University of Louisville. He is a member of the law firm of Humphrey, Crawford and Middleton.

OBITUARY

JOHN J. APPEL, vice-president of the Indianapolis Street Railway, vice-president of the Terre Haute, Indianapolis & Eastern Traction Company, director of the Terre Haute Traction & Light Company and other corporations, died recently. He was also president of Gregory & Appel, Inc., and was a well-known capitalist and business promotor in Indianapolis. Although a conspicuous figure in the utility field, he never served in the operating end, but lent his genius toward improving enterprises and working out the financial organization of properties. Mr. Appel was 69 years old.

RICHARD M. KERSCHNER, associated with Hubbard & Company for the past sixteen years, died on Dec. 8, in Zelinople, Pa. Upon leaving school Mr. Kerschner obtained a position with the old Chicago Edison Company, with which he remained until 1900 when he joined the sales force of the Union Electric Company of Pittsburgh. In 1914 he joined the sales department of Hubbard & Company, later becoming sales manager. In 1924 he supervised the buiding of the new Hubbard factory at Oakland, Calif., remaining in charge there until 1927 when he returned to Pittsburgh to assume charge of the department of development and research, in which position he was active up to the time of his death.

Large Equipment Orders Pending

Lackawanna asks bids on $18,000,000 electrification. Brooklyn consolidation may mean $15,000,000 car order. $5,000,000 terminal for St. Louis. New freight interchanges being constructed by South Shore Lines

PLANS recently announced have advanced to the place where the Delaware, Lackwanna & Western Railroad, Hoboken, N. J., is inviting bids for its electrification project. The initial cost will be from $10,000,000 to $12,000,000 for track, rolling stock and distributing equipment. If satisfactory arrangements for power supply are not made, the company will build its own power station which will mean an added cost of about $4,000,000. The ultimate cost of the entire electrification is approximately $18,000,000. Unlike the Pennsylvania Railroad electrification from Wilmington to New York, which will use 12,000 volts, the Lackawanna has decided to use 3,000 volts direct current. It is not planned to extend the electrification beyond the suburban district for some time.

Possibility of Large Car Order

From $10,000,000 to $15,000,000 will be spent for cars by a new company, if the plans go through to which reference is made elsewhere in this issue, for the consolidation of the surface lines of the Brooklyn - Manhattan Transit Company and their separate operation, and for that company to take over the grants for bus operation already made to the Equitable Coach Company, subject to confirmation by the Transit Commission. The new company would probably start to function early in 1929.

Construction of three new freight interchanges with major steam railroads has been started by the Chicago, South Shore & South Bend Railroad, Michigan City, Ind. Work is now under way on the interchange with the New York Central Railroad at South Bend, Ind., consisting of two interchange tracks, each of nineteen-car capacity. The interchange tracks now being laid at Michigan City will open freight connection with the Michigan Central Railroad and the Chicago, Indianapolis & Louisville Railroad.

Seventy-pound rail laid on treated ties and cinder ballast will be used on each project. The interchange tracks will be electrified for use of the South Shore Line electric locomotives and will employ light catenary overhead. Completion of these three projects will bring the South Shore Line into direct connection with thirteen steam railroads, and a number of belt lines will insure switching connections with all the principal railroads entering Chicago.

St. Louis Terminal

The Missouri Public Service Commission, in an order issued Dec. 13, grants the Illinois Terminal Company, Springfield, Ill., and the St. Louis Electric Terminal Railway, St. Louis, Mo., a certificate of convenience and necessity for the construction of a $5,000,000 terminal in St. Louis, to include a subway and elevated line. These subway and elevated lines will connect the McKinley Bridge with a new freight and passenger terminal in the blocks bounded by Twelfth Boulevard, Lucas Avenue, Eleventh Street and Washington Boulevard.

Electric operation of 80 miles of the main line of the Great Northern Railway, St. Paul, Minn., has been started between Wenatchee and Skykomish, Wash. Completion of this part of the project along with the boring of the 8-mile cascade tunnel which will be ready for trains shortly after the first of the year, and the relocation of 20 miles of east approach to the tunnel, represents an expenditure of $25,000,000 by the Great Northern Railway in improving its route across the cascades.

California Construction

In California bids have been called for by the Northwestern Pacific Railroad, San Francisco, Cal., for the construction of a new depot at D Street, San Rafael. This company has also awarded a contract to the Austin Company of California, to construct a $32,500 machine shop at Tiburon, Cal.

The St. Louis Public Service Company, St. Louis, Mo., has started the construction of its new office and shop addition to the De Baliviere Avenue carhouses. The new building will be a two story structure, costing about $40,000. The Springfield Street Railway, Springfield, Mass., and the Worcester Consolidated Railway, Worcester, Mass., have sold wire, rails, poles, and other accumulated equipment amounting to $2,060,718.

The city commissioners of Kansas City, Kan., have announced that they would request the Kansas City Public Service Company to remove and replace with a permanent structure, the wooden street car incline leading from the east end of the Central Avenue Viaduct to the surface at First Street and Central Avenue. The present incline was built in 1923 and was said to cause traffic congestion.

Rolling Stock

The Chicago South Shore & South Bend Railroad, Michigan City, Ind., has ordered two caboose cars from the American Car & Foundry Company. The Lynchburg Traction & Light Company, Lynchburg, Va., is building a loop in Peakland and has purchased land near Fairview Heights for a "Y" switch which is to be used in turning the one-man cars to be tried out by this company next month. It is planned to bring a new Birney one-man car to Lynchburg for trial. The International Bus Corporation, subsidiary of the International Railway, Buffalo, N. Y., has rebuilt six of its double-deck passenger buses. The stairway to the upper deck has been shifted from the rear of the bus to the front, which enables the bus driver to collect fares. These buses have been equipped with semi-enclosed tops, making it possible to heat the upper deck during the winter months. Additional light has also been installed. In the near future the company plans to remodel in a similar manner other double-deck buses on its system.

Cleveland Railways, Cleveland, Ohio, has placed an order with the White Company for twenty 40-passenger buses. This order is the result of recently placed bids for 25 new buses. The Louisville Railway, Louisville, Ky., has placed orders for two Club-type Studebaker buses. Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y., has ordered two A.C.F. Fageol De Luxe, street-car type buses, and the Eastern Massachusetts Street Railway has purchased one A.C.F. De Luxe urban-type coach. The Indianapolis Southeastern Railway, Indianapolis, Ind., has purchased five 22-passenger Seminole parlor observation-type Studebaker coaches.

Equipment Orders

Among orders of equipment purchased recently, the Lehigh Valley Transit Company, Allentown, Pa., has ordered two miles of No. 00 grooved copper trolley wire, two miles of No. 8 weatherproof wire, 400 bags of rock salt, 5,000 type M brake shoes, No. 3153, 1,000 type M brake shoes No. 3154, 56 bags of Tucolith, five 63-tooth gears, six sets of armature coils, 2,500 rolls of friction tape, 2,000 lb. of No. 097 double covered magnet wire and 2,000 lb. No. 9 double covered magnet wire. This company has also purchased 5,000 ft. of snow fence complete with posts and caps, one six-section model steam boiler, and miscellaneous sizes of machine chains.

The Georgia Power Company, Atlanta, Ga., has purchased two electric switching and throwing devices, one signal block and one electric switch, 100 30-ft. creosote pine poles, 1 mile of No. 00 copper wire and 200 26-in. car wheels. The Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., has ordered small supplies of car equipment. The Duluth Street Railway, Duluth, Minn., has purchased 160 class B, 30-ft. Western red cedar poles.

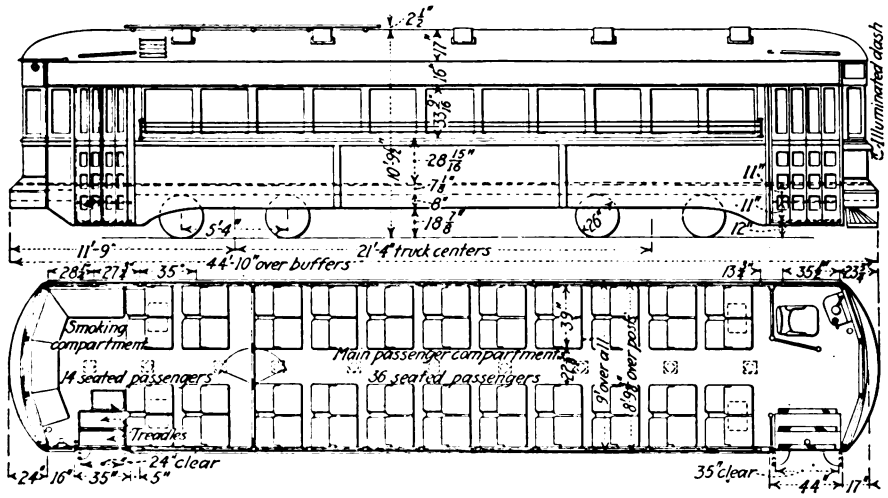
Specifications of Two Cars for Gary

Midland Utilities Company, Chicago, Ill., has ordered two one-man motor passenger cars from the Cummings Car & Coach Company for the service on the lines of the Gary & Southern Traction Company, which was recently purchased by the Midland Utilities Company and is being operated by the Gary Railway, Gary, Ind.

These cars are of the interurban, single-end, double-truck type, seating 50 passengers. They weigh 42,000 lb. each and are 44 ft. 10 in. long and 9 ft. wide. The bodies are of all-steel construction with arched roofs and folding end doors and are finished in orange and maroon lacquer. The trucks are equipped with two inside-hung motors and 26-in. steel wheels. Both armature and journal bearings are of the plain type. Further details of these cars are given in the following specifications:



Cars being built for Gary & Southern Traction Company seat 50 passengers

Date of order	Oct. 10, 1928
Date of delivery	Feb. 20, 1929
Length over all	44 ft. 10 in.
Truck wheelbase	5 ft. 4 in.
Width over all	9 ft.
Height, rail to trolley base	11 ft.
Window post spacing	35 in.
Body	Steel
Roof	Arch
Doors	End, folding
Air brakes	General Electric
Armature bearings	Plain
Car signal system	Faraday
Compressors	GE. CP. 27
Conduit	Flexible
Control	G.E. K-75
Curtain fixtures, Rex-National Lock Washer Company	
Curtain material	Black Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Energy saving device	Economy meters
Fare boxes	Ohmer
Finish	Lacquer
Floor covering	Rubber tiling
Gears and pinions	General Electric
Glass	Plate
Hand brakes	Cummings
Heaters	Truss plank-Railway Utility
Headlights	Golden Glow
Headlining	¼-in. Agasote
Interior trim	Haskelite
Journal bearings	Plain
Journal boxes	Service
Lamp fixtures	Electric Supplies Company
Motors	Four G.E. 247, inside hung
Painting scheme	Orange and maroon
Registers	Ohmer
Roof material	Canvas
Safety car devices	Safety Car Devices Company
Sash fixtures	O. M. Edwards Company
Seats	Hale & Kilburne; bucket type, non-reversing
Seat spacing	35 in.
Seating material	Grey Byzantine plush
Slack adjusters	Anderson
Steps	Folding
Step treads	Kass
Trolley	Ohio Brass retrievers
Trolley base	General Electric
Trolley wheels	Holland
Trucks	Cummings No. 64
Ventilators	Railway Utility Company
Wheels, type. Davis one wear, steel, diameter 26 in.	

Cincinnati Car-Versare Merger Approved

Stockholders of the Cincinnati Car Company at a special meeting Dec. 14, gave unanimous approval to the merger agreement entered into by the directors of their company and those of the Versare Corporation of Albany, N. Y., as had been anticipated in announcements made a number of weeks ago.

The two plants will be merged in the formation of the Cincinnati Car Corporation, with headquarters in Cincinnati. The engineering facilities and offices of the Albany corporation will be brought to the Ohio city, but physical property will remain at Albany.

To effect the merger, the Cincinnati Car Corporation will purchase all the assets of the Cincinnati Car Company except 89,661 shares of stock of the Cincinnati Railway Company, the Traction Building in Cincinnati and the earnings and profits of the company for the year 1928. The stock will be distributed to stockholders of record at the close of business Dec. 31, 1928. The Cincinnati Car Company will receive for the assets which will be retained for manufacturing purposes, 125,000 shares $20 par value 7 per cent preferred stock and 50,000 shares of Class B stock without par value of the Cincinnati Car Corporation.

The stockholders at their meeting authorized the formation of the Cincinnati Traction Building Company to accomplish a complete distribution of the assets of the Cincinnati Car Company. The Traction Building Company will be the holding concern for the building, surplus holdings, profits for 1928 and the fractional shares of stock of the Cincinnati Street Railway Company, and the 7 per cent and Class B shares of the newly formed corporation—which stocks can not be distributed in kind because of the small fractions into which they would have to be split. Authorization was given the directors to sell these undistributable assets and to make cash distributions of the proceeds.

The agreement provides for issuance to the Versare Corporation of 10,000 shares of Class A stock without par value for all the property of that firm, including patent rights. This stock will be subordinate in claims for assets and earnings, to the 7 per cent preferred stock which the Cincinnati Car Company stockholders will receive. The Versare company will also receive 50,000 shares of Class B stock without par value as additional payment for its interest.

Public Hearing Held on New York Car Contract

The New York Board of Transportation, building the city's new subway system, held a public hearing Dec. 19 on the draft form of contract for the construction of 300 steel cars for operation from Chambers Street to the Harlem River and 207th Street by the fall of 1930. The hearing was conducted by John H. Delaney, chairman of the board, and Commissioner Daniel L. Ryan. It was attended by numerous representatives of railroad car manufacturing corporations in the eastern part of the country.

In opening the public hearing, Chairman Delaney said that it was the first time in the history of rapid transit in New York City that the car and signal contracts for subway service were prepared by municipal engineers and designers. He related how a group of outside engineers and practical railroad car builders had been in consultation with the engineers and designers of the Board of Transportation for the past year, working out the best possible design and specification which would permit of the widest competition in bidding for the work of car construction.

The Transportation Board Chairman paid public acknowledgment of the gratitude of New York City toward those experts for their gratuitous assistance and advice. He named James S. Doyle, Assistant to General Manager Frank Hedley of the Interborough; W. J. Gove, superintendent of equipment for the B.-M.T. system; A. E. Ostrander, assistant vice-president of the American Car & Foundry Company; W. H. Mussey, general mechanical engineer for the Pullman Company; and W. P. Potter, chief engineer of the General Electric Company.

The Board of Transportation engineer in charge of equipment and operation is Harry N. Latey. The car designer is John O. Madison.

In the presence of representatives of the Pressed Steel Car Company, the Standard Car Company, the Pullman Company and the American Car & Foundry Company, counsel for the latter made some observations of the specifications as drawn for the new cars. The

Digitized by Google

observations dealt mainly with penalties for non-performance, patent restrictions and other minor points. Brief memoranda were filed by representatives of the several car manufacturers, relative to legal questions and provisions of the Labor Law as being not applicable to other states.

The draft form of contract in the main was not objected to, but some of the car manufacturers asked for more time in which to study the technical construction features of the proposed new cars. Whereupon, Chairman Delaney suggested that each of the larger manufacturers assign a delegate or representative, highly qualified, to discuss with the engineers of the board the various features of the proposed contract.

The public hearing was then adjourned to Thursday, Jan. 3, at 11:30 A.M.

Towne Service Building Dedicated

The new service building of the Yale & Towne Manufacturing Company, Stamford, Conn., was formally dedicated on November 26th. Funds approximating $500,000 for the erection and care of this building, which will be known as the Towne Service Building, were provided through a special bequest in the will of the late chairman of the board, Henry R. Towne, and this building represents his plans and purposes for the progression and advantage of the thousands of the company's workers, both now and in the future. The structure is modern in construction and up to date in heating, lighting and ventilation facilities, and will admirably serve as a recreational center for the thousands of employees of the company.

The main floor houses the works hospital, dental clinic, and industrial relations bureau. The second floor has a large auditorium, gallery and stage, with a seating capacity of 400. The commodious library is also located on this floor. In the basement are four bowling alleys and two pool tables.

A motion picture outfit will also be installed for the entertainment of the employees.

Government to Publish Catalog

While the federal standard stock catalog is being prepared primarily for the government service, it is believed that its usefulness could be extended to the commercial field. For this reason it is planned to have copies of the catalog—either complete or in sections—made available for sale through the superintendent of documents, Government Printing Office, as soon as possible after the printing of the book is authorized by Congress.

As the assignment of nomenclature to the items comprised in the catalog is based on a truly scientific system, it is believed that its adoption as a standard will be welcomed by industry and will have a widespread and beneficial effect in the commercial field.

METAL, COAL AND MATERIAL PRICES F.O.B. REFINERY

	Dec. 18, 1928
Metals—New York	
Copper electrolytic, cents per lb.	15.775
Copper wire, cents per lb.	17.875
Lead, cents per lb.	6.5
Zinc, cents per lb.	6.7
Tin, Straits, cents per lb.	49.5
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons.	$4.375
Somerset mine run, f.o.b. mines, net tons.	1.875
Pittsburgh mine run, Pittsburgh, net tons.	1.80
Franklin, Ill., screenings, Chicago, net tons.	1.425
Central, Ill., screenings, Chicago, net tons.	1.15
Kansas screenings, Kansas City, net tons.	1.625
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.5
Weatherproof wire base, N. Y., cents per lb.	18.625
Cement, Chicago net prices, without bags.	2.05
Linseed oil (5-bbl. lots) N. Y., cents per lb.	10.4
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.2
Turpentine (bbl. lots), N. Y., per gal.	0.645

The importance of exactness and uniformity with respect to nomenclature cannot be overemphasized. With a single standard of nomenclature in general use, the transactions of individuals, firms, industries, and the government—both inside and outside their organizations—would be greatly facilitated, uncertainty would disappear and the routine of supply and procurement standardized, expedited and made more economical.

The government's requirements in the way of supplies and materials cover a very great variety. This is reflected in the catalog by the segregation into 81 classes for storage and issue of the upwards of 60,000 items it will list. Furthermore, this is shown by the fact that these commodities are obtained from 61 main groups of industry, which are further subdivided wherever specialization in industry has developed.

The work of compiling the federal standard stock catalog has been advanced to a point where several of its sections can be published, as soon as funds for its printing are made available by Congress. The bureau of the budget has given its approval to the project, and the question of providing the necessary funds for printing will be laid before Congress at the coming session.

TRADE NOTES

O. M. Edwards Company, Syracuse, N. Y., has announced that T. P. O'Brian will have entire charge of its sales in the railroad, traction and bus fields in the Eastern and Southern districts. Mr. O'Brian has opened up a new office at 50 Church Street, New York City, and will be assisted by George B. Allison in his new work. Mr. O'Brian started his career in the railroad field in the service of the Pullman Company, working in various capacities until 1910 when he left the Pullman Company to become associated with the O. M. Edwards Company. In 1916 he accepted a position with the Curtain Supply Company in its sales department, having charge of the Southern district. In 1922 Mr. O'Brian was made Eastern sales manager for the Curtain Supply Company, remaining in this position until the company was merged with the Adams & Westlake Company in 1927, when he took charge of the combined Eastern offices in New York City. Mr. Allison became associated with the Curtain Supply Company the early part of 1919 and after three years service in the factory and general office, he became office manager. In 1922 Mr. Allison was transferred to the Eastern sales office in New York City working under the direction of Mr. O'Brian. Mr. Allison will have charge of the Southern district.

Timken Roller Bearing Company, Canton, Ohio, has established two new permanent offices, one in Los Angeles, Cal., and one in Seattle, Wash. The former will be in charge of Roy Cross, with address at 1361 South Figueroa Street, Los Angeles, and the latter in charge of Marshall Cooledge, with address at 321 South Pine Street, Seattle. G. C. McMullen remains as district manager at the company's San Francisco office.

J. W. Fristoe, president and general manager of the T. J. Moss Tie Company, St. Louis, Mo., since 1902, on Dec. 5 was elevated to chairman of the board while E. E. Pershall, vice-president, was elected president. J. S. Penney, who has been general superintendent, becomes vice-president.

H. A. Houston, Wilkinsburg, Pa., has been appointed works manager of the R. D. Nuttall Company, makers of Westinghouse-Nuttall gears, according to an announcement by Vice-President Milton Rupert.

ADVERTISING LITERATURE

Compressed Air Society, New York, N. Y., has issued the third edition of its "Trade Standards" pamphlet. It has been considerably enlarged and improved, comprising 47 pages in 8½x11 in. size, with numerous illustrations and tables that will be of assistance in the treatment of various compresser problems. New material that has been added includes a description of the A.S.M.E. standard air receivers with list standard sizes of these receivers; pneumatic tool standards; a section on portable compressors; and additional information relating to the installation and care of compressors.

General Electric Company, Schenectady, N. Y., has issued booklets No. 1012 entitled, "Electric Heat in General Electric Factories" and No. 482A on "Silent Gears." The latter booklet gives physical specifications, application data, formulas for helical gears, recommended practice for machining Fabroil blanks, recommended practice for machining Textolite, and dimensions of the various types of gears and blanks.

"The Greatest Law Suit in History"

INTEREST on the part of the electric railways in the so-called O'Fallon case is not so remote as it at first might seem to be. The company's brief has been filed with the Supreme Court and the argument has been set for Jan. 2. The St. Louis & O'Fallon Railroad is resisting the efforts of the Interstate Commerce Commission to collect the recapturable portion of the alleged excess earnings of the carrier for the last ten months of 1920 and for the years 1921, 1922 and 1923. The amount which the commission is seeking to recapture in these proceedings is only $226,880 and interest. But the question of the principles of valuation seems involved, which is the reason for the attention attracted by the case.

The majority ruling of the Circuit Court held the commission's determination valid, with the specific reservation that the method used in arriving at the value on which the earnings in percentage are calculated should not enter into the case. The minority concurred in the judgement, but expressed the opinion that the commission's valuation method was justified, although defective in some particulars. It seems that the road earned more than 6 per cent on the full valuation claimed by it. The point the majority made was that under such circumstances a claim of confiscation could hardly be made. The brief of the company recently filed with the Supreme Court makes the point that in fixing the valuation of a railroad for recapture purposes under the transportation act, consideration should be given to all relevant facts and circumstances, including the present level of reproduction costs.

The O'Fallon case was the first decision by the Interstate Commerce Commission interpreting and applying the so-called recapture clause of the transportation act of 1920. Since no definite rule of valuation was laid down in that act, the commission proceeded on its own initiative. By a vote of six to four it held in effect that the value of the property for rate-making purposes, as determined by the commission for 1914, approaches more nearly the reasonable amount to be allowed on the property than the cost of reproduction. It based the valuation on its tentative valuation figures of 1919 (based on 1914 unit prices) as far as available, allowing for property added in succeeding years at actual cost less depreciation, without giving effect to the cost of reproducing the original property at present-day prices. The idea of cost of reproduction new at prices current on the valuation date, laid down as a rule in previous court decisions, was rejected by a majority of the commission on the ground that it would prevent stability of rates and that it was unjust and unworkable. Between that method and the use of 1914 unit prices as a base, the commission held no intermediate practice was "possible which is capable of being applied to any rule independent of the caprice of those who apply it."

Adoption of 1914 prices by the commission appears to be justified by that body on the theory that this schedule of prices is fair to all concerned. This question of a fair basis of valuation is obviously of major importance to every form of regulated utility. A member of the Interstate Commerce Commission is said to have referred to the case as "the greatest law suit in history." Should the Supreme Court by chance decline to pass upon the valuation and confiscation questions and affirm the previous ruling, the railroads would be back where they started on the valuation issue. Not only that, but utilities in general would be deprived of the benefits of a ruling that would tend further to clarify the much contested question of proper valuation. The fact that no utility other than a railroad is affected by the "recapture" statute does not lessen the general interest in the case, provided, of course, the Supreme Court in its decision does deal with the matter of the basis of the valuation.

There Is Danger in the Lure of New Business

IN ONE of his well-known fables, Æsop tells how a dog, carrying a piece of meat in his mouth, saw in the water of a stream he was crossing, what appeared to be another dog also carrying a piece of meat. Opening his mouth to snap at the reflection in the water, and dropping his own piece of meat, he realized his folly too late.

In the transportation industry, new forms of business appear extremely alluring. This is particularly true of new bus business. Chartered trips, special tours, de luxe operation at higher fares, and similar types of service offer an attractive means of augmenting transportation revenue. The harassed manager, weary of trying to render adequate mass transportation service for an inadequate fare, turns with enthusiasm to this new field where there seems to be a chance to make a reasonable profit. This is as it should be. The attractive opportunity which he envisages is far more substantial than the shadow seen by Aesop's dog. It is well worth going after—but it should not divert attention from the all-important task of holding fast to existing business by improvements carried out with enthusiasm comparable to that manifested in developing a new field of operation.

The straphanger in a crowded, dirty, old-fashioned street car is not particularly interested in the fact that the same company operates attractive de luxe bus service on some other route. What he wants is good service on his own route. That the company operates special bus service is no reason that it should not also render good mass transportation service, but it sometimes happens that enthusiasm for the former results in neglect of the latter. The outcome of such a policy cannot be other than disastrous. Special service holds much promise as a supplement to regular service. In the long run, however, the company's fate will be determined by the quality of its regular service, which is the backbone of the community transportation system.

Ten Years of Service at Cost in Rochester

NEGOTIATIONS seem likely to begin soon for a renewal of the service-at-cost contract under which the Rochester Lines of the New York State Railways are operated. The present contract, drawn for a period of ten years, remains in effect until Aug. 1, 1929. That the contract will be renewed seems quite likely. It also seems quite likely that the contract will be modified. There have been some differences of opinion about the valuation figure, but while the railway officials believe that a higher valuation is justified, they are understood to be willing to allow the present figure, $20,314,905, to stand.

The situation in Rochester has been changed recently by the operation of the high-speed line built in the old canal bed. Some modification in the contract may be necessary because of this operation, although other changes that may be made are a matter of speculation at this time. But in the light of the coming negotiations the figures on operation in Rochester for the year ended July 31, 1928, digested in the JOURNAL for Dec. 15, are of special interest. To recapitulate them is not necessary. It is of interest, however, to note that riding continues to decrease. This decrease in passengers over the previous year was 5,180,000, or 7.7 per cent. For the year there was a surplus from trolley operation of $67,898, but this was offset by a deficit of $60,105 on the bus lines and a deficit of $8,123 from subway operation, making the total deficit for the year $329, compared with a deficit of $60,128 for 1927. The accumulated deficit for the period of the service-at-cost contract as of July 31, 1928, was $341,791.

Full account of the fact that some of the bus lines have been extended into territory that cannot for the present be expected to afford a return is taken by the commissioner of railways of the city in his report. He is apparently opposed to economies that would impair the character of the service, for he says that there is only reasonable fulfillment of the requirements for comfort and convenience of passengers. There is no disposition to suggest further economies at the expense of the patrons' comfort. In other words, Rochester wants service and is prepared to pay for it. If that were not so then the fact would have been manifested following the recent announcement by the company that on Jan. 1 cash fares will go to 10 cents. The ticket rate will, however, remain at twelve for a dollar.

While Rochester appears to be willing to pay, there is no disposition to be profligate. Out of the fourteen lines operated in the city only two are handled with one-man cars, with some additional use of this type of equipment on other lines on Sundays and during hours of light travel. Mr. Barnes, the commissioner, holds that the serious reduction in the number of passengers carried by the trolley cars in the service-at-cost territory requires that, if possible, some steps be taken to change this condition. He feels that this can best be done, as demonstrated by the experience of other cities, by extending the use of one-man cars to other lines and reducing the headway on these lines during the non-rush hours, thus improving the service while at the same time reducing the cost.

On the whole, it is a broad view of the matter to which Rochester apparently subscribes, particularly since the railway commissioner has reiterated the fact that co-ordination of transportation in the manner now existing in Rochester is becoming increasingly necessary and favored throughout the country. The service-at-cost type of franchise was adopted originally in Cleveland as a way out of a very complicated situation. The grant there had to be modified in the light of subsequent experience. That also was true in Toledo. It may prove true in Rochester. It does appear, however, that Rochester is in a position to profit immeasurably from its own experience and the experience of others. Regardless of the details of the new contract, so long as it adheres to the principles of co-ordination and adequacy of service above other considerations Rochester will not go far wrong.

Ideals Flow Through Channels of Human Contact

TWO questions immediately confront the management which plans to keep its employees informed on company affairs so that they may be properly equipped to capitalize the opportunities offered by their contacts with the public. First, what information should be given to the employee, and second, what methods should be employed in transmitting this information to the rank and file of the operating organization? Actual practice today varies widely with differences in policy and attitude on the part of railway managements.

In general, however, it is almost self evident that employees should have a working knowledge of the general economic problems that confront an electric railway, with particular attention to the principal factors that are controlled by the public's attitude toward its railway. In addition, employees should be furnished with specific information concerning the activities of the company. If the platform man realizes the effects of the radio, the private automobile, the taxicab and other forces of competition, he will recognize the need for meeting this competition and will be able to talk intelligently about his company's affairs to those of the public who inquire.

Periodic statements of revenue and operating expenses should be distributed among the employees. There is no surer way of making them feel that they are being given all of the essential facts regarding their company's operations.

On comparatively small systems the problem of disseminating information among the employees is not a difficult one. On the larger systems, however, this task becomes more difficult and complicated. Educational classes, interestingly and intelligently conducted, offer an effective method. These can be supplemented to advantage by bulletins, house organs and other publications. Nothing, however, can take the place of regular, direct contact by responsible officials with the men in the ranks. Unfortunately, it is physically impossible on a large system for the chief operating executive himself to talk directly to all of his men except in large meetings which necessarily take on an element of formality.

Day to day contacts must necessarily be maintained through authorized representatives. To the degree that these supervisory officials down the line reflect the true ideals and objectives of the management, they will be successful in developing that spirit of teamwork which is so essential in the transportation business today. It is upon these channels of human contact within an organization, that management today is chiefly dependent for transmitting not alone the facts of the company's operation, but its ideals as well, to the men in actual contact with the public.

Alert Management Succeeding Even in Small Communities

ARTICLES and advertisements now inform a sophisticated public that in the United States there are some 3,000,000 "two-car" families. It is safe to assume that a large proportion of these families are located in the smaller cities where backyards are big and parking space downtown is liberal. Yet even in these towns there is ample evidence that public transportation facilities are a necessity.

A case in point is that of the Greenfield & Montague Transportation Area, the progress of which is discussed elsewhere in this issue. Originally this was part of a far-flung cross-country trolley system which had none too many riders even in the pre-automobile era. The automobile took away most of the country business and threw the property into bankruptcy. Under Massachusetts' transportation area act, one fragment of the property was purchased for a little more than scrap value by Greenfield with 16,000 inhabitants and its neighbor, Turner's Falls in Montague Township, with 5,000 inhabitants. There are plenty of automobiles in both places, but the citizens declared by formal ballot that they wanted dependable public transportation too.

One might expect that a system like this would be handled in a humdrum way, for who would really try to make transportation pay in communities of such size when the law permits the bond interest and amortization to be a lien on the general tax funds? Yet the contrary has been the case. The manager believed that you can get more riders on smooth track than on bumpy track; more riders on soft cross-seats than on hard longitudinal benches; more riders with cheery-colored cars than with funereal shades; and more riders with frequent, sensibly-worded appeals for patronage than with glum advertisements about getting a square deal.

The manager not only believed these things himself, but also sold his viewpoint to his trustees and the public. The result was surprising. The Greenfield & Montague Transportation Area today is doing far better than could reasonably have been expected. It may not be making a return on "reproduction cost new." However, if judged from the commercial basis of a merchant who makes a fresh start with a marked-down inventory of his out-of-date stock, this undertaking shows every promise of being rebuilt into a successful business.

Brooklyn Bus Settlement in Sight

PROSPECTS appear to be promising for a new alignment of surface lines in Brooklyn, with bus service co-ordinated. So far as the public announcement indicates, the plan would contemplate the segregation of the surface lines of the Brooklyn-Manhattan Transit Corporation from the rapid transit lines and the operation of these surface lines in conjunction with 82 miles of bus routes of the Equitable Coach Company in Brooklyn and Queens, for which rights have been granted by the city but still subject to approval of the New York Transit Commission as to their convenience and necessity.

It is a matter of speculation whether the lines of the Brooklyn City Railroad will be included, but it would appear more than likely that they will. In any event the territory will undoubtedly be so allocated that there will be no duplication of service. This would leave to the Equitable the franchise rights it has obtained for crosstown lines in the Borough of Manhattan.

The possible modification of the rights of the Equitable is a subject now before Mayor Walker. Pending the result of negotiations with the city by the interests concerned in this latest move, the New York Transit Commission announced that it would suspend all proceedings on the Equitable's plea for certificates of convenience and necessity. The matter of bus rights in New York City has been long drawn out. So far as the borough of the Bronx is concerned the principal bus awards there were made to a subsidiary of the Third Avenue Railway and a service of more than 75 miles of routes is being run in that borough. Now it begins to look probable that the issue in Manhattan, Brooklyn and Queens will be settled on the basis of co-ordination instead of needless competition and duplication. On that basis it could have been settled long ago.

Regulation Essential for Taxicab Stability

RECENT figures quoted in the public press indicate the importance of the taxicab in the field of urban transportation and the need for stabilization of this preferred carrier system by regulation. A. Freed, president of the Paramount Cab Manufacturing Company, estimates that the 20,000 cabs in New York City have an annual income of $160,000,000. He says that for every $1 received by all other public transportation agencies in New York, $1.02 is spent for taxi rides.

Nevertheless, the mortality rate in the taxi business is high. It is reasonable to believe that lack of regulation and independent operation of cabs, resulting in price wars, inferior service to the public, and traffic congestion, are largely responsible for the unsavory record of this business. When cabs are operated in large fleets by organizations properly controlled, each cab is in use from 18 to 24 hours a day, requiring from two to three drivers. Repairs and service are made in the most economical way by mass production methods. Thus major economies in equipment and in maintenance are made possible, to say nothing of the reduction in waste mileage and street congestion that results from an organized and responsible service.

Such operation by individual owners is impossible. As a result, the taxi industry contains a large percentage of owner-drivers who work from twelve to fourteen hours a day, often converting their cabs to semi-jitneys, in an attempt to keep their individual taxi businesses in existence. If such a labor condition existed in any of the so-called capital controlled industries, regulatory legal steps would be taken immediately.

The public should have primary consideration in the operation of any means of public transportation. For this reason public utilities are subjected to regulation. The important place to which the taxicab has grown in the transportation of the general public is indicated by the income figures cited for New York. It is an important utility and, when unregulated, degenerates through unrestricted competition both within itself and with other transportation organizations which are under public control. Why then should not taxicabs be under supervision comparable to that exercised over other utilities? Regulation would benefit the cab industry through stabilization. It would lead to co-ordination in operation that would reduce traffic congestion. It would surely tend to make it possible for each cab to earn its justified income, give better service and bring working conditions for cab drivers to a par with that of other industries.

Cars of the Greenfield & Montague Transportation Area operate over this bridge across the Connecticut River

Continued Improvement

Shown at Greenfield

Rehabilitation, new de luxe cars and merchandising methods have brought a substantial increase in the net earnings of the operating company

CONCLUSIVE evidence of the need for public transportation systems in small communities is furnished by the experience of the Greenfield & Montague Transportation Area during the past four years. Located in the middle valley of the Connecticut River, these Massachusetts towns are in rather hilly country, which gave them a relatively high riding habit in the old days. Conditions are different now because the skilled mechanics who make up most of the wage-earners have long been owners and operators of automobiles. The only way for the electric railway to appeal to them is with modern service at attractive fares. That this has been done successfully is shown by the fact that the railway revenue for the past two years has averaged more than 10 per cent above the figures that were reached in 1925.

This undertaking dates from the transportation area act of 1920. Under this act, one or more communities may unite to establish a "transportation area" under that specific title, when the property can be bought "on the basis of actual value at the time of appraisal and not on the cost of replacement."

Origin of the Transportation Area

Following the mandate of a general election on May 24, 1924, the two towns of Greenfield and Turner's Falls in the township of Montague, paid the receiver of the Connecticut Valley Street Railway $62,000 for 8.7 miles of track with cars and repair facilities. Operation began on Aug. 1, 1924, under a board of four trustees, two from each town, who appointed Frederick A. Persons to be superintendent-manager. Although publicly owned, the Transportation Area is subject to the regulation of the State Department of Public Utilities with regard to fares, extensions, expenditures for new cars and so forth. The funds for the original purchase came through an

Digitized by Google

issue of ten-year serial bonds, of which $70,000 were issued by Greenfield and $31,000 by Montague. Since the purchase price was $62,000, the undertaking began with a working capital of $39,000.

The transportation area act permits deficits to be made up out of taxes. Luckily, it has not been necessary to take advantage of this provision. Depreciation is figured on the basis of not less than 3 per cent and not more than 5 per cent of the book value. The higher figure is used in this instance because of the low investment.

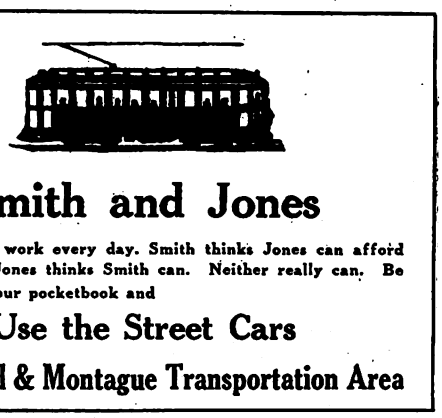
Alternative Bus Operation Abolished

The period of the World War, 1914-1918, was one of tremendous activity in the Greenfield-Turner's Falls district because of the demand for precision tools, shell-making machinery and other war supplies. As elsewhere, these conditions were accompanied by an influx of jitneys. It was not until 1918 that Massachusetts passed legislation permitting electric railways to run buses; and it was 1919 before the Connecticut Valley Street Railway was running them between Greenfield and Turner's Falls, a distance of 3.14 miles by highway but 4.8 miles by railway. These buses were operated on the basis of cutting the railway service in two, giving a combined headway of 30 minutes. The same fare was charged on the buses as on the cars.

When the Transportation Area took over the property its management could not see the utility of running two classes of service. It was concluded that all-rail service on the 30-minute headway was the most economical and the one that would get most out of the investment. The question of greater safety on grades in winter-time was also a factor in the decision to stick exclusively to the rail.

Track and Car Rehabilitation Begun at Once

The property taken over was not far from the status of junk. Extensive rehabilitation was necessary. For example, a total of 9,192 ties have been replaced. On the basis of 2-ft. spacing, this corresponds to 3½ miles of the 8½ miles operated. The bridge over the Connecticut River has been completely repaired, repainted and its timber deck and rails completely replaced. Hundreds of dished joints were welded and ground smooth; much special work replaced; the overhead wiring repaired; and a new roof put on the carhouse. Moreover, all of the rolling stock was painted an attractive combination of chrome yellow and cream. Two of the six-passenger cars were fitted with automobile cushion cross seats in place of side seats.



Type of newspaper advertisement used to sell electric railway transportation in Greenfield

The rehabilitation carried out during the fall of 1924 and the season of 1925 was charged in part to capital account and in part to maintenance of way. The work done during 1926 and 1927 was charged entirely to maintenance account. In all, about $30,000 was expended on rehabilitation up to the end of 1927, over and above ordinary maintenance charges.

Nor was rehabilitation all that the management undertook. Encouraged by a 25 per cent increase in receipts which followed double-truck car operation on Conway Street, Greenfield, in March, 1926, specifications were prepared for two light-weight, semi-steel cars with deep-cushioned, leather-upholstered seats. These cars were delivered in May, 1927.

Ride-Selling Campaign Begun

By Dec. 1, 1925, physical improvement of the property had reached the point where the management felt that ride-selling ideas could be applied. Up to that time there had been no regular newspaper advertising nor changes in fare. The standard rates had remained 10

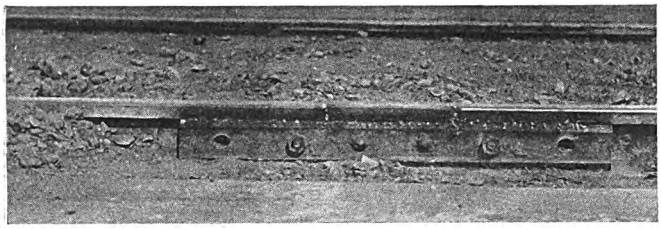
Digitized by Google



Appearance of rail joint after repairs

cents cash minimum and twelve tokens for 50 cents, but as two tokens were charged for the first two zones or part thereof, the lowest adult rate was 8⅓ cents. Beginning Nov. 30, 1925, two types of unlimited-ride, transferable weekly passes were offered: a $1 pass good in any selected pair of adjacent zones; and a $1.50 pass good within the entire five zones. The pass proved successful despite the fact that most of the buyers could not take advantage of the luncheon period to eat at home; nor could the property offer the short headways and variety of off-peak attractions of larger cities. Nevertheless the first twelve months of 1926 showed a revenue improvement from $79,024 to $86,938, or 10 per cent, as compared with the preceding year.

A Sunday-holiday pass was started on May 1, 1927, and has been retained as an all-year feature. Another new-business idea was the trial of evening passes for the summer, beginning with June 26, 1927. These daily passes and evening passes cost 25 cents as compared with 50 cents a round trip with cash or 43⅓ cents with tokens. Holders of the $1 weekly passes may ride into additional zones on payment of 5 cents cash or a 4⅙-cent token per zone.

Special Causes Bring Temporary Recession of Earnings

Every move that the Transportation Area has made in modernizing the equipment and sales methods of the property indicates that there is a demand for service, regardless of the large use of the private automobile. This was shown in the growth of revenue and riding during 1926 in comparison with 1925, when passenger revenue advanced 10 per cent, and the increase in the number of riders was about 26 per cent!

For the first ten months of 1927, a further improvement was noticed. Then came the great flood of November, 1927, which cost something like $2,500 in receipts, and extra expense in restoring the condition of the property. Nevertheless, with a drop of $1,270 in revenue, total operating expenses were lowered by $4,592. This saving made it possible to apply $5,000 to reserves under "appropriations of surplus" as against $1,600 in 1927 and $1,450 in 1926.

As occurred on many other New England properties, the first quarter of 1928 fell behind because of an unusually mild winter. Another loss was suffered from a change in the movement of Boston & Maine train crews. These crews formerly were good cash customers on the run between East Deerfield yards and Greenfield, but since April 1 most of the train crews run through between Boston and Troy and Mechanicsville, N. Y.

Despite these difficulties, the management is facing the future with confidence. Indications point to better industrial conditions, which will benefit the railway. Since April, 1928, the sale of weekly passes has increased 5 per cent over the same period of 1927. Pass sales, it is believed, are a good index of the trend of employment.

The accompanying tables tell the story clearly.

It should be noted that the division of the route into zones calls for multiple registration of the same rider. While there were 2,281,056 fare registrations for 1927, there were two registrations for each 10-cent cash fare, 8⅓-cent token fare or $1 pass; and three registrations for each 15-cent fare, 12½-cent token fare or $1.50 pass. The actual number of individuals, based on an average of 2.25 registrations per rider, would thus be 1,013,802 or 4.43 per car-mile.

*1924—5 months of operation.

The decrease in way expenses shows that the ideal of a smooth rail is approaching fulfillment; and the decline from 3.7 kw.-hr. to 3.5 kw.-hr. per car-mile with only a half-year's use of lighter cars for part of the mileage demonstrates one of the outstanding advantages of modern equipment.

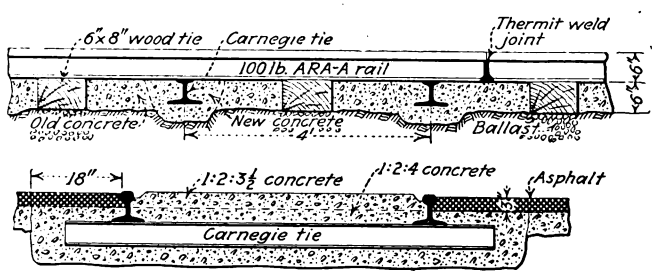
Track Reconstructed Using Both Steel and Wood Ties

By A. W. Baumgarten
Division Engineer Chicago & Joliet Electric Railway, Joliet, Ill.

During the summer of 1928, the Chicago & Joliet Electric Railway was confronted with the problem of rebuilding 3,300 ft. of single track. The 60-lb., 6-in. rail was completely worn out and the condition of the paving also was bad. The old standard single-track construction consisted of wood ties on stone ballast, concrete paving base from the bottom of the wood ties to the base of the rail, and grouted brick paving on a sand cushion. Upon examining sections of such track that had been in use for over ten years, it was found that a slight settling of the rail structure had occurred on account of the settling of the stone ballast, thereby causing paving failures in areas where automotive traffic was fairly heavy. From previous experience on double-track construction, it was believed that steel ties in concrete would be a more permanent type of structure.

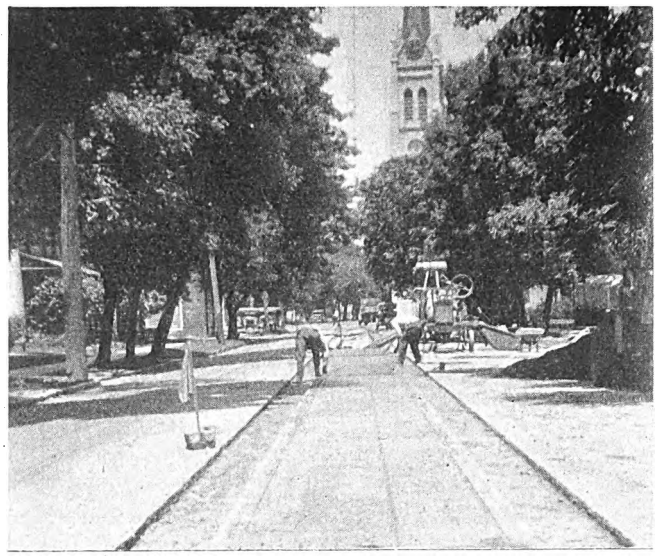


Cross-section of the type of combined wood and steel tie construction used in relaying 3,300 ft. of track in Joliet, Ill.

However, on single-track lines, this type of construction could not be used without interrupting service unless temporary track was laid. Laying temporary track would have made the cost of the work almost prohibitive. It was decided, therefore, to design a combination of wood tie, steel tie and concrete structure which would permit the work to be done without excessive cost, while still obtaining to a large extent the advantages of the steel tie in concrete. A plan and cross-section of this design is shown herewith. The materials used consisted of 100-lb., A.R.A. type "A" rail with Carnegie type M-26 ties and 6-in. x 8-in. x 7-ft. wood ties spaced alternately on 2-ft. centers.

The procedure of removing the old structure and relaying track and paving was carried on with minimum interruption to service. All of the old brick paving was removed down to the base of the rail at the same time the old concrete was broken away from each side of the alternate wood ties. It so happened on this particular construction that the concrete paving base was in excellent condition and the old wood ties were in fair condition with the exception of being rail-cut. For this reason, it was decided to remove only alternate wood ties to be supplanted by Carnegie steel ties, leaving the old concrete paving base and remaining wood ties on which to surface and line the new 100-lb. rail. Short sections of the old rail were then removed; at the same time old wood ties which had been previously loosened were taken out, new steel ties placed in the old trench and new rail laid in place. In this way, practically no interruptions occurred in service over this track.

Digitized by Google



New track as it looked before flange-way forms were removed or outside strips filled with asphalt

The new rail was next surfaced and lined on the old wood ties, using steel and wood shims where necessary, the steel ties also being connected to the rail. After installing several hundred feet of rail section as outlined above, the new rail joints were thermit-welded and ground to surface, leaving the section of track ready for concreting. Concrete was poured monolithic to the surface between rails, using a 1:2:4 mix with a low water content on the base and a 1:2:3½ mix on the top, three inches of paving surface between rails. Because this track was laid in a street with asphalt paving, it was decided not to lay a concrete surface over the 18-in. space outside the rail. Concrete was laid in the 18-in. space only to within three inches of the top of the rail, this strip later being filled with asphalt and thoroughly rolled.

Flange-ways were formed by wiring wood strips to the rails, allowing them to remain in place for about four hours until the concrete had started to set. In finishing the top surface of the paving between the rails, the concrete was thoroughly tamped with a tamping bar but no belting was done, leaving the surface somewhat roughened.

CONSTRUCTION COST OF 3,300-FEET CONCRETE PAVED TRACK

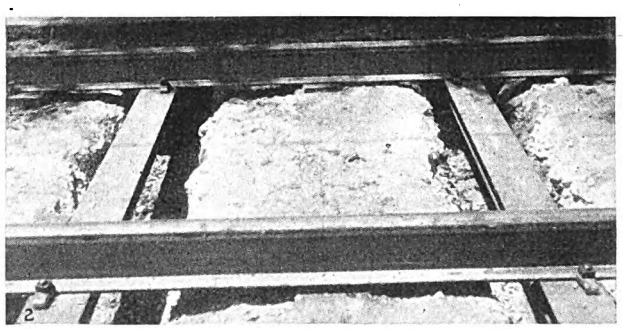
Material	Total Cost	Cost per Foot
Rails—100 lb. ARA	$5,255.00	$1.59
Ties—steel	2,205.00	.67
Cement	2,193.23	.66
Sand and gravel	1,590.74	.48
Joints—thermit-welded	552.00	.17
Asphalt paving	2,782.50	.84
Miscellaneous material	1,062.14	.32
Engineering superintendence, accounting, etc.	2,817.92	.86
Total material	$18,458.53	$5.59
Total labor	6,208.34	1.88
Total cost of new track	$24,666.87	$7.47
Labor removing old track and paving	2,337.00	.71
Total cost of completed job	$27,003.87	$8.18

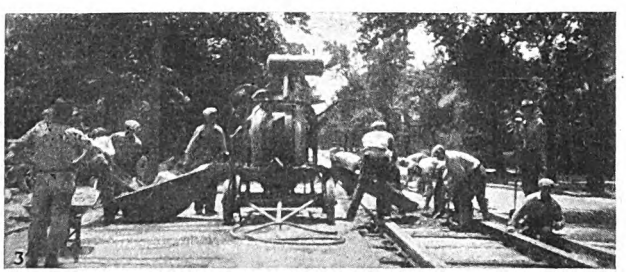
The entire construction was carried on progressively and, with the exception of about ten hours after completing a section of concrete, there were no interruptions to car service over this track. It was felt that no harm would result to the concrete where the rails were firmly supported on the wood ties. In fact, close examination along the rails, after the concrete had set, failed to disclose any movement having taken place between rail and concrete.

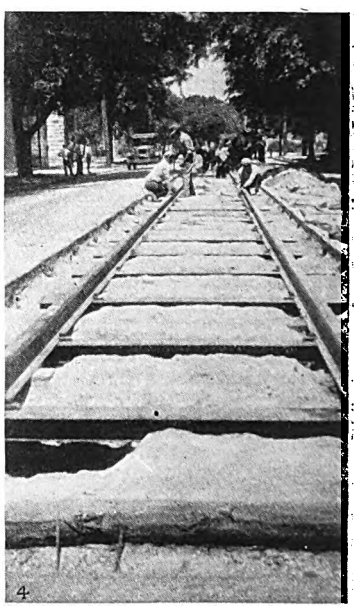
Total Cost $8.18 Per Foot

The accompanying table itemizes the cost of this construction, including all charges such as engineering superintendence, accounting, interest on idle investment and trucking expense. In addition, the complete cost of removing old track and paving has been shown separately, making the total cost $8.18 per foot for removal of old track and complete reconstruction with new. The cost is no greater than that of the previous standard type of construction followed, wherein wood ties were used exclusively. At the same time it is considerably less than it would have been had all steel ties been used, involving, as this would, the laying of temporary track.

It was found, although not anticipated, that after the asphalt paving strips were laid adjacent to the rails, the noise of cars passing over this type of monolithic construction was materially reduced.







No. 1—Air hammers were used in removing old rail and alternate wood ties from pavement.

No. 2—New track was surfaced with aid of shims on undisturbed wood ties imbedded in original concrete base.

No. 3—A one-bag mixer handled the concrete pouring job satisfactorily.

No. 4—Retention of alternate wood ties speeded job of lining and surfacing new track.

Modern Problems of

Motor Coach Design

Demand an Open Mind

The wide discrepancy in performance between motor coaches and automobiles is brought out in this article, which is based upon an address presented before the Metropolitan sections of the A.E.R.A. and S.A.E. The author explains some of the design and manufacturing problems with which the motor coach engineer is confronted—particularly in vehicles for long distance, high-speed service

By G. A. Green
Vice-President in Charge of Engineering
General Motors Truck Corporation

THE amazing growth of the motor coach industry is indicated by the fact that during the year ending December, 1927, motor coaches handled 13.5 per cent of all passengers transported by all forms of common carriers. This development and expansion cannot fail to make one optimistic as regards the future. In order to grasp intelligently the significance of what has actually happened during the five-year period ended December, 1927, it is of interest to compare the relative use of various available means of passenger travel as shown in the following table:

		Per Cent
Population	Increased	8.6
Total common carrier passengers	Increased	9.1
Riding habit	Increased	0.4
Steam road passengers	Decreased, 92,826,473	9.7
Electric railway passengers	Decreased, 400,044,561	0.2
Motor coach passengers	Increased, 1,657,000,000	197.0

These figures speak for themselves. But the motor coach industry is only in its swaddling clothes. Twenty years ago horse-drawn stages were operated for hire on Fifth Avenue and about that time the first motorized equipment appeared there. It would be wrong to say that progress from a design standpoint during this period has been rapid, for it certainly has not and this is unquestionably due to lack of foresight. Neither the manufacturers nor the largest potential buyers, namely, the electric and steam railroads, were at first able to see the possibilities of the motor coach.

Although the general attitude toward motor coaches has now changed considerably, it seems only fair to point out that this wonderful industry has been built up almost entirely as a result of the vision, foresight and courage of the individual operators who until recently received little if any support from the manufacturers or from the steam and electric railroads. Undoubtedly, many will recall the pressure brought to bear upon the manufacturers by the individual operators to produce suitable equipment; also that the manufacturers were for a long time deaf to the operators' pleas. This forced the individual operator to employ converted trucks and modified automobiles. In some instances, in a small way, operators were even forced by circumstances to manufacture their own equipment.

Perhaps, in thus pointing out the comparatively slow progress in coach development and in calling attention to lack of foresight in recognizing its possibilities, I may ruffle the feelings of some of those associated with the industry from its early days. There is, however, no intention of discourtesy. It seems to me that we should face the facts fearlessly, and the facts, as I see them with respect to the motor coach, are that we have much ground to cover before we can boast of our achievements. This is particularly true with respect to developments to meet the conditions imposed by long-distance, high-speed operations.

In all that I may say regarding the problems of coach design, my comments represent only my personal views in the light of present-day experience. These may necessarily be subject to change. I am convinced, however, that motor coach engineers should not be satisfied with present results and my feeling is that they should leave no stone unturned in the effort to convince their managements of the necessity of expending substantial sums on research and development.

Coach Design Demands an Open Mind

Considering now specific questions of design, there is room for much difference of opinion as to the possibilities of various ideas that have been advanced. But the proper point of view for the engineer is admirably conveyed by that famous slogan whose author is, I think, responsible more than any other man for the amazing achievements and world leadership of the American automobile industry; namely, "An Open Mind." And it is with an open mind that we should approach such design questions as: (1) larger engines; (2) oil cooling; (3) use of superchargers; (4) improvement, or better still, elimination of the transmission; (5) gas-electric drive; (6) steam propulsion; (7) six-wheel system.

At the present time there is a clearly-defined demand for at least three general motor coach types with a number of different body styles, the so-called street car and

Digitized by Google

parlor car bodies being fitted to any of the chassis. Very briefly, these chassis types are:

1. A small vehicle particularly suited for school and hotel services. Both automobile and truck chassis with relatively minor changes are generally employed and the design needs no particular comment. Such vehicles accommodate from 8 to 16 passengers and the average automobile power plant provides satisfactory performance.

2. Motor coaches for medium duty services, seating from 17 to 25 passengers. There is a growing demand for this class but the demand has been slowed down by unsatisfactory design. On the whole, coaches of this type have been a disappointment to the user. The power plants were too small and the general construction too light. The maintenance costs have been high. These conditions are changing, however, and satisfactory chassis are now available.

3. Heavy-duty coaches seating from 25 to 40 passengers. This class in the smaller seating capacities is in general use for urban and interurban services, including long-distance coast-to-coast day and night runs. The 40-seat capacity type is a somewhat recent development which has aroused a very considerable interest.

Long Distance Operations Present Greatest Problems

For urban operation the present types appear to give fairly satisfactory results, although in the larger units added power would be welcome. But in interurban service, particularly the long-distance high-speed runs, available vehicles are underpowered. Briefly, such vehicles do not meet with public approval since they lack that which the public desires most; namely, automobile performance with respect to speed and acceleration. These comments are intended as general and should not be applied to any specific type. It is obvious that more than one size of power plant is required. The very large power output so necessary for heavy-duty parlor car coaches for long-distance service would, in the majority of cases, be unsuitable if used elsewhere. Smaller engines may be employed for urban service because a lower gear ratio can be used.

Today, practically everybody recognizes that all highway vehicles for passenger transport are in the automobile class. The motor coach and the automobile employ the same highway and the public is demanding that motor coaches from the standpoint of safety, comfort, appearance, speed, acceleration and deceleration, compare favorably with the average automobile as now built. Unfortunately, however, the difficulties in the way of meeting this standard of motor coach performance are many and varied. There are wide differences in the type and character of the various services to be met, including speeds, loads, road surfaces, grades, etc. This means that unless a vehicle is specifically designed to meet the needs of a specific kind of service, compromises, mechanically speaking, are inevitable.

It is evident that the manufacturers hold widely divergent views as regards mechanical fundamentals. For example, the purchaser is offered power plants of varying types possessing in total from four to twelve cylinders. He may also acquire single- or dual-drive installations for both gear and gas-electric; and before very long, steam may become a factor. The net result is a certain kind of confusion on the part of the buyer. In a general way, we know that there is a vast difference between automobile and motor coach performance, which is to be expected in view of the fact that the so-called heavy-duty motor coach engines as now commonly used displace only from 450 to 500 cu.in.

Coach Performance Far Below Automobile

To be specific, let us compare the actual high gear acceleration values (of this year's automobiles and motor coaches) under laden conditions in terms of miles per hour per second at from 10 to 35 m.p.h. Average high gear acceleration value for the automobile is 2.262; the maximum 2.53. The corresponding motor coach figures, considering both urban and interurban equipment of various seating capacities, are 0.5 and 1.25 respectively, with a full seated load. It should be mentioned that 1¼ m.p.h.p.s. is an unusually good performance as judged

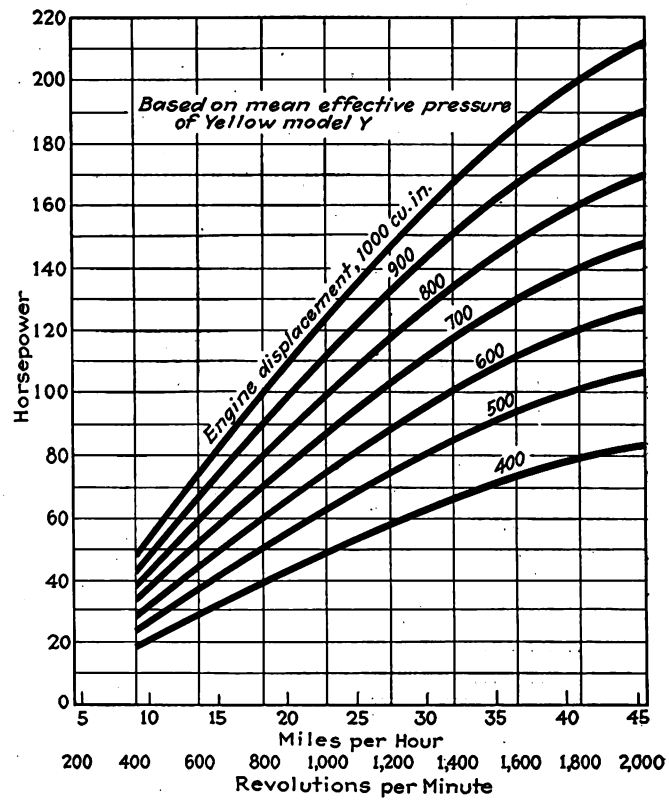

Fig. 1—Horsepower output for engines from 400 cu.in. to 1,000 cu.in. displacement, assuming no change in efficiency resulting from the increase in engine size. Calculations are based on mean effective pressure of Yellow model Y

by present standards. To the best of my knowledge there is only one motor coach which will meet this figure, and that is the Yellow model W parlor car. Here, however, in round figures there is a 100-hp. engine for a 17-passenger vehicle, the unladen weight of which is in the neighborhood of 10,000 lb. Briefly, it is clear that automobile acceleration rates are from two to five times the best obtainable performance of motor coaches.

In order to present clearly the nature of the motor coach performance that can be expected as a result of the employment of engines of widely varying displacements, the accompanying graphs have been prepared, showing horsepower output of engines displacing from 400 to 1,000 cu.in., the corresponding torque, respective acceleration and hill climbing ability, respective hill climbing distances, and respective acceleration values.

In the preparation of these charts certain assumptions

Digitized by Google

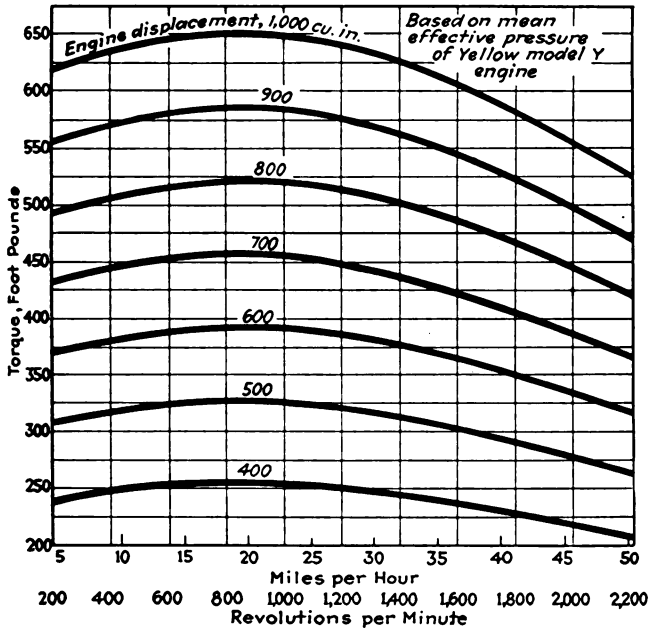

Fig. 2—Torque output per engine for engines from 400 cu.in. to 1,000 cu.in. displacement assuming no change in efficiency resulting from the increase in engine size

were made with respect to rear axle ratio, tire size, wind resistance, rolling resistance, efficiency and weight. The mean effective pressures of the Yellow model Y were used in arriving at the horsepower and torque figures. The data can be considered as applying specifically to interurban high-speed equipment. The weight, 19,250 lb., is not abnormal since it includes a full complement of both passengers and baggage. It should be noted that the calculations assume no change in the efficiency of the power plant or drive mechanism resulting from increased engine size; a uniform vehicle weight, irrespective of engine displacement; and the same relative power consumption for all accessories.

In the accompanying Fig. 1 the engine revolutions per minute, miles per hour and horsepower are shown for engines from 400 cu.in. to 1,000 cu.in. displacement. It will be seen that the maximum power output is available at 2,000 r.p.m., which is equivalent to a road speed of 46 m.p.h. The 400-cu.in. engine produces a maximum of 82.5 and the 1,000 cu.in. 212 hp.

In Fig. 2 are shown the engine revolutions per minute, miles per hour and torque, for engines from 400 cu.in. to 1,000 cu.in. displacement. The maximum torque is available at 800 r.p.m., which is equivalent to a road speed of 18 m.p.h. The curves are fairly flat between 400 and 1,400 r.p.m. With the 400-cu.in. engine the maximum torque is 256 ft.-lb. With the 1,000-cu.in. engine the corresponding figure is 650 ft.-lb.

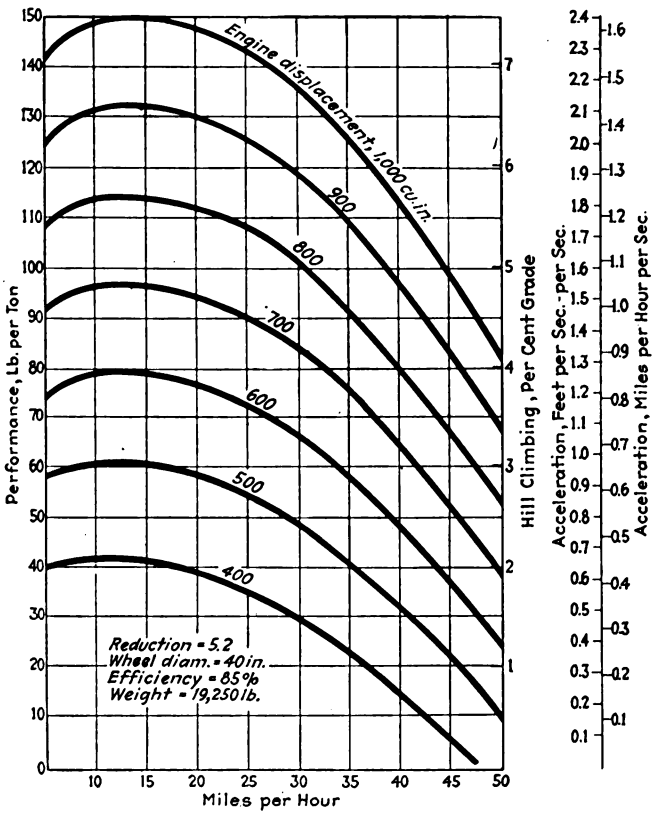

Fig. 3—Graphical comparison of performance in pounds per ton, acceleration, and hill climbing ability in high gear for engines from 400 cu.in. to 1,000 cu.in. displacement. Vehicle weight is assumed to be 19,250 lb. and to remain constant for all engine sizes

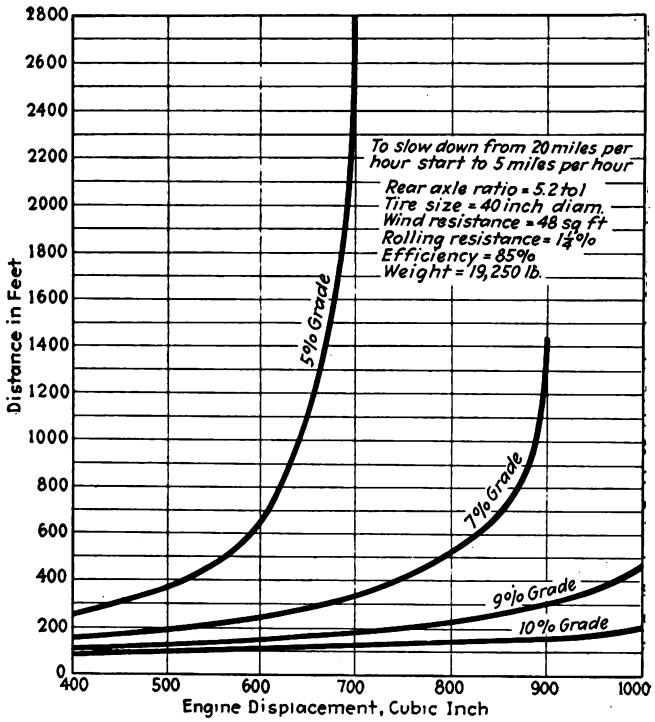

Fig. 4—Hill climbing distances in high gear on grades of 5 per cent, 7 per cent, 9 per cent and 11 per cent for engines from 400 cu.in. to 1,000 cu.in. displacement, assuming constant vehicle weight of 19,250 lb. and constant engine efficiency. The calculations are based upon approaching the grades at 20 m.p.h. vehicle speed

1,000-Cu.In. Engine Accelerates 1.63 M.P.H.P.S.

Fig. 3 shows the performance in pounds per ton, acceleration in feet per second and in miles per hour per second, and hill climbing ability on grades of from 2 per cent to 7 per cent, for engines from 400 cu.in. to 1,000 cu.in. displacement. The assumed weight of the vehicle is 19,250 lb. It is interesting to note that the maximum acceleration value with a 1,000-cu.in. engine is 1.63 m.p.h.p.s. and that this is effective at a road speed of 15 m.p.h. It will be seen that a 400-cu.in. engine will climb a 2 per cent grade and that a 7½ per cent grade can be negotiated with a 1,000 cu.in. engine. The

		No restrictions.	7 states		

curves in Fig. 4 are based on approaching the bottom of the hill at a speed of 20 m.p.h., and show the distances on grades of 5 per cent, 7 per cent, 9 per cent and 11 per cent that can be climbed by engines from 400 to 1,000-cu.in. displacement. The vehicles are considered as having stalled when a speed of 5 m.p.h. has been reached. It is interesting to note that engines of the following displacements are required in order to climb these grades: 5 per cent, 700 cu.in.; 7 per cent, 900 cu.in.; 9 per cent, 1,182 cu.in.; 11 per cent, 1,406 cu.in. Actually a 1,000-cu.in. engine will stall on a 9 per cent grade after reaching 450 ft. and on an 11 per cent grade after having reached 200 ft. It was previously stated that these calculations are all based on high gear performance. Of course, in actual practice stalling would not take place since the operator would shift gears before this occurred.

1,425-Cu.In. Engine to Duplicate Automobile Acceleration

The graphs in Fig. 5 show acceleration values in miles per hour per second and feet per second per second from 10 to 25 and 10 to 35 m.p.h. These curves are of special interest since they permit a ready comparison to be made between the relative acceleration abilities of the automobile and motor coach. It was previously shown that under laden conditions the average 1928 automobile acceleration rate from 10 to 35 m.p.h. is 2.262; the maximum 2.53. Now to duplicate this condition with a motor coach having the characteristics as outlined in the graphs would require engines displacing 1,425 and 1,605 cu.in. respectively. Such engines would be capable of delivering, respectively, about 302 and 340 hp. These are theoretical figures. In actual practice considerably more power would be needed than these figures indicate, and it is obvious that excessive engine sizes would be required to approximate automobile performance.

Consider for a moment some of the practical problems involved in producing heavy-duty motor coach engines. In the first place, the designing and development, including samples, tests, patterns, tools, jigs and fixtures, would require an expenditure of at least $500,000 to produce what might be termed a heavy-duty engine. This expenditure is based on limited tooling to provide for around 2,000 units annually. It is possible to employ heavy-duty motor coach engines modified in various respects for marine purposes, rail cars, tractors and the like, but this kind of business is highly specialized and with the exception of the tractor no great volume is in sight. Unfortunately, with the tractor, first cost is an all-important issue and this practically rules out the possible use of the motor coach engine. Producton possibilities are therefore very limited.

Large Engines Introduce Complications

With larger engines the tire mileage cost will be greater. Larger tires will be needed to carry properly the additional weight of both engine and chassis. Then, also, more rapid acceleration means increased tire wear. Obviously the larger the tire the more difficult the steering. Furthermore, tire diameter increases adversely affect the turning radius.

A larger engine will project further into the body with a resultant decrease in passenger capacity. This may be partially offset by permitting the engine to project behind the dash but there is a limit to what can be done in this respect. With the existing so-called heavy-duty engines an average parlor car, the over-all length of which is held within 30 ft., cannot accommodate more than 29 passengers with any reasonable degree of comfort. Assuming an engine of 700 cu.in. capacity or greater, and even taking into account the maximum permissible projection

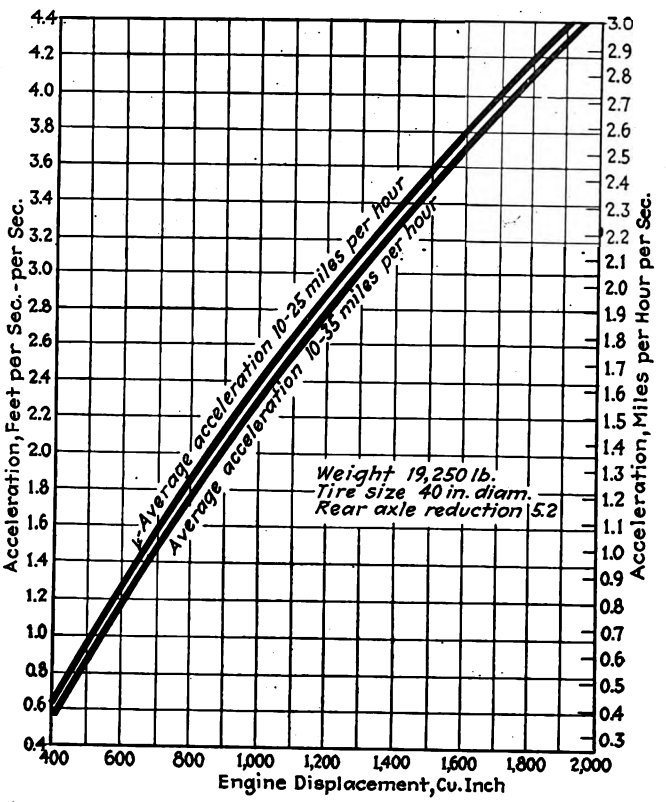

Fig. 5—Acceleration values for various engine displacements assuming constant vehicle weight. Average 1928 automobile acceleration rate from 10 to 35 m.p.h. is 2.262 and the maximum 2.53

behind the dash, in all probability the seating capacity would be automatically reduced to 25 passengers unless, of course, the over-all coach length is arbitrarily increased, which would rule out this type of equipment from 11 important states.

Further Complications Are Presented by Larger Engines

The drive mechanism must be strengthened throughout, which means the enlargement of the clutch, transmission, propeller shaft and final drive. Naturally, considerable additional weight will result. In effect, a very large engine will necessitate what practically amounts to a new chassis, with resultant designing, testing, tooling and development expenditures of possibly another $500,000.

Larger engines present a cooling problem as well. With a single engine installation the frame determines the width of the radiator; the driver's vision and ground clearances determine the height dimension; thermal conditions, the thickness of the core; the power losses determine the amount of air that can be drawn through the core. At present with some designs as much as 10 per cent of the available engine output is at times used to

Digitized by Google

drive the fan. As an average, probably from 2½ to 5 per cent of the power output is so employed constantly. This is a factor of considerable importance, particularly when one considers that a corresponding percentage of the total fuel bill is involved.

There is, of course, the alternative of providing two engines, but there are a number of difficulties; for example, seat arrangement, cooling, prevention of heat and odors entering body, accessibility, and last but not least, added upkeep cost resulting from the dual drive system. It should also be pointed out that where two engines are employed the cooling problems are as great, if not greater than, with the single unit, and a point not to be lost sight of is that two relatively large engines will be needed and the difficulties to be encountered resulting from their projection both above and below the frame line cannot be discounted.

With any very large increase in engine displacement a greater average fuel consumption is to be expected, but the extent of the increase will depend largely upon the character of the operation and the skill of the operator. Naturally there is a loss in efficiency when very large engines are operated at part throttle. If it were possible to considerably increase the engine output without adding weight to the engine or other chassis parts the situation would be less serious, but unfortunately this cannot be accomplished.

Automobile Performance Improbable

Despite all of the design problems presented, however, there is a persistent demand for larger engines. One point stands out with unmistakable clarity; namely, it is highly improbable that the performance of an internal combustion engined motor coach can ever be expected to parallel that of the average automobile. But it is also obvious that engines must be made available which will permit of sustained high vehicle speeds. There are many services where sustained speeds in excess of 60 m.p.h. are absolutely safe. But such engines should be capable of giving reliable service of this kind day after day, year after year, with only the absolute minimum of attention. Vehicles in this type of service will regularly cover from 75,000 to 100,000 miles annually and, assuming proper design, practically no attention should be required other than periodic examinations and cleaning. It is needless to stress the reliability factor, particularly in connection with long-distance operation. Such vehicles frequently do not return to their respective divisions for weeks at a time, and when one considers the immense annual mileage, it will readily be seen that the actual time available for inspection and repairs is, as a rule, quite limited. Of course, failures of any kind are to be deplored, but the results of a failure of a motor coach on a long-distance run are of immeasurably greater consequence than in city service.

Six-cylinder engines in excess of 500 cu.in. displacement cannot be expected to give economical service if turned over for very long periods in excess of 2,000 r.p.m. Furthermore, the size and weight of six-cylinder engines becomes out of all proportion where a very large power output is required. It seems reasonably clear that engines displacing beyond 600 or 700 cu.in. should be of the V type, not the least of the advantages being the question of space occupancy. Generally speaking, with large engines the length factor is determined by the bearings and not by the cylinder bores. For this reason, among others, a square engine should be considered, and since for a 1,000 cu.in. engine a six would require 6x6-bore and stroke, an eight 5½x5½, and a twelve 4¾x4¾, the evidence points to the largest number of cylinders; namely, twelve. Unless supercharging becomes a factor in increasing coach engine power, it seems quite evident that future heavy-duty parlor car engines will displace from 900 to 1,000 cu.in.

Other Possible Improvements Require Study

Superchargers—Concerning the possibility of supercharging, it is unquestionably a matter deserving of the closest possible scrutiny. Many passenger car engineers disregard this issue altogether, preferring the popular annual reaming process for increasing engine output. Of course, this is the easiest way out but there is a limit to the possible size of motor coach engine cylinders, and engines in excess of 700 cu.in. represent a tremendous mass of metal, take up a lot of room and cost a lot of money to buy and to maintain. Tests made to date indicate that supercharging is within the realms of possibility. The best scheme appears to be the high-pressure type blower of large size operated at relatively low speeds. Unfortunately, however, there is little or no likelihood of developing superchargers that may be attached to existing engines for the engine and supercharger design must be worked out jointly.

Transmission—Transmission design has changed very little since the first automobile was built—a rather discouraging state of affairs—and no matter how one may reflect on the situation, it is little short of amazing that such a barbarous piece of mechanism exists in this day and age. The problem of gear shifting, of course, is still with us, but the question of noise is the vital issue. There is no such thing as a quiet transmission, silence being merely a relative term.

Everyone appreciates the amazing developments that have taken place with regard to automobile design. Unfortunately, however, but a very small percentage of the brains employed on this work have been devoted to the transmission question. The weaknesses are recognized, but in automobile design the only remedy found to date is the enlargement of the engine. Hence the customary annual reaming operations on engine bores. Actually, automobile engines have now reached such proportions that transmissions can be considered as auxiliary devices, their use being primarily devoted to the business of reversing the motion of the vehicle. But a different condition is faced with the motor coach, for no matter how we enlarge the engines, still the transmission will be required to perform a considerable amount of service and the higher torque which must be transmitted through our future transmissions will increase rather than decrease our difficulties.

Manufacturers Not Asleep

Gas-Electric Drive—From these remarks it should not be concluded that manufacturers are entirely asleep at the switch. Experiments are constantly being made with various forms of variable gearing. Then there are, of course, the possibilities of electricity and, last but not least, steam. It is considered by some that the gas-electric will be the final solution. Perhaps this is so, but the present electrical systems are heavy and expensive. The approximate weight of single or dual gasoline-electric equipment for use in connection with an engine developing around 100 hp. is from 1,900 to 2,100 lb., and the cost is in the neighborhood of $1 per pound. These figures speak for themselves.

It is generally recognized that the characteristics of the

Digitized by Google

average motor coach engine are not suited to the electrical equipment now available, and it has been suggested that the motor coach industry should produce entirely special engines, but the enormous development cost is prohibitive. Briefly, the average motor coach manufacturer is reluctant to place himself unqualifiedly behind the gas-electric drive because he is not sure that the electrical manufacturers will move with the times. Mention should be made of the fact that the gas-electrically propelled motor coaches as now built by the various American manufacturers are, generally speaking, mechanically sound, the only real objections being high fuel consumption, weight and cost.

Steam Offers Possibilities

Steam Propulsion—It is somewhat surprising that steam has not played a more prominent part in the motor coach industry. Perhaps here again the chief reason is that only a very limited percentage of the total available brains has been engaged upon the solution of the various difficulties. At first sight steam is the ideal solution, but little or no success has attended the various developments which from time to time appear. Nearly all steam-propelled vehicles give a spectacular performance, yet none of them have satisfactorily withstood the acid test of time and distance, but this does not mean that steam is out of the picture. In fact, future developments along this line are assured. How successful they will be it is hard to foretell. But the tremendous advantages, such as maximum torque at zero speed and absolute silence, are irresistibly attractive. However, steam as a factor in the motor coach industry is still far distant and in all probability the tremendous advantages have corresponding disadvantages—at least this has been the history of the past.

Oil Cooling—The following potential advantages are offered by oil cooling: Easier starting, since lighter oils may be employed; less oil consumption, since the viscosity may be kept more nearly constant; less cost because more miles per gallon can be expected from relatively lower priced oils; less wear due to better lubrication throughout, as a result of the ability to maintain a higher average viscosity; longer bearing life due to the decreased tendency of the babbitt to soften as a result of heat; less carbon formation resulting from the use of lighter oils having a lower carbon content.

The modern high-speed interurban motor coach is required to operate for very long periods with the engine delivering a large percentage of its total power output. This condition introduces a number of complications, particularly with respect to lubrication. As a result of the accumulated heat, many of the oils commonly used tend rapidly to decrease their viscosity, in some instances to such an extent that the oil film is no longer capable of supporting the pressure imposed upon it.

With practically all aircraft engines provision is made for oil cooling. It would be difficult, if not impossible, to run these engines successfully otherwise, and the operating conditions of motor coach and aircraft engines are in some respects comparable, since high duty for continuous periods is one of the controlling issues in both cases. From the standpoint of decreasing operating expenses generally, in so far as the engine is concerned, the influence of oil cooling cannot be over-estimated.

Six-Wheel System—That this system is going to play an important part in the future development of the heavy-duty motor coach there is little doubt. This statement is made bearing in mind the unsatisfactory service received from the earlier American models. There has been much loose talk concerning the six-wheel system with respect to tire economy, riding properties and roadway damage. With present six-wheel designs there is considerable doubt in my mind if economy exists with respect to tires, and in so far as riding properties are concerned it can be readily demonstrated that just as good, if not better, results are obtainable with the conventional system. *But the advantages* are clearly in favor of the six-wheel system as regards possible roadway damage, and it is more than probable that the six-wheel system can be made to ride better than the conventional arrangement and can be made to give better tire mileage. Furthermore, there is another point; namely, that with the six-wheel principle properly executed, so-called mass transportation equipment, whether used in urban or interurban service, can be designed with a relatively short wheelbase without excessive rear or front overhang. The importance of this cannot be over-emphasized.

You may say that all of this is poor sales argument for present standard coaches. I don't think so, my feeling being that the average operator will be glad to know that manufacturers do not think that they know it all. I think operators will also be glad to know that manufacturers are continually experimenting with new devices of one kind or another. Then the fact that someone has sufficient courage openly to face the definite trend in public opinion toward motor coaches with automobile performance and to show in a general way some of the difficulties of attainment, should be welcomed.

No Radical Changes Imminent

To allay the fears of operators who have purchased or are about to purchase equipment, as regards the possible proximity of major motor coach design changes and new developments I should like to say that such fears are, to the best of my knowledge and belief, groundless. In short, we are not on the eve of startling events. It is, of course, evident that the more important manufacturers are carrying out experimental and developmental projects of one kind or another, but manufacturers have learned from experience that it is wise to make haste slowly, otherwise service costs soon absorb profits and dissatisfied customers mean an immediate and permanent loss of business.

Public Service Buses Carry Foreign Visitors on Long Trip

EIGHT buses of Public Service Co-ordinated Transport covered 2,500 miles each in a single chartered trip during October. The group carried consisted of some 200 members of the automobile club of Germany, who came to this country to study the methods of automobile manufacture. The trip began on Oct. 10 from the Hotel Pennsylvania, New York, and night stops were made at Philadelphia, Washington, Uniontown, Pa., Columbus, Cincinnati, Indianapolis, Chicago, Detroit, Hamilton, Niagara Falls, and Binghamton. With an average mileage per bus of 2,500, the total miles run were 20,000. The total consumption of gasoline was 3,350 gal., and 158½ gal. of oil were used.

The only delay during the entire trip was a broken ring gear on one of the buses between South Bend and Detroit, but the passengers were transferred to another bus, and the one disabled was soon repaired and in its customary place in the line-up the following morning.

This express passenger electric locomotive was built in Japan for the Government Railways

New Express Passenger Electric Locomotives in Japan

Recent equipment for the Japanese Government Railways includes seven 1,800-hp. high-speed passenger locomotives, built in Japan. Details are given of one supplied by the Kawasaki Dockyard Company, Ltd.

PRESENT plans of the Japanese Government Railways for the main line electrification of sections in the heavy grades and tunnels are quite comprehensive. Much of this work is in the neighborhood of Tokio. Seven high-speed electric locomotives built in Japan have lately been added to the equipment and will be used in express passenger service on the line from Tokio to Kosu, about 100 miles. The accompanying illustrations show a locomotive built by the Kawasaki Dockyard Company, which, with three other large electrical manufacturers in Japan, supplied the equipment mentioned.

The locomotive is of the articulated truck type with six main driving axles arranged for gear drive, with a small guiding four-wheel truck at each end. The principal dimensions, weight, etc., of the locomotive are shown in the accompanying table. The specification relating to starting provides that the locomotive should start from rest a train weighing from 500 to 700 metric tons on a rising grade of 1 per cent and should attain a speed of 50 km. (31 miles) per hour on 1,350 volts.

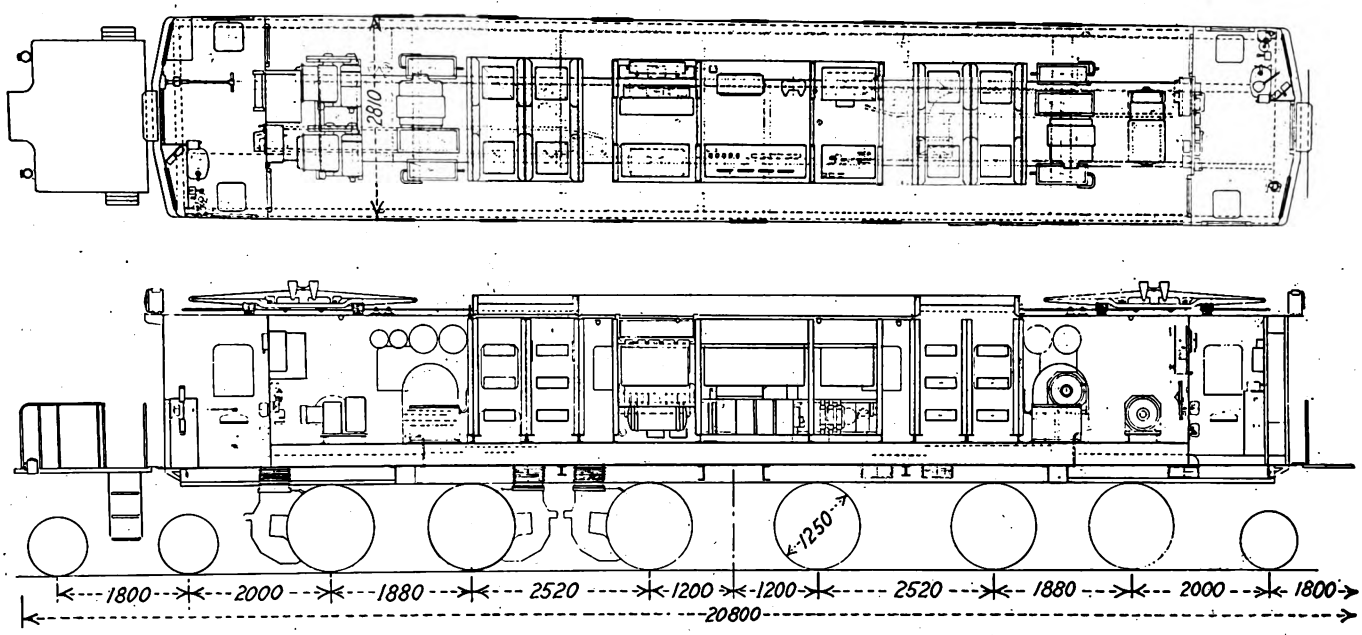
DATA OF LOCOMOTIVE BUILT FOR TOKIO-KOSU LINE

Truck gage	1,067 mm. or 3 ft. 6 in.
Total length over buffers	20,800 mm. or 68 ft. 3¼ in.
Rigid wheelbase	4,400 mm. or 14 ft. 5 in.
Driving wheel diameter	1,250 mm. or 4 ft. 1¼ in.
Leading wheel diameter	940 mm. or 3 ft. 1 in.
Over-all width over platform	2,810 mm. or 9 ft. 2¼ in.
Hourly rating	1,350 kw.
Speed at hourly rating	45 km.p.h. or 28.1 m.p.h.
Normal maximum running speed	90 km.p.h. or 56.2 m.p.h.
Total weight of locomotive	106 metric tons or 233,200 lb.
Supply voltage	1,500 volt d.c.

The mechanical and electrical parts follow the standards of the Japanese Government Railways. On each of the six main driving axles is mounted an axle-hung geared motor. To provide smooth transmission of the torque between the pinion and gear, the latter is of the spring gear type. The motor frame is of cast steel. Forced ventilation is furnished by two motor-driven blowers, the air being passed not only over the armature and the field coils but also through ducts in the armature cores. The average supply voltage is 1,350 volts, and as there are always at least two armatures in series, there is normally a maximum of 675 volts across any armature. The control system is arranged to give series connection with six armatures in series, series parallel with two parallel groups of three in series, and parallel with three parallel groups of two in series. Resistance steps are provided in each motor grouping, there being twelve series notches, eight notches with three motors in series and eight notches with two motors in series, thus insuring even acceleration. In addition, two weak-field notches are provided for speeding up the motors. The main grid resistors are designed so that their maximum temperature rise will not exceed 250 deg. C.

The control system is of the electro-pneumatic type, the line switches, resistance switches and combination

Digitized by Google



The layout of the equipment is well balanced, as shown in this plan and elevation

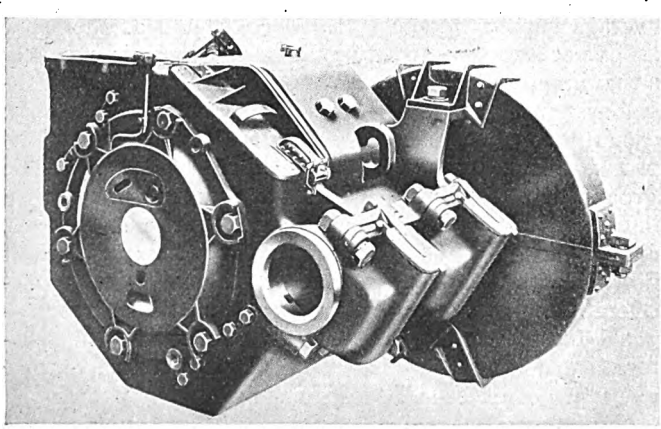
switches consisting of compressed air-operated contactors. The reversing switches are of the drum type, also air operated. All air valves on these switches are operated electrically from a 100-volt supply, obtained by a 1,500/100-volt, 2-kw. motor generator. This motor generator is designed to give a constant voltage irrespective of the supply voltage.

The valve operating circuits are controlled from the master controllers, one of which is mounted at each end of the locomotive. The controllers are fitted with two handles, one for reversing and the other for grouping motors, resistance and field control. A motorman's cab is provided at each end of the locomotive body, the motorman's seat being located on the left-hand side of each cab.

The train is fitted with vacuum brakes, but the locomotive itself is separately equipped with air brakes of the Westinghouse 14-EL type. Accordingly, the equipment includes an air compressor and a vacuum pump, both electrically driven, the latter for operating the train brakes and the compressor for operating the locomotive air brakes. This duplicate arrangement will continue only until all trains can be equipped with air brakes, according to the present plans of the Government Railway Department.

The general arrangement of the locomotive equipment is shown in the plan and elevation. The arrangement adopted gives great accessibility of auxiliary motors and control gears, combined with a uniform distribution of the weight throughout the locomotive. Two through corridors, one along each side of the locomotive, connect the two motorman's compartments. These corridors facilitate inspection of the auxiliary machines and switch gears.

The control portion of the locomotive is in the high-tension switch-gear compartment. There are two auxiliary machine compartments next to the motorman's cab, each separated from the high-tension compartments by a grid resistor compartment. Suitable battery groups are provided in the auxiliary machine compartment to act as a spare of the motor-generator. Change over is effected by a switch on the auxiliary circuit switch panel. The auxiliary circuit includes a control circuit and a lamp circuit, and its nominal voltage is 100 volts. Overload protection is provided by a G-E type high-speed circuit-breaker. There is a choke coil in connection with each pantograph circuit, and an aluminum-type arrester insures protection from lightning and surges. The test run of the locomotive was very successful.



The main traction motors use 1,500 volts direct current

Evansville Freight Shipments Increase

FREIGHT shipments by the traction line route in and out of Evansville, Ind., are showing a steady increase in volume, particularly on the line between Evansville and Owensboro, Ky., according to G. R. Millican, general manager of the Evansville & Ohio Valley Railway. Jobbers and merchants are availing themselves of this service. Through shipments from Evansville to Owensboro are now offered twice a day. The traction car leaving Evansville in the morning insures delivery of freight in Owensboro the same afternoon, while freight leaving Evansville by traction at night is delivered early the morning following.

Both the Evansville & Ohio Valley line and the Evansville, Suburban & Newburgh line, are hauling a great deal of coal at the present time, there being a large number of coal mines scattered along these routes. Many southern Indiana mines now are operating on full time.

New National

Bus Regulatory Measure

Full text of bill introduced by Representative Parker to replace law proposed last year. New measure believed to overcome previous objections

ANOTHER attempt is to be made at this session of Congress to bring about a degree of order in the regulation of interstate buses by bringing them under regulation. To that end a new bill has been introduced by Representative Parker, as noted in the JOURNAL for Dec. 22, page 1097. The effort made in the present bill is to overcome the objections made to the one lost in the last session largely because of the objection that the measure as it then stood, while it provided for regulation, might tend to hamper the free development of the bus and truck industry. Under the new bill certificates of convenience and necessity are necessary for interstate bus lines, for which applications must be filed with the Interstate Commerce Commission. The so-called grandfather clause will date from Nov. 1, 1928. To go into a lengthy analysis of the provisions of the measure, however, is not necessary since the bill in full is presented herewith.

A Bill

To regulate interstate commerce by motor vehicles operating as common carriers of persons on the public highways

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled.

DEFINITIONS

Section 1. (a) The term "corporation" shall include a corporation, company, association, or joint-stock association.

(b) The term "person" shall include an individual, firm, or co-partnership.

(c) The term "Board" means the commission, board, or official (by whatever name designated in the laws of a state) which, under the laws of any state in which any part of the service in interstate commerce regulated by this act is to be performed, has or may hereafter have jurisdiction to grant or approve certificates of public convenience and necessity or other form of permit to motor vehicle common carriers in intrastate commerce over the public highways of such state; or, if there be no such authority in the State, then as to that state it means the commission, board, or official which such state may hereafter create or designate.

(d) The term "commission" means the Interstate Commerce Commission.

(e) The term "certificate" means a certificate of public convenience and necessity authorized to be issued under the provisions of this act.

(f) The term "public highway" shall include the public roads, highways, streets, and ways in any state, or any political subdivision thereof or in the District of Columbia.

(g) The term "motor vehicle" includes all vehicles or machines propelled by any power other than muscular power and used upon the public highways for the transportation of persons, except that the same shall not include any vehicle, locomotive, or car operated on a rail or rails, or motor vehicles used exclusively in the transportation of property.

(h) The term "motor carrier" shall mean and include any carrier of persons which holds out, announces, or advertises the operation of motor vehicles for compensation in interstate commerce, or which operates or runs motor vehicles over any street, highway, or public place in interstate commerce, and accepts and discharges such persons as may offer themselves for transportation, either at a terminus or points along the way or route on which such motor vehicles are used or operated or may be running. Nothing in this act shall be construed to include buses employed solely in transporting school children and teachers, or taxicabs having a capacity of six passengers or less not operated on a regular route, or buses owned or operated by or on behalf of hotels and used exclusively for hotel patrons.

(i) The term "chartered motor vehicle" means a motor vehicle hired for a specific trip or trips which is subject to the direction of the person hiring the same.

(j) The term "state" includes the several states and the District of Columbia.

ADMINISTRATION OF THE ACT

Section 2. (a) It shall be the duty of the commission and of joint boards to be created hereunder acting as federal agencies to administer the provisions of this act. All powers heretofore granted in the Interstate Commerce Act to said commission are hereby extended to it for the purpose of the enforcement of this act and it may adopt uniform rules for the regulation of motor carriers and such rules and regulations as may be necessary for the proper administration or enforcement of this act. Any member of a joint board may administer oaths in a proceeding before such joint board. The general rules governing the time and place of meetings of joint boards and the procedure to be used by them shall be promulgated by the commission after a conference with the state boards.

(b) For the purposes of administration of this act, nothing contained in Section 500 of the Transportation Act, 1920, shall be construed by any joint board, by the commission, or by any court to express a policy of Congress in favor of any other form of transportation as against transportation by motor vehicle or to affect in any manner the issue of a certificate under this act, if the issue of such certificate, after all pertinent facts and circumstances have been duly considered on their merits, is deemed proper in the public interest; and nothing herein contained shall be construed as a declaration by Congress of the relative importance to the public of the several kinds of transportation.

(c) For the purpose of carrying out the provisions of this act the commission shall refer all matters over which it has jurisdiction hereunder (except the rules and regulations it may adopt pursuant to paragraph (a) of this section; the regulations provided in sections 6 (b), 7, 8 and 9; the issuance of certificates to bona fide operators in operation on Nov. 1, 1928, without hearing as provided for in section 3 hereof) to joint boards made up, in each case, of representatives of the boards of the several states in which any part of the interstate operation is, or is proposed to be, conducted. On such joint boards there shall be one representative from each of such states, and such representative shall be designated by the board in such state, either from its own membership or staff, or from the membership or staff of a board interested in the proceedings, as such board may elect. If there be no such board in any state or if the board in any state or states shall fail to designate such representative, the joint board shall function without a representative from such state or states and if the said boards of all such interested

Digitized by Google

states shall fail to designate representatives the commission shall hear and determine such matter.

(d) The joint board so constituted shall render a decision on matters submitted to it. Such decisions shall thereupon be filed with the commission and all parties to the record notified thereof. The commission in not less than ten or more than thirty days after the filing of a decision by a joint board and notice thereof to interested parties shall issue an order or a certificate in accordance with the decision of the joint board. If a party to the record shall file with the commission notice of an intent to appeal from such decision within ten days after notice thereof such order or certificate shall not be issued until time for appeal from decision of joint board has expired.

(e) The joint board shall keep a record of its proceedings, which shall be filed with the commission. If the joint board is unable to reach a decision within 60 days from the submission of the matter by the parties, unless the time shall be extended by the commission, the commission shall decide the matter upon the record of such proceedings.

(f) If a joint board to which any matter is referred for decision shall fail to start hearing the same within sixty days from its reference, unless the time shall be extended by the commission, such matter shall be heard and decided by the commission.

Certificate of Public Convenience and Necessity

Section 3. No corporation or person shall engage as a motor carrier in interstate commerce on any public highway in any state without having first obtained from the commission a certificate of public convenience and necessity authorizing such operation: *Provided,* That motor carriers in operation on the date of the approval of this act shall have 90 days from such date in which to file application for certificates hereunder and shall have the right to continue in operation until their applications have been finally decided: *Provided further,* That if a motor carrier, or its predecessors in interest, was in bona fide operation over any route on Nov. 1, 1928, and (except as to seasonal service or interruptions of operation over which the applicant or a predecessor in interest had no control) continuously has been so operating since that date and such motor carrier shall make application to the commission for a certificate of public convenience and necessity, it shall be served by the commission with a questionnaire in respect to the matters which, in the judgment of the commission, shall constitute bona fides of operation, which questionnaire the applicant shall answer within 90 days from the receipt thereof; and if it appears from the answers to such questionnaire or from information furnished by any board that the operations of such applicant are bona fide for the purpose of furnishing transportation to the public and of continuing the same for a reasonable period, a certificate shall be issued to such applicant as a matter of course; but if, from the answers to such questionnaire or from information furnished by a board, the commission shall not be satisfied of such bona fides it shall refer such matter to a joint board for decision. A copy of all questionnaires and the answers thereto shall be furnished by the commission to the board of every state in which any part of the service is conducted.

Applications

Section 4. Any corporation or person desiring such certificate shall make application therefor in writing to the commission, which application shall be verified under oath and be in such form and contain such information as the commission by order shall require.

Hearing on Application

Section 5. (a) Hearings on applications of motor carriers in operation on the date of the approval of this act shall be given precedence over hearings on other applications.

(b) In determining whether or not a certificate should be issued, the joint board and the commission shall, among other pertinent matters, give reasonable consideration to the convenience of and necessity to the public to be served thereby of the service by motor vehicle applied for and to existing available transportation agencies and service.

Certificate

Section 6. (a) The joint boards or the commission in deciding the matter of a certificate may authorize the operation proposed, in whole or in part, and may attach to the exercise of the rights granted thereby such reasonable terms, conditions, and regulations as in their judgment the public interest may require, and shall specify the route or routes over which, and the fixed termini, if any, between which the motor carrier is authorized to operate.

(b) Any motor carrier holding a certificate under this act may operate chartered motor vehicles in interstate commerce or may occasionally depart from its regular route for the purpose of providing special service to a point beyond such route, subject to police regulations and according to such rules and regulations as the commission may prescribe.

(c) Certificates issued under this act shall be effective from the date thereof, and shall continue in effect until suspended or revoked. Upon complaint of any board filed with the commission the certificate of a motor carrier may be suspended or revoked, in whole or in part, after hearing by a joint board, for failure to comply with this law or any lawful orders or rules promulgated hereunder.

(d) No certificate issued to a person shall expire solely by reason of death, but a personal representative may operate under such certificate, to the same extent and subject to the same conditions as such decedent could if living.

Transfer Certificates

Section 7. Certificates may be transferred, and the commission shall approve the transfer thereof, subject to the provisions of this act, upon compliance by the transferee with such general rules and regulations as the commission may prescribe respecting such transfers.

Security for the Protection of the Public

Section 8. No certificate shall be issued or remain in force unless the holder thereof shall comply with such rules and regulations of the commission as it shall adopt governing the filing of bonds, policies of insurance or such security or agreement in such form and adequate amount and conditioned as the commission may require for the payment of any final judgment which may be rendered against any such motor carrier arising out of the death of or injury to any passenger or injury to other persons or property as a result of any negligent operation of the motor vehicles of such motor carrier, with power in the commission to permit self-insurance whenever, in its opinion, the financial ability of the motor carrier warrants.

Rates

Section 9. (a) All rates, fares, and charges of motor carriers shall be stated in money, and shall be just and reasonable. Tariffs shall be prepared, filed, and posted in such manner as may be prescribed by the commission.

(b) No motor carrier shall charge or demand or collect or receive a greater or less or different compensation for such transportation of persons, or for any service in connection therewith, between the points named in such tariffs, than the rates, fares, or charges which are specified in the tariffs in effect at the time; nor shall any such motor carrier refund or remit in any manner or by any device any portion of the rates, fares, or charges so specified, nor extend to any person any privileges or facilities for the transportation of persons except such as are specified in such tariffs: *Provided, however,* That any motor carrier authorized to operate under the provisions of this act may issue or give interstate free tickets, free passes, and free or reduced transportation to persons engaged in the service of the carrier.

(c) No change shall be made in any such rate, fare, or charge which shall have been filed and posted in compliance with paragraph (a) of this section except after 30 days notice of the proposed change filed and posted in like manner, which notice shall plainly state the change proposed to be made and the time when the change will take effect: *Provided,* That the commission may, in its discretion and for good cause shown, allow changes upon less than the notice herein specified or modify the requirements of this section in respect to posting and filing of tariffs, either in particular instances or by a general order applicable to special or peculiar circumstances or conditions.

Appeals

Section 10. Any party to the record in any matter submitted to a joint board may appeal within thirty days after receiving notice of the filing of the decision of such joint board to the commission from the decision rendered.

The commission shall decide such appeal on the record made before such joint board and may affirm the decision of such joint board or may set the same aside or modify the same or order a rehearing of the matter or make such other order as the public interest may require.

The commission may stay the issuance of an order putting into effect the decision of a joint board during the pendency of an appeal.

Any order entered by the commission which constitutes a final order under the provisions of this act shall be subject to the same right of relief in court by any party in interest as is now provided for in respect to orders of the commission in the act to regulate commerce approved Feb. 4, 1887, as amended.

Orders and Notices

Section 11. (a) It shall be the duty of every motor carrier as defined in this act to file with the board of every state in which it operates, and with the commission, designation in writing of the name and post office address of a person or corporation upon which person or corporation service of notices or orders may be made on such motor carrier. Such designation may from time to time be changed by like writing similarly filed. Service of notices or orders may be made upon a motor carrier by personal service or by mail on the person or corporation so designated by it at the address filed, or by personal service on such person or corporation. In default of such designation, service of any notice or order may be made by posting in the office of the secretary or clerk of the board of the state wherein the motor carrier maintains head-

Digitized by Google

quarters and in the office of the commission.

(b) Notice of every decision of a joint board, or of an order or certificate of the commission entered after hearing affecting any motor carrier shall be given to all parties to the record in the proceedings, either by personal service or registered mail.

Unlawful Operation

Section 12. (a) Upon conviction in any federal court having jurisdiction any person or corporation who shall have operated a motor vehicle of any character in willful violation of the provisions of this act, either in his own interest or as the agent of another or shall have otherwise willfully violated any provision of this act, or any lawful order of the commission, shall be fined not more than $100 for the first offense and for any subsequent offense shall be fined not more than $500. Each day of violation of a provision of this act shall constitute a separate offense.

(b) If any motor carrier shall operate in violation of the provisions of this act, or shall fail or neglect to obey any lawful order of the commission, the commission, or any party injured, may apply to any court of competent jurisdiction in any district where such motor carrier is engaged in business for the enforcement of this act or such order; and the court shall have jurisdiction to enforce obedience thereto by a writ of injunction or other proper process, mandatory or otherwise, and to restrain such carrier, its officers, agents, employees, or representatives from further violation of this act or of such order, or to enjoin upon it or them obedience to the same.

Appropriations for Contingent Fund

Section 13. There is hereby authorized to be appropriated out of the Treasury of the United States such sums as may be necessary, to be paid to the commission and held by it as a separate contingent fund, out of which it may meet such expenses of the administration of this act as are incurred by it or by the joint boards.

Powers of the States

Section 14. Nothing in this act contained shall be construed to affect the powers of taxation of the several states or to authorize a motor carrier to do an intrastate business on the highways of any state. It is not intended hereby to interfere with the exclusive exercise by each state of the power of regulation of motor carriers on the highways thereof engaged in intrastate commerce; and, notwithstanding this act, motor carriers operating in intrastate commerce on the highways of a state shall continue to be subject to the laws thereof and motor carriers engaged in interstate commerce hereunder shall be subject to the proper exercise by the state of its police powers.

The commission while acting under authority of this act shall not have any jurisdiction or authority over intrastate commerce by motor carriers and the commission is expressly prohibited from interfering in any way with or attempting to regulate such intrastate commerce by motor carriers.

Section 15. Any corporation or person which shall engage in the transportation of passengers by motor vehicle upon the public highways, or which shall own and control a motor carrier which operates such motor vehicles, or which shall purchase and own the whole or any part of the capital stock of a corporation organized or engaged as a motor carrier in the transportation of passengers by motor vehicle upon the public highways in interstate commerce, and for the operation of which motor vehicles a certificate of public convenience and necessity has been obtained as in this act provided, shall be, and it is hereby, relieved from the operation of the "anti-trust laws," as designated in section 1 of the act entitled "An act to supplement existing laws against unlawful restraints and monopolies, and for other purposes," approved Oct. 15, 1914, and of all other restraints or prohibitions by any law, state or federal, in so far as may be necessary to enable it to own, control, and operate, either directly or through a subsidiary corporation, such motor vehicles upon the public highways for the transportation of persons, property, or mail.

Section 16. Nothing in this act shall prevent Congress from repealing, amending or modifying this act, or any privilege or right granted thereunder.

Constitutionality

Section 17. If any provision of this act shall be held unconstitutional, either as respects all motor carriers or as respects any motor carrier or class of motor carriers, such invalidity shall not be held to affect any other provision thereof.

Exhibit Shows Work of Commission

UTILITIES serving Grand Rapids, Mich., are regulated by a city commission, a body which has accomplished much for both the utility group and the city. To portray the work of the utilities department of the commission, an exhibit was prepared and displayed in the City Hall. The Grand Rapids Railroad, the Consumers Power Company, the Michigan Bell Telephone Company and the Grand Rapids Gas Light Company are the four utilities whose activities are portrayed on the exhibit. The portion devoted to the Grand Rapids Railroad has a duplicate of the Charles A. Coffin award certificate, replicas of the gold medal which accompanied the certif-

Exhibit in the City Hall of Grand Rapids picturing the activities of the city's four utilities. The upper left-hand quarter is devoted to the Grand Rapids Railroad

Digitized by Google

icate and numerous photographs and charts depicting the company's progress. Much favorable comment on the exhibit has been received from the thousands who have viewed it.

The utilities department is headed by Gerald J. Wagner, consulting engineer.

Buffalo Tries New Car Stop Signs

AT THE suggestion of one of its employees, the International Railway, Buffalo, N. Y., is experimenting with a new method of marking car stops. The company at present follows the conventional practice of painting a white band around the nearest pole, carrying the words "car stop" written perpendicularly in 4-in. letters.

I.R.C. acts on suggestion of one of its trainmen in making up new car stop sign

Recently a trainman suggested that, inasmuch as each car stop is actually a street car service station for the public, this thought be incorporated in the wording of the signs. In line with this suggestion the railway company has repainted one of the poles on Main Street in Buffalo as shown in the accompanying picture. Thus far the only comments heard have been of a favorable nature and consideration is being given to the advisability of similarly marking each of the company's 1973 car stops in the cities of Buffalo, Niagara Falls and Lockport.

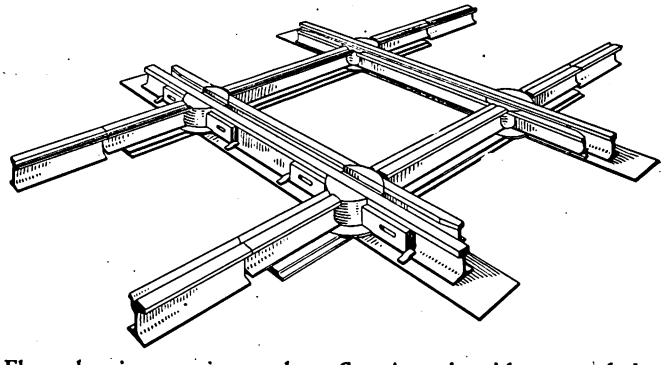
Chicago Terminal Joins Three Systems

ESTABLISHMENT of the downtown Chicago terminal of the Chicago, Aurora & Elgin Railroad at Quincy and Wells Street as an inbound "Loop" station for the trains of the Chicago, North Shore & Milwaukee Railroad was announced recently by R. S. Amis, general passenger agent of the North Shore Line. Heretofore, persons traveling to Chicago from North Shore Line points have had no inbound station facilities in the downtown business district. The Northshore Line station at 223 South Wabash Avenue is the main Chicago "Loop" station for all outbound stations.

The Wells Street terminal is directly connected by an overhead bridge with the Quincy-Wells Street station platform of the Chicago Rapid Transit Lines, which is a regular stop for all southbound North South Line trains. With its spacious waiting room and restaurant facilities, the terminal is a convenient central location where persons arriving in Chicago over the North Shore Line may be met. The terminal also affords direct connection with trains of the Chicago, Aurora & Elgin Railroad, operating to western suburbs.

Experience with Flange-Bearing Crossing Over Steam Road Rails

EXPERIMENTS extending over a period of several years have been made by the San Antonio Public Service Company, with electric railway over steam crossings of the type shown in an accompanying illustration. The object at first was to eliminate the severe impact caused by steam railroad trains passing over the flangeways cut out of the railway rails. First crossings of this



Flange-bearing crossing made at San Antonio with a new design of light construction

type were installed in 1921. In 1926 another type of flange-bearing crossing was designed, in which two steel castings were used, one for the gage, the other for the side opposite the gage, both of which acted as points of contact for the crossing with the steam railroad rails. A description of this was published in ELECTRIC RAILWAY JOURNAL for Dec. 27, 1927.

It was decided to incorporate in this design, flange-bearing rail the entire length of the street car part, so that, regardless of the depth of the flanges, cars would pass over in the same plane, causing no impact except over the spaces left to accommodate the steam railroad flanges. Four of this type of crossing were installed in the fall of 1927 and four additional such crossings have just been completed. They use L. S. Section 98-451 rail instead of the 7-in., 150-lb. flange-bearing rail for the street car part of the crossings. This design calls for a fill in the groove to within ½ in. of the top of the rail, thus making a lighter construction but retaining at the same time the good features of the heavier crossing.

The steam railroad rails in this type of crossing are not deformed in any way but are held in line by tie clips which are a part of the framework of the crossing, leaving the steam rails free to move longitudinally.

Practical Ideas *for the* Maintenance Man

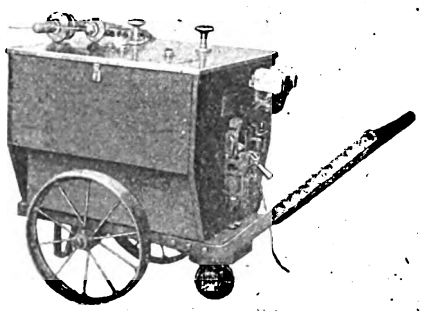
Insulation Tests for Traction Apparatus

By G. L. Moses

Renewal Parts Engineer Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

USE of suitable insulation test voltage in repair shops will reduce the number of pull-ins as it is a satisfactory guarantee of the sufficiency of the insulation. The cost of equipment and additional labor to make such a test is slight, as compared with the saving, because of the reduction in road failures and improvements to the service. Such testing equipment, therefore, pays big dividends. Any insulation test is meaningless unless a sufficiently high test voltage is used to show up the potential faults. For this reason the standard insulation test voltage for traction apparatus, as recommended by the American Institute of Electrical Engineers, has been set sufficiently high to provide a satisfactory factor of safety. The standard test for control apparatus used on voltages of 600 and over is $2\frac{1}{4}$ times normal voltage plus 2,000 volts, and for motors is two times normal voltage plus 2,000 volts. Assembled apparatus, where a number of individual units are connected, may be tested at 15 per cent lower voltage. The test voltage should be applied continuously for one minute. Alternating current is recommended for making insulation tests.

Equipment which has been overhauled should be in a condition comparable with the original. All dust, dirt and grease should be removed; burnt and cracked insulation replaced; and all the insulating parts painted with an insulating varnish or dipped and baked. After this is done the equipment should be given the same insulation test as is given new equipment. The test voltages recommended for such apparatus are given in Table I. When equipment is only partially overhauled, such as if a motor has the armature rewound and the field coils are not rewound, the completely overhauled parts should be given this test and the remainder may be tested at the depreciated test voltage in Table II.



Type of high-voltage test equipment used in many electric railway shops

At each inspection period the dust and dirt should be removed from the insulation and faulty parts replaced. Grease should be removed from the insulation with benzine or gasoline. Parts which show signs of burning should be scraped clean and painted with an insulating varnish. After the work is completed, an insulation test of 70 per cent of the standard test voltage for new equipment should be applied. The test voltages for this class of apparatus are given in Table II.

TABLE I—INSULATION TEST VOLTAGES COMPILED FROM AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS' STANDARDS TO BE USED FOR APPARATUS WHICH HAS BEEN OVERHAULED THOROUGHLY

Line operating voltage	600	1,200	1,500	3,000
Main circuits to ground control (control app.)	3,350	4,700	5,380	8,750
Between main circuit leads with switches open	3,350	4,700	5,380	8,750
Motor leads to ground	3,200	4,400	5,000	8,000
Control circuits to ground	2,000	2,500	2,500	2,500
Between control circuit fingers and contacts that are open in operating position	500	500	500	500

For line voltages not listed standard A.I.E.E. test voltage applies.

TABLE II—SUGGESTED VOLTAGES FOR TESTING APPARATUS WHICH HAS BEEN IN SERVICE, AFTER IT HAS BEEN INSPECTED, CLEANED AND THE NECESSARY REPAIRS MADE

Line operating voltage	600	1,200	1,500	3,000
Main circuits to ground (control apparatus)	2,350	3,300	3,800	6,100
Between main circuit leads with switches open	2,350	3,300	3,800	6,100
Motor leads to ground	2,250	3,080	3,500	5,600
Control circuits to ground	1,400	1,750	1,750	1,750
Between control circuit finger and contacts that are open in operating position	350	350	350	350

For line voltages not listed use 70 per cent of standard A.I.E.E. test voltage.

Form-Board for Concrete Track Foundation*

By Louis T. Botto

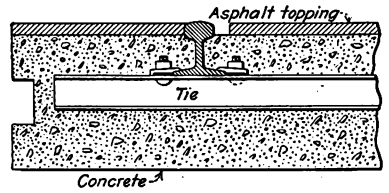
Superintendent Maintenance of Way Department, San Antonio Public Service Company, San Antonio, Tex.

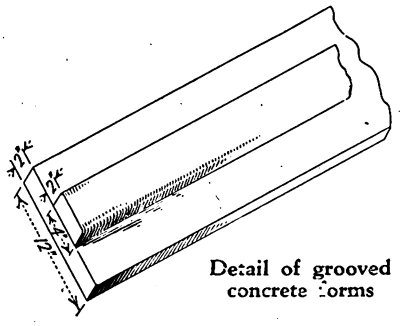
Track construction with forms in place for concrete

IT SOMETIMES happens that, where the concrete paving foundation joins the concrete track foundation, a large crack in the asphalt paving surface appears. This break in the paving is very unsightly and often causes an expensive maintenance charge. With a view to correcting this, a new type of form-board, for use when concreting track

**Submitted in* Electric Railway Journal *Prize Contest.*

Digitized by Google





Detail of grooved concrete forms

and paving foundation, has been adopted by the San Antonio Public Service Company. It is constructed by nailing a 2-in. x 4-in. timber to the 2-in. x 12-in. plank that had been used previously as a side form for the concrete. After the 2-in. x 4-in. piece has been nailed in position, the edges are adzed round and smooth, so that it can be removed easily after the concrete has set.

This simple and inexpensive construction has proved very successful, as the contractor's concrete makes a kind of mortise joint with the Traction Company's track foundation, and no breakage occurs where used.

Steam Heater Piping Repaired by Welding

By J. A. Duffy

Superintendent of Equipment Monongahela-West Penn Public Service Company, Fairmont, W. Va.

LEAKS in the steam heater piping in the Fairmont carhouse of the Monongahela-West Penn Public Service Company caused consideration to be given some time ago to the desirability of replacing it. The cost of replacement would have been $150, it was estimated. Seeing a chance to save money for the company, the shop force undertook to repair the piping by welding. This was done at a cost of $4 for materials, thus effecting a saving of $146 exclusive of the welder's time.

Welder repairing carhouse heating coils at Fairmont

Wheel Work Speeded Up With New Lathe*

By C. B. Hall

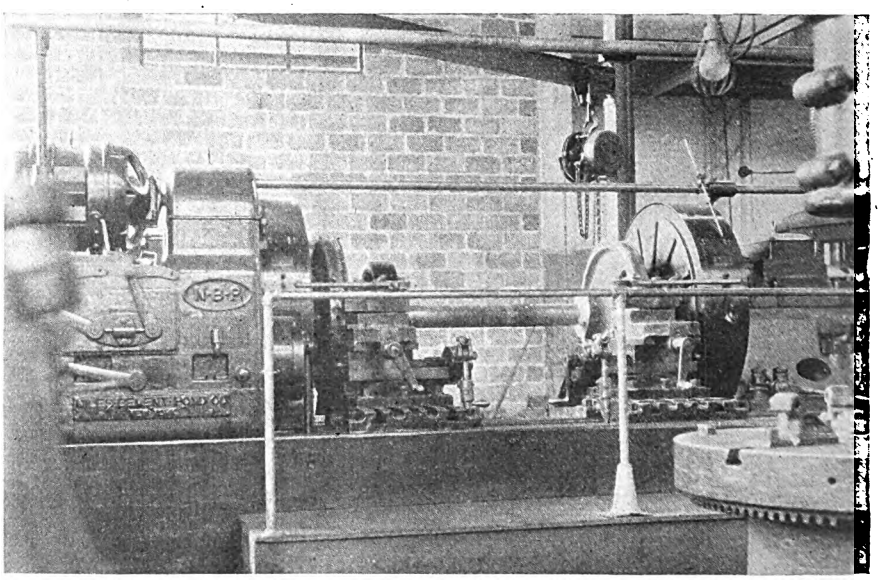
Chief Clerk Mechanical Department, Virginia Electric & Power Company, Norfolk, Va.

WORKMANSHIP has been improved and more than half the time saved for wheel turning has resulted through the installation of a new Niles-Bement Pond Company's 42-in. car wheel lathe by the Virginia Electric & Power Company. The new lathe takes care of the turning of all steel wheels for the railway equipment which range in diameter from 18 in. to 42 in. Large shaft work is also done in the lathe. Previous to the receipt of this lathe, a 36-in. Lodge & Shipley lathe was used for this work.

Wheels are moved into and out of the machine by means of a revolving crane of 6 in. channel and 7 in. iron, with an 8-in. upright and 6-in. boom with a chain-fall attachment.

Submitted in Electric Railway Journal Prize Contest.

Glass visors and signs warning workers to wear their goggles have reduced emery wheel accidents



New wheel lathe as installed in the shops at Norfolk

Emery Wheel Glass Visor

EVERY machine is carefully guarded and nothing is left undone to make working conditions safe in the shop of the Staten Island Rapid Transit Railway, Staten Island, N. Y. In the case of the emery wheels, two precautionary measures are taken to protect the eyes of the employees from flying particles of emery. Each wheel is equipped with a guard and a stationary glass visor. In addition the employees are compelled to wear goggles. A conspicuous sign over each wheel informs the men constantly that this is necessary.

The visor is shaped to conform to the contour of the wheel guard and is attached to the guard at an angle to permit an unobstructed view of the work. The brackets and frame are made from $\frac{1}{32}$-in. sheet iron. The glass is installed in guides, designed so that a glass can be removed or installed easily.

Since this double precaution has been taken emery wheel eye injuries have ceased.

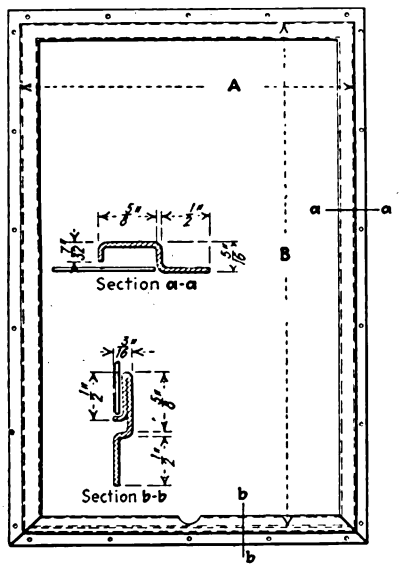
New Offerings of

Useful Equipment

Frames for Dashers

BELIEVING that pedestrian traffic forms a large part of the potential market for car transportation sales, and that a neatly framed sign is an important help toward increasing car riders, the J. G. Brill Company, Philadelphia, Pa., is now marketing dasher sign frames. These are available for standard size cards.

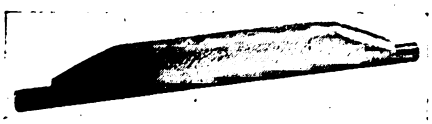


Construction details of new dasher sign frame

Butt-End Trolley Splicing Sleeve

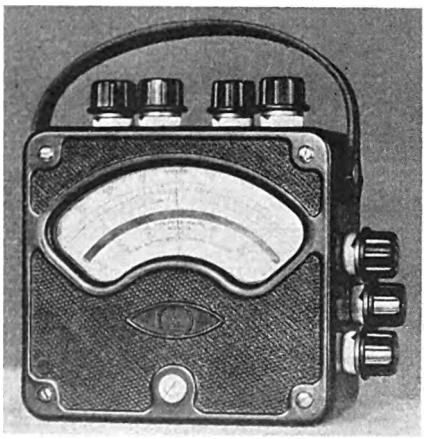
A NEW design of butt-end splicing sleeve for trolley wires, introduced by the General Electric Company, is so constructed that no portion of the sleeve extends below the groove of the trolley wire. The wire is attached in the sleeve by special screws inserted in shallow holes near the ends of the wire. The sleeve is said to be the lightest of equivalent strength on the market and the only one which gives a straight and smooth surface for the collector. It eliminates the splicing sleeve hard spot and thus insures as good a connection at the splice as at any other place in the overhead.

Two styles of the new splicing sleeve are available. One has a wheel clearance and the other is for a slider collector. The slider collector type in repeated tests has given better than 90 per cent of the ultimate strength of the trolley wire. It has been installed in several electrifications, one of the largest being in the Philadelphia-Wilmington section of the Pennsylvania Railroad.



Butt-end splicer for grooved trolley wire

Portable Instruments for Railway Testing



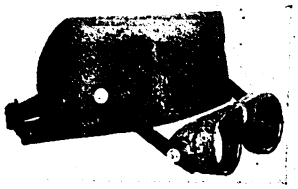
General purpose meter for railway testing

RAILWAY maintenance demands dependable instruments of lasting and reliable calibration and certain electrical properties necessary for testing. Among late developments by the Westinghouse Electric & Manufacturing Company are the Coded Current Meter and the General Purpose Meter, type PX-4, which are especially adapted to automatic train control testing. The Coded Current Meter has a twofold application in that it may be used as a standard instrument, as well as one especially designed to measure coded current. The transformation operation is very simple, and readings may be obtained quickly and accurately. The General Purpose Meter is a six-scale volt-ammeter, and takes the place of six instruments with its three voltage ranges and three current ranges. The various scales are accessible through seven insulated terminals and a push button.

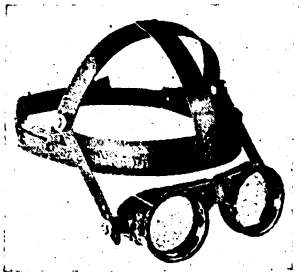
Skeleton Type Helmet Goggles

ACCESSORIES for welding and cutting recently added to the line of the Oxweld Acetylene Company, New York City, are the Oxweld cap and skeleton type helmet goggles. The No. 9 cap type consists of a strong fiber cap to which a pair of goggles is attached by means of fiber links. The goggles can be raised over the forehead or lowered over the eyes with one hand. The bridge is adjustable and is covered with rubber insulation. Replaceable lenses, in the same size and colors as are supplied in Oxweld No. 6 goggles, are used, the colored lenses being protected by cover lenses of clear glass. The No. 10 skeleton type goggles are the same except that the goggles are attached to a lattice skeleton cap. Both styles are provided with leather straps at the rear for head-size adjustment.

The cap and skeleton type goggles furnish adequate protection and are very durable. They have been found by welders who have used them to be extremely comfortable and convenient.



Goggles are attached to fiber cap by fiber links



Light construction is provided by attaching goggles to a skeleton helmet

News of the Industry

Seeks Increase in Fare in La Crosse

The Mississippi Valley Public Service Company, La Crosse, Wis., has petitioned the State Railroad Commission for authority to increase its street car rates, alleging that it is operating under a deficit, and that its earnings for several years have fallen short of a reasonable return by $80,000 to $90,000 annually. In the petition the company asks for a cash fare of 10 cents and a token rate of six tickets for 50 cents, in place of the present 7-cent cash fare and token rate of eight for 50 cents. It further asks to be permitted to establish a five-car, twelve-minute schedule on the south side, 23rd Street line, in place of the present six-car, ten-minute service, and to be allowed to abandon car service on the Badger line from Fourth and Vine Streets to Losey Boulevard.

Constantly increasingly street paving obligations are declared by the company to be the greatest single factor necessitating the relief sought. Under the 1929 city program for construction, the company will be subjected to an outlay of about $91,000, of which, it estimates, almost half will be used in paving streets, the remainder in reconstruction of tracks. Such expenditures, it says, will not increase but diminish its revenues, by reason of the greater use of automobiles upon the improved streets, and will increase the investment of the petitioner upon which it will be entitled to a reasonable return.

Renewed Service on Lincoln Interurban Under Consideration

Restoration of passenger service on the Omaha, Lincoln & Beatrice Interurban, Lincoln, Neb., abandoned six months ago by permission of the State Railway Commission, is contemplated by the new owners with George P. Abel, wealthy paving contractor, at their head. Morris Freshman, vice-president and general manager of the company, which has been confining its activities to operating only the freight service on an East Lincoln belt line, says, that if the company is permitted to make certain changes in trackage, it will resume hourly passenger runs. Petitions from 700 residents of the suburbs of University Place and Bethany have been filed with the Council, asking that passenger service be restored. The Lincoln Traction Company has been running buses into part of the sections formerly served by the interurban, but this has not proved satisfactory to those located farthest from its route. The commission and the City Council have promised favorable action.

Abandonment was permitted because there was no money available for replacements and the state could not compel continued operation at a loss. The new owners purchased the stock from the Robinson and Musser interests of Akron, Ohio, to prevent the loss of freight service to industries they owned on its side tracks, and canvasses of the situation have induced them to resume passenger service. New equipment of cars of the double-end type with cross seats will be ordered, the track entirely reballasted outside the paved section, new concrete loading stations erected at needed points and wooden bridges replaced by permanent concrete construction. Direct service instead of shuttle cars will be run to University Place.

Unification Suggested for St. Louis

Preliminary report of engineers recommends to the transportation survey commission that a single company operate all the local transportation facilities under a terminable permit

COMPLETE unification of the city's transit facilities, and their operation by a single company under a terminable permit, was the outstanding recommendation made by Kelker, De Leuw & Company, Chicago, consulting engineers for the transportation survey commission at St. Louis, Mo., in their first report to that body.

The recommendations are similar to those advocated by Mayor Victor J. Miller some two years ago, and it is believed certain that the present city administration will support the program advanced.

The report was submitted by Rudolph F. Kelker, Jr. Pending final action on the report, the commission, at a meeting on Dec. 21, authorized modifications in a bill to be presented to the Missouri General Assembly next month, which would enable the city to proceed legally with its plans for a city-wide rapid transit system. The changes in the measure were of a minor nature, but were urged by Mr. Kelker as essential to obtaining quick action by the state lawmakers.

If Mr. Kelker's recommendations are carried out fully, it will mean that one company, probably the St. Louis Public Service Company, will acquire all existing transportation facilities including street cars, bus lines and service car routes. The same principle would be followed when and if the city builds subways or elevated rapid transit lines.

The advantages of unification pointed out by Mr. Kelker are: Elimination of needless duplication of service; lowest fares; best service; improvement of traffic conditions; reduction of operating expenses, especially in overhead; and provisions for adequate service in all parts of the city.

Mr. Kelker also advocates that the city have the right and power to purchase the property of the utility and terminate the permit granted it. He told the commission that a part of the income of the transportation company should go into a municipal fund, which in time would prove sufficient to purchase the transit property.

At present St. Louis transit facilities are on a competitive basis. The St. Louis Public Service Company operates all of the electric car lines in St. Louis and St. Louis County and also through its bus auxiliary, the St. Louis Bus Company, has a number of feeder bus lines, while the People's Motor Bus Company, a competitor, has a comprehensive city-wide bus system.

In addition, hundreds of independently owned service cars take business that should go to the street cars or

"Permanent Parkers"

STUDENTS of traffic problems in all the large cities are beginning to discover that one of the most difficult of its phases for which they seek the solution is that of the "permanent parker," the driver who leaves his automobile on the public highway all day long instead of taking it to a garage. He is the individual against which legitimate complaint is made. If he could be eliminated, there would be fewer demands for rigid parking restrictions.

Automobile owners undoubtedly suffer a hardship, when they are compelled to come into the congested urban centers, by their inability to find a place to park during short business stops. No city, however, has as yet possessed a sufficient traffic force or found the way to discriminate between the permanent and the temporary parker. The one is a nuisance for whom there is no real defense. The other is entitled to a reasonable freedom in the use of the streets of which he is part owner. The survey that can find a way out of this difficulty will win the gratitude of all motordom.—*Philadelphia Ledger.*

Digitized by Google

buses. The city recently adopted a very rigid ordinance for the regulation of the service car lines, and it is believed that in a very short time they will cease to be a serious factor.

While Mayor Victor J. Miller and other city officials are openly in favor of a single transportation system, residents of some of the outlying districts, notably Lindenwood, Walnut Park, and the Holly Hills section are well satisfied with the present arrangement, under which service is competitive. They believe they have benefited. In view of this situation, it may require considerable work to educate thousands in St. Louis to advantage of single control of a complete transportation system.

A few years ago the interests that reorganized the St. Louis railway system endeavored to purchase the People's Motor Bus Company, but the deal fell through because of failure to agree on the price. Later the auxiliary bus company, the St. Louis Bus Company, began operations as a subsidiary of the railway.

Service Changes in Milwaukee Under Consideration

Extension of the Sherman Boulevard bus line to Keefe Avenue and the issuance of transfers from street cars to the Green Bay Avenue bus lines will be taken under consideration by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. Officials of the company state there is no way they can make the change and operate at the present fare, since Sherman Boulevard buses are operating beyond the line where a reasonable profit is returned on the 10-cent fare. The Green Bay Avenue line is operating at a loss.

Another County Heard from on Traffic

Considerable opposition is being aroused to any plans to reroute the street cars in Indianapolis, Ind., off Washington Street, the main business street, to eliminate traffic congestion. One patron in a letter addressed to one of the newspapers said:

> In a recent issue of a national magazine, it was shown by actual counts made in numerous cities that the street railway passenger occupies only 6 sq.ft. of street space as compared to 44 sq.ft. for the auto rider; that the street car occupies only 2 per cent of the street space, yet carries 75 per cent of street users; that the larger the city, the more vital the necessity for the efficient use of street space. It also was shown that more than 91 per cent of downtown shoppers use the street car.
>
> I imagine our merchants will be delighted with a plan to inconvenience 91 per cent of their customers in order to convenience 9 per cent. To a mere citizen it would appear that any plan of traffic control should give first consideration to the most efficient user of the street space, the street car.

Proposal Before Seattle Council

"Parents don't raise sickly children to health and then let them be adopted by others. So it is with our railway system." This graphic comparison, voiced by Councilman Philip Tindall, seems to represent the sentiment of the City Council of Seattle, Wash., toward the proposal that the municipal railway be leased to a private company for 50 years at a one-fourth "cut" of the line's possible profits. The Council now is considering this proposal and two others pertaining to the taxicab situation, as it touches on the trolley question, realizing that it must soon decide on some method of taxi regulation and railway retrenchment so both may prosper.

Karl H. Kaye wants to lease the railway for 50 years in return for an exclusive franchise for taxi operation within the city. This would bar all other taxi companies. E. W. Taggart of the Red Top Company, wants a similar exclusive franchise for 40 years, but without the risk of operating the trolley system, and promises to pay the city 2 per cent of his gross earnings for the concession.

This is countered by a new proposal from Frank Waterhouse, owner of the Yellow Cab Company, George Colman, owner of the Royal Blue Cab Company, and some ten other cab operators, who ask the issuance of certificates of necessity to all the cab companies now in operation. This would ban the expansion of the present operators, or the entrance of new companies into the city, until such time as the Council believes additional cabs are needed. The cab men also want a return to a straight meter basis with extra fares for additional passengers, and the right for any cab to park in any taxi stand along the streets. They also agree to pay the 2 per cent. They say that a return to meter fares would benefit the city's rail revenues by an aditional $100,000 annually, but at the City Hall it was said the change to zone rates saw no big change in receipts.

1,918,805,044 Passengers in Portland Without a Fatality

WHILE the nation celebrates "Safety Week," Portland has a man who has done more, perhaps, than any other to make public safety a national crusade. Credit for the slogan that has saved lives, "Safety First," is often given to Benjamin F. Boynton of this city. "Think," a trenchant suggestion to the heedless, is his. He has worked tirelessly and widely to develop the bump of caution. One of his rewards is the record of the company for which he works. The Portland Electric Power Company since Jan. 1, 1907, has carried 1,918,805,044 passengers and none has been killed.—*Oregon Daily Journal of Portland.*

Whatever plan is adopted by the Council, it is almost certain that the railway will not go again into private ownership. Mr. Tindall favors the granting of certificates of necessity, to prevent the demoralization of the taxicab industry in Seattle, but favors the zone system of fares with the right to charge for extra passengers.

Santa Claus Becomes Motorman in San Francisco

Santa Claus recently accepted an invitation to become a motorman for the Municipal Street Railway, San Francisco, Cal. He gave the children of the poor free rides to Christmas parties, feasts and entertainments.

Bringing the Force Together in Baltimore

The United Railways & Electric Company, Baltimore, has leased six entire floors in the new Court Square Building and about March 1 will move its offices from the Continental Building, where its offices are scattered over a number of floors.

Big Transit Developments Proposed for Cleveland

An open scramble for subway franchise rights in Cleveland, Ohio, developed recently when it became known that a $100,000,000 system of street railways, rapid transit and subways had been projected by the Cleveland Railway and Van Sweringen interests. The method of representation in the management has not yet been worked out, but it is understood that the Van Sweringens have considered the purchase of the Cleveland Railway.

The announcement of the proposal drew from Raymond Cragin, promotor of the Cleveland Subway Company, a statement charging that his offer to build subways worth $30,000,000, to be operated by the Cleveland Railway and paid for from street car fares, had been shelved by the railway. Mr. Cragin declared he had back of him certain groups "who believe it inadvisable to place temporary control of the city lines in the hands of those who permanently own suburban lines."

M. F. Bramley, president of the Cuyahoga Subway Company, has completed the circulation of petitions for an initiated ordinance granting his company the right to construct and operate subways, but has delayed filing the petitions with the City Council. A new company known as the Union Subway Company is advertising for persons to circulate initiated ordinance petitions.

Taxi Regulation for Cincinnati

Cincinnati's City Council has extended the present taxicab ordinance for two months, forbidding issuance of licenses in the meantime, to permit consideration of a new ordinance making cabs public utilities.

From Criminals to Street Cars

Every day since New York's new police commissioner, Grover A. Whalen, has been in office, the newspapers have carried columns on his plans for the pursuit of the criminal. But the new commissioner's activity in catching criminals does not cause him to overlook other opportunities for making good newspaper "copy." In discussing the traffic situation on Dec. 28, the commissioner said:

I have a theory that the city is almighty and all-powerful. If we decide the surface cars must go, we will find a way to force them to go.

The street car companies talk and will continue to talk of "vested rights." Well, as far as I can see, their "vested right" now consists of the privilege of continuing to do business at a loss. Their own books show that, in many cases.

Twelve years ago the railways were offered the privilege of converting their surface lines into bus lines, their street car franchises into bus franchises. They couldn't see it. Now they are willing to make the change if the city will pay all the expense.

Then there is no doubt in my mind that the parking privilege is being abused. There must be some way we can work out a compromise with the merchants, a method which would permit women to shop by motor and still eliminate the nuisance parking that selfishly blocks the streets.

Planning for the future is slow work and we cannot expect much relief from new facilities for several years. But there must be a lot of things that we can do immediately with a little intelligent study.

In addition to taking up space in the middle of the city's most important thoroughfares, he points out, trolleys take up space in safety zones at intersections.

One of the first moves, when the results of the police traffic survey are in Mr. Whalen's hands, will be to call a conference with the merchants. He favors the handling of certain types of merchandise at night.

St. Louis Wage Argument Finished

Final arguments were submitted before the Missouri Public Service Commission, on Dec. 21 and 22, on the wage demands of the carmen and shopworkers of the St. Louis Public Service Company, St. Louis, Mo. The union men have requested higher wages and better working conditions. A counter-proposal of the company was for reduced wages.

Lloyd Landau, special counsel for the company, said that last May when a strike of the street car men threatened, Mayor Victor J. Miller called both sides into a conference at which it was agreed the dispute should be submitted for arbitration by the state board with the city acting as an interested party in behalf of the car riders. The city, however, has merely acted as an observer, submitting no evidence and no briefs.

Contending that the company had been brought into the arbitration by the city and then left to its own devices in presenting the case, Mr. Landau called upon Forrest Ferris, Jr., an associate city counselor, who was present, for an explanation of the city's stand. Mr. Ferris replied the city had bound itself to abide by any wage grant the commission might make, but had not bound itself to approve any increase in fares as a result of such wage awards.

Film Features 1929 Tokyo World Congress

A film, designed to arouse the interest of engineers in the World Engineering Congress to be held in Tokyo, Japan, in 1929, was shown for the first time before a group of engineers in New York on Dec. 18. The film will be exhibited at meetings of engineering societies in the principal cities of the United States, it is understood.

In addition to the glimpses of Japanese statesmen and engineers associated with the Congress that the film depicts, engineering enterprises in Japan which are to be visited by delegates to the world meeting also are shown. Views of each of the chief cities are included, and special attention is given to the sights in each city of interest to engineers.

T. E. Mitten Retires from Bank Post

T. E. Mitten will retire as president and chairman of the board of the Mitten Bank and Trust Company. This was announced after nineteen directors, elected at a meeting of stockholders, had selected officers for next year. W. K. Myers, vice-president of Mitten Management, Inc., was elected president of the bank and Dr. A. A. Mitten was named to succeed his father as chairman of the board.

According to the announcement these changes are in accord with Mr. Mitten's plan to withdraw from the active leadership of Mitten managed properties, leaving their direction to the younger members of Mitten Management, Inc.

100 Per Cent Operation for Five Consecutive Days in Chicago

A new record in service was made by the Chicago Surface Lines during the week before Christmas when all of the 3,639 passenger cars on the system were in operation for five consecutive days.

In 1926 the system approached 100 per cent operation on several days during the Christmas shopping season and atttained it on one day. Last year 100 per cent operation was accomplished on three days during the shopping season.

In order to keep all the cars in operation for five consecutive days, the most careful organization of shops and carhouse repair crews was necessary. Schedules of overhauling and car repair work were speeded up during the latter part of the summer and early fall so that all equipment might be in the best possible condition. After the shopping season began to demand more service, the number of cars in the shops and in repair bays in the carhouses was decreased daily and the equipment was put out on the street.

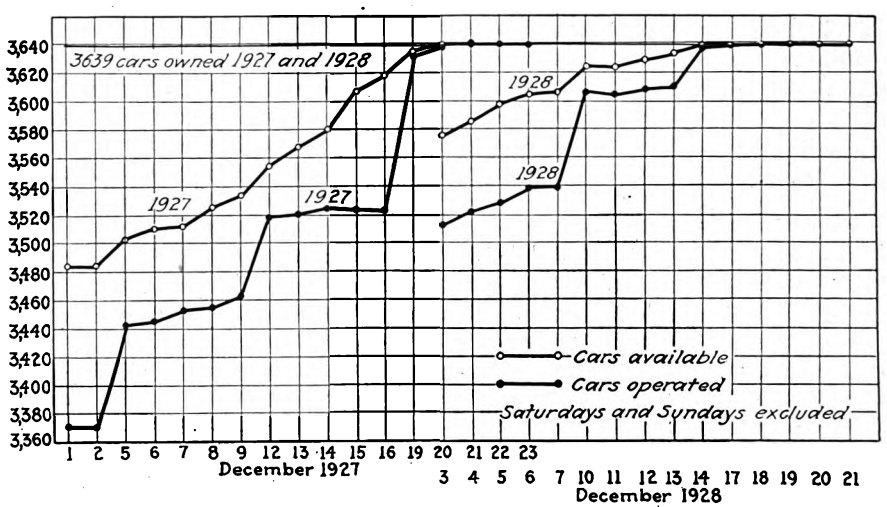

Chart showing performance of Chicago cars

On Dec. 17, H. H. Adams, superintendent of shops and equipment, reported that every car was out on the streets and he was able to maintain the equipment so that all of the cars were subject to call for rush hour periods every other day of the week up to and including Dec. 21.

In order to accomplish this, it was necessary to do some quick repair work on a number of cars damaged in traffic accidents. One car in particular, which was badly damaged on Friday, when it was struck by an oil truck, was repaired in record time.

The Chicago Surface Lines also made a new record for riding during the Christmas shopping season. Saturday, Dec. 22, was the biggest day in the history of the company, with 5,296,081 rides, including transfers, and 2,934,442 revenue rides. The riding for the week, in spite of inclement weather during the first days, exceeded that during the similar week last year.

Experts Favor Car Riders

Many interesting facts about accidents, parking, etc., revealed by New Orleans survey

THE IMPORTANCE of street cars as carriers of a large proportion of the population, the small percentage of accidents caused by street cars, the many traffic violations by motorists, the futility of parking laws, and the failure of traffic control to avoid congestion, are among the many features of interest and importance to the street railway industry and the public in the report of experts on traffic conditions in New Orleans just submitted to the City Council.

The study was made by Miller McClintock of the Albert Russell Erskine Bureau of Harvard University, and Harland Bartholomew, St. Louis. It includes a thorough survey of all phases of traffic control, with a proposed remodeled traffic ordinance for the city.

The following provisions of the proposed code relate to street cars:

1. No passing of a street car on the left, except on one way streets or on streets too narrow on the right to make passing possible. Where a safety zone is established, a vehicle need not stop before passing a street car discharging or receiving passengers.

2. Any vehicle on the street car tracks in front of a street car must leave the tracks "as soon as practicable" after signal from the street car. No vehicle shall drive upon or across the car tracks within the intersection in front of a street car, when the car has just started to cross an intersection.

3. No vehicle shall drive over or through a safety zone.

4. No person shall board or alight from a street car or other vehicle in motion.

5. No person shall ride on any part of a street car or other vehicle not intended for passengers, except employees in discharge of duty and those in truck bodies in space intended for merchandise.

6. No steam or street railway train or car shall obstruct the street longer than five minutes. This does not apply to trains or cars in motion unless engaged in switching. No street railway train or car shall stop within an intersection or on a crosswalk to receive or discharge passengers.

Says the report:

New Orleans is fortunate in the possession of so large a number of neutral ground streets, which permit the segregation of street car and vehicular traffic. This separation of right-of-way is of great advantage in street car operation and at the same time permits a greater freedom of movement of vehicles upon street car streets than would be possible otherwise.

Only 1.06 per cent of personal injury accidents are caused by street cars, while private passenger cars cause 69.26 and trucks 18.76 per cent. Bicycles cause 2.88 per cent, motorcycles 2.52, horse vehicles 2.34, taxicabs 2.12, other vehicles 0.47, motor buses 0.28, railroads 0.23, and unknown 0.08.

In data showing the classes of public accidents in New Orleans from 1921 to 1927, it is noted that the total increase from 696 to 1,165 can be attributed to motor vehicles. In the same period, the report states, accidents from street cars have constantly declined from 156 in 1921 to 63 in 1927. To no small extent, says the report, this is due to improved operating and safety conditions.

A traffic engineering division is recommended, with a competent traffic engineer and at least four traffic investigators. A regular parking squad of not less than twelve officers is also recommended. "Of all aspects of traffic control in New Orleans at the present time," the report says, "the enforcement of the parking regulations is by far the most unsatisfactory."

To determine the total concentration of vehicular traffic in the central business district, a count was made on several days from 8 a.m. to 6 p.m. It was found that 66,846 automobiles entered that district in a day and that the average automobile carried only 1.6 persons.

According to the New Orleans Public Service, the average street car carries into this district each day from 8 a.m. to 6 p.m. 37 passengers.

It is shown in the report that the largest number of motor vehicles in the central business district at one time, either parked or in motion, occurs at 4:30 p.m., when approximately 6,200 are there. This peak of accumulation occurs in other large cities studied between 12 noon and 2 p.m. It is, therefore, deduced that in New Orleans there is a larger use of motor cars by persons who leave them within the district the entire day than is to be found in other cities.

What a Railroad Is Worth

Another plea made for a definite pronouncement by the Supreme Court of the legal principles which shall govern valuation for rate-making and recapture of excess earnings

IN FIXING the valuation of a railroad for recapture purposes under the Transportation Act, consideration should be given to all relevant facts and circumstances including the present level of reproduction costs, according to a brief by the St. Louis & O'Fallon Railway and the Manufacturers' Railway, jointly owned, filed on Dec. 14 in the Supreme Court, which has fixed Jan. 2 for hearing arguments in the case. Since certain fundamental questions are involved, the matter is regarded as of widespread interest to all utility corporations.

The case is essentially an appeal from a decision of the Federal District Court for the Eastern District of Missouri, sustaining in most part an order of the Interstate Commerce Commission, in which it was held that the net railway operating income of the O'Fallon railroad for the last ten months of 1920 and the calendar years 1921, 1922 and 1923 exceeded 6 per cent on the value of the property of that carrier and requiring the road, under the recapture provisions of the Transportation Act, to turn over to the commission 50 per cent of the excess which the commission found in each period.

In seeking to have the Supreme Court reverse the decision of the district court, the brief attacks the decision of the lower court on the grounds that the O'Fallon and the Manufacturers' railways, contrary to the finding of the commission, constitute a system of carriers under common control and management, and that the valuation and earnings of both roads should have been taken into consideration instead of the O'Fallon alone. Says the brief:

It appears upon the face of the report that the commission did not determine or undertake to determine the "present value" of the O'Fallon by consideration of all relevant facts and circumstances, but that its so-called findings of value in respect to the O'Fallon were based upon a mathematical formula, the avowed purpose of which was to determine the approximate investment in its property; that the commission refused in such so-called determination of value to give either effective weight or any weight whatsoever to the present cost of construction; that such refusal was not based on any fact or facts found by the commission pertaining to the property of said carrier, but upon the conclusion of the commission that no consideration should be given to present-day prices in determining the value of any railway property for the purpose of either rate making or recapture; that the commission's so-called findings of value are based upon an erroneous conception of the law and of its powers thereunder and are unsupported by and contrary to the evidence; and that the true value of the O'Fallon greatly exceeded the so-called values found.

The brief points out that, under the provisions of the Transportation Act, all net railway operating incomes in excess of one-half of the amount by which such income exceeds 6 per cent of the value of the carriers property remain the absolute property of the carriers and, consequently, the order of the commission, if it takes more, constitutes the taking of the carriers' property without due process of law, and a taking of private property for public use without just compensation.

The carriers charge in the brief that

Prize Beef

FIFTEEN yearling Hereford steers, averaging 1,060 pounds, were purchased by the Chicago, South Shore & South Bend Railroad to be used in the serving of choice cuts on dining cars during the Christmas season.

The steers, all prize winners, raised by Allen Newland & Son, Hudsonville, Ill., were purchased through Armour & Company. They were prepared for slaughter right after their purchase and appeared in the form of special steaks and roasts on South Shore Line dining car menus.

Digitized by Google

the Interstate Commerce Commission greatly exaggerates the supposed "unfavorable economic consequences" which might occur were freight rates made on the basis of the true value of the property. The brief continues:

The present rate-making rule is believed to be a salutary rule. It has led to no unfavorable economic consequences in the past. Despite its observations as to what might have been or might be, the commission is obviously of the view that it will lead to no unfavorable economic conditions in the future. If contrary to such expectation, the restraint of self-interest and of the power reserved to the commission in the maintenance of individual reasonable rates should turn out to be inadequate to protect the commerce of the country against exorbitant charges, under the rate-making rule prescribed by Section 15a as it now reads, Congress has full power either to repeal or modify it.

The brief contends that the Interstate Commerce Commission should have determined the value of the O'Fallon railroad in accordance with established law, but instead guessed at the original cost which was actually unknown.

The value of a public utility property, whether it be a railroad or a water plant, may be more or less than the sum of the cost of reproduction, less depreciation, if any, of its several units. Property is not all of the same quality. Consequently, the relevant facts and circumstances vary as to different properties, and no formula can be employed.

The railroads in this case are merely insisting on the same constitutional protection given other utilities, according to the brief, which points out that "on proper analysis it appears that the only difference between the original cost as of 1910, and the reproduction cost as of 1920-3 for the O'Fallon railroad is that the former is expressed in past prices measured in an obsolete dollar, whereas the latter is measured in today's dollar.

The brief says that the public utilities of the country other than railroads, as a result of the decisions of the court, have not been excluded from the operation of this economic law which has affected all of the monetary transactions of the country. The railroads should not be excluded, and cannot be, without actual deprivation of property.

Transportation Association Committee to Study Equipment

Detailed consideration of the scope of its assignment occupied the attention of the new transportation and traffic committee on "The Equipment," at an organization meeting held at association headquarters in New York on Dec. 6, 1928, with Adrian Hughes, Jr., chairman, presiding. This committee, under the new plan of committee assignments in the transportation and traffic association, includes the work of the former bus committee of that association and, in addition, covers the study of rail equipment from the several angles of interest to transportation men.

It was decided that the committee's work properly embraces the general question of the size, arrangement and character of public transportation vehicles. This year's study will be confined to surface cars and buses for use in cities above 75,000 in population, since another committee has been organized to study the specific transportation problems of the small community.

The work of the committee for the year will be divided into three principal divisions. First of these is a study of the facilities that should be provided on modern car and bus equipment for the comfort and convenience of passengers, to the end that the service may be made as attractive as possible. In this phase of the study, consideration will be given to the relation between the particular class of service in which the vehicle is to be used, and the character of equipment which is desirable and practicable under these conditions. The second division of the committee's subject will deal with the determination of the general size and characteristics of public transportation vehicles most suitable for various classes of service. Both studies will include buses as well as rail equipment, and will develop the matter of equipment size and characteristics in its relation to such service conditions as heavy trunk line service in large cities, cross town and secondary lines, service in moderate sized cities, special combinations of express and local service, de luxe scheduled service, chartered and tour service, etc. Consideration will be given to the possibilities of trackless trolleys.

A third division of the committee's work contemplates the preparation of a report outlining the need for accounting information, that will serve as a guide in transportation management by giving needed data regarding the results of operation of individual lines, both cars and buses. This is a continuation of the work done last year by the bus committee in suggesting a similar arrangement of accounts with respect to bus operation. It is the intention to prepare a tentative outline of the accounting information needed for intelligent transportation planning and management, in the hope that the Accountants' Association may be interested in the need for this classification of operating information not provided by the present classifications of accounts.

In addition to the above program, it was decided to suggest to the American Association that the new committee on car financing undertake to obtain accurate information regarding the actual results achieved with new equipment, in the way of increased revenues and reduced costs, supplementing and bringing up to date similar information previously collected by other committees and agencies. Those present at the meeting included the following: Adrian Hughes, Jr., R. J. Bennett, J. F. Craig, H. H. Dartt, C. F. Kells, E. R. Kelly, T. R. Langan, T. W. Noonan, E. A. Palmer, M. W. Rew, A. Shapiro, E. F. Theisinger, representing C. W. Stocks, J. C. Thirlwall, H. B. Whitman representing A. T. Warner, J. W. Welsh, Charles Gordon, G. C. Hecker, and Samuel Riddle, sponsor.

Bondholders Object to Chicago Plan

Representatives of holders of Chicago Railways bonds says proposed financial scheme will not work

DECLARING that the City Council has been proceeding on the wrong theory in attempting to work out the details of an ordinance before obtaining the necessary enabling legislation from the General Assembly, Albert W. Harris, chairman of the bondholders' protective committee of the Chicago Railways, urges that attention be centered on legislation and that negotiations for an ordinance be delayed until this step is taken.

The proposed ordinance which company and city officials have been discussing for some time, Mr. Harris says, is "essentially a municipal ownership franchise and attempts to fix rates and arrange an income which within 40 years will result in city ownership out of earnings and accumulated interest of various funds. It provides in the interim for a local commission which will practically run the property. Nowhere in the franchise does it agree to buy, and the rates proposed, in my opinion, will not be adequate to meet the requirements called for by the plan." He also said:

It sets up a financial scheme which will not work and under which any company to be formed to take over the properties could not set up a workable financial plan. And, finally, it purports to be a service-at-cost franchise when it is not, because of the extra charges put upon the car rider for the purpose of purchasing the property. In other words, it is a municipal ownership franchise without agreeing to purchase. It proposes a consolidation of surface and elevated lines under an impossible financial scheme and gives to a local commission all the powers of an operating body, and the details of the franchise will not make it possible to carry out the plan, if such it may be called.

Admitting that the details might be changed, such as an agreement for a reasonable return on the capitalization, suitable rates of fare agreed upon from time to time instead of for a fixed term of years, etc., it would not change the fundamentals embraced in the franchise. This is the third attempt to settle the railway matter by taking up the last thing first, viz., the franchise, and illustrates the futility on the part of the transportation committee, who have no authority in law for making the kind of trade they are trying to make, in trying to trade with people who have no authority to trade. Legislation must first be had making it legal to take the action necessary and a company must then be formed with which the city can deal.

There should be only two parties to the kind of trade proposed—a company and the city, both with authority to trade—not three companies and the city, neither with power to act, neither agreeing upon what they want. To carry the above procedure out, the legislation should first be had, next a company should be formed to take over the consolidated properties, and, third, a franchise should be entered into between the city and the new company. This is the plan originally proposed after a great deal of discussion, and the fact that it has not been carried out is the reason why nothing has been accomplished.

Wanton Destruction of Cars Charged in Rochester

Rochester lines, New York State Railways, has declared war on vandalism in the 12-mile municipally built and railway operated subway at Rochester, N. Y. In a statement asking public co-operation to prevent destruction of property, Charles E. Lewis, superintendent of interurban transportation for the railways, complained that hinges on doors and light bulbs have been broken and stolen, and subway stations generally defaced. He suggested that the public report loiterers about the stations.

The subway, which began operation on Jan. 1, 1928, is located in the bed of the abandoned Erie Canal. High speed locals, interurban and freight lines use the erstwhile "big ditch" of Clinton.

Newspaper Urges Paving Relief in Grand Rapids

Relief from the burdens imposed by meeting paving requirements is being urged by the Grand Rapids *Press* in the interest of securing a square deal for the Grand Rapids Railroad. The situation as that paper sees it is, perhaps, best described in the exact words of the paper's editorial presentation, in part as follows:

Grand Rapids has been asked to consider its street railway system in the light of the experience of Michigan's destroyed interurbans. The railway system is worth $6,000,000. It is maintained by public spirited men who have passed up dividends year after year in order to put their returns back into tracks and rolling stock for the service of the Grand Rapids public. Its progressiveness and efficiency of operation have been rewarded by presentation of the Coffin medal to Manager DeLamarter. Its economy has brought committees and administrative experts from other centers to study the details of car rebuilding and service policy.

Under a service-at-cost franchise, fares in this city are adjusted to income with an 8 per cent limit on the company's earnings. In the year ending Oct. 31 the actual earnings were 5.95 per cent.

Facing this situation the proposal has been made that the company go over to buses. City Attorney Taggart has asked for an estimate of the effect of such a change upon the city and upon the railway. It is obvious, in the first place, that abandonment of the tracks would at once relieve the company of the cost of paving between them, an expense for which there is no justification. In the second place, its rolling stock would be taxed by the state instead of the city, and Grand Rapids would lose the income. That is, gasoline and license taxes for state highway maintenance would be substituted for city taxes; and at present only a trifling part of the motor vehicle taxes paid by a city comes back to it. Finally, in place of the fixed street car with its minimum effect on traffic congestion, we should have a fleet of heavy buses increasing street hazards, swinging in to curbs for passengers, and wearing out brick and concrete instead of company rails.

Consulting Engineer Wagner estimates that had the company been operating a bus system last year it could have saved $50,541 in taxes, using as a basis a fleet of 202 buses and including state license and gasoline taxes. Mr. Wagner's conviction is that such a change is inevitable, unless the city meets the situation by relieving the company of part of its expense.

There is no reason why, as soon as the necessary charter steps can be taken, Grand Rapids should not free the company from the paving charge. That step would be an economy, not a loss, in the long run, entirely aside from the inequity of charging motor traffic highways against rail traffic which never touches them.

Original Ideas in Wisconsin on the Use of Old Cars

When buses and one-man cars replaced the old equipment of the Wisconsin Public Service Corporation at Green Bay, Wis., ten old cars were dismounted and the bodies sold. But such replacement did not spell the end of the cars. For driving into the city on Highway 141, one comes upon an old interurban car which has been transformed into the "Trolley Barbecue." In one end of the car alternate seats were removed to make room for tables, giving the place four tables seating four persons each. The other end of the car has a counter running lengthwise. The vestibule beyond is occupied by a large brick barbecue fireplace equipped with an electric turnspit.

So-called "Trolley Barbecue" on Highway 141

On the Sturgeon Bay road, one of the old cars has been set up on stilts at the rear of a roadhouse, to be used as a restaurant. The Bay road leads to another old car, disguised almost beyond recognition. Wide porches have been built at either side and around the front end which faces the bay. The seats have been removed from the car and arranged around the porches. The whole "cottage" has been painted white.

The Wisconsin Public Service Corporation began in 1921 to change to Birney cars. The first one was put in service that year and by 1924 the old cars had been practically replaced. Buses went on the interurban run. The Green Bay carhouse had seventeen old cars. Five of them were dismantled, but the bodies of the others were sold, bringing from $50 to $100 apiece.

Paving Matter Discussed in Lynchburg

Negotiations are under way between officials of the Lynchburg Traction & Light Company, Lynchburg, Va., and City Manager R. W. B. Hart, looking to a compromise on the franchise stipulations in regard to the paving of track areas in certain streets.

A previous proposal of the City Manager, which called for payment by the railway of $8,500 to the city for a period of fourteen years, was frowned upon by the company officials, and as yet no agreement has been reached.

According to Mr. Hart, the company has submitted to him a tentative draft of certain proposals, and he said he would have to go over and revise this draft and resubmit it to the company again.

Excursion to See South Side of Chicago

In an effort to acquaint more residents of Chicago with the electrified suburban train service that is being furnished the south side of the city, the Illinois Central Railroad recently offered a special 25-cent round trip fare between any two points on its Matteson, Blue Island and South Chicago suburban divisions. The special excursion tickets were good on Sunday only—the date of issue—between certain hours of the morning and certain hours of the afternoon. "Stop-Overs" were allowed at any point en route.

This was the first excursion of the kind ever conducted by the Illinois Central on its Chicago suburban lines.

Holiday Services for Students on Southern Pacific Routes

The Southern Pacific Company put on its special service on the Red Electric line for holiday students from Oregon State College, the University of Oregon, and the Oregon Normal School. It also offered accommodation to a number of smaller private schools down the Willamette Valley.

New Fare Arrangement in Decatur

Tentative agreement between the city of Decatur, Ill., and the Illinois Power & Light Corporation, subject to approval of officials of the latter company, has been reached, providing for lower tariffs when large blocks of tickets are purchased.

The City Council protested the recent fare increase, attempted to reopen the case before the commission and agreed to accept the conciliatory efforts of the Association of Commerce. A 10-cent basic fare and the three-for-a-quarter ticket plan are retained, but seven tickets are available for 50 cents and fifteen for $1 with twenty school tickets in a book for $1.

Safety Rewards in Jacksonville

Turkeys and hams were presented to operators and conductors of the Jacksonville Traction Company, Jacksonville, Fla., who aided in the operation of cars without chargeable accidents. The contest, which lasted 80 working days, closed on Dec. 15. Winners included 89 operators and eleven conductors. In addition, eighteen other men operated without chargeable accidents, but had not worked the number of days required for recognition.

Settlement of Construction Work in Lebanon

Several injunction proceedings instituted by Lebanon, Pa., against the Lancaster, Ephrata & Lebanon Street Railway in the Court of Common Pleas of Lebanon County, to compel relaying of tracks to paving grade, and repaving by the company of six blocks on Walnut Street in Lebanon, were decided adversely to the city by the lower court. The decision was upon the ground that there had not been a formal and lawful establishment of the new grade.

The city thereupon went before the Supreme Court, where the appeals were pending until recently. In the meantime the officials of the railway and the Councilmen of the city entered into amicable conferences and determined upon a program of co-operation. The railway furnished its men for grading and lowering of tracks, and the city furnished the stone and the oil.

The outcome was so satisfactory to the city officials that the appeals which were made to the Supreme Court have been discontinued.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Jan. 4, 1929*—Metropolitan Section, American Electric Railway Association, 33 W. 39th St., New York, N.Y.**

***Jan. 14-18*—American Road Builders' Association, convention and road show, Cleveland, Ohio.**

***Jan. 15-16*—Kentucky Association of Public Utilities, annual meeting, Brown Hotel, Louisville, Ky.**

***Jan. 22*—New York Electric Railway Association, mid-winter meeting and dinner, Hotel Commodore, New York, N. Y.**

***Jan. 23-25*—Electric Railway Association of Equipment Men, Southern Properties, and Southwestern Public Service Association, Mechanical Division, joint meeting, Houston, Tex.**

***Jan. 24-25*—Central Electric Railway Association, Claypool Hotel, Indianapolis, Ind.**

***Jan. 25-26*—Central Electric Railway Accountants' Association, Claypool Hotel, Indianapolis, Ind.**

***Jan. 28-Feb. 1*—American Institute of Electrical Engineers, annual convention, 33 W. 39th St., New York, N. Y.**

***Feb. 7-8*—Midwest Electric Railway Association, Midwinter meeting, Robideaux Hotel, St. Joseph, Mo.**

***Feb. 14*—Central Electric Railway Master Mechanics' Association, Youngstown, Ohio.**

***Sept. 28-Oct. 4*—American Electric Railway Association, 48th annual convention and exhibit, New Public Auditorium, Atlantic City, N. J.**

New Association Members

MEMBERSHIP in the American Electric Railway Association was voted by the executive committee at its meeting held in New York on Nov. 25 to four manufacturer companies, one associate and fourteen individuals. New company members are:

ASSOCIATE

Jackson & Moreland, consulting engineers, Boston, Mass.

MANUFACTURER COMPANIES

Anderson Body Company, Sidney, Ohio.
Cleveland Graphite Bronze Company, Cleveland, Ohio.
Highway Service, Inc., New Bedford, Mass.
United States Nito Company, Inc., Columbus, Ohio.

Hearing on Wage Increase for Indianapolis Men Set

First hearing on the petition of employees of the Indianapolis Street Railway, Indianapolis, Ind., for a 15-cent increase in pay has been set for Jan. 10, according to an announcement by Frank Baker, attorney for the Amalgamated Association. The hearing will be held before Howell Ellis, a member of the Indiana Public Service Commission. Mr. Baker said the Indianapolis pay schedule of 40 and 45 cents an hour was below that of any other city of similar size in the United States and Canada.

Higher Fare Sought for Green Line

Officials of northern Kentucky communities utilizing the Green Line of the Cincinnati, Newport & Covington Railway Company heard a plea on Dec. 14, made by H. C. Blackwell, president of the Green Line, for increased fares. Mr. Blackwell told his audience the Green Line is losing money. He said its physical value is about $8,000,000 and its earning capacity should be $1,200,000 a year. But instead the Green Line is showing a net annual earning of only $299,000. This leaves it about $900,000 a year short of an adequate return.

Mr. Blackwell had first broached the topic at a dinner he tendered officials in Cincinnati some months ago. On Nov. 16 the Covington commissioners heard it, and at the latest gathering the speaker expressed willingness to meet the officials in each of the communities, but would prefer to negotiate with a committee of business men representing all the towns and cities.

His idea of a satisfactory fare is one similar to that in force in Cincinnati, which is three tickets for 25 cents or 10 cents cash for a single fare. He observed that the average carfare all over the country at present is 8.2 cents, while Green Line riders pay a nickel. In summing up his position President Blackwell said that the present 5-cent fare could not continue, that the company was not earning even expenses and that bridge tolls and terminal charges brought the fare on the line down to 4½ cents.

He seeks a franchise running twenty years and calling for a higher fare, in place of the present perpetual franchise which fixes the fare at 5 cents.

More Free Ride Privileges in Detroit

Free rides have been voted by the Street Railway Commission of Detroit, Mich., to all employees of the department, totalling 7,500. Heretofore only platform workers in uniform have been permitted to ride without charge. A system of identification for all non-uniform employees will be worked out by the Department of Street Railways, it was decided.

Recent Bus Developments

Substitutions in Connecticut

Permission was granted to the Connecticut Company to discontinue railway service between Winsted and Torrington, Conn., and between Thomaston and Fort Sill, Waterbury, Conn. The service will cease on Jan. 5 and will be succeeded on Jan. 6 by bus service by the New England Transportation Company. The latter company will operate a through bus service from New Haven to Winsted via Waterbury, Thomaston and Torrington. At the same time the Connecticut Company was authorized to replace railway service in Portland and between Portland and Middletown, Conn., a route which crosses the Connecticut River, with bus service. Service on this route will be changed on Jan. 13.

Blanket Permit Sought in Berkshire County

Through Clinton Q. Richmond, general manager of the company, the Berkshire Street Railway has presented a petition asking for permission to operate buses on any or all of its trolley routes operating throughout Berkshire County in western Massachusetts. The blanket permit would be subject to the approval of the Public Utilities Commission on each subsequent bus line before operations could be started.

Petersburg Company Seeks Agreement With Railway

Officials of the Southside Transportation Company, which is under new management, plan to increase the service of the company and will apply to the Petersburg City Council for universal transfer service and an increased fare. It will ask for a 7-cent fare and the universal transfer, which will be acceptable on all of the lines, buses and street cars operated in Petersburg by the Virginia Electric & Power Company.

Illinois Properties Cannot Be Sold

Rehearing of a petition to sell its subsidiary motor coach properties, known as the Alton Transportation Company, to the Chicago & Joliet Electric Railway and the Illinois Power & Light Corporation was denied to the Chicago & Alton Railroad on Dec. 18 in an order entered by the Illinois Commerce Commission. At the same time, the commission annulled the certificate previously granted the Alton Transportation Company for the transportation of passengers between East St. Louis and Chicago over state highway No. 4 and awarded the permit to the Tri-State Bus Company, Springfield, Ill.

Opportunity for Development Given to Pacific Electric

In a divided opinion, Commissioner William J. Carr dissenting, the California Railroad Commission denied on Dec. 17, the application of T. C. Gillespie to operate auto stage service locally between Hollywood and Ocean Park. He was granted permission to reroute his buses.

In the same opinion the commission ordered the Pacific Electric Railway, protestant against the application, to submit to the commission, after conferring with the parties appearing in the present proceeding, a plan to experiment adequately with the operation of bus service to meet the situation developed in the present proceeding. The commission took this action because of its belief that the Pacific Electric Railway, which at present occupies the field with its railway service, has striven to furnish an adequate service, and at reasonable rates, and if there is a demand for bus operation between the points involved in the present operation, the Pacific Electric Railway should be given an opportunity to supply that service, or to experiment toward such development.

Commissioner Carr in his dissenting opinion agrees with the conclusion that, under the record in the proceeding, the commission cannot refuse the Hollywood-Santa Monica section some relief in the way of addition or improved transportation. He held that natural sympathy for the Pacific Electric, in its struggle to make its passenger business pay, should not lead to the establishment of a new principle or rule, which places existing utilities in a highly entrenched position and correspondingly discourages all new utility enterprises. He is of the opinion that Mr. Gillespie should be permitted to render a service recognized as necessary.

The majority opinion points out that the Pacific Electric Railway has made experiments in the development of bus transportation and also in the matter of revising its rates, with the view to developing additional traffic and additional revenue, such efforts being made under the direction and with the approval of the commission.

The commission concluded as follows:

The record before us shows that the passenger operations of the protestant's railway on the whole are conducted upon a very narrow margin of profit. If a substantial amount of business is diverted by a policy of unrestricted competition from bus lines, added to the competition of private automobiles, its revenues very probably would be reduced to a point where virtual abandonment might be necessary.

Crude Oil Used Successfully in Philadelphia

ALTHOUGH some of the best chemists and analysts have insisted that crude oil cannot be used as fuel for buses, the Philadelphia Rapid Transit Company is now operating twenty buses with crude oil. That means a saving of $50 per bus per month, and as the system will soon be operating 1,000 buses, a substantial saving will be made for the company. An apparatus has also been developed to analyze and test the bus exhaust gases, making it possible to reduce the percentage of carbon monoxide to between 1 per cent and 3 per cent, whereas the average for all motors is 5 per cent to 9 per cent. Not only will this safeguard the health of bus riders, but if this method could be applied to all motors, the tragic deaths from this source would be greatly reduced.—*Service Talks.*

Would Abandon in Hudson and Greenport

The Eastern New York Transportation Corporation, Rensselaer, N. Y., has applied to the Public Service Commission for permission to abandon its existing bus service in Hudson and Greenport, alleging that the income from operation has not been sufficient to pay the operating costs. It states that the total operating revenue in 1927 was $18,650 and the total expenses $25,786, while from January to November inclusive, in 1928, the income was $24,314 and the expenses $31,596.

In the petition it states that it has conformed to various local requests with reference to the bus service, but that it has been unable to continue operations without obtaining advances of contributions from the Eastern New York Utilities Corporation to make up bus deficits. Conferences have been held with the local authorities in relation to a change in the local franchise under which the company operates, but no action has been taken by the Hudson Common Council committee toward relief in the form of a 10-cent cash fare, thirteen tickets for $1. The company does not believe there would be much relief under the 10-cent fare proposed.

St. Louis Agrees With Company Request

City Counselor Muench of St. Louis, Mo., recently filed a brief with the Missouri Public Service Commission, in which the city joins the St. Louis Public Service Company's request for the abandonment of its Vandeventer Avenue car line between Market Street and Natural Bridge Avenue, provided that adequate bus service is substituted. The city holds the state commission has authority to impose a condition that buses be supplied for patrons if the line is to be abandoned.

Financial and Corporate

$47,000 Improvement in Toledo in November

Revenue of the Community Traction Company, Toledo, Ohio, was $316,389 for November, a gain of $43,260 over the corresponding month of last year, reflecting better industrial conditions and active business in the community. Passenger revenue on the street cars was $235,665 and total revenue $248,838. This left an income of $53,637 for railway cars after $181,436 operating expenses and $13,763 taxes.

Coach revenue was $65,944 and net income $9,323, the best showing since buses have been operated by the company. Bus deliveries are being hurried in an effort to bring the coach capacity of the company up to size sufficient to make possible the establishment of the new Franklin Avenue line which will replace the Bancroft Belt line, to be abandoned.

After heavy maintenance charges there was a net surplus of $2,355 for the stabilizing fund compared with a deficit of $44,765 for the corrresponding month a year ago.

Cars and coaches carried 4,211,404 passengers. This was an increase of 500,000. Service was increased and operating expenses rose, due to larger proportion of motor coach service.

The influenza epidemic hit Toledo in the midst of the Christmas shopping period and cut into railway revenues in early December at a rate of $1,000 a day. At one time, as many as 150 employees of the company were on leave due to sickness.

$3 Basis in Cincinnati

The Cincinnati Street Railway, Cincinnati, Ohio, has placed its $50 par capital stock on a $3 annual dividend basis against $2.50, previously paid. The company declared a dividend for October at the former annual rate of 5 per cent and for November and December at the new rate of 6 per cent, payable Jan. 1, to stock of record Dec. 24.

More Valuable Rights for Montreal Holders

Following a meeting of the board of Montreal Tramways, Montreal, Que., it was announced the company will issue 10,000 additional shares of capital stock of $100 par value, and will offer them at $150 per share to holders of existing stock of record Dec. 21, in the proportion of one share for every six shares held.

The issue of 10,000 shares will bring the outstanding stock of the company up to $7,000,000 and is the third issue of $1,000,000 of stock in the past two years. The treasury will receive $1,500,000 in cash as a result of the financing.

At their meeting the directors also declared the regular quarterly dividend of $2.50 per share on the capital stock.

3,000,000 More Ride on Chicago Surface Lines Than a Year Ago

Riding on the Chicago Surface Lines has continued to increase and November shows a total increase over a similar month last year of 3,032,039 rides. The 134,285,240 rides, including transfers, exceeded the previous high November riding, 1926, by 2,933,370 rides. Revenue rides were 74,402,575, an increase of 723,876 over November, 1926, and of 1,041,735 over November last year.

Gross receipts during the month were $5,137,094, an increase over 1926, the previous high November, of $50,627.

Expansion by Georgia Power

Two utilities in Augusta, Ga., were recently taken over by the Georgia Power Company and will be operated as an integral part of that system. They are properties of the Augusta-Aiken Railway & Electric Corporation and the Georgia-Carolina Electric Company. With the announcement of the acquisition, it was stated that F. B. Culley, vice-president and general manager of the Augusta-Aiken Company, will continue in charge with the title of division manager of the newly created Augusta division of the Georgia Power Company. The utilities involved in the new expansion of the Georgia Power supply, besides electric light and power, railway service in Augusta.

This purchase followed close upon that of the Macon Railway & Light Company, Macon.

P. S. Arkwright, president of the Georgia Power Company, said that the closer alliance now effective between the Georgia Power Company and the Augusta utilities should prove of great advantage to both companies.

New York Traffic Figures Released

For fiscal year ended in June 2,921,200,000 passengers rode rapid transit and street surface lines. Bus and tube traffic swell total to 3,235,200,000

PASSENGERS numbering 3,235,200,000 were carried on the rapid transit lines, the Hudson tubes, the street surface lines and the bus lines during the fiscal year ended June 30, 1928. Rapid transit and street surface lines in New York City carried 76,700,000 more passengers during the fiscal year ended June 30, 1928, than they carried during the preceding fiscal year. Total number of passengers carried on the rapid transit and street surface lines in New York City for the fiscal year just ended was 2,921,200,000. The increase in percentage was 2.7 per cent over the preceding fiscal year. In addition, the Hudson & Manhattan Railroad carried 112,500,000 passengers, and the bus companies reporting to the Transit Commission carried 86,100,000.

It is estimated that the traffic carried by the municipal bus lines during the fiscal year reached a total of 97,750,000. The Williamsburg Bridge local line carried 17,600,000 passengers. These figures when added give a grand total of 3,235,200,000.

Below is a table showing the percentage of this total carried by the various lines:

	Per Cent of Total Traffic
Interborough Rapid Transit Company	
Subway division	27.75
Elevated division	10.85
Total, Interborough Rapid Transit Company	38.60
New York Rapid Transit Corporation (Brooklyn-Manhattan Transit)	20.70
Total, rapid transit lines	59.30
Street surface lines	31.54
Hudson & Manhattan Railroad	3.48
Bus lines (exclusive of municipal bus lines)	2.66
Municipal bus lines (estimated)	3.02
Total	100.00

Metropolitan Acquisition in Boston

A BILL has been filed in the Massachusetts Legislature for the incorporation of the Metropolitan Transit Company with authority to take over the various transportation lines within the Metropolitan area of Boston. The lines which it is sought to consolidate, under the provisions of this bill, are the Boston Elevated, some of the old Boston & Northern, the Newton Circuit of the Boston & Albany Railroad, and the Boston, Revere Beach & Lynn Railway, recently electrified. Sections of other lines are wanted. A part of the Eastern Massachusetts Street Railway is located in the district.

In the matter of financing it is proposed to create 7,500,000 shares of capital stock of a par value of $10; of this 2,500,000 shares are to be set aside for extensions and improvements; bonds up to $125,000,000 would be authorized.

Appearing as petitioners for this legislation are William J. McDonald, A. H. Kenyon and Elbridge R. Anderson.

Digitized by Google

The Interborough Rapid Transit station at Times Square is still the busiest station in the city. A total of 55,093,646 fares were collected there during the last fiscal year, an increase of 6,970,080 over the previous year. Grand Central is the next busiest station. For the fiscal year 1928, 44,371,196 fares were collected at that station, an increase of 4,164,868 over the previous year. The Pennsylvania station of the Interborough stands third on the list with 41,885,547 fares collected, an increase of 3,911,292. The fourth largest station is the Brooklyn-Manhattan Transit station at Times Square, at which 34,630,250 fares were collected for the 1928 fiscal year, an increase of 1,782,250 over the previous year.

The accompanying table shows the ten largest stations on the Interborough and Brooklyn-Manhattan lines with a comparison of the 1928 and 1927 figures.

Four of the stations on the Brooklyn-Manhattan Transit lines show a decrease when compared with the figures of 1927. The explanation offered is that the 1927 figures were slightly abnormal because of the strike on the Interborough lines during July, 1926, which resulted in a shift of passengers to the Brooklyn-Manhattan lines. Thus, if these stations on the B.M.-T. had had only their normal increase for the fiscal year 1927, the figures for 1928 would probably not show a decrease.

The maximum traffic days for the fiscal years ended June 30, 1928, and 1927, on the I.R.T. subway and elevated lines and on the B.-M.T. lines were:

	Fiscal Year Ended June 30 1928	1927
I. R. T. Subway Division		
Dec. 19	3,113,346	
Feb. 21		2,861,217
I.R.T. Elevated Division		
Oct. 24	1,109,003	
July 12		1,227,047
B.-M.T. New York Rapid Transit		
Dec. 19	2,105,989	
July 12		2,095,146

The subway division of the I.R.T. with a traffic of 897,700,000 passengers made the greatest gain during the year, with an increase of 83,100,000 passengers, or 10.2 per cent. The elevated division of the Interborough carried 7,800,000 fewer passengers than during the preceding year. The B.-M.T. lines carried 669,600,000 passengers for the 1928 fiscal year; an increase of 13,000,000 or 2 per cent for 1927. The street surface lines in Manhattan lost nearly 15,800,000 passengers and in Richmond nearly 6,800,000. Bronx street surface lines gained about 8,500,000, Brooklyn gained about 1,650,000, and Queens gained about 750,000.

For the fiscal year ended June 30, 1928, the I.R.T. lines showed an increase in operating revenue amounting to $3,889,206. B.-M.T. lines showed an increase in operating revenue of $693,343. The elevated division of the I.R.T. showed a loss in operating revenue amounting to $456,744. Surface line companies operating in five boroughs showed a decrease of $694,278 in operating revenue for the fiscal year ended June 30, 1928.

Total operating revenues of all street railway lines in New York City amounted to $157,065,000 for the fiscal year 1928, or $3,888,000 more than the preceding fiscal year. Rapid transit lines passed the $100,000,000 mark with total operating revenues of $101,928,000, an increase over the preceding fiscal year of $4,582,000. The street surface lines had a total operating revenue of $55,137,000, a decrease of about $694,000.

Among the Manhattan surface companies, the New York Railways Corporation had the biggest decrease in revenue. That company's shrinkage was $324,369. Street surface companies in Queens reported an increase in operating revenue. The Brooklyn surface companies reported an increase in passenger revenue of $91,000, which was more than offset by the decrease of $99,000 in revenue from freight operations on the South Brooklyn Railway, making the total operating revenues of the Brooklyn surface companies show a decrease of $4,000. Street surface companies in the Bronx, all included in the Third Avenue Railway, reported an increase in revenues of $428,000.

Dividends declared during the fiscal year ended June 30, 1928, were as follows:

By the New York Rapid Transit Corporation on 282,760 shares of capital stock (no par value), $16 per share.

By the South Brooklyn Railway on $500,000 capital stock, 8 per cent.

By the Manhattan Bridge Three-Cent Line on $450,000 in capital stock, 3 per cent.

By the Hudson & Manhattan Railroad on preferred stock, par value, of ap-

TABLE SHOWING DISTRIBUTION OF NEW YORK TRAFFIC

	Fiscal Year Ended June 30 1926	1927	1928

proximately $5,200,000, 5 per cent, and on common stock, par value, of approximately $40,000,000, 2½ per cent. Hudson & Manhattan Railroad declared interest of 5 per cent on $33,102,000 of adjustment income bonds.

Third Avenue Railway declared interest of 2½ per cent on $22,536,000 of adjustment mortgage bonds.

The Fifth Avenue Coach Company declared a dividend of 1,000 per cent on $50,000 capital stock.

The Eastern Parkway, Brownsville & East New York Transit Relief Association declared dividends of 375 per cent on $28,600 capital stock.

The accompanying table shows the number of passengers carried on rapid transit and street surface lines during the years 1928, 1927 and 1926; also the number of passengers carried by the Hudson & Manhattan Railroad (part of which traffic is outside of the city limits), the Fifth Avenue Coach Company, the Eastern Parkway, Brownsville and East New York Transit Relief Association, Inc., the Surface Transportation Corporation of New York, and two small bus companies, together with certain other data pertinent thereto.

Illinois Removal Allowed

Authority to discontinue local service between Ottawa and Streator, Ill., and to remove its tracks on this 8-mile line was asked in a petition recently filed with the Illinois Commerce Commission by the Illinois Traction, Inc. The railroad has been operating supplementary motor coach service between the two cities for several months.

A. R. Kuser Resigns in New Jersey

Col. Anthony R. Kuser, a director of Public Service Corporation of New Jersey since its formation in 1903, has resigned from the corporation and subsidiary companies as a director, due to ill health. He was also a member of the executive committee. Colonel Kuser was one of the original 24 directors of the corporation on its organization in June, 1903. He was also at that time made second vice-president, and continued as a vice-president until 1923 when he resigned, retaining his position, however, on the directorate.

Abandonment on Northeastern Lines Deferred

Hearings were completed before the New Hampshire Public Service Commission on Dec. 19, regarding the abandoning of railway lines in Salem, N. H., by the Massachusetts Northeastern Street Railway. Counsel for the town of Salem has been allowed until Dec. 29 to file a brief and the Northeastern will have an additional five days to answer it. Although initially the railway had planned to cease operations on these lines on Dec. 26, the date for suspension was put off until after Jan. 1.

Clifton L. Bartlett, vice-president, stated at the hearing that the company had lost $150,000 in Salem during the past ten years. Prospects, he said, did not look bright for improving revenues, and $60,000 would have to be spent to make the tracks reasonably safe.

Town Counsel Chester T. Woodbury spoke for a continuation of the Salem lines. He said that many people who lived in Salem, N. H., worked in Lawrence and Haverhill and required the transportation.

Separation in Dallas

Separation of the Dallas-Terrell interurban railway from other operations of the Texas Electric Railway has been effected with the granting of a state charter to the Dallas-Terrell Interurban Railway. Capital stock in the company consists of 90,000 shares with no par value.

Incorporators are: W. B. Head, John W. Carpenter and Richard Meriwether, Dallas, all executives of the Texas Electric Railway. The officials and directors of the two companies will remain the same, however, and ownership of stock in the new company is vested with the Texas Electric Railway. The action was taken to facilitate operation.

$65,155 Loss on Interborough for Five Months

For the five months' period ended Nov. 30, 1928, gross revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., was $27,468,408, which represented an increase of $781,673 over a similar period of 1927. Expenditures for operating and maintaining the property totaled $17,531,504, or an increase of $1,595,850 for the five months' period ended November, 1927. The balance, after deducting the 5 per cent Manhattan dividend rental, was a deficit of $65,155, compared with a net profit of $233,181 in the five months ended Nov. 30, 1927.

Final Accounting for Shore Line Accepted

The final accounting of Receiver Robert W. Perkins for the Shore Line Railway was accepted on Dec. 19 by Judge John Richards Booth in the Superior Court at Norwich, Conn. Judge Booth ordered the sum of $185,000 turned over to the Old Colony Trust Company, Boston, Mass. A balance totaling $8,083 is to be held by the receiver to await further jurisdiction by the court. An unsettled claim against the Shore Line Railway has yet to be considered. Action is pending in this case on a petition by the Westinghouse Company, which seeks judgment to the amount of $6,500 against the defunct railway.

Date of Puget Sound Sale Set

Feb. 25 has been set as the date of sale of the operating properties of the Puget Sound Electric Railway, which runs the Seattle-Tacoma-Renton Interurban lines. Bids will be received until the date of sale.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Personal Items

W. G. Murrin Prepared for New Post

When George Kidd gives over the reins on Jan. 1 next to W. G. Murrin, another progressive and energetic man will hold the chief executive post connected with the British Columbia Electric Railway in Vancouver, B. C., and will likely carry on the expansion policy which characterized the service period of his predecessor and friend, both of whom, English born, found themselves in Canada in their early youth, ambitious to make their way. Mr. Kidd becomes chairman of the board of the holding company.

Back in 1903 Mr. Murrin was connected with the London Electric Lighting Company, remaining with that company until 1912, simultaneously holding the office of works manager of the London United Tramways. In 1913 he went to the Canadian property as mechanical superintendent with a reputation for resourcefulness and accomplishment which soon won for him the position of superintendent, assistant general manager and later vice-president.

W. G. Murrin

He is known as a hard worker and has also a large capacity for relaxation and social intercourse. His interest in his work is intense, but he also knows the value of an avocation, giving his attention to the Little Theatre Movement in Vancouver, as president.

Trained as an engineer and copiously endowed with experience in the operation of hydro-electric enterprises and the management of light, heat, power and tramway undertakings, Mr. Murrin, at 53, becomes president of one of the biggest enterprises in Western Canada.

Technical Journalist Joins Bendix Corporation

David Beecroft, associated with the Chilton Class Journal Company and the Class Journal Company for 24 years, resigned on Dec. 1, 1928, to become vice-president in charge of the newly-established New York office of the Bendix Corporation. For more than eighteen years he was connected with the editorial department of the Class Journal publications, beginning with *Motor Age* in 1905 and acting as directing editor of all the Class Journal publications until his withdrawal from the editorial department in 1922.

Mr. Beecroft entered the motor vehicle industry in December, 1903, as editor of the *Automobile Review*, published weekly in Chicago, but in March, 1905, he joined the staff of *Motor Age* as technical editor and in 1908 editor.

In 1911, in addition to his editorial work on *Motor Age*, he took on the editorial work of *The Automobile*, later converted into *Automotive Industries*, and in 1913 became directing editor of the Class Journal Company, then also publishing *Motor World* and *Commercial Vehicle*. In January, 1917, he established *L'Automobile Americano* and an automobile export paper printed in Spanish.

In November, 1923, he entered the business department of the Class Journal Company. During the past two years he has devoted all of his time to studies in the automobile field, particularly market analysis.

Mr. Beecroft was president of the Society of Automotive Engineers during 1921 and previous to that he was a member of the board for several years. He was chairman of the papers committee of the society for five years.

At present he represents the American Automobile Association on the motor vehicle conference committee and has been a member of the contests board of the American Automobile Association for twenty years. Mr. Beecroft has also been active in the work of the trade paper associations.

The Bendix Corporation owns and operates the Bendix Brake Company, South Bend, Ind., and controls and operates the Eclipse Machine Company, Elmira, N. Y. Mr. Beecroft's office will be located at 2837 Grand Central Terminal Building.

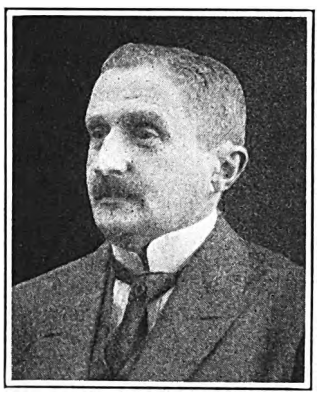
ARTHUR G. WADLEIGH, Lynn, and Fred J. Crowley, Lowell, have been reappointed by Governor Fuller to the Board of Public Trustees of the Eastern Massachusetts Street Railway, Boston, Mass.

ROBERT A. PRITCHARD, vice-president of the J. G. White Management Corporation, has succeeded James H. Pardee as president of the Equitable Coach Corporation, which has secured bus rights for Brooklyn and Manhattan from the Board of Estimate and is reported now to be in a deal under which it will be included in a new company that will take over its rights and fit in the new operation with that of the surface lines of the Brooklyn-Manhattan Transit Corporation.

Honor for Wilhelm Stein

Wilhelm Stein, manager of the Hamburg Elevated Railway, has just received the degree of Doctor of Engineering, from the Hanover School of Technology. The degree was awarded *honoris causa*. Dr. Stein is vice-president of the German Co-ordinated Transport Association and a member of the executive committee of the International Tramway & Bus Association, with headquarters in Brussels, Belgium.

Dr. Stein was born Sept. 5, 1870, and studied mechanical engineering at both the Hanover School of Technology and in Berlin, later receiving the degree of Regierungsbaumeister. In 1897 he became associated with the Siemens & Halske Company of Berlin, and in 1898 was asked by that concern to supervise the construction of equipment of the Hamburg Elevated Railway. On its completion he was appointed general manager. After the elevated railway was consolidated with the surface lines and other means of public transport in Hamburg and became a municipal property, Dr. Stein was appointed manager of the entire system.



Wilhelm Stein

In 1926, he visited the United States and made an extended inspection trip of the electric railways and transportation facilities in this country.

HARLEY A. JOHNSON, general manager of the Chicago Rapid Transit Company, Chicago, Ill., has been spending the last two months in Europe studying heavy electric traction installations. He has been doing so as chairman of the sub-committee on European practice of the electrification of steam railroads committee, of the National Electric Light Association. Three other members of the committee accompanied him: Reinier Beeuwkes, electrical engineer of the Chicago, Milwaukee, St. Paul & Pacific Railroad; Louis E. Fischer, vice-president of the Illinois Power & Light Corporation, and Horace H. Field, secretary of the electrification of steam railroads committee of the National Electric Light Association. The party sailed from New York on Oct. 27, 1928, and expected to return from Southampton on Dec. 27, 1928. Their itinerary included England, Sweden, Germany, Switzerland, Italy and France.

Annual Construction Programs Announced

Tennessee Electric Power will spend $470,000 on railways. Portland Electric Power Company to make large expenditures. One hundred and six cars for Montreal

IN CONTEMPLATION of a generally sustained commercial and industrial activity during the coming twelve months, the Tennessee Electric Power Company, Chattanooga, Tenn., and its subsidiary companies will spend the sum of approximately $5,000,000 on new construction work during 1929. This new program is equally as large as that appropriated for the current year. Construction activities of this company for the past five years have amounted to $25,000,000. The new estimate will run the total to $30,000,000 by the end of 1929.

As in former years, the greater portion of the construction budget authorized by the management will be expended on the electrical division of the property for new and additional power facilities, and for improvements and betterments in service. This amount will be around $4,500,000 including the Nashville property. Expenditures for the street railway department in Nashville and Chattanooga will total $470,000. The remainder will be utilized by the water, ice, and telephone division for general business requirements.

A number of service improvements will be made at the power houses, including the installation of temperature recording apparatus on each of the fourteen generators. Mica insulated windings will be provided for two of the present 4,200 hp. generators, thereby increasing the hp. rating of each, 2,000.

The Portland Electric Power Company has announced expenditures of $15,850,000 for the next year, $2,000,000 of which will go into new construction. A large part of this will be spent in extending the lines of the company and in additions to power plants and substations. $400,000 will be spent for railway improvements and about $1,500,000 for substation improvement and extensions.

Cars for Montreal

The purchase of 106 cars by the Montreal Tramways Company, Montreal, Que., has been authorized by the Montreal Tramways Commission. These cars to be ordered from the Canadian Car & Foundry Company will consist of 50 two-man cars similar to the last group of cars received, 30 one-man cars similar to the present class 1950, 20 one-man cars with draw bars fitted at the front end to permit each car to be used as a trailer and hauled by any of the 2100 class cars, and 6 double-end one-man, two-man cars with platforms arranged for double end operation with either one man or two men. The company will order 30 more of the one man type 1950 cars, if the present coupling plan works out satisfactorily.

The Chicago South Shore and South Bend Railroad, Michigan City, Ind., is installing two new freight switching connections, one at Burnham, Ill., and the other at Shearson, Ind. At Burnham, a new main line track for West Farm trains will be built to the north of the present double track and main line. The former east bound main track will then become a yard track with two additional yard tracks paralleling it to the south, also 1,500 ft. of tail track. The yard when completed, about March 1, will run 5,500 ft. west of the state line at Hammond to Burnham, and will greatly facilitate the handling of increasing carload shipments by the Belt Railway.

At Shearson, Ind., a new single receiving track, connecting with the Indiana Harbor Belt Railroad, is being built. This track is going in south of the main line for a distance of 2,000 ft. It will be used as a new receiving track, the present interchange going over to delivery only. Seventy lb. rail is being laid on treated ties. Construction work on the New York Central connection at South Bend, and the Michigan-Central Monon route interchanging at Michigan City, is virtually finished.

The railway project for Mount Hood in Oregon is still under consideration, the latest development being when J. L. Meier of Portland, chairman of the special committee, personally delivered to the Secretary of Agriculture at Washington, D. C., an answer from Portland interests. This was a reply to the secretary's decision postponing action of any definite nature on this proposed project. The Portland committee is trying to speed up a favorable and early reaction to the plan for the railway.

The Pacific Electric Railway, Los Angeles, Cal., has placed an order with the Union Switch & Signal Company for alternating current, automatic block signalling material to be installed on the Pasadena Short Line between Indian Village and Newton Park, Cal. This installation will comprise 34 color light signals, 56 impedance bonds, 55 relays with the necessary transformers, reactors, copper oxide rectifiers and housings. New 122-lb. rail has been installed by the East St. Louis Railway Company, East St. Louis, Ill., on Collinsville Avenue from Missouri to Illinois Avenues. The rail joints were thermit welded, and ready mixed concrete was delivered to the job by trucks. The cost of the complete installation was approximately $25,000. The Toronto Transportation Commission has recently purchased land for the construction of a loop on the east side of Mutual Street, just North of Queens Street, Toronto.

During the year 1928 the Worcester Consolidated Street Railway, Worcester, Mass., completed 14,000 ft. of track. In this work there was used 420 tons of 7-in. girder rail, 14,500 ties, 15,000 tie plates, and 3,500 flat tie rods. There were special work renewals in 22 locations in various parts of the city, at an expenditure of about $35,000.

Building Construction

The St. Louis Public Service Company, St. Louis, Mo., will build an addition to its mechanical shop and operating building, to cost $45,000. The Iowa Railway & Light Corporation, Cedar Rapids, Iowa, plans on operating a building at Marshalltown, Iowa, to cost about $70,000. A railway company in northern New York State has purchased transformers costing $30,000.

It is reported that a model town is being laid out on the bank of Flin Flon Lake, Manitoba, about 3 miles from the Flin Flon Mine, and that it is proposed to build an electric railway from the town to the mine, for the convenience of the company's employees. The Montreal Tramways Company has prepared plans for the construction of a viaduct at Atwater Avenue, across the Canadian National Railway tracks, for electric railway traffic only. This company is building approximately 2.25 miles of track in various locations, and is contemplating the construction of approximately 2 additional miles.

The Nova Scotia Light & Power Company, Halifax, Nova Scotia, is building a single track extension, 1,494 ft. in length. The Ottawa City Counsel, Ottawa, Ont., has let a contract for the construction of a viaduct at Somerset Street, at a cost of $119,025. The City Counsel has discussed the raising of about $145,000 to pay the cost of the structure, including the cost of sidewalks, land damages, etc. The Ottawa Electric Railway is to pay 60 per cent of the viaduct's cost.

Los Angeles Railway, Los Angeles, Cal., has placed orders for two twin

Digitized by Google

coaches and one White 29-passenger single-deck treadle door motor coach for use on its lines. The Pacific Electric Railway and the Los Angeles Railway have each ordered three twin coaches, making a total of six to be placed in service on the Western Avenue lines of the Los Angeles Motor Coach Company. The Alabama Power Company, Birmingham, Ala., has completely rebuilt one of its 56-passenger cars. It is equipped with new trucks, electric heaters, air brakes, and all other equipment was thoroughly overhauled.

The three-story brick building used as a carhouse, repair shop and paint shop, at Jamestown, N. Y., by the Jamestown Street Railway Company and the Jamestown, Westfield and Northwestern Railroad has been practically destroyed by fire and the loss was placed at close to $80,000. Three street cars were consumed in the blaze, one a large center entrance interurban unit and two city-type cars.

U. S. World Trade Increasing

The foreign trade of the United States is forging ahead steadily, according to the quarterly report on the value and volume of the principal exports and imports between the United States and its chief foreign markets, issued by the foreign commerce department of the Chamber of Commerce of the United States. The general expansion of this country's foreign commerce is now indicated clearly by a comparison of the statistics for the January-September period of 1928 with the average of the same nine months from 1923 to 1927. The foreign trade of the United States for the first three quarters of 1928 totaled $6,628,000,000, nearly 5 per cent greater than the average of the five corresponding nine-month periods of 1923 to 1927.

Exports amounting to $3,559,000,000, the largest since 1920, is 1.4 per cent above 1927 and 8 per cent over the above mentioned average. Imports amounting to $3,070,000,000, though 2.7 per cent below the 1927 total, were still 1.5 per cent above the 1923 to 1927 average receipts. While exports for the third quarter of 1928 exceeded $1,000,000,000 for the seventeenth consecutive quarter, imports for the quarter fell below $1,000,000,000 for the first time since 1924. Exports of foreign merchandise (re-exports), included with total exports, amounted to $76,037,000 or $4,830,000 lower than last year. Owing to a heavy demand for gold by countries which were placing their currencies on a gold basis, exports of that metal in the January to September period of 1928 were especially heavy, totalling $535,216,000 as against imports of $100,026,000.

Exports of finished manufactures have shown a steady increase from the $1,120,000,000 total for the first three quarters of 1923 to $1,668,000,000 for the nine months of 1928, a gain of almost 50 per cent. Compared with 1927, this group shows a gain of nearly 11 per cent and was 25 per cent above the 1923-1927 average. Finished manufactures constitute nearly 48 per cent of the total exports, a proportion exceeded only in 1916 during the World War.

Exports of semi-manufactures increased from $417,911,000 in 1923 to $537,615,000 in 1928, a gain of 28 per cent. Their gain over 1927 was less than 2 per cent, though 13 per cent above the 1923-27 average. To these two groups of manufactured goods is due largely the extraordinary expansion of the United States export trade.

The course of the crude material group has been uneven with a decided upward trend from 1923 to 1925, and then a severe decline in 1926. In the last three years, however, this group has varied little, the 1928 figures being 2 per cent below the 1923 to 1927 average. Imports of raw materials by value were 9.6 per cent lower than a year ago and 4 per cent lower than the average of the previous five years. Imports of finished manufactures continue their advance and were 10 per cent above the average.

Perhaps the most striking example of the expansion of exports of manufactures is the continued increase in exports of automobiles, parts and accessories, the total value of which increased 77 per cent as compared with the average for the past five years, and was above the record set last year. Machinery exports, lead by industrial machinery, showed an increase in value of 12 per cent above 1927 and 33 per cent above the 1923 to 1927 average. Electrical machinery and apparatus, 4 per cent above 1927, was 16 per cent above the average. The value of exports of metals was up 5 per cent over last year, shipments abroad of semi-manufactures of iron and steel advancing 3 per cent, steel mill products 8 per cent and advanced manufactures of iron and steel 7 per cent. Exports of non-ferrous metals increased over 4 per cent.

Export of railway cars, although not one of the important exports, showed a considerable gain over 1927. Freight cars exported from January to September, 1928, numbered 2,279 as compared to 2,085 in the same period during 1927, or a gain of 9.3 per cent. The number of passenger cars exported during the three quarters of 1928 was 320 as compared to 215 exported during the same period in 1927, making a gain of 48.8 per cent.

Weekly Business Conditions

Steel plants showed lessened activity during the week ended Dec. 22, as compared with the preceding week, but were almost 20 per cent more active than a year ago, according to the weekly statement of the Department of Commerce. The volume of money turnover, as indicated by check payments, was greater than in either prior period. Employment in Detroit factories, indicating the activity of the automobile industry, was seasonally smaller than in the preceding week but showed a substantial gain over the same period of 1927. Petroleum output during the last reported week showed gains over both periods. Lumber production, however, showed declines from both the preceding week and the same period of last year. Bituminous-coal production, on the other hand, though declining from the previous week, was greater than a year ago.

The general index of wholesale prices was slightly stronger than in the preceding week, being still somewhat higher than a year ago. Prices for iron and steel showed no change from the previous week but were higher than a year ago. Copper prices, showing no change from the previous week, were considerably higher than for the same period last year.

Loans and discounts of federal reserve member banks showed only slight change from the previous week but were higher than a year ago. Interest rates on time money averaged higher than in either the preceding week or in the same period of last year. Prices for stocks recovered from the level of the preceding week. Bond prices, reflecting higher interest rates, were still lower than in either the preceding week or the same period of 1927. Business failures were less numerous than in either the previous week or the same period of 1927.

Weekly Business Indicators

(Weeks ended Saturday. Average 1923-25 = 100)

Cincinnati Car Offers New Line of Industrial Locomotives

The Cincinnati Car Corporation, Cincinnati, Ohio, now offers to users of industrial haulage and switching equipment a complete line of industrial locomotives in gasoline, gasoline-electric, Diesel, electric trolley and storage battery types, known as the Cincinnati line.

These locomotives will be furnished in a variety of sizes from small 2 and 3-ton units up to 50-ton, or larger, and in various track gages, affording equipment suitable for handling either small or large industrial cars in all kinds of service, as well as for switching railroad cars, for which a pronounced demand has developed among shippers and receivers of carload freight, as well as among the steam railroads for use in small terminals on short divisions.

The company has been building electric trolley type locomotives of various sizes for years and many of the proven features of design in this type are incorporated into the additional types, particularly the gas-electric. Different features of design otherwise are based on the experience of a part of its present organization extending over 15 years in the gasoline locomotive field, and involve the most up-to-date mechanical and construction ideas and principles. Ruggedness, ample power, simplicity and accessibility are the prime features sought throughout all of the different types and models.

H. R. Sykes, who is one of the pioneers in the development, manufacture and sale of industrial locomotives, and who is well known to many of the locomotive using public, will be in charge of sales and service of the locomotive division.

Two of its popular size gasoline-powered locomotives will be exhibited at the coming show of the American Road Builders' Association at Cleveland in January.

Welded Chain Simplification Ready for Acceptance

The division of simplified practice of the U. S. Department of Commerce has sent copies of the proposed simplified practice recommendation, for welded chain, to manufacturers, distributors and users of this commodity for acceptance. This recommendation was approved at a general conference of all interested elements in the industry, held under the auspices of the division of simplified practice at the Department of Commerce on Nov. 15.

The simplified list of sizes and varieties is based on a careful survey of existing conditions and requirements in the industry. When the recommendation has been accepted by the industry as a whole, it will become effective for new production on Feb. 1, 1929, subject to annual review thereafter. A standing committee representing all interests was appointed at the general conference. This committee will review the project one year after the effective date, and will then either reaffirm the recommendation for another year, or modify it to meet changed conditions or new developments in the industry.

ADVERTISING LITERATURE

South Bend Lathe Works, South Bend, Ind., has issued a new booklet No. 23, describing the new model 9-in. junior South Bend back-geared screw cutting lathe, showing a variety of sizes and drives. In this booklet is shown for the first time the new horizontal motor drive which is fully illustrated and described. Aside from the complete description of these lathes, the catalog contains a number of detailed illustrations, showing the practical jobs which may be executed with this new model. A copy of this booklet will be mailed postpaid to anyone desiring it.

St. Louis Car Company, St. Louis, Mo., has issued a catalog, No. 106, illustrating the new Birney car. The features of this car, and the new Type B.A. 50 double-truck used, are shown by detailed pictures and drawings. Aside from a complete description of the features of the car, this catalog contains full specifications of all the equipment used.

Chausse Oil Burner Company, Elkhart, Ind., has issued circular No. 14, descriptive of Chausse oil burning concrete mixers, heaters and kerosene torches. Other equipment described in this bulletin includes portable asphalt plants, tar kettles, tool heaters, oil burning surface heaters and self-heating smoothing irons.

Barrett, Haentjens & Company, Hazleton, Pa., has issued a new pamphlet, describing a method used to make suction lift centrifugal pumps automatic. This bulletin, while dealing with but one automatic pumping system, is of rather general interest since this is the system most commonly used. It shows how the centrifugal pump can be started and stopped by a float switch, push button, pressure regulator, or time switch. It explains the way in which the pump is primed, and describes the several devices used to protect the pump and electrical equipment against damage due to loss of prime, suction air leaks, a broken discharge pipe, and many other adverse operating conditions.

General Electric Company, Schenectady, N. Y., has issued bulletin GEA-971, descriptive of the gas-electric railway car. This bulletin contains illustrations, operating charts and tables, and a detailed description of this type of car. Other bulletins recently issued by this company include GEA-408A, describing electric heating equipment for industrial ovens; GEA-876B, describing the type WD-400-A arc welder; GEA-874C, describing type WD-200A arc welder; GEA-569B, describing potential arc welding sets; GEA-881A, describing General Electric arc welder, gas-engine driven; and GEA-878 which contains a description of a testing set for railway circuit breakers.

Stuebing Cowan Company, Cincinnati, Ohio, in collaboration with railroad representatives, Leeds, Tozzer & Company, New York, N. Y., has just issued an interesting pamphlet entitled "Straight Line Trucking" which describes the use of the lift truck platform system by railroads and other common carriers.

Wagner Electric Corporation, St. Louis, Mo., has just issued a new 52-page catalog describing Wagner distribution transformers in single-phase and three-phase, pole-type and subway-type, in ratings up to and including 500 kva.

TRADE NOTES

Synthane Corporation, in September, 1928, under the laws of Delaware, is completing the building of its plant at Oaks, near Philadelphia, Pa., and expects to commence production of Laminated Bakelite products in the early spring. R. R. Titus, formerly vice-president and general manager of the Diamond State Fibre Company and the Celeron Company of Bridgeport, Pa., heads the corporation as president, with J. B. Rittenhouse as vice-president and George J. Lincoln, secretary and treasurer.

Wagner Electric Corporation, St. Louis, Mo., announces the addition of R. L. Matthews to the sales force of its Chicago branch office.

Hisey-Wolf Machine Company, Cincinnati, Ohio, manufacturer of electric drills, grinders and buffers, has recently opened a branch office at 549 West Washington Boulevard, Chicago, Ill. The office will be in charge of Roy D. Haworth, who will be a direct representative.

PILING UP BUS MILEAGE

By increasing travel comforts and dependability of schedules, bus owners' *income* is increased.

By lessening maintenance, lengthening mechanical life, reducing lubrication and fuel costs, bus owners' *outcome* is assured.

Here Timken Bearings offer exclusive advantages — so far in advance that "Timken-Equipped" has become a national demand fast becoming unanimous among those who seek maximum returns on the original mechanical investment.

Fifteen new high-speed interurban cars for the Pittsburgh Railways are among the new types of cars equipped with Westinghouse-Nuttall US-20-A Trolley Bases.

US-20-A TROLLEY BASES
for the Latest Types of Cars

THAT the Westinghouse-Nuttall US-20-A Trolley Base, manufactured by the R. D. Nuttall Company, Pittsburgh, Pa., has been selected for many of the new types of cars introduced within the past year, bespeaks the confidence that this trolley base has established among progressive operators and car builders because of its unusual durability and sensitiveness in operation.

Since their inception, US-20-A Trolley Bases have been a preëminent success because of such features as:

1. Tapered Timken Roller Bearings for swivel.
2. Light weight.
3. Positive simple lubrication systems for swivel and pole socket axle pin, requiring infrequent attention.
4. All wearing parts hardened.
5. Compactness.
6. Bearings protected against entrance of dirt and grit.
7. Current shunted around axle pin prevents pitting.
8. Pole can be locked in horizontal position by trigger device.
9. Complete spring adjustment by one screw.
10. Ease of accessibility to all parts.

All Westinghouse-Nuttall products are sold through the Westinghouse Electric & Manufacturing Co. Address all inquiries to the nearest Westinghouse office.

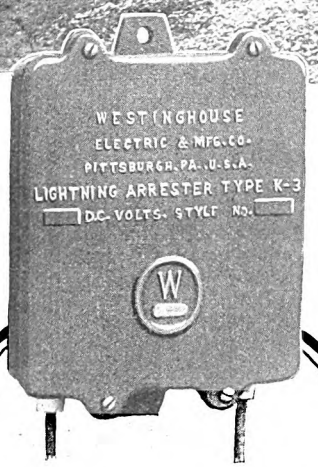
One of the modern cars of the Pittsburgh Railways Company, passing a block signal protected by Westinghouse K-3 Arresters.



Protecting Signal Equipment on the Pittsburgh Railways

THE Pittsburgh Railways Company, Pittsburgh, Pa., winner of the Coffin medal in 1925, has found the Westinghouse K-3 direct-current lightning arrester most desirable for the protection of its automatic block signal system and car equipment.

The K-3 arrester gives positive protection against surges induced by lightning.

Years of field service with thousands of installations prove this arrester to be without an equal.

This arrester requires very little maintenance as it has no liquids to freeze or plates to deteriorate.

It is simple and effective in operation, and consists chiefly of a condenser with or without spark gap.

The K-3 arrester is designed for line, car, and station protection on 100 to 1500-volt direct-current circuits.

Mr. N. C. Towle, Transp. Division
Westinghouse Electric & Mfg. Co.
Pittsburgh, Pa.

Dear Mr. Towle:

. . . . We have found the K-3 arrester quite satisfactory in the protection of automatic signals, and also for the protection of the equipment on our cars. The maintenance cost is practically negligible. . . . .

Yours very truly,
The Pittsburgh Railways Co.
A. H. Leschke
Operating Engineer.

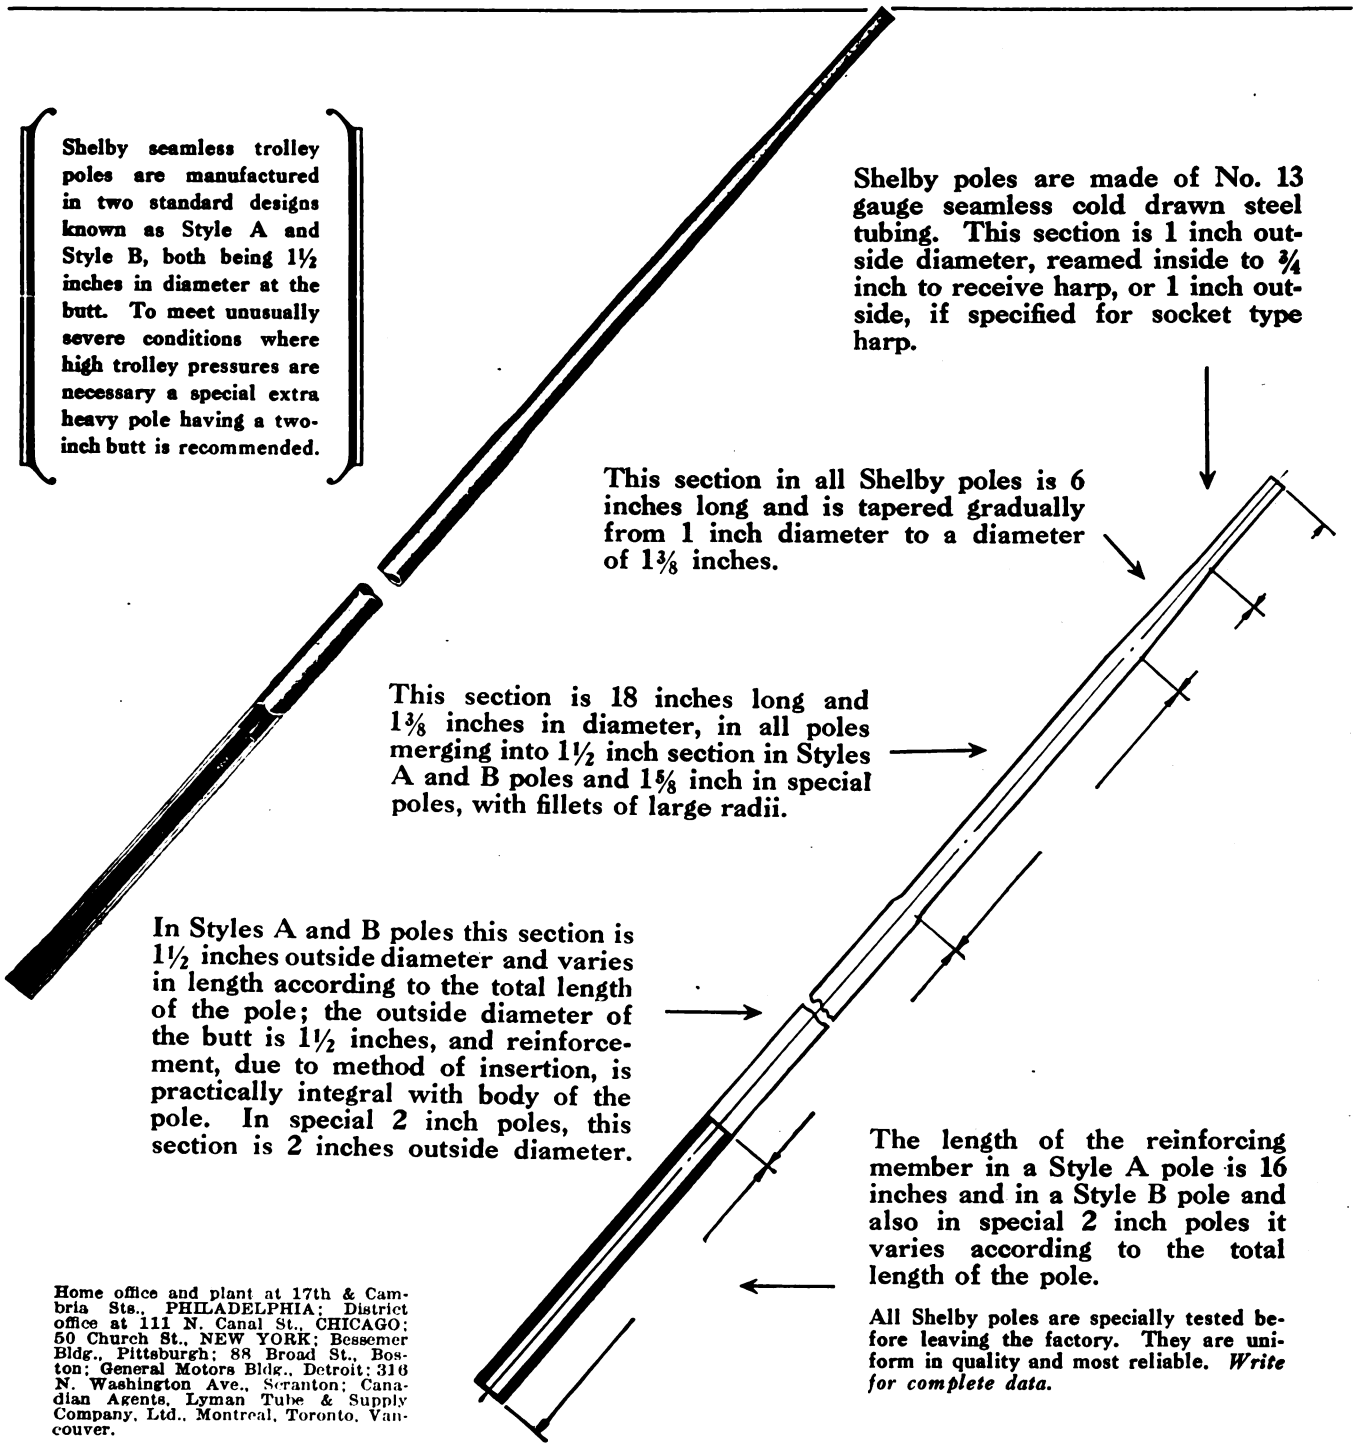
TIME-TESTED *by* THOUSANDS *of* MILES *of* SERVICE

Shelby seamless trolley poles are manufactured in two standard designs known as Style A and Style B, both being 1½ inches in diameter at the butt. To meet unusually severe conditions where high trolley pressures are necessary a special extra heavy pole having a two-inch butt is recommended.



Shelby poles are made of No. 13 gauge seamless cold drawn steel tubing. This section is 1 inch outside diameter, reamed inside to ¾ inch to receive harp, or 1 inch outside, if specified for socket type harp.

This section in all Shelby poles is 6 inches long and is tapered gradually from 1 inch diameter to a diameter of 1⅜ inches.

This section is 18 inches long and 1⅜ inches in diameter, in all poles merging into 1½ inch section in Styles A and B poles and 1⅝ inch in special poles, with fillets of large radii.

In Styles A and B poles this section is 1½ inches outside diameter and varies in length according to the total length of the pole; the outside diameter of the butt is 1½ inches, and reinforcement, due to method of insertion, is practically integral with body of the pole. In special 2 inch poles, this section is 2 inches outside diameter.

The length of the reinforcing member in a Style A pole is 16 inches and in a Style B pole and also in special 2 inch poles it varies according to the total length of the pole.

All Shelby poles are specially tested before leaving the factory. They are uniform in quality and most reliable. *Write for complete data.*

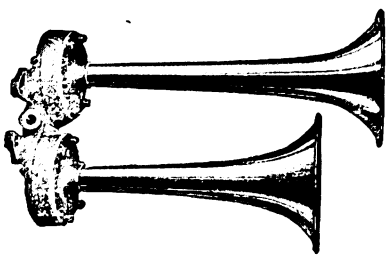
PNEUPHONIC

Sounding a NEW NOTE in WARNING SIGNALS



The Westinghouse Pneuphonic Horn uses very little air, operates successfully over a wide range of pressures, and is of sturdy and durable construction. It is available in single tone or chime design.

As your bus skims over the highway or ambles through traffic its warning signal must appeal for the right of way in tones that are positive but pleasing. It must be heard—it must not be harsh. Those who step out of your way today may want to step into your bus tomorrow—their good will should be retained.

Here is a device that gives warning of approach, unmistakable, yet not irritating or startling. Its tone is loud, clear, and harmonious, easily distinguished from ordinary highway noises, and distinctly audible over a wide area.

The PNEUPHONIC HORN

Cold weather requires *a fighting* gasoline

ZERO weather, wind and snow—a winter combination that tests to the limit the fuel you use in your buses. Gasoline to be dependable under such conditions, must possess to a high degree every feature essential to a good gasoline—quick starting in cold weather, proper arrangement of boiling point fractions assuring maximum development of power, economical mileage.

Red Crown Gasoline meets every one of these requirements. It is noted for its quick starting qualities. Low initial boiling point assures quick vaporization, so that the spark catches promptly.

Red Crown Gasoline is further characterized by the perfection of its chain of boiling point fractions, giving quick acceleration, maximum power and clean combustion. This is why Red Crown causes less dilution of oil in cold weather, why it gives more mileage per gallon.

If you would maintain your winter schedules; if you would reduce your winter operating expenses to the lowest possible point, Red Crown as a factor in accomplishing this surely deserves your consideration. Test it in one of your buses against any other fuel—prove to yourself that it is the most efficient and economical fuel—winter or summer.

Type W

YELLOW COACH

"8 cylinder"

TWO years of intensive engineering development, research and refinement, backed by the vast research laboratories and testing facilities of the General Motors Corporation, were required to develop a small vehicle, that would measure up in every particular to the high standards of excellence that are characteristic of larger Yellow Coach models.

Now, in every detail of design and construction—power plant, axles, frame, brakes, springs and body—we present a coach whose satisfactory performance and lasting qualities meet every Yellow Coach engineering tradition.

The full head-room 21-passenger City Service Coach

Combining Beauty *with* Practical Utility

THAT a full head-room coach can possess the distinctive grace of line and balanced proportions of a parlor coach, without sacrificing carrying capacity and head-room, is well proven in the design of the Type "W" City Service Coach.

Practical operating utility has been carefully combined with the features that attract and please passengers. In the building of Type "W" bodies, great care is exercised in the selection of materials and in the methods of assembly and construction. The frame work is built of thoroughly seasoned second growth ash. The exterior is covered with aluminum. There are no exposed wooden parts. Accurate uniformity and fit are assured by building and assembling each individual body section over precision jigs and fixtures.

This modern method of sub-assembly, while too costly for small production, is justified where volume can offset the high initial investment in jigs and fixtures. It results in the highest degree of accuracy and precision fit, and guarantees a well built body of lasting qualities. Furthermore, it insures freedom from squeaks and rattles.

Digitized by Google

The entrance door of the City Service Coach is of the jack knife type and is built of steel—another advance in lasting body construction. Being built over jigs and fixtures permanent alignment and perfect fit is assured. Furthermore, it is lighter, stronger, free from rattles and will resist warping and twisting.

An important passenger requirement in city service operation is maximum visibility, good ventilation and heating, hence the careful planning of these three factors.

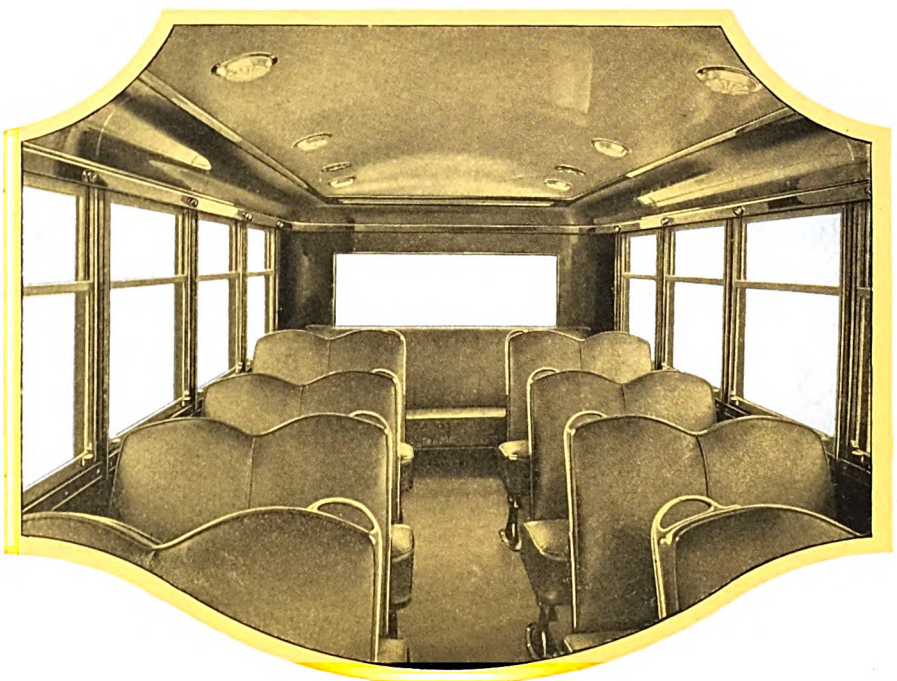
A practical rear of graceful proportions and pleasing lines

Windows are of the raised type, with fixed upper transoms, which permit of an exceptional high range of lift. Large ventilators are set in the roof and added circulation is provided by three large cowl ventilators. Heating is supplied by a blower system that eliminates all pipes within the body. An electric switch on the dash controls the entire heating system.

The body wiring is conveniently located under the advertising racks and is removable as units. All body wiring is carried to one terminal block on the chassis to simplify the joining of chassis and body circuits.

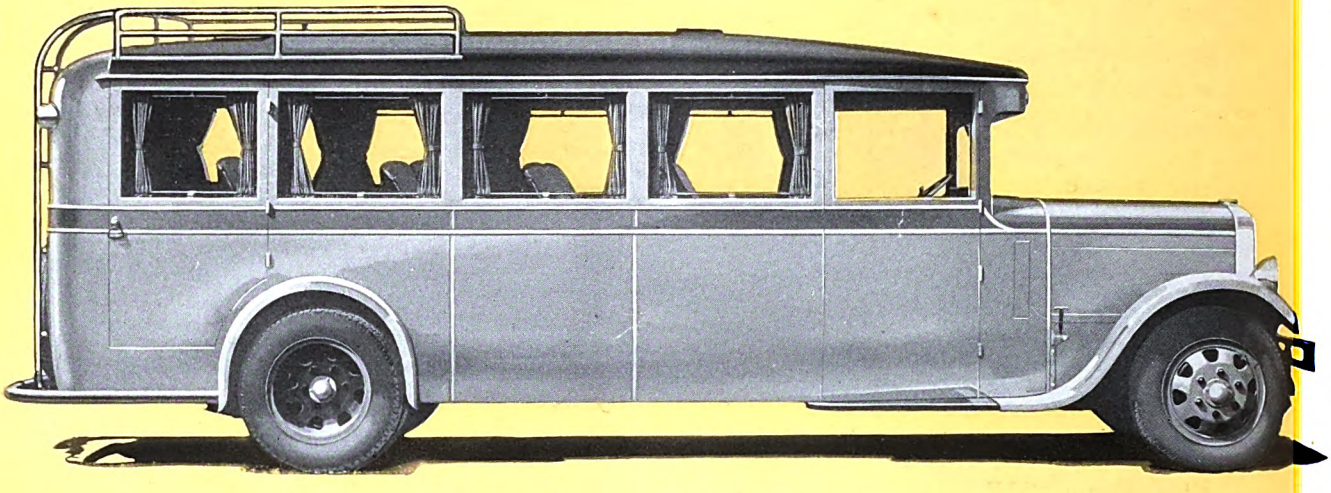
The full head-room body can be easily converted into a beautiful semi de luxe 21-passenger vehicle by installing parlor car chairs and window drapes, at a small extra cost.

Good visibility for the passengers and every convenience for the driver. Fittings by Ternstedt



There are generous accommodations for 21 seated passengers. The seats are well shaped, comfortable, strongly built and attractively upholstered in genuine brown leather. An alternative arrangement is the use of longitudinal seats over the wheel housings, providing accommodations for 23 seated passengers

Digitized by Google



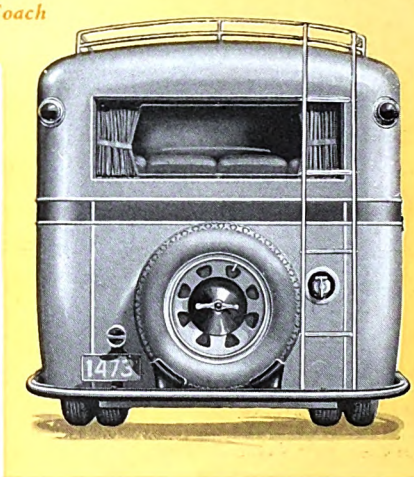
The 17-passenger Parlor Coach

The Parlor Coach

THE 17-passenger parlor coach was designed to approximate in every detail the performance and desirable features usually associated with the finest of personal motor cars. It is thoroughly modern in every detail of appearance and provision for passenger comfort and convenience. Its speed, acceleration and all-round performance can truly be compared with America's finest motor cars.

It is built with a narrow overall width (only 84 inches) to permit greater flexibility of operation and speed on narrow highways and in heavy city traffic.

17 passengers can be accommodated with more than ordinary comfort. All chairs are finely and strongly built of tan colored fibre, upholstered in rich green Spanish leather. On the left side are four high-backed double chairs, and on the right, four high-backed single chairs. The rear lounge seat accommodates four. At the driver's right is a folding observation chair.



The rear of th Parlor Coach Beauty of ap pearance is com bined with pra tical utility. Th emergency doo is on the le side at the rea

An attractive and comfortable feature . . . unusually high (40 in.) back chairs. Fittings by Ternstedt

At the driver's right is a folding observation chair

Digitized by Google

At a slight extra cost, an alternative seating arrangement can be had by installing special seats that unfold intothe aisle space, accommodating four additional passengers.

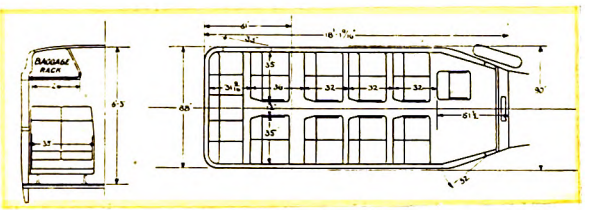
Following established practice in the fine motor car field, the interior side panels are finished in mohair, and the roof head-lining is of velour. Plate glass windows have smart looking drapes, sliding on chromium plated rods.

The Observation Parlor Coach

AS IN the City Service Coach, all body sections are precision built over special jigs and fixtures.

The Type "W" Observation Coach closely resembles the Parlor Coach in its appointments, trim and construction, but was designed to provide a full width (90 in.) full head-room (6 ft. 3 in.) Parlor Coach that will easily accommodate 21 seated passengers.

It has the same comfortable high back chairs as the Parlor Coach, but with four double chairs on each side of aisle.

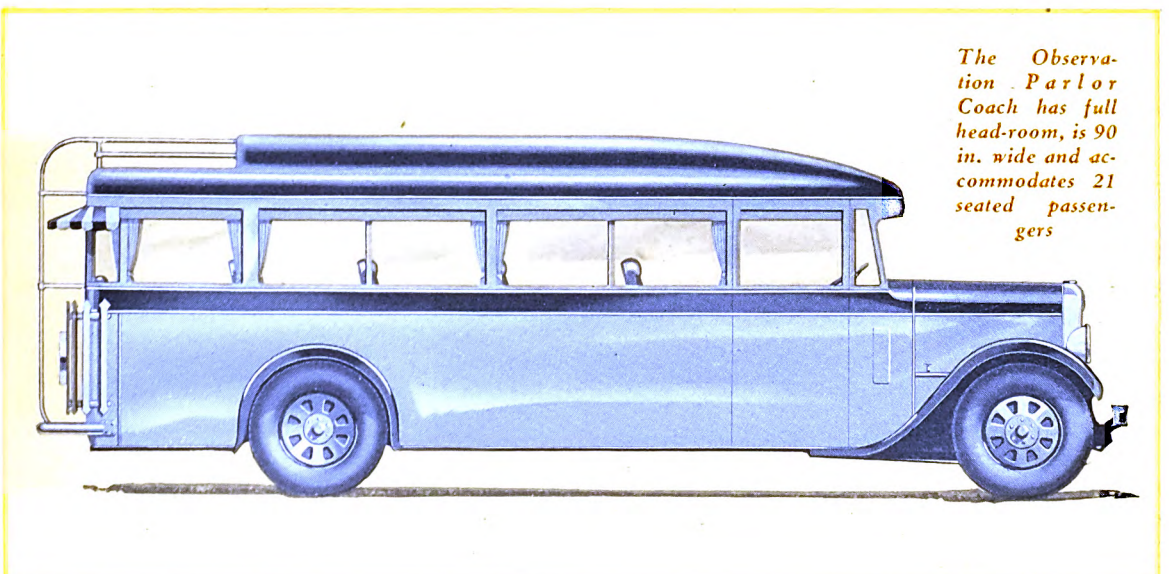


The Observation Parlor Coach has two rows of double
The Observation Coach has two rows of double

A Monitor type of roof was used to provide interior baggage racks of generous proportions. An exterior luggage rack provides further accommodations for excess baggage and special express service.

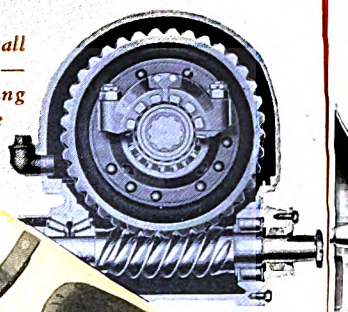
Wherever possible, aluminum has been used in order to combine durability and strength with lightness of weight. The fittings are by Ternstedt.

The observation rear has been carefully planned to insure the utmost in visibility for passengers.

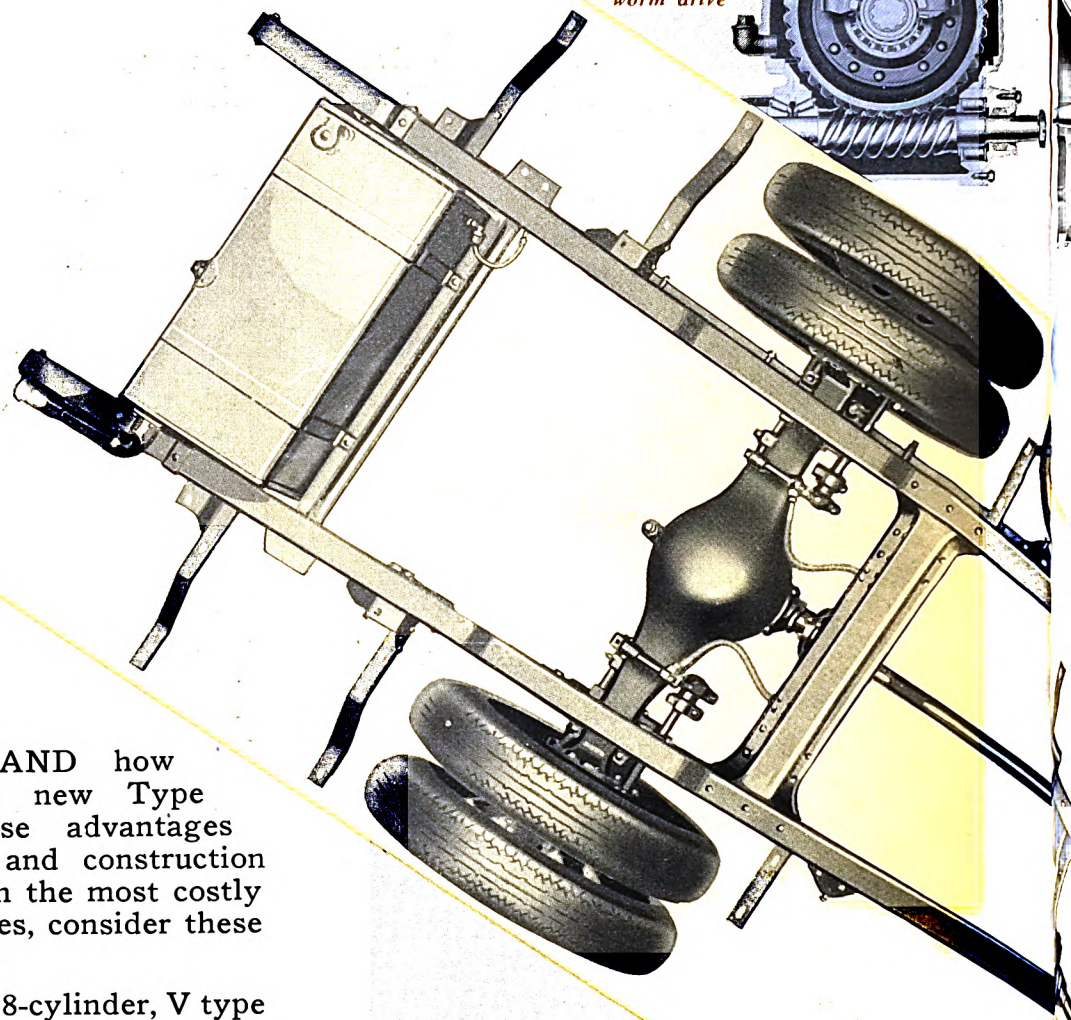


The Observation Parlor Coach has full head-room, is 90 in. wide and accommodates 21 seated passengers

Digitized by Google



New in small coach design— an underslung worm drive



TO UNDERSTAND how completely the new Type "W" supplies those advantages of performance and construction usually found only in the most costly large capacity coaches, consider these important features—

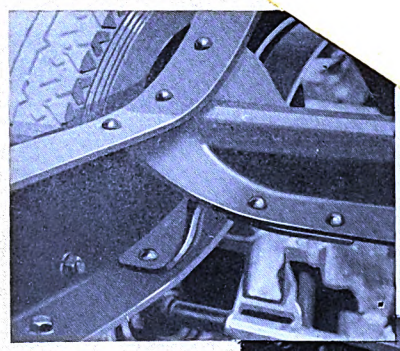
The famous Cadillac 8-cylinder, V type power plant, modified to meet motor coach requirements.

Four-wheel, four-segment service brakes with vacuum Booster, operating through an entirely new method of hydraulic synchronized application, insuring powerful and instantaneous brake action, with minimum effort.

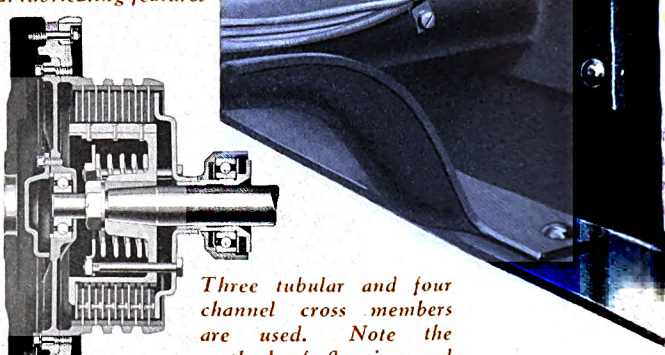
An underslung worm-driven rear axle, of over-size capacity.

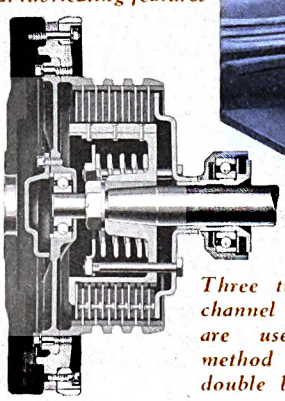
A frame of unusually rigid construction, employing seven cross members, three of which are tubular. The side rail members are of ¼-in. pressed steel, with a maximum depth of 8 inches.

A new front spring suspension that results in exceptional roadability, excellent riding qualities, easy steering, and minimum maintenance. This is accomplished by the outboard mounting of the front springs, which are shackled at the front to a heavy channel cross member outside the chassis frame, instead of directly under it.



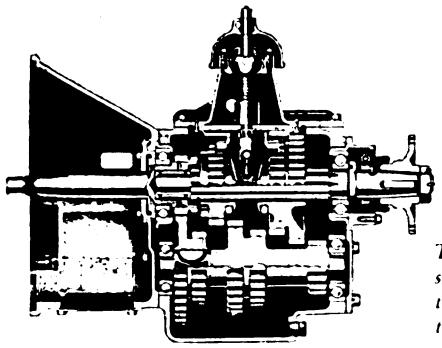
Multiple disc clutch is cooled by induced air currents and has special lubricating features



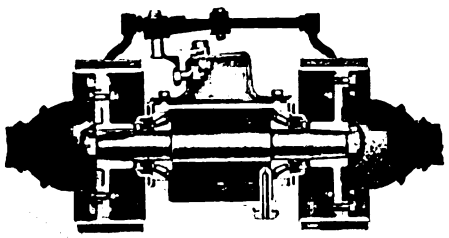


Three tubular and four channel cross members are used. Note the method of flanging and double bracing to insure rigidity

Digitized by Google



The specially designed four-speed transmission contributes to swift acceleration and quiet operation



The two external contracting brake bands are anchored on either side of the center bearing housing

The result is a lower frame level, wider spring centers, better balance, relief to wheel bearings, and protection to steering gear from heavy road shocks, and the elimination of any tendency of spring action to throw the steering gear out of alignment.

All spring mountings are adjustable, of a new patented design which eliminates the common two-piece shackle, and simplifies adjustment and maintenance.

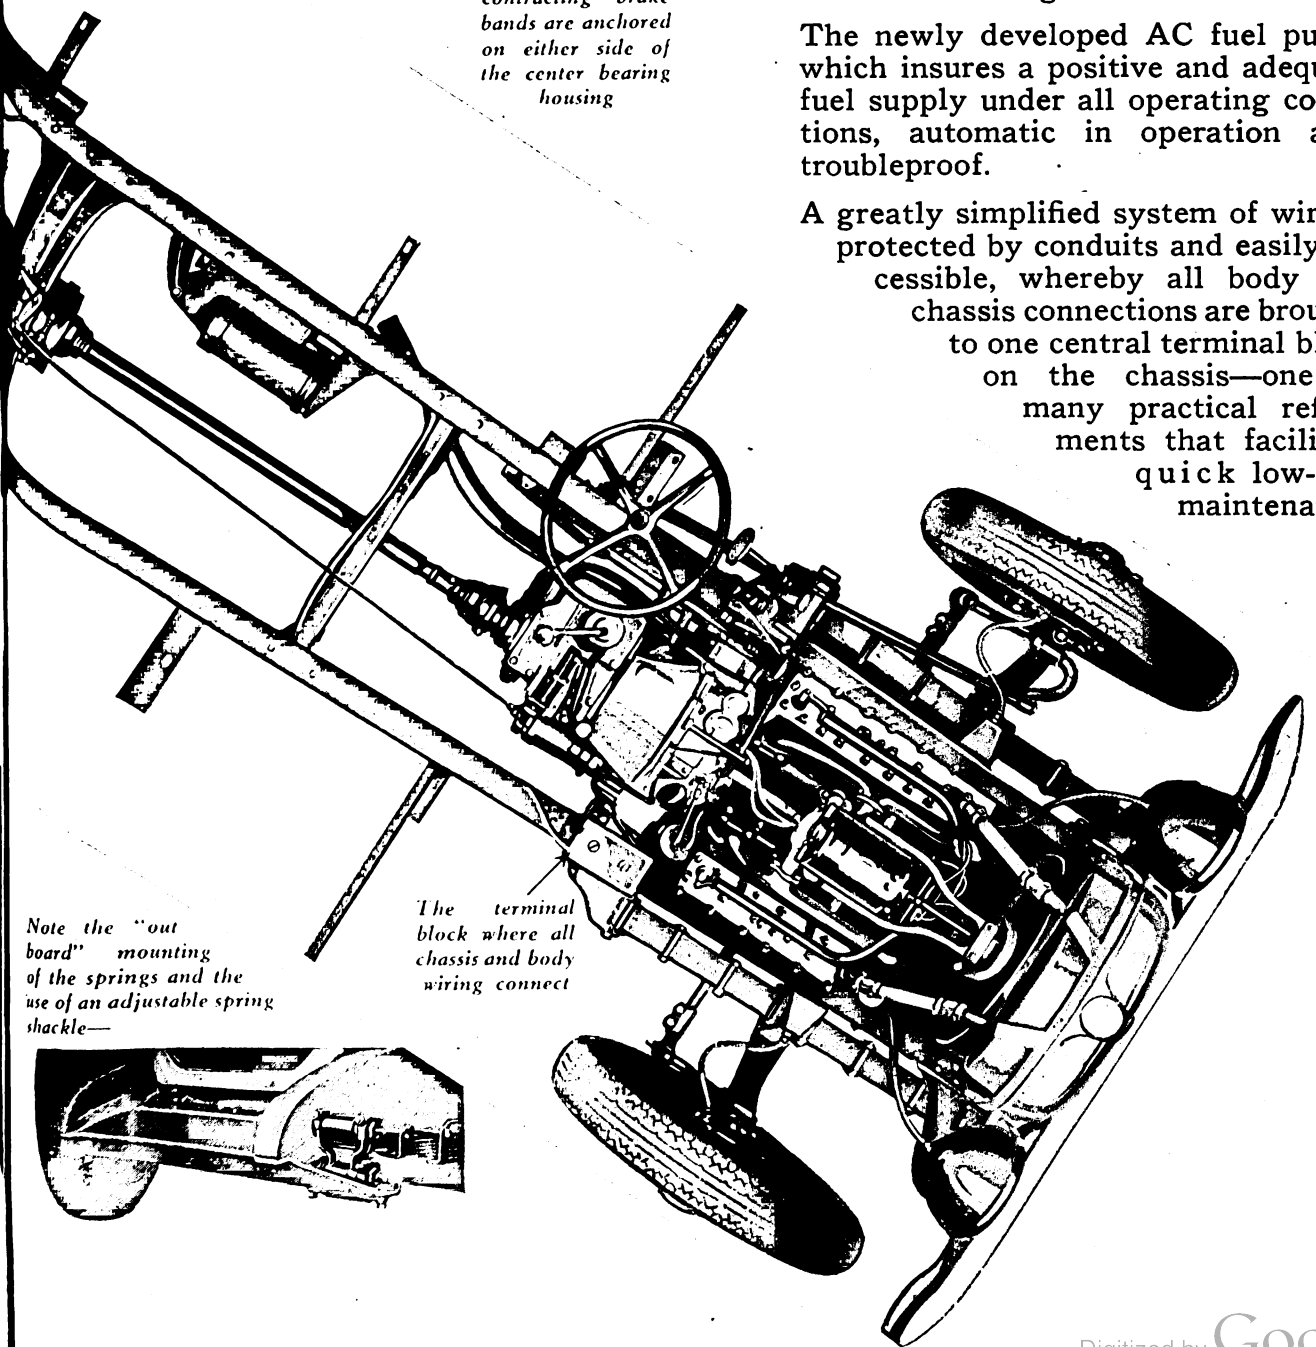
A four-speed transmission, new in small coach design.

The fastest, easiest steering ever known in a coach of this capacity.

A vertical tube radiator, of 518 cubic inch frontal area and nine gallon capacity. Core specially shrouded to increase air cooling.

The newly developed AC fuel pump, which insures a positive and adequate fuel supply under all operating conditions, automatic in operation and troubleproof.

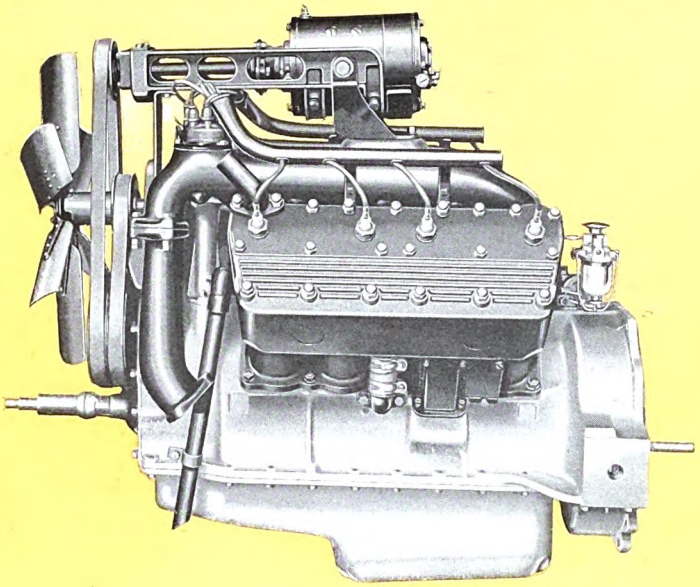
A greatly simplified system of wiring, protected by conduits and easily accessible, whereby all body and chassis connections are brought to one central terminal block on the chassis—one of many practical refinements that facilitate quick low-cost maintenance.



The terminal block where all chassis and body wiring connect

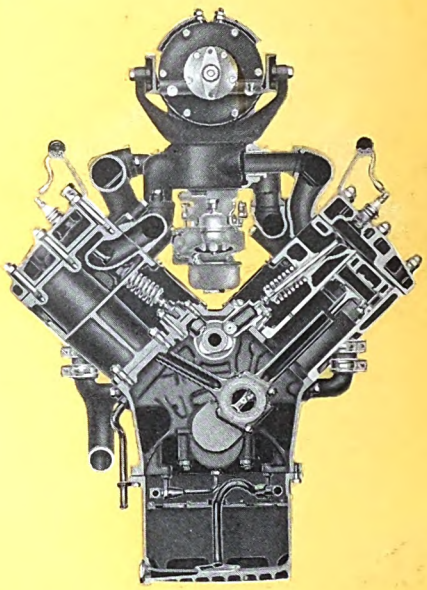
Note the "out board" mounting of the springs and the use of an adjustable spring shackle—

Digitized by Google



The famous Cadillac Engine modified to meet the requirements of motor coach service. 341 cu. in. displacement

Note that the 12-volt generator is easily accessible and well ventilated



THE same wonderful source of tremendous power, fast acceleration, smooth flexibility and freedom from vibration that gained for Cadillac its world-wide reputation for unexcelled performance is used in the Type "W" Yellow Chassis.

The V-type, 8-cylinder engine, as modified to meet the requirements of transportation service, is ideally suited to small coach construction.

It is very compact, and yet all units are easily accessible. The short engine length makes possible a greater useful loading space for a given overall length.

It is mechanically simple. Two short cylinder blocks paralleling one another insure highly efficient and simplified cooling, better carburetion, fuel distribution and lubrication.

It has long life. All units that are subjected to high stresses, such as crankcase, crankshaft, camshaft and cylinder blocks, are short and consequently very rigid. Their useful life, therefore, is greatly increased.

There is no tendency for the short crankshafts and short camshafts to whip. Three main bearings support the crankshaft in precise alignment, as against the seven or nine required in engines of greater length. Only four crank throws are required, where other engines require one for each cylinder. Compensating weights permanently attached to the crankshaft give inherent balance.

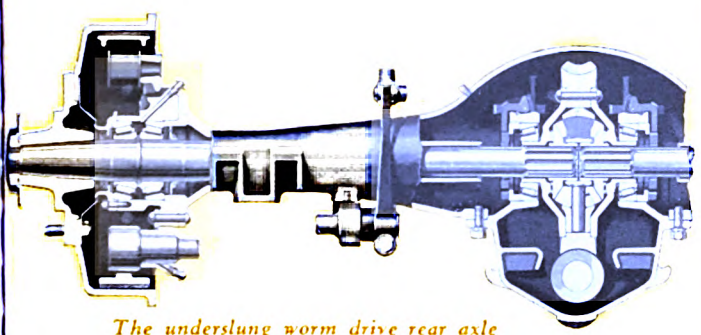
With this design the power impulses are equally spaced and are equally overlapping. Smooth power is assured whatever the engine speed.

Furthermore, it weighs less for its rated horsepower than a six or straight line eight of similar piston displacement.

Digitized by Google

Another notable development new in small coach design is the use of an oversize, underslung, worm-drive rear axle.

Exceptional strength, a safety factor far in excess of normal requirements, and many features calculated to facilitate maintenance, characterize the entire design of this important unit.



The underslung worm drive rear axle has an unusually high factor of safety to take care of maximum loads

The worm shaft is mounted in a carrier on two opposed taper roller bearings at the rear end, and a straight type roller bearing at the forward end. The rear bearing takes fore and aft thrust of the worm shaft in addition to the radial load. The front bearing takes radial load only. The bronze worm wheel is riveted to the differential case.

The front axle is of the reverse Elliott type, with I-beam section. The load thrust is taken on roller bearings interposed between the axle end and the lower fork of the steering knuckle, as well as on the wheel bearings. The pivot pin and wheels are slightly inclined in order to provide for better steering and roadability.

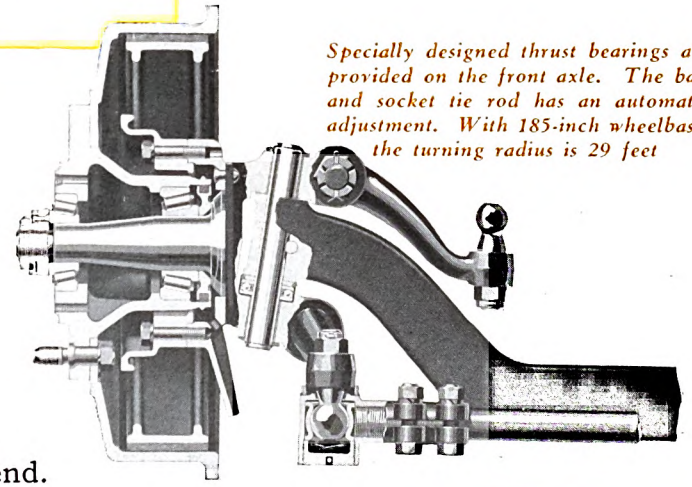
The front axle steering tie rod is of the heavy self-adjusting ball and socket type. Wear is automatically compensated for.

The steering gear is of the cam and lever type, with provision for easy adjustment or quick removal.

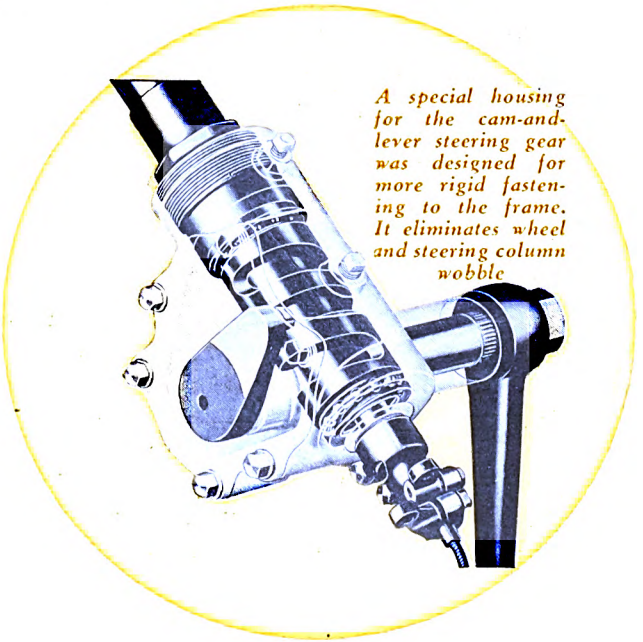
Careful attention has been paid to caster and camber, as well as to all other factors that are of vital importance in influencing easy steering and simplicity of adjustment.

The four-wheel service brakes employ a vacuum booster with hydraulic control to actuate the mechanical-type brakes.

A new type of hydraulic control was first



Specially designed thrust bearings are provided on the front axle. The ball and socket tie rod has an automatic adjustment. With 185-inch wheelbase, the turning radius is 29 feet



A special housing for the cam-and-lever steering gear was designed for more rigid fastening to the frame. It eliminates wheel and steering column wobble

Digitized by Google

developed, in which the operating cylinders were reduced in diameter and mounted away from the wheels, so that they would be easily accessible, well ventilated and removed from any destructive heat generated by the brakes. To this was added a vacuum booster. This construction combines the light pedal pressure of the booster, the smooth efficiency, and the perfect brake equalization of the hydraulic, with all the desirable advantages of four-wheel mechanical-type brakes.

Adjustments for wear are exceedingly simple, and no equalization adjustment is necessary. Due to the even pressure maintained, and the unusually large braking area, brake lining life is exceedingly great. Brake drums are of gun iron, 16⅓ in. in diameter, ground to a perfect fit and balanced after being machined outside as well as inside. The combined service and emergency brake area amounts to 836 square inches, or nearly six square feet.

The emergency brake mechanism is a duplex propeller shaft brake entirely independent of the four-wheel service brakes. These two 8-in. gun iron drums are 3½ in. wide. Brake bands are external contracting, operated by hand lever.

Summed up, service brakes in the Type "W" combine these specific advantages—

Powerful and smooth braking action, with very slight pedal pressure.

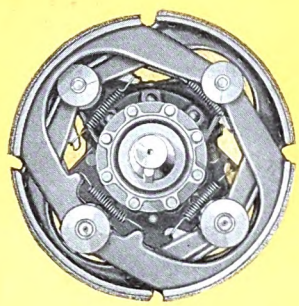
Perfect automatic equalization of brake pressures on all four wheels.

Adjustment for brake lining wear is exceedingly simple, quick and accurate.

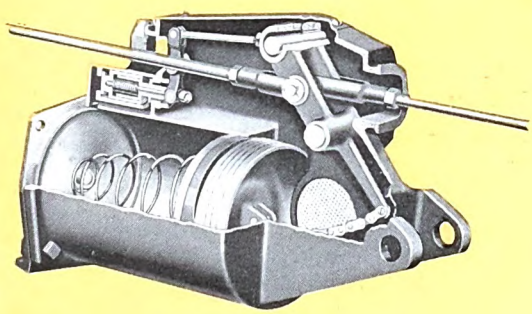
Low maintenance cost.

Easy accessibility and simplicity.

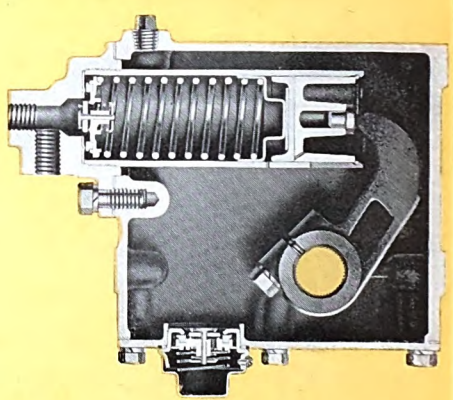
Each service brake contains four fabric lined shoes, interchangeable front and rear. Drums are of gun iron, machined and balanced

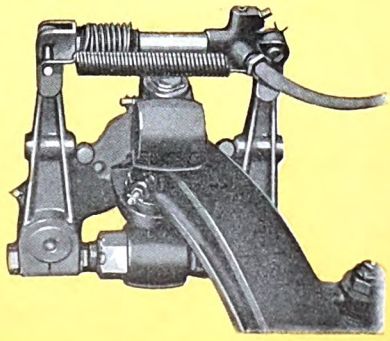


The vacuum booster "steps-up" the brake action and gets quick and positive results with light pedal pressure



TYPE W





The simplified operating cylinders of the hydraulic control that actuate the brake mechanism. They are mounted away from the wheels and are consequently well ventilated and accessible

The hydraulic master cylinder is the self-compensating type. The only rubber cup in the entire system is used here

Digitized by Google

TYPE "W" SPECIFICATIONS

Chassis

GENERAL DIMENSIONS
Wheelbase, 185 in.
Dash to C/L. Rear Axles, 156½ in.
Frame height from ground loaded, 21⅜
Frame width—Front, 30 in.
Frame width—Rear, 41¼ in.
Track—Front, 69¾ in.
Track—Rear, 65¼ in.
Turning radius, 28 ft. 3 in.
Overall width over rear tires, 81⅜ in.

ENGINE—Modified Cadillac V-8 cylinder, 3⅞ in. bore, 4½ in. stroke, 341 cu. in. displacement.

Fan—21 in. diameter, 6 blades mounted on roller bearings. V belt with adjustment.

Lubrication—Force feed to main bearings and connecting rods. Oil pump attached to crankcase top half and positively driven from spiral gear on cam shaft.

Water Circulation—Centrifugal Pump, gear driven.

Oil Cleaners—A.C. Type.

Carburetion—Special designed multiple jet plain tube type with adjustment for low and high speed.

Exhaust Manifold—Single porcelain enameled cast iron manifold on each cylinder block connected by Y branch to single exhaust pipe.

Crankshaft—Heat treated, statically and dynamically balanced, 3 main bearings, 2⅜ in. diameter; connecting rod bearings 2⅜ in. diameter.

Crankcase—Upper and lower halves aluminum with rigid webbing.

Ignition—Delco, battery type, 12 volt, automatic advance with two breakers, one breaker adjustable for synchronizing.

Battery—100 ampere hour, 12 volt, rubber case. Leads carried to side of case with special terminals.

Generator—Delco, 12 volt, 300 watt capacity. Automatic voltage regulation.

Starting Motor—Delco, 12 volt manual shift.

RADIATOR—Vertical copper finned tube chromium plated shell.

CLUTCH—Multiple disc type, cooled by induced air current. Fabric friction linings. Adjustable and easily replaced.

CONTROL SET—Gear shift lever mounted directly on transmission at right of driver. Emergency brake lever at right of driver.

TRANSMISSION—Four speed selective, unit type mounted on engine flywheel housing.

PROPELLER SHAFTS—Tubular shafts with grease type metal joints. Center support bearing self contained, wide spacing between roller bearings; of sturdy construction to take propeller shaft brake stresses; large oil capacity.

STEERING GEAR—Cam and lever, mounted on top of frame, 19 in. wheel.

FRAME—Rigid, pressed steel side bars with kick up over rear axle. Seven cross members, three of which are tubular. Maximum side bar depth 8 in. Maximum flange width 3 in. Frame ¼ in. thick.

FRONT SPRINGS—Heat treated alloy steel, semi-elliptic 43 in. long, 3 in. wide. Shackled at front end.

REAR SPRINGS—Heat treated alloy steel, semi-elliptic 58 in. long, 3 in. wide.

SPRING MOUNTING—Metal shackle type, pins 1 in. diameter, side adjustment on all shackles.

FRONT AXLE—Reverse Elliott. Wheel loads taken on specially designed thrust bearings. Taper roller wheel bearings. Ball and socket tie rod, with automatic adjustment.

REAR AXLE—Underslung worm and wheel with cast steel housing. Axle semi-floating. Bearings taper roller with shim adjustment. Worm wheel bronze.

Ratios as follows:— 5.00-1 6.00-1 (Standard)
5.4-1 7.00-1

BRAKES—Service: 4-wheel hydraulic internal expanding type employing a Westinghouse Booster unit. Each brake drum has four fabric lined shoes simultaneously operated giving approximately even pressure all around drum; drums 16½ in. dia., shoes 3¼ in. wide; operating cylinders placed outside of drums keeping them free from all braking heat. Master cylinder arranged to automatically replace any leakage or fluid. **Emergency:** External contracting hand brake working on twin brake drums one on each end of propeller shaft center bearing, mechanically operated by pull-on type hand lever.

WHEELS—Pressed steel disc, cast steel hubs. Dual rear. Rims 20 in. dia.

TIRES—34x7.50 balloons, front and rear.

GASOLINE TANK—Capacity 46 gallons. Located and supported in rear end of frame.

GASOLINE FEED SYSTEM—A.C. Fuel Pump with integral strainer.

STANDARD ELECTRICAL EQUIPMENT—Ammeter, voltage regulator, reverse current cut-out, lighting, buzzer and ignition switches and heat indicator.

STANDARD CHASSIS EQUIPMENT—Front bumper, head lamps front fenders, hood, electric horn, tail and stop light, one extra disc wheel, speedometer, oil gauge and tools.

21-Passenger City Service Body

GENERAL DIMENSIONS
Coach length over bumpers—23 ft. 8 in.
Overall length of body—18 ft. 1⅜ in.
Overall width of coach—90 in.
Overall height (full load)—8 ft. 7⅝ in.
Head-room inside body—76½ in.
Floor height (loaded)—25¼ in.
Height of step from ground (loaded)—13⅝ in.

SEATING ARRANGEMENT—Twenty-one passengers all facing forward. Eight double seats—4 on each side. Cross seat at rear seating 5. Bucket type driver's seat.

CONSTRUCTION—Framework of second-growth, thoroughly seasoned ash, braced and jointed in conformity with best body-building practice. All joints treated with white lead or glue and either screwed or bolted.

ROOF—Formed from slats, over ash car-lines, covered with black top decking. Construction extremely rigid and waterproof. Inside veneer.

PANELS—Entire exterior covered with sheet aluminum. No exposed wood members. Panels individual and readily detachable.

WINDOWS—Raised type, with fixed upper transoms. 15⅜ in. window lift. Sash of drawn brass providing maximum window vision and minimum weight. Equipped with anti-rattling devices and held to adjustable heights by racks and locks. Sash glazed with double strength window glass. Sash, glass and guides easily removable as a unit, 29⅞ in. post spacing.

ENTRANCE DOOR—Jack-knife type, steel, opening outward. Operated from driver's seat by adjustable mechanism. Upper door panels of glass. Entrance step incorporating safety tread.

EMERGENCY DOOR—Located at left side. Equipped with safety lock.

INTERIOR FINISH—Below belt rail—special composition recessed panels. Brown finish. Mahogany molding. Roof—white enamel. Floor covered with special waterproof composition.

SEATS—Upholstered in genuine brown leather. Full sprung cushions and backs. Light pressed steel pedestals. Seats fitted with polished grab-handles. Seat width 33 in.; aisle width 18¼ in. at cushion and 21¼ in. at seat back; seat spacing 30 in. to 33 in.

HEATING SYSTEM—Blower system. Air circulated around multitubular unit heated by exhaust gases. Controlled by switch on instrument panel.

VENTILATORS—Three large ventilators located in roof. Three ventilators in cowl.

WINDSHIELD—Plate glass with metal frame. Ventilating panel at top equipped with windshield wiper.

WIRING—Cables of stranded wire type, rubber and fabric covered. All exposed wiring protected with loom or metal conduit.

INTERIOR LIGHTING—Eight dome lights of 21 C.P. Light wiring self-contained in advertising racks and removable as a unit. Destination sign illuminated by three 4 C.P. bulbs.
Signal buttons at each seat.
Curtain, at rear of driver's seat.

ADVERTISING SPACE—Standard 11 in. wide advertising sign rack along upper part on both sides and rear of body, mahogany finish.

SUN VISOR AND DESTINATION SIGN—Hunter roller type. Size 8 in. x 40 in. Lettering space 6 x 36 in. Lettering optional. Sun visor located below destination sign.

STANCHIONS—Grab-rail in vertical position at entrance door.

REAR VISION MIRROR—Located on panel above and in front of driver.

LIGHTS—Front and rear marker lights with optional lens colors. Step light at entrance door.

BUMPERS—Tube type rear bumper and channel front bumper.

TIRE CARRIER—One spare tire carrier at rear.

PAINTING—Optional as to colors.

LETTERING—Extra charge for lettering, monograms, gold and silver leaf striping.

TYPE "W" SPECIFICATIONS

17-Passenger Parlor Car Body

GENERAL DIMENSIONS
Overall length over bumpers—23 ft. 8 in.
Overall length of body—18 ft. 1¾ in.
Overall width of coach—84 in.
Overall height (full load)—7 ft. 10¾ in.
Head-room inside body—68 in.
Overall height body including luggage rack—8 ft. 8¼ in.
Floor height (loaded)—25⅝ in.
Height of step from ground (loaded)—13⅝ in.

SEATING ARRANGEMENT—Seventeen passengers, all facing forward, accommodated in four rows of double seats on left side and four rows of single seats on right side of coach, a rear cross seat for four and an observation seat (hinged) alongside driver.

CONSTRUCTION—Same as in city service body.

ROOF—Formed from slats, over ash car-lines, securely fastened in place. Corners hammered aluminum. Roof covered with black top decking. Construction extremely rigid and waterproof.

PANELS—Exterior, side and rear covered with heavy gauge metal. No exposed wood members.

WINDOWS—Window post spacing 39 $\frac{7}{16}$ in. Glass ¼ in. plate, frameless, sliding in felt channels. All side and door windows of drop type, operated by Ternstedt heavy duty crank type regulators fitted with anti-rattlers. Rear window stationary.

ENTRANCE DOOR—Sedan type, 34 in. wide, opening outward controlled by adjustable mechanism from driver's seat. Entrance step incorporating safety tread.

EMERGENCY DOOR—Sedan type, 34 in. wide, opening outward, located at rear on left side of coach, fitted with safety lock.

BAGGAGE DOOR—Sedan type, 34 in. wide, opening outward, located at rear on right side of coach.

LUGGAGE RACK—On roof at rear—three bar type with folding steps and grab-rails at side of coach.

INTERIOR FINISH—Lower side panels of waterproof metal board covered with mohair. Roof headlining of velour. All hardware bright chrome finish. Floor covered with linoleum.

CHAIRS—De Luxe type, tan colored fibre chairs with arm rests. Detachable double cushions. Chair back cushions and arm rests all upholstered in genuine green Spanish leather. Double chair width over arm rests 38 in. Single chair width over arm rests 22 in. Chair spacing 30 to 39 $\frac{1}{16}$ in. Aisle width at arm rests 14 in.

HEATING SYSTEM—Blower system. Air circulated around multitubular unit heated by exhaust gases. Controlled by switch on instrument panel.

VENTILATORS—Three roof ventilators of large capacity. Three ventilators in cowl.

WINDSHIELD—Plate glass with metal frame. Ventilating panel at top equipped with windshield wiper.

WIRING—Cables of stranded wire type, rubber and fabric covered. All exposed wiring protected with loom or metal conduit.

INTERIOR LIGHTING—Eight 21 C.P. dome lights. Signal cord at each seat.

CURTAINS—Window drapes at side and rear windows sliding on chromium plated rods. Curtain at rear of driver's seat.

SUN VISOR AND DESTINATION SIGN—Sun visor metal fixed type. Built-in illuminated destination sign. Roller Hunter type. Lettering optional.

REAR VISION MIRROR—Located on panel above and in front of driver.

LIGHTS—Front and rear marker lights with optional lens colors. Step light at entrance door.

BUMPER (Rear)—Tube type rear bumper and channel front bumper.

TIRE CARRIER—One spare tire carrier at rear.

PAINTING—Optional as to colors.

LETTERING—Extra charge for lettering, monograms, gold and silver leaf striping.

21-Passenger Observation Parlor Car Coach

GENERAL DIMENSIONS
Overall length over bumpers—23 ft. 8 in.
Overall length of body—18 ft. 1½ in.
Overall width of coach—90 in.
Overall height—101 in.
Headroom inside body—75 in.
Floor height (loaded)—24½ in.
Height of step from ground (loaded)—14 in.

CAPACITY AND SEATING ARRANGEMENT—21 Passengers, eight double 35 in. wide fibre back chairs with headroll design, all facing forward, one cross seat at rear, seating five and individual driver's seat with adjustable pedestal. Aisle width 12 in. Seat spacing 32 in.

CONSTRUCTION—Same as in City Service Body.

ROOF—Center panels of roof three-ply poplar veneer. Front section formed to shape of roof. Roof over rear end slat construction. Center panel and rear end covered with long grain top material. Balance of roof covered with sheet aluminum.

PANELS—Entire exterior covered with sheet aluminum. No exposed wood member; panels are individual and readily detachable.

WINDOWS—Glass $\frac{3}{16}$ in. plate, frameless, sliding in felt channels. All side windows including door windows, drop type, operated by Ternstedt heavy duty crank type regulators. Rear window stationary glazed with ¼ in. dangershield glass.

ENTRANCE DOOR—Sedan type opening outward, controlled by adjustable mechanism from driver's seat.

EMERGENCY DOOR—Located at left rear side. Equipped with three-point lock.

INTERIOR FINISH—Wainscoting and pillars above belt covered with leather cloth to match genuine leather used on chairs. Floor covered with battleship linoleum to harmonize with trimming. All hardware bright nickel finished.

CHAIRS—Fibre chairs with arm rest on aisle side only and divided backs accommodating two passengers each. Double cushions. Backs to be headroll type. Cushion backs and arm rests all genuine leather.

HEATING SYSTEM—Same as in City Service Body.

VENTILATORS—Four large ventilators with stationary grills and screen in roof. Three ventilators in cowl.

WIRING—All wiring protected with metal conduit. All circuits of 12 volt double contact type.

INTERIOR LIGHTING—Interior illuminated by six (6) 12 volt 21 C.P. dome lights.

SIGNAL CORD—Located conveniently for each seat.

CURTAINS—Window drapes at side and rear windows full width of window.

SUN VISOR AND DESTINATION SIGN—Sun visor, metal fixed type. Built-in illuminated destination Hunter sign with roller curtain having provision for 15 readings.

WINDSHIELD—Windshield, one-piece stationary, glazed with plate glass, equipped with windshield wiper.

REAR VISION MIRROR—Located on panel above and in front of driver.

LIGHTS—Front and rear marker lights with optional lens color. Step light in well and on top of entrance door. Combination tail and stop light and license bracket at rear.

OBSERVATION REAR—Equipped with ornamental grill and awning. Center of grill equipped with illuminated disc.

BUMPERS—Tube type rear bumper and channel front bumper.

TIRE CARRIER—One spare tire carrier mounted at front of coach on left side.

OUTSIDE BAGGAGE RACK—Baggage rack with tarpaulin cover on rear of roof with ladder at rear right side.

INSIDE LUGGAGE RACK—A built-in luggage rack on inside of body formed by space in monitor in front section of roof on both sides of body.

TOOL CHEST—Under rear cross seat, accessible thru left emergency door without disturbing rear seat cushions.

PAINTING—Optional as to colors. Extra charge for lettering.

RELIEVING CONGESTION
through
TREADLE-IZATION

"The Circulating Load Uses the Rear Treadle

The circulating load—in at the front, out at the rear door by standing on the treadle—will relieve congestion in the front end of safety cars.

Isn't that simple? It is for your convenience and if you follow that practice you will find your street car riding much more comfortable. And, too, if you move away from the entrance you often will find a vacant seat even at the rush hours of the day.

The treadle—that piece of aluminum in front of the rear exit on safety cars—operates with but a minimum of assistance from you. Just stand on the treadle and the door opens automatically when the car stops. You not only get off the car quicker, but by relieving congestion at the entrance door, help us to give you better service."

This is the way the Georgia Power Company presents treadle-ization to its passengers.

Competition . . . NEVER Waits!

WRITE it down that competition will either benefit or destroy a business, but whichever it does, it never waits!

You need Cincinnati Modern Cars on your property today. Tomorrow the job of keeping your present patrons, winning back your lost ones, will be harder.

Your cars are your salesrooms, your customers are being impressed by the service you render today, not the service you may have been *planning* to render all these years.

Look to your cars—they're the foundation of your business.

Cincinnati cars will increase your business, create and *hold* more business—and they'll pay for themselves in a short time out of increased profits.

The Dayton Integral of Track and Paving

THE Dayton Integral System of Track and Paving Structure has been perfected through years of Engineering Research plus long experience with paved track.

Called forth by inherent weakness of wood tie, gravel ballast, with separate paving slab.

The Dayton Integral System unifies track and paving into a durable monolithic structure, in which complete strength of all parts is uniformly developed.

More than a tie, the Dayton Tie becomes in the Integral System a reinforcing member, plus an effective device for absorbing traffic vibration, which otherwise tends to destroy the concrete.

Both track and paving loads are carried by the whole thickness of the reinforced slab, much as concrete and reinforcing of a floor combine to carry a floor load.

Vibration absorption is accomplished by a mixture of asphalt and abestos fibre, contained in a metal box. Upon this mixture rests a wood block for the rail bearing.

Many examples prove soundness. Notably Toledo, Ohio. Here it was necessary to wreck some eleven-year-old Dayton Integral Track (in perfect condition) to build an undergrade railway crossing. The Track was so solid that heavy pile drivers were resorted to after other demolition methods failed.

Common—yet not Commonplace

The Safety Car Control Equipment . . . which interlocks power, brakes, and door control to provide maximum safety and convenience for cars operated by one man . . . is now universally used by traction properties.

To street railway men this equipment is familiar, yet not devoid of interest. It still attracts attention by virtue of its contribution to safe, speedy, and economical transportation. Its potentiality for improvement in service and public goodwill is being recognized more extensively from year to year.

Living up to the time-table

In the electrified zone of the New York Central Railroad, the mechanisms and apparatus which control traffic must not fail—trains must be on time.

General Electric truck-type switchboards, at Harmon and Port Morris, assist in maintaining continuity of service. Power and signal interruptions are minimized by the facility with which a spare truck can be inserted when it becomes necessary to withdraw a unit for inspection or repair. All live parts are enclosed and protected; this reduces fire hazard and practically prevents the danger of accident to personnel. Again, this type of switching equipment can be installed in the shortest possible time, for the units are completely assembled when shipped.

Consult any G-E switchgear specialist as to the application of G-E truck-type switchboards to your problem.

Our story *and we'll stick to it*

PEACOCK STAFFLESS BRAKES

1. *Are Most Powerful:*—An average man can apply up to 3000 lbs. braking force with a 20-inch hand-wheel.

2. *Are Fast:*—This powerful braking force can be applied most rapidly and effectively with Peacock Staffless Brakes, stopping car in shortest possible time.

3. *Have Unlimited Capacity:*—Unique in ability to wind in almost any amount of chain without binding. Neither slack in rigging nor worn brake shoes can prevent effective operation.

4. *Do Save Space and Weight:*—Despite rugged construction and great capacity, Peacock Staffless Brakes occupy minimum platform space and weigh only 72 lbs.

5. *Require Least Maintenance:*—Graphite bronze bushings do away with the need for periodical oiling. Every part strong and simple.

How to keep up with your field

How do you keep in touch with developments in your field? Where do you turn for reference, study or research? Where can you turn? What's available? A good part of the written record—the "canned experience" of your field is to be had in McGraw-Hill Books. You have the key to this experience in the

New 1928 Catalogue of McGraw-Hill Books

The catalogue lists and describes all McGraw-Hill Books in dozens of different branches of dozens of different fields.

It gives you the key to the existing literature on many different scientific engineering and business subjects.

It is a valuable catalogue to have handy and a copy is waiting for you if you want one. Just send us your name and address.

Handy Plan for Your Book Buying

The catalogue describes a plan whereby you can put your book-buying on a convenient budget basis—get the books that you want as you need them—pay for them by the month as you use them.

Send for a copy —it's free

Used and Surplus Equipment

INDIVIDUAL items of used equipment, or surplus new equipment, or complete plants, are disposed of (and found) through advertising in the *Searchlight* Section of this paper.

This is the section which so effectively aided the Government in selling the many millions of dollars worth of surplus material and equipment accumulated during the war without disturbing the market.

"SEARCHLIGHT"

Digitized by Google

Specify these poles . . . *then cut your maintenance budgets for 40 years!*

PUT these strong, long-lasting Prettyman Preserved Poles of Southern Yellow Pine in your lines in 1929. Then forget them . . . forget replacement and maintenance costs until 1969. Creosoted under pressure, full length to the heartwood, they will last from 25 to 40 years—5 to 8 times the natural life of an untreated pole, which in 40 years would cost you something like 23 times its original price in replacements and labor.

Southern Yellow Pine is stronger, too. It has 44% higher static bending strength than the next strongest pole wood. Specify it and cut equipment costs by using fewer or smaller poles per given load. But be sure it is Prettyman Preserved for, however strong, untreated pine is highly susceptible to the attacks of termites (white ants) and decay-producing fungi. Write today for prices on air-seasoned Prettyman Preserved Poles, framed and treated to your own specifications.

That perplexing problem

Modern transportation is responsible for many problems—many of them complicated and requiring a very considerable amount of technical research before they can be answered with accuracy.

The trained viewpoint of engineering service, focused on these problems, will assist you in their solution.

Heralding a year of activity and progress

The ANNUAL STATISTICAL ISSUE

of

Electric Railway Journal

January 12, 1929

This important issue is being awaited with even greater interest than usual. It will chronicle the achievements of a year that has seen encouraging progress. And it will forecast an increasingly optimistic picture for 1929.

The contents of the issue will include the basic statistics for 1928; a complete picture of the Industry's budgets for 1929; high spots of the year's progress in financing, construction, operation and maintenance, and a review of the advances made by manufacturers.

The advertising pages will, as usual, form an important new year exhibit of the latest in equipment, materials and supplies.

Advertising forms close JANUARY 2nd

THIS MAN IS COMFORTABLE AT HOME

IS HE COMFORTABLE IN YOUR CARS?

When a chair at home is too near the heat or too far from the light, it can easily be *moved* into proper relation. But the seats, lights, windows and heaters on a trolley car are in a *fixed immovable position.*

Once uncomfortable upon a car—always uncomfortable. It is necessary, therefore, to bring these factors into right relation at the start and a Hale & Kilburn seating engineer, working with you from the beginning of the design of the car, will assure the maximum degree of final comfort.

We have half a century's experience to aid, not only in providing the most practical *arrangement* of these comforts, but in providing the most practical and comfortable type of *seat* for every type of city and inter-city service.

The H. & K. No. 900D Double Chair has brought street railway seating to the highest point of modern luxury and comfort. It is, however, but one of the many Hale & Kilburn styles developed to fulfill this function in all fields of transportation.

because of-

The La Cuba S. A., bus operators in Havana, have purchased 100 Studebaker "75" heavy duty bus chassis for city service.

Preference for Studebakers was based upon superior design and quality, plus the low cost of these powerful units.

Brilliant performance of Studebakers on many of the world's most difficult bus routes is proof positive of Studebaker quality, famous for more than three quarters of a century.

STUDEBAKERS are

Digitized by Google

first cost

You get more for your bus dollar in Studebakers because these busses cost less to buy. They are lower in price than any other quality bus of comparable power and capacity.

operating cost

Studebaker busses cost less to operate as proved by the books of Studebaker bus operators in every section of the country. The C. S. B. & N. I. R. R. report a total operating cost of .0624 per mile with their "75" busses, exclusive of drivers' wages.

maintenance

Highest quality materials, precision, workmanship and rigid inspections insure exceptionally long life and freedom from mechanical difficulty. The Southern Kansas Stage Lines write: "Six of our Studebakers have covered 50,000 miles without one cent for repairs except valve grinding."

depreciation

Studebaker busses have a notably low rate of depreciation because of their low first cost and the tremendous mileage which is built into them. For instance, J. A. Snyder Transportation Company of Joplin, Missouri writes: "Four of our Studebakers have gone over 100,000 miles. Two of these more than 200,000 miles, and all of our Studebakers are giving perfect service."

Mutual Service

TO the manufacturers and distributors of America and the street railway systems that transport the millions of America's potential buyers, Collier offers a mutual service.

This service has brought the street railway riders in thousands of cities and towns throughout the country to look upon car cards as extremely useful and pleasing features of up-to-date street car service. It has given national and local advertisers a medium thru which they can get their messages to selected territories easily, economically and convincingly.

Our business is one of service—service to the street railway industry, service to America's National and local advertisers, service to the millions of people who daily ride on street cars.

"Opportunity" Advertising:

Think
"*SEARCHLIGHT*"
First!

Saving is a good habit, BUT— Why Save Things You'll Never Use?

WHY let Mother Nature grow grass between the wheels of replaced cars? Why pile up rails, shop equipment, power plant equipment, line equipment, car appliances, road building material, etc., etc., you will never use again?

TODAY you can turn them over at a fair price. Tomorrow they will be—JUNK. Is it not the better part of good horse-sense to dispose of them NOW?

6000 other electric railway men will see your advertisements of used or surplus equipment and materials here—in the Searchlight Section of their business paper.

Some of these men—officials or executives of other lines in other parts of the country and operating under different conditions—can use what you no longer need. For an insignificant investment you can tell these others what you have. And they will buy.

One "Searchlight" advertiser wrote, "We can cheerfully recommend the Searchlight Section as a wonderful medium for reaching buyers of rails and equipment." Another—"The strongest proof that your 'Searchlight' finds its way to many readers is shown by the numerous letters we have received in answer to our recent ad."

Let us tell you the cost of advertising your used or surplus equipment and materials in the Searchlight Section. Just address a list of what you have to dispose of to the

DEALERS IN SCRAP METALS FOR OVER THIRTY YEARS

Heartiest Season's Greetings

To our many friends in the electric railway industry, we extend our cordial good wishes.

It is pleasant to look back over the past year and think of our old friends as well as those who during the year we have been privileged to serve for the first time.

To you all, may the coming year be prosperous — a year during which you will reap greater benefits than ever before from the good will which you, too, are fostering among those you serve.

Wilmington Citizens Ride In Comfort

No detail of any electric car affects the "comfort consciousness" of passengers more than the seats. The ten new cars built by Brill for the Delaware Electric Power Company are therefore equipped with Brill No. 201-D Seats, for there is no better built or more comfortable seating equipment.

These deep-spring, leather upholstered seats possess the in-built wearing qualities that impart lasting satisfaction. There is no skimping on materials underneath the upholstery. All Brill Seats are built according to Brill standards of construction.

As an aid in building transportation sales, specify Brill Seats—it pays.

ELECTRICITY IMPROVES SERVICE AND INCREASES REVENUE

THE ILLINOIS CENTRAL
electrified to improve suburban operation

The Illinois Central, which serves Chicago's crowded suburban area, carried more than thirty million commuters in 1927—twenty-five per cent more than in 1926.

President L. A. Downs, of the Illinois Central, attributes much of the increased patronage to the faster and more frequent train service provided in the electrified zone.

Complete electrification of terminal lines not only brought about this sudden and substantial increase of riders but also turned the $337,000 operating deficit of 1926 into an income of $530,000 in the following year.

Speed always appeals to commuters; and in addition to speed, riders have been attracted by the absence of smoke, cinders, and noise; by the seating capacity and smooth motion of the trains; and by the clean comfort of the cars.

Not only at terminals, but on the long, level stretches of main line, electric operation produces more revenue, simplifies operation, reduces maintenance, and gives better service.

Manifold advantages of electric operation have resulted from the use of electric locomotives and cars on main and branch lines, at terminals, and in suburban traffic; gas-electric cars for light-traffic lines; oil-electric locomotives in freight yards; and gas-electric buses for feeder service. Electric floodlights expedite freight sorting, and electric signal systems promote safe transportation.
